6.4.2 *Nitrogen*: Nitrogen may be cooler than the pipe but as the nitrogen warms the pressure will increase. If using nitrogen from a liquid transport truck, then ensure that only vaporized nitrogen is introduced in the pipe.

6.4.3 *Water*: Follow procedures in [PTST 2.3](#) Hydrostatic Pressure Testing.

6.4.4 It is critical that the temperature of the test medium and pipe be allowed to equalize before initiating the test.

6.5 Once the desired leak test pressure is reached and stabilized, hold the pressure on the segment for the required test duration as a minimum.

6.6 If the pressure does not stabilize check for leaks and repair any leaks found. Initiate the leak test process as indicated in [6.3](#) above.

6.7 The person responsible for the test shall ensure and document that the recording device has been zeroed prior to beginning the test. Additionally, the person responsible for the test shall document, the reason for any pressure fluctuation, such as temperature, vibration, vandalism, leak, etc., once the test duration has begun. Fluctuation shall be documented in the Comments section on the pressure test stamp. Refer to [PTST 1 Section 8.1.2.4](#) if recording device has digital display.

6.8 Where a separate leak and strength test is required, the strength test will follow a successful leak test.

- 6.9 If the pressure tested segments are not going to be immediately tied into the gas system, pressure may be left on the segment until the final tie in is made.
- 6.10 Tie-in joints shall be leak tested with leak detection solution or leak detection instrument at the current operating pressure.

7.0 Leak Test Records

- 7.1 Each leak test performed on a main or fabricated unit shall be documented on the appropriate Ameren Illinois forms. See [PTST 3](#) for copy of LTF (Leak Test Form) or LSTF (Leak Strength Test Form).
- 7.2 Refer to [PTST 1](#) for test record requirements.

End of Instructions.

Operator Qualification (OQ) Required?

PTST 2.1 Pressure Testing: Leak Test, October 1, 2020

Revision Notes

UNCONTROLLED IF PRINTED

Location of Changes	Summary of Changes
Paragraph 4.2.1	125 psig or 60 psig replaces 100 psig for PE segments
Subsection 5.2	125 psig replaces 100 psig for HDPE pipe
Paragraph 5.2.4	Revised – The leak test pressure can be left on longer than the required test duration with the possible exception for service lines.
Paragraph 5.2.4 Item 1.	New – Service lines with 175 psi rated meter valves that are being leak tested at a pressure greater than 200 psig shall have a maximum duration of no more than 2 hours. The test pressure shall be relieved or lowered to under 200 psig within 2 hours. Refer to PTST 1 Paragraph 10.6.1 for meter valve limitations.

PRESSURE TESTING

October 1, 2020

PTST 2.2 Strength Test

1.0 Purpose

This document specifies the requirements for conducting strength testing of pipelines, fabricated units, or short sections of pipe in accordance with 49 CFR 192 Subpart J.

Test Pressure and Duration Tables ([PTST 1.1](#)) specify pressure test requirements for given pipe materials, sizes and lengths.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Test Medium](#)[6.0 Strength Test Procedure](#)[7.0 Strength Test Records](#)

3.0 Target Audience

- Gas Engineering
- Gas Construction Personnel
- Gas Supervisors
- Gas Construction Services Personnel
- Gas Integrity Management Personnel
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Storage Field Supervisor
- Gas Storage Field Operators

4.0 General

- 4.1 When a separate strength test is required from [PTST 1](#), the strength test shall be performed after the leak test is successfully completed.
- 4.2 Strength test durations are shown in the following tables:
 - 4.2.1 [PTST 1.1 Table D](#) Steel Main, All Steel Pipe Sizes thru 30" with Design MAOP 100 PSIG or Greater
 - 4.2.2 [PTST 1.1 Table E](#) Fabricated Unit/Assembly or Short Section of Pipe
 - 4.2.3 [PTST 1.1 Table F](#) Farm Tap, Single Cut, 60 to 450 PSIG Inlet Pressure
 - 4.2.4 [PTST 1.1 Table G](#) Farm Tap, Double Cut, 451 to 1000 PSIG Inlet Pressure
- 4.3 Do not apply test pressure against a closed valve. In-line valves should be tested in the open position unless otherwise specified in the project procedures.
- 4.4 Maximum test pressure on steel pipe with Design MAOP of 100 psig or greater should not exceed that designated by GTE or GSE.

5.0 Test Medium

- 5.1 Water may be used as the test medium for any strength test. See [PTST 2.3](#) Hydrostatic Pressure Testing.

UNCONTROLLED IF PRINTED

5.2 Air, nitrogen, natural gas or combination of air and nitrogen may be used, provided the following maximum hoop stress limitations apply. See Table 1.

Table 1: Maximum Hoop Stress Allowed as Percent of SMYS

Class Location	Maximum Hoop Stress Allowed (% SMYS)	
	Natural Gas	Air or Nitrogen
1	80	80
2	30	75
3	30	50
4	30	40

5.2.1 For pipelines that operate at 30% or more of SMYS that are in a Class 1 or Class 2 location where there is a building intended for human occupancy within 300 feet of the pipeline, the strength test shall be as follows:

1. Hydrostatic test shall be conducted to a test pressure of 1.5 times the Design MAOP on the segment of pipe within 300 feet of such building. In no event may the test segment be less than 600 feet, unless the length of newly installed or relocated pipe is less than 600 feet.
2. However, if the building is evacuated while the test pressure exceeds 50% of SMYS, air or inert gas may be used as the test medium.

5.2.2 In a Class 1 or Class 2 location, each compressor station, regulator station and measuring station shall be tested to at least Class 3 location test requirement.

5.3 When strength testing with nitrogen, calculate the volume needed to fill the line, and schedule the necessary equipment. Nitrogen may be added to compressed air which was used for the leak test. See [PTST 2.4](#) Nitrogen Pressure Testing.

6.0 Strength Test Procedure

6.1 The mechanical recording chart, electronic pressure recording device or calibrated dead weight tester should be installed and recording prior to the initial pressurization to

6.1.1 Verify operation of the recorder, and

6.1.2 Verify that the correct pressure is being recorded.

6.1.3 A test gauge or calibrating gauge may be used to verify accuracy of the recording device if there is question.

6.2 Pressurize the pipe or fabricated segment to the required strength test pressure.

6.2.1 The official pressure gauge, mechanical chart recorder, electronic recording device, or calibrated dead weight tester may be located at any point on the line.

6.2.2 If using air, nitrogen or natural gas as a test medium, then locate the recording device near the compressor connection or fill end to prevent accidental over pressurization.

6.3 If water is used as a test medium, refer to [PTST 2.3](#) Hydrostatic Pressure Testing.

6.4 If a wide variation in ambient temperature is anticipated, install a recording temperature gauge, with probe buried at pipe level, adjacent to the pressure gauge.

6.5 If the test segment is going to be blown down following the test, the pressure recording chart, electronic pressure recording device or calibrated dead weight tester should be in operation at the initial start of the blow down to verify operation of the recorder. Docu-

ment on the chart or record, if the test segment is not being blown down at the completion of the test.

- 6.6 Once the desired strength test pressure is reached and stabilized, hold the pressure on the segment for at least the required test duration. If the pressure does not stabilize, check for leaks and repair any leaks found. Reestablish the strength test pressure for the required duration.
- 6.7 The person responsible for the test shall document the reason for any pressure fluctuation (temperature, vibration, vandalism, leak, etc.) once the test duration has begun. Fluctuation shall be documented in the Comments sections on the pressure test stamp. Refer to [PTST 1 Section 8.1.2.4](#) if recording device has digital display.
- 6.8 After completion of test, appropriately release the test medium. However, pressure may be left on the segment until the final tie-in.
- 6.9 Tie-in joints shall be leak tested with leak detection solution or leak detection instrument at the current operating pressure.

7.0 Strength Test Records

- 7.1 Each strength test shall be documented on the appropriate Ameren Illinois forms. See [PTST 3](#) for LSTF (Leak Strength Test Form).
- 7.2 Refer to [PTST 1](#) for test record requirements.

End of Instructions.

Operator Qualification (OQ) Required?

PRESSURE TESTING

October 1, 2021

PTST 2.3 Hydrostatic Pressure Testing

1.0 Purpose

This procedure specifies the requirements for conducting hydrostatic pressure testing of pipelines, fabricated units, or short sections of pipe in accordance with environmental protection requirements and 49 CFR Part 192 Subpart J.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Environmental Protection Requirements](#)[6.0 Safety](#)[7.0 Prior to Hydrostatic Testing](#)[8.0 Filling with Water](#)[9.0 Pressurizing](#)[10.0 Depressurizing/Dewatering](#)[11.0 Spike Hydrostatic Pressure Test for Transmission Lines \(49 CFR §192.506\)](#)[12.0 Test Records](#)**3.0 Target Audience**

- Gas Engineering
- Gas Construction Personnel
- Gas Supervisors
- Gas Construction Services Personnel
- Gas Integrity Management Personnel
- Gas Tech Engineering (GTE)
- Gas Tech Services (GTE) Supervisors
- Gas Tech Services (GTE) Personnel
- Gas Storage Engineering (GSE)
- Gas Storage Field Supervisor
- Gas Storage Field Operators

4.0 General

- 4.1 GTE or GSE shall provide written hydrostatic testing and spiking testing procedures for each applicable project. These instructions will be part of the job packet and shall be reviewed with personnel responsible for performing and monitoring the test.
- 4.2 See [PTST 1, Section 7.0](#) Test Medium for test medium requirements.
- 4.3 A separate leak test is not required for hydrostatic pressure testing.

5.0 Environmental Protection Requirements

- 5.1 GTE or GSE will contact Ameren Environmental Services when planning a hydrostatic test to verify permitting and water testing requirements associated with hydrostatic testing and discharging.

UNCONTROLLED IF PRINTED

- 5.2 Ameren Illinois (AIC) has a blanket IL EPA Water Pollution Control Permit for the discharge of hydrostatic test water but that permit has specific requirements that must be met. A copy of this permit should be part of the final job packet when hydrostatic pressure testing is performed.
- 5.3 GTE or GSE, along with Ameren Environmental Services, will coordinate the required water sampling and testing.
- 5.4 Ameren Environmental Services will submit all required documentation to the appropriate IL EPA office. GTE or GSE shall provide Environmental Services with project-specific information (Table 1).

Table 1: Project-Specific Hydrostatic Test Information

Project-specific information	Description/example
General Location of Discharge Site(s)	e.g. Northeast side of Neil Street and Jones Rd
Project Description	e.g. New 12" from Marion to Johnston City
Scheduled Release Date(s)	Month/Day/Year
Estimated Duration of Release	Approximate hours
Source of Test Water	e.g. City of Marion water department
pH of Source Water	Obtain in advance from source of supply
Estimated Volume of Discharge	Gallons
Release Site(s)	Type of land, such as farmland, pasture, gravel yard, etc.
Site Coordinates of Discharge Site(s)	County, township, range, section, and road intersection if possible or GPS coordinates
Site Map	e.g. Would be to show the discharge location on a USGS Quadrangle Map. Ameren Environmental Services has previously taken the information supplied by the Engineer and created the Site Map to submit to the IL EPA

6.0 Safety

- 6.1 Restrict access to the test area (along and around the pipeline being hydrostatically tested) to only those persons needed to perform the test.
- 6.2 Conduct a Job Briefing identifying potential safety hazards associated with hydrostatic testing including the filling and discharge operations.
- 6.3 Anchor or restrain hydrostatic test water discharge piping to prevent excessive movement that could cause the line to separate at connections to couplings, valves, or other fittings.

7.0 Prior to Hydrostatic Testing

- 7.1 Before pipeline segment is hydrostatically tested, complete all nondestructive testing and/or all repairs.

- 7.1.1 Prior to performing a hydrostatic retest on existing transmission pipelines (i.e., to revalidate serviceability of the line) Integrity Management may consider running an in-line inspection tool to detect time-dependent defects.
- 7.2 Before filling with water, pipelines should be pigged to remove any debris.
- 7.3 Consider elevation differences:
 - 7.3.1 The lowest elevation point on the line will be subjected to the greatest pressure during the test due to the additional static head of water.
 - 7.3.2 The highest elevation point will have the least pressure during the test since it will have no additional pressure because of the weight of water.
 - 7.3.3 The static pressure of water is equal to 0.433 psig per foot of elevation.
 - 7.3.4 The intent is to subject the entire length of pipe to a pressure that meets or exceeds the minimum strength test requirement while not exceeding a pressure that is greater than the yield strength of the pipe.
- 7.4 GTE or GSE will determine the volume of water required and provide that information to the individual responsible for hydrostatic testing.
 - 7.4.1 Use water from a potable city distribution system whenever possible. Use check-valves in fill lines, as necessary, to prevent possible contamination of city water.
 - 7.4.2 If water is from a potable water source, the city operator should provide pH information.
 - 7.4.3 If water is from a lake, stream, or pond, the water shall be field tested prior to use. Use only if pH is between 6.0 and 9.0.
 - 7.4.4 If assistance is needed, contact Ameren Environmental Services.

Auxiliary tanks and pumps may be used as necessary to supplement the availability of city water and pressure.

8.0 Filling with Water

- 8.1 Install valves and fittings at the line inlet and outlet to control the water injection rate and air removal. Valves and fittings shall have a pressure rating equal to or exceeding the maximum test pressure.
- 8.2 Inject water into the line in a manner that most effectively eliminates air pockets left in the pipeline. The preferred manner is to inject the test water behind a pig, pushing the pig with water to the end of the pipeline.
 - 8.2.1 Other methods may be used as long as they effectively minimize the amount of air left in the pipeline.
- 8.3 Inject water at a steady rate such that the pig travels between 176 and 264 feet per minute (approximately 2 to 3 miles per hour). A water meter can be used to determine pig location and travel speed. Calculate pig speed as follows:

$$\text{Pig speed (feet per minute)} = \frac{\text{(Cubic feet per minute of water)}}{\text{(Cubic feet in one foot of pipe)}}$$

- 8.4 If an extreme drop in elevation is encountered along the route, then it may be necessary to apply back pressure at the discharge end.

- 8.5 When the pig reaches the end, continue discharging water through the vent lines until it runs free of any bubbles (entrapped air).
- 8.6 Fittings at the line outlet (end where the pig is received) should have valving allowing removal of the pig without introducing air into the line OR be arranged to allow reversal of the pig direction for water removal.

9.0 Pressurizing

- 9.1 Once the line has been filled with water and is free of entrapped air, use a hydrostatic test pump or portable pressure washer to increase pressure to the determined strength test pressure.
- 9.2 After the desired pressure is reached, monitor the recording gauge for about 15 minutes.
 - 9.2.1 If pressure drops steadily, check for potential leakage and repair.
 - 9.2.2 If pressure drops at first and then levels off, the cause is due to a change in the water temperature inside the pipe.
 - 9.2.3 GTE will specify required leak test duration.
- 9.3 After verifying a stable pressure, continue pressurizing as needed to reach the desired strength test pressure and start the recording gauge chart.
 - 9.3.1 Record on the pressure chart, or pressure log, the time, date, temperature, order number.
 - 9.3.2 If using a temperature recorder, record the time, date, and order number on the chart.
- 9.4 Continue the strength test for the required time duration. Although the pressure may vary, the pressure should **not** fall below the minimum required strength test pressure at any time during the test.
 - 9.4.1 Record the time and date the test was completed.
 - 9.4.2 The signature of the individual conducting the test, or the Ameren Illinois witness, should be on the chart, test log, or record.
 - 9.4.3 The serial number of the pressure recorder and/or temperature recorder should be documented on the appropriate chart and the calibration date of the recorder.
- 9.5 Any leaks or failures found during the test shall be noted on the test record.

10.0 Depressurizing/Dewatering

- 10.1 When testing is completed, relieve pressure through valves on test header.
- 10.2 Propel pigs with air pressure to dispel all water through discharge end.
 - 10.2.1 Control pig speed by maintaining back pressure at the discharge end through valve adjustment.
 - 10.2.2 A pig moving uniformly will create a steady pressure and a uniform length of water jet from the discharge piping.
 - 10.2.3 Pig speed on discharge should be the same speed as filling.
- 10.3 Release discharge of test water onto the release site should be controlled. The AIC blanket IL EPA Water Pollution Control Permit requires that provisions be made to pre-

vent the flow of water into ditches, streams, or ponds. Test water should be allowed to seep into the ground without causing erosion.

10.4 Contact Environmental Services for hydrostatic test discharge water sampling kits and instructions for sampling, sample preservation, and shipment to laboratory. The discharge test water will be generally analyzed for oil, grease, pH, total suspended solids, dissolved and total iron per the blanket IL EPA Water Pollution Control Permit.

10.5 Following initial water discharge, the pipeline should be pigged as many times as necessary to assure removal of free water. Little, if any, free water should be discharged on the final discharge/drying pig run.

11.0 Spike Hydrostatic Pressure Test for Transmission Lines (49 CFR §192.506)

11.1 Spike Test Requirements

11.1.1 Whenever a segment of steel transmission pipeline is spike tested under this part:

1. Use water as medium.
2. Have baseline test pressure of at least 1.5 times the design MAOP.
3. Hold at or above baseline test pressure for a minimum of 8 hours.
4. After the test pressure stabilizes at the baseline pressure and within the first 2 hours, subject and hold the spike test pressure test for at least 15 minutes after the spike test pressure stabilizes.

12.0 Test Records

12.1 Each strength test shall be documented on the appropriate Ameren Illinois forms. See [PTST 3](#) for Hydrotest Strength Test Form.

12.2 Refer to [PTST 1](#) for test record requirements.

End of Instructions.

Revision Notes

Location of Changes	Summary of Changes
2.0 Scope – Section 7.0	Revised title – Prior to Hydrostatic Testing
Section 4.0	Added Subsection 4.3 - Separate leak test is not required when hydrostatic pressure test is performed.
Section 7.0	Changed to Prior to Hydrostatic Testing
Section 7.0	Removed – Place test gauges or recording devices as needed near the highest and lowest points on the pipeline being tested.
Paragraph 9.2.2	Revised to - If pressure drops at first and then levels off, the cause is due to a change in the water temperature inside the pipe.
Paragraph 9.3.1 and 9.3.2	Removed "project name"
Paragraph 11.1.1	Item 3 – Changed to "at or above baseline pressure"
Subsection 12.1	Hydrotest Strength Test Form replaces LSTF (Leak Strength Test Form)

PRESSURE TESTING

December 15, 2021

PTST 2.4 Nitrogen Pressure Testing

1.0 Purpose

This procedure provides requirements for nitrogen pressure testing mains and service lines in accordance with 49 CFR Part 192 Subpart J.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Properties of Nitrogen](#)

[6.0 Use of Compressed Gas Cylinder](#)

[7.0 Cylinder Requirements](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services personnel
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Engineering (GSE)
- Gas Storage Field Supervisor
- Gas Storage Field Operators

4.0 General

- 4.1 All valves, gauges, hoses and fittings used for nitrogen pressure testing shall have pressure ratings that exceed the test pressure and the pressure of the nitrogen tank used.

5.0 Properties of Nitrogen

- 5.1 Nitrogen is an inert gas. It is colorless, odorless, non-toxic, non-combustible and non-corrosive.
- 5.2 Gaseous nitrogen is extremely dry and absorbs moisture.
- 5.3 Nitrogen should be used as a safe medium for pressure testing mains and service lines and as a purge slug.

6.0 Use of Compressed Gas Cylinder

- 6.1 An adjustable regulator with gauges for upstream and downstream pressures is required for pressure testing applications.
- 6.2 Regulator, valves, gauges, hoses, and fittings designed and rated for the intended application and pressure shall be used.

7.0 Cylinder Requirements

- 7.1 When nitrogen pressure testing relatively small volumes of piping, use the Cylinder Estimation Graph ([Table 1](#)) to determine the number of required cylinders.

UNCONTROLLED IF PRINTED

7.1.1 The Cylinder Estimation Graph assumes starting with a 100 psig air test and provides at least one more cylinder than is required.

7.1.2 *Example:* How many cylinders of nitrogen are required to test 1,400 feet of 3-inch pipe at 1,080 psig?

1. Follow the arrows to find 1,400 ft on the Pipe Length scale. Go vertically to the 3" Nominal Diameter line, and then go horizontally to the 1,080 psig Test Pressure line.
2. On the top scale, read the number of cylinders required for the corresponding cylinder size: 34 cylinders (Cylinder Size 226/2200) OR 20 cylinders (Cylinder Size 370/2400).

Table 1: Cylinder Estimation Graph

7.2 If more than 60 cylinders are required to establish the desired test pressure, then purchasing compressed nitrogen in a tube trailer may be a more economical alternative.

End of Instructions.

UNCONTROLLED IF PRINTED

Operator Qualification (OQ) Required?

YES

0561: Pressure Test - Nonliquid Medium - MAOP Less than 100 Psi

0571: Pressure Test - Nonliquid Medium - MAOP Greater than or Equal to 100 Psi

PRESSURE TESTING

October 1, 2021

PTST 2.5 MAOP Determination

1.0 Purpose

This document outlines determination methods for establishing maximum allowable operating pressure (MAOP) on gas pipeline facilities owned and operated by Ameren Illinois (AIC) in accordance with 49 CFR Part 192 Subpart J and Subpart L.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 MAOP for Steel or Plastic Pipelines \(49 CFR §192.619\)](#)

[6.0 MAOP for High Pressure Distribution Systems](#)

[7.0 MAOP for Low Pressure Systems](#)

[8.0 Records](#)

[9.0 Alternative MAOP for Certain Pipelines](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Integrity Management
- Gas Storage Engineering (GSE)
- Gas Tech Services Supervisors
- Gas Storage Field Supervisors
- Gas Supervisors

4.0 General

- 4.1 49 CFR Part 192 requires that each section of pipeline OR each segment of a distribution system have a MAOP established.
- 4.2 Federal pipeline safety standards 49 CFR §§ 192.607, 192.619, 192.620, 192.621, 192.623, and 192.624 list the factors to review in determining the MAOP.
- 4.3 Prior to 49 CFR Part 192, MAOP was determined by the Illinois Commerce Commission, General Order No. 192, Rule for the Construction and Operations of Gas Transmission and Distribution Piping Systems, June 1967.

5.0 MAOP for Steel or Plastic Pipelines (49 CFR §192.619)

- 5.1 For new pipelines, MAOP should be determined by the design pressure of the weakest element in the system.
- 5.2 For in-service steel pipelines, MAOP is established by determining the lowest of the following:
 - 5.2.1 The design pressure of the weakest element in the system.
 - 5.2.2 The pressure obtained by dividing the test pressure after construction by the appropriate class location factor (Table 1).

UNCONTROLLED IF PRINTED

Table 1: MAOP Determination - Class Location Factors

Class Location	Steel pipe (operated at 100 psig or more)				Plastic pipe (all locations)
	Installed Before Nov. 12, 1970	Installed On or After Nov. 12, 1970 and Before July 1, 2020	Installed On or After July 1, 2020	Covered Under 49 CFR 192.14	
1	1.1	1.1	1.25	1.25	Test pressure is divided by a factor of 1.5.
2	1.25	1.25	1.25	1.25	
3	1.4	1.5	1.5	1.5	
4	1.4	1.5	1.5	1.5	

5.2.3 The highest actual operating pressure between July 1, 1965 and July 1, 1970.

5.2.4 The maximum pressure considered safe by the operator after considering and accounting for records of material properties, including materials verified by material testing if applicable, and the history of the pipeline system, known corrosion and actual operating pressure history.

5.2.5 The highest actual operating pressure during the 5-year period preceding July 1, 1970. This pressure restriction applies unless the segment was tested in accordance with the factors shown in Table 1 between July 1, 1965 and July 1, 1970 or the segment was uprated in accordance with Uprating section of Part 192.

5.3 In accordance with 49 CFR §192.624, the maximum allowable operating pressure of all steel transmission pipeline segments must be reconfirmed if certain conditions are met.

5.4 For in-service PE pipelines the MAOP is the test pressure divided by a factor of 1.5.

6.0 MAOP for High Pressure Distribution Systems

6.1 The MAOP cannot exceed the lowest of the following pressures, as applicable:

6.1.1 Design pressure of the weakest element in the segment as determined by Pipe Design and Design of Pipeline Components sections of 49 CFR Part 192.

6.1.2 Pressure determined by the operator to be the maximum safe pressure after considering the history of the segment, particularly known corrosion and the actual operating pressure.

6.2 Overpressure protection devices shall be installed to prevent the MAOP from being exceeded above the allowable maximum emergency pressure.

7.0 MAOP for Low Pressure Systems

7.1 On low pressure systems where gas is delivered to the customer with no service regulator, the MAOP is determined by the operator based on the maximum pressure which can safely be delivered to the customer.

8.0 Records

8.1 The MAOP records on gas facilities are retained and maintained in electronic and paper format.

8.2 In accordance with 49 CFR §192.619 (4)(f), operators of onshore steel transmission pipelines must make and retain records necessary to establish and document the MAOP of each pipeline segment in accordance with 49 CFR §192.619 paragraphs (a) through (e) as follows:

- 8.2.1 Operators of pipelines in operation as of July 1, 2020 must retain any existing records establishing MAOP for the life of the pipeline;
- 8.2.2 Operators of pipelines in operation as of July 1, 2020 that do not have records establishing MAOP and are required to reconfirm MAOP in accordance with §192.624, must retain the records reconfirming MAOP for the life of the pipeline; and
- 8.2.3 Operators of pipelines placed in operation after July 1, 2020 must make and retain records establishing MAOP for the life of the pipeline.

9.0 Alternative MAOP for Certain Pipelines

9.1 The MAOP as determined by using alternate design factors and alternate test factors in accordance with Table 2:

Table 2: Alternative MAOP Design and Test Factors

Class Location	Alternative Design Factor (F)	Alternative Test Factor	Comment
1	0.80	1.25	
2	0.67	1.5	
		1.25	Segments installed prior to December 22, 2008
3	0.56	1.5

PTST 2.5 Pressure Testing: MAOP Determination, October 1, 2020

Revision Notes

Location of Changes	Summary of Changes
Subsection 5.2	Added: steel, in-service steel pipelines
Subsection 5.4	New: For in-service PE pipelines the MAOP is the test pressure divided by a factor of 1.5.

PRESSURE TESTING

December 15, 2021

PTST 2.6 ASME Pressure Vessels

1.0 Purpose

- 1.1 This procedure is applicable to pressure testing and inspecting of ASME pressure vessels installed on the Ameren Illinois (AIC) natural gas system.
- 1.2 ASME pressure vessels, which may be identified by a certification stamp or tag physically attached to the vessel, have unique testing and inspection requirements that Ameren must document prior to placing them into service.
- 1.3 This procedure does not apply to pressure testing of prefabricated assemblies of standard pipe and fittings. These prefabricated assemblies are typically pressure tested in accordance with 49 CFR, Part 192, Subpart J and **PTST 1** Pressure Testing Requirements and **PTST 1.1** Test Pressure and Duration Tables. Examples of prefabricated assemblies that are not subject to this procedure include:
 - 1.3.1 Metering stations.
 - 1.3.2 Regulating stations.
 - 1.3.3 Valve stations.
 - 1.3.4 Pig launchers and receivers constructed from standard pipe and fittings.
 - 1.3.5 Prefabricated section of pipeline constructed of one or more joints of pipe, valves and/or fittings.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 Regulatory Requirements for ASME Pressure Vessels](#)****[5.0 Testing and Inspection Requirements](#)****[6.0 Use of a Manufacturer's Pressure Test or Prior Pressure Test](#)****[7.0 Temporary Removal from Service](#)****[8.0 Relocation of An Existing Pressure Vessel](#)****[9.0 Records](#)**

4.0 Regulatory Requirements for ASME Pressure Vessels

- 4.1 An ASME pressure vessel is a specify fabricated component which must be designed, constructed, tested in accordance with ASME BPVC Section VIII Division 1 or Section VIII Division 2 as follows:
- 4.1.1 Except for branch connections and assemblies of standard pipe and fittings joined by circumferential welds, the design pressure of each component fabricated by welding, whose strength cannot be determined, must be established in accordance with paragraph UG-101 of the ASME BPVC Section VIII Division 1.
- 4.1.2 Each prefabricated unit that uses plate and longitudinal seams must be designed, constructed, and tested in accordance with ASME BPVC as defined in either Section VIII Division 1 or Section VIII Division 2, except for the following:
1. Regularly manufactured butt-welding fittings.
 2. Pipe that has been produced and tested under a specification listed in Appendix B of 49 CFR, Part 192.
 3. Partial assemblies such as split rings and collars.
 4. Prefabricated units that the manufacturer certifies have been tested to at least twice the maximum pressure to which they will be subjected under the anticipated operating conditions

5.0 Testing and Inspection Requirements

- 5.1 A pressure vessel installed after July 14, 2004 is not subject to the strength testing requirements of §192.505(b), which requires pressure testing to Class 3 location for pipeline facilities located in compressor stations, regulator stations, and measurement stations. Provided the pressure vessel has been tested in accordance [Paragraph 4.1.1](#) or [Paragraph 4.1.2](#) with a test factor of at least 1.3 times MAOP.
- 5.2 A pressure vessel installed after July 14, 2004 but before October 1, 2021 is exempt from the pressure test durations requirements of 192.505(c) and (d) and 192.507(c), provided the pressure vessel has been tested according to the requirements of ASME BPVC Section VIII Division 1 or Division 2.
- 5.3 A pressure vessel installed on or after October 1, 2021 must be tested for at least the duration specified under 192.505 (c) or (d), 192.507 (c) or 192.509 (a) whichever is applicable for MAOP of the pipeline in which the pressure vessel is being installed.
- 5.4 Pressure vessels installed permanently or temporarily must be either:
- 5.4.1 Pressure tested by AIC after placed on its support at its final location either before or after tied-in to the pipeline facility. OR
 - 5.4.2 Pressure tested by AIC prior to installation. OR
 - 5.4.3 Pressure tested by the manufacturer in accordance with 192.153(e) and this procedure. Refer to Section 6.0 for conditions required to use the manufacturer's pressure test.

- 5.5 Pressure vessels that are tested prior to installation or where manufacturer's pressure tests are used, shall be inspected after being placed on its support structure at its final installation location. Inspection is to confirm the pressure vessel was not damaged during any prior operation, transportation or installation into the pipeline.
- 5.5.1 This inspection must be performed prior to operation but may be performed either before or after it has been tied into the pipeline.
- 5.5.2 The inspection must include visual inspection for damage to the pressure vessel at a minimum to include the inlets, outlets, and lifting locations.
- 5.5.3 If injurious defects that are an integrity threat are found, the pressure vessel must be either non-destructively tested, re-pressure tested, or remediated in accordance with [REPR 1](#) or with the applicable ASME BPVC Section VIII Division 1 or ASME BPVC Section VIII Division 2 requirements. Injurious defects may include:
1. Dents
 2. Gouges
 3. Bending
 4. Corrosion
 5. Cracking
- 5.5.4 Inspection Form in Appendix A shall be used to document the inspection and associated remediation if required. AIC should consult with a certified service provider and/or inspector if remediation is required for an ASME pressure vessel.

Governing requirements and authorities for repairs:

- The Illinois Boiler and Pressure Vessel Safety Division (BPVSD) has jurisdiction over the construction, installation, operation, inspection, and repair of pressure vessels and maintains an online list of licensed repair agents.
- While newly fabricated pressure vessels are covered by ASME BPVC, repairs to ASME pressure vessels are covered by the requirements in the National Board Inspection Code (NBIC) or API 510 "Pressure Vessel Inspection Code".

6.0 Use of a Manufacturer's Pressure Test or Prior Pressure Test

- 6.1 A pressure vessel's manufacturer's initial pressure tests may be used provided the pressure vessel is newly manufactured and installed on or after October 1, 2021.
- 6.1.1 An initial pressure test from the manufacturer or other prior pressure tests on new or existing pressure vessels may also be used for a vessel temporarily installed in the pipeline facility in order to complete a testing, integrity assessment, repair, odorization or emergency response-related task including noise or pollution abatement:
1. The manufacturer's pressure test must meet the minimum requirements contained in [Section 5.0](#) Testing and Inspection requirements.
 2. AIC must inspect the pressure vessel after installation and remediate any injurious defects.

3. The temporary pressure vessel must be promptly removed after completion of the task.
4. If operational or environmental constraints require leaving the pressure vessel in place longer than 30 days, AIC must notify PHMSA and the ICC.
 - 4a. The Supervising Engineer shall notify the Manager, Pipeline Safety Compliance when it is apparent the pressure vessel will remain in place for more than 30 days.
 - 4b. The Supervising Engineer will provide the details as to the constraints preventing the removal.
 - 4c. The Manager, Pipeline Safety Compliance, shall provide the electronic mail notification to PHMSA via informationResourcesManager@dot.gov; and
 - 4d. Notify the PCC by phone or email

7.0 Temporary Removal from Service

- 7.1 An existing pressure vessel that is temporarily removed from a pipeline facility to complete a testing, integrity assessment, repair, odorization, or emergency response-related task including noise or pollution abatement, and then re-installed at the same location, must be inspected in accordance with [Subsection 5.5](#). A new pressure test is not required provided no damage or threats to the operational integrity of the pressure vessel were identified during the inspection and the MAOP of the pipeline is not increased.

8.0 Relocation of An Existing Pressure Vessel

- 8.1 Pressure vessels which are relocated on or after October 1, 2021 must meet the following requirements:
 - 8.1.1 The pressure vessel must be designed and constructed in accordance with the requirements of 9 CFR Part 192 in place at the time the vessel is returned to operational service at the new location.
 - 8.1.2 The pressure vessel must be pressure tested by AIC in accordance with the testing and inspection requirements applicable to newly installed pressure vessels.
 - 8.1.3 An existing pressure vessel being temporarily installed at a new location must be meet the requirements of [Section 6.0](#) Temporary Installation.

9.0 Records

- 9.1 Tests, inspection and repair records for a pressure vessel shall be kept for the operational life of the pressure vessel. Refer to [PTST 1 Section 14.0](#) for test record requirements.
- 9.2 Inspection record shall be documented on the Inspection of ASME Pressure Vessel Form as shown in [Appendix A](#).

Appendix A - Inspection of ASME Pressure Vessel Form.

INSPECTION OF ASME PRESSURE VESSELS
In Accordance with §192.153(e)

Purpose

This Form documents visual inspections of ASME Pressure Vessels for potential damage resulting from transportation and installation or other conditions which potentially affect the integrity of the pressure vessel. This inspection must be performed after the relocated pressure vessel has been installed in its final location but prior to placing it in service. The inspection may occur before or after it has been tied into the pipeline.

Instructions

Visually inspect all locations on the Pressure Vessel shown for all defects show. Note "Y" if a defect was observed and "N" if no defects was observed.

Pressure Vessel Locations Inspected	Potentially Injurious Defects Observed -- Indicate by Y or N					
	Dents	Gouges	Bending	Cracking	Corrosion	Note Any Other Observed Defects
Inlets	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Outlets	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Lifting Locations	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Structural Supports	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Revision Notes

Location of Changes	Summary of Changes
PUBL 2.2	Removed Section 8.0 Natural Gas Emergency Procedure

1.0 Purpose

This document specifies requirements for Ameren Illinois' (AIC) public education program. The public education program complies with 49 CFR §192.616 and follows guidance and recommendations provided in API RP 1162.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Objective](#)

3.0 Target Audience

- Communications/Public Relations Department
- Public Awareness group

4.0 Objective

- 4.1 AIC has developed and implemented a Public Awareness Program in accordance with 49 CFR §192.616. See [PUBL 3](#).
- 4.1.1 The Public Awareness Program is a requirement, documented externally to the O&M Plan, which more specifically defines the content of an effective public education program. The public education program is based on the standards of the American Petroleum Institute's Recommended Practice RP 1162. See [Section 4.2](#) and [PUBL 2.1](#).
- 4.1.2 The Public Awareness Program addresses:
1. The stakeholder audience.
 2. The basic content of the message to be delivered.
 3. How often the message is delivered.
 4. Method of delivery.
 5. Program evaluation and effectiveness.
- 4.1.3 Note that the following Appendices referenced in the Public Awareness Program ([PUBL 3](#)) are subject to change, so they are not included in the O&M. These documents are maintained by and available through the Public Awareness group.
1. Appendix A: Self-Assessment
 2. Appendix B: Communication Methods
 3. Appendix C: Communication Committee
 4. Appendix D: Letter of Support
- 4.2 AIC has developed a public education program to provide consumers, affected public, local public officials, emergency officials, excavators and operators of facilities in the vicinity of our pipelines with information concerning the following topics:

- 4.2.1 Facts about natural gas.
 - 4.2.2 Importance of recognizing and reporting a natural gas emergency.
 - 4.2.3 How to report a gas emergency to Ameren Illinois.
 - 4.2.4 What actions to take in an emergency or when natural gas is detected.
 - 4.2.5 Importance of reporting any and all gas odors, no matter how slight of odor.
 - 4.2.6 Recognizing and reporting other types of hazards or potential hazards related to natural gas facilities, including customer's gas meter assembly.
 - 4.2.7 Causes and hazards of carbon monoxide.
 - 4.2.8 Identifying pipeline markers.
 - 4.2.9 Importance of reporting any damage or movement of gas facilities.
 - 4.2.10 The use of Illinois' One Call system, JULIE.
- 4.3 Local government agencies responsible for emergency response should be provided with information regarding natural gas emergency and procedures they should follow when responding.

End of Instructions.

PUBLIC EDUCATION

October 1, 2022

PUBL 2.1 Public Notifications

1.0 Purpose

This document describes Ameren Illinois' (AIC) public education program, designed to educate the public, customers, government organizations, emergency responders, and excavators on how to recognize and react to natural gas pipeline emergencies.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Gas Safety Notifications to New Customers](#)[6.0 Gas Safety Notifications to the General Public](#)[7.0 Pipeline Emergency Response Notifications to Government Organizations](#)[8.0 Records](#)**3.0 Target Audience**

- Communications/Public Relations Department
- Public Awareness group

4.0 General

- 4.1 The Public Education Program consists of notifications in the form of advertisements, annual mailings, billing messages, face-to-face meetings and presentations.
- 4.2 These notifications provide information on the purpose and reliability of a natural gas pipeline, awareness of potential hazards, prevention of natural gas pipeline damage and response to natural gas pipeline emergencies. See [PUBL 3](#) for copies of these notifications.

5.0 Gas Safety Notifications to New Customers

- 5.1 New customers will receive the Natural Gas Safety flyer with the first customer bill.
- 5.2 The flyer covers the following topics:
 - 5.2.1 Recognizing and Reporting Gas Leaks
 - 5.2.2 Responsible Digging Starts When You Call the One-Call System
 - 5.2.3 What You Should Know About Carbon Monoxide
 - 5.2.4 Water Heater Settings
 - 5.2.5 Storing and Using Common Flammable Household Items
 - 5.2.6 Natural Gas Piping, Fittings and Connections
 - 5.2.7 Customer-Owned Buried Gas Lines
 - 5.2.8 Pipeline Safety and Reliability
 - 5.2.9 Appliance, Equipment and Interior Piping

UNCONTROLLED IF PRINTED

6.0 Gas Safety Notifications to the General Public

- 6.1 Semi-annual notifications will be made to the general public in the AIC service area, which describe how to contact AIC if they smell gas. These notices will normally be given through newspaper advertisements.
- 6.2 Semi-annual mailings will also be sent to customers, which provide general natural gas safety information and instructions to call AIC if they smell gas. There is no charge when AIC responds to a gas odor call.
- 6.3 Residences located along the AIC natural gas transmission pipeline rights-of-way and natural gas storage fields will receive a direct mailing once every 2 years.
 - 6.3.1 This direct mailing will cover the following topics:
 1. Pipeline purpose and reliability.
 2. Awareness of hazards and prevention.
 3. Damage prevention.
 4. One-call requirements.
 5. Pipeline markers.
 6. How to contact Ameren Illinois for additional information.
- 6.4 Notifications are scheduled and initiated by the AIC Communications/Public Relations Department.

7.0 Pipeline Emergency Response Notifications to Government Organizations

- 7.1 The Public Awareness group is responsible for notifying the appropriate government organizations and providing them with information regarding a natural gas pipeline emergency.
- 7.2 Government organizations include city and county officials, law enforcement agencies, and fire departments.
- 7.3 Notifications shall include the following:
 - 7.3.1 Procedures to follow when notified of a natural gas emergency.
 - 7.3.2 A phone number for reporting a natural gas emergency to AIC.
 - 7.3.3 A confidential number for use by emergency response personnel such as the fire department and police may be included.
 - 7.3.4 Natural Gas and Electrical Safety Emergency Responder brochure.
 - 7.3.5 The availability of a gas safety training program. The program is available for presentation to fire and law enforcement personnel, government organizations, and community groups upon request.
- 7.4 Refer to [PUBL 2.2](#) for a sample annual notification letter and the emergency procedure.

8.0 Records

- 8.1 The AIC Public Awareness group will maintain the following records. All information is maintained on the Public Awareness SharePoint site:

- 8.1.1 A copy of the annual mailing and list of emergency responder training for fire, police, and other emergency agencies which include dates, locations, topics, and number of attendees.
 - 8.1.2 A list of face-to-face visits through Paradigm meeting and public education programs.
 - 8.1.3 A copy of the contractor mailing list and materials.
 - 8.1.4 A copy of the brochure and Ameren Illinois fact sheet sent to public officials once every 2 years.
- 8.2 AIC Communications/Public Relations shall maintain a copy of the semi-annual public notifications and customer mailings.
- 8.3 Copies of the annual notifications shall be maintained for a minimum of 5 years.

End of Instructions.

PUBLIC EDUCATION

October 1, 2022

PUBL 2.2 Liaisons with Fire, Police and Public Officials

1.0 Purpose

This document describes Ameren Illinois' (AIC) public education efforts and outreach for fire, police and public officials on how to recognize and react to natural gas pipeline emergencies.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Periodic Contact](#)

[6.0 Mailing](#)

[7.0 Face-to-Face Visit](#)

Appendices:

[Appendix A - Sample Letter of Emergency Procedure](#)

[Appendix B - Sample Operator Page](#)

3.0 Target Audience

- Communications/Public Relations Department
- Public Awareness group

4.0 General

- 4.1 An Ameren Illinois (AIC) representative shall make periodic contact with fire, police and public officials.
- 4.2 This periodic contact should include, a mailing to fire and police annually and public officials once every 2 years and/or a face-to-face visit.
- 4.3 AIC Public Awareness group is responsible for maintaining these liaisons.

5.0 Periodic Contact

- 5.1 This periodic contact is required to acquaint fire, police, and public officials with emergency procedures.
- 5.2 Appropriate fire, police and other public officials should be informed of the availability, capability and location of the AIC personnel, equipment, and materials for responding to gas pipeline emergencies. The 24-hour emergency service number should be provided.
- 5.3 The representative should stress the importance of the fire, police and public officials making immediate contact with AIC on all natural gas emergencies.
- 5.4 Paradigm meetings satisfy the periodic contact requirement for the fire, police, and public official in attendance. These meetings are held in the 1st quarter each year.

6.0 Mailing

UNCONTROLLED IF PRINTED

- 6.1 AIC Public Awareness' sample letter with First Responders Natural Gas Emergency Procedure used for the annual mailing are shown in [Appendix A](#).
- 6.2 AIC's Operator Page and Public Officials Along Transmission Pipelines and in Our Service Areas brochure are mailed to public officials every 2 years.
 - 6.2.1 See [Appendix B](#) for the sample Operator Page.
 - 6.2.2 See [PUBL 3](#) Forms and Reference Materials for copy of Public Officials Along Transmission Pipelines and in Our Service Areas brochure.
- 6.3 Public Awareness' sample letter, with First Responders Natural Gas Emergency Procedure and/or Operator Page along with the appropriate brochure should be mailed to Emergency Responders and Public Officials in the communities where AIC provides natural gas service. See [PUBL 3](#) Forms and Reference Materials for the appropriate brochure.
 - 6.3.1 Emergency Responders Along Transmission Pipelines and in our Service Areas.
 - 6.3.2 Public Officials Along Transmission Pipelines and in our Service Areas.

7.0 Face-to-Face Visit

- 7.1 The AIC representative should discuss the following during face-to-face visits:
 - 7.1.1 The responsibility and resources of each government organization that may respond to a gas pipeline emergency.
 - 7.1.2 Acquaint the Emergency Responders and public officials with AIC's ability in responding to a gas pipeline emergency.
 - 7.1.3 Identify the types of gas pipeline emergencies of which AIC notifies the Emergency Responders and/or public officials.
 - 7.1.4 Plan how AIC and Emergency Responders and public officials can engage in mutual assistance to minimize hazards to life and property.
- 7.2 Face-to-face visits should be documented by the AIC representative.

Appendix A - Sample Letter of Emergency Procedure

October 1, 2022

Dear Emergency Responder,

Firefighters and law enforcement are typically first on the scene in an emergency and need to assess the situation quickly to respond effectively. It is critical that all first responders understand the properties of natural gas and the actions needed to make the situation safe.

Don't Delay – Make this Call When a Gas Odor or Related Problem is Reported

Fire, law enforcement, or 911 dispatchers should immediately call the Ameren Illinois Fire and Police Hotline at 1.800.767.8048.

Your assistance and support in implementing this procedure throughout your organization is critical to ensuring an effective, consistent response if a gas emergency should occur. Our average response time to natural gas leaks is less than 23 minutes.

Natural Gas Safety Training

Ameren Illinois also offers a natural gas first responder safety training program free of charge. Our Natural Gas Safety training qualifies for two Continuing Education Units (CEUs). Use the following website AmerenIllinois.com/Presentations to request a safety training session or a presentation. Contact Jacob Dukett, Supervisor, Public Awareness, at 1.217.358.6575 or JDukett@ameren.com.

Online Gas Pipeline Information

A national pipeline mapping website is also available to you at www.npms.phmsa.dot.gov. This website allows emergency responders to register to receive information on the location of pipelines that run through their response area and the type of products transported in those pipelines.

New JULIE Number

Please note that the nationwide "Call Before You Dig" number (JULIE) is now 811. For more information, visit Illinois1Call.com.

Thank you for your support of safety. Please contact us if we can be of further assistance or visit our website at AmerenIllinois.com.

Sincerely,

JACOB DUKETT

OT 8005

FIRST RESPONDERS **NATURAL GAS EMERGENCY PROCEDURE**

This procedure identifies the actions that should be taken by fire, law enforcement, 911 dispatchers and other emergency response personnel when a gas odor or other natural gas-related problem is reported.

1. **CALL 1.800.767.8048 to report all natural gas odors or other natural gas-related problems to Ameren Illinois.**
2. Emergency response personnel should respond to the call. Upon notification, Ameren Illinois will also dispatch an employee to the site as soon as possible.
3. If the gas odor is strong indoors, immediately evacuate the building. Do not operate any electrical switches and leave the door open after exiting as the strike plate may cause a spark.
4. If the gas odor or apparent damage to gas facilities is outdoors, barricade the street or area, and keep all people at the site a safe distance away. Remove any sewer manhole covers near the area if the odor appears to be originating below ground.
5. Check surrounding buildings for potential gas migration and evacuate as necessary. Continue to monitor gas readings as conditions may change or migration expand. Keep Ameren Illinois updated as conditions warrant.
6. When a structural fire occurs around natural gas service, you can turn off the gas service at the meter; however, do not restore gas service. In these situations, Ameren Illinois will inspect the premises and determine if service can be safely restored. In all cases where a fire is suspected to have been fueled by natural gas, Ameren Illinois must be called immediately.

To report a natural gas or electrical emergency, call Ameren Illinois at:

1.800.755.5000 *(Public Number)*

1.800.767.8048* *(Emergency Response Personnel Only)*

We respond to emergency calls 24 hours a day, seven days a week.

**Note: This phone number is intended specifically for first responders and should not be distributed to the general public. With the merger of AmerenCIPS, AmerenCILCO and AmerenIP to form Ameren Illinois, we have consolidated the previous numbers for first responders, so the number you need to call may have changed. Please be sure to update your records. Older numbers will eventually be phased out.*

IMPORTANT INFORMATION ABOUT GAS PIPELINES IN YOUR AREA

About Ameren Illinois

Ameren Illinois is a regulated electric and gas delivery company based in Collinsville, Illinois. Ameren Illinois serves approximately 840,000 gas customers, making us the state's third largest distributor of natural gas. We provide natural gas service in more than 550 communities in central and southern Illinois. Our extensive delivery system includes 18,000 miles of natural gas transmission and distribution pipelines and 12 underground natural gas storage fields.

What does Ameren Illinois do if a gas leak occurs?

To prepare for the event of a natural gas leak, Ameren Illinois regularly communicates, plans and trains with local emergency responders. The company offers free workshops for fire and police personnel, paramedics, public works employees and others whose jobs may involve working around natural gas.

Ameren Illinois personnel and emergency responders are trained to protect life, property and facilities in the case of an emergency.

Upon the notification of an incident or leak, Ameren Illinois will immediately dispatch qualified personnel to respond to the emergency. We respond within the hour – around the clock – with an average response time of 23 minutes.

In the event of an emergency, Ameren Illinois will take steps to minimize the amount of leaking gas and isolate the pipeline emergency.

Maintaining pipeline safety and integrity

Ameren Illinois invests significant time and money to maintain the integrity of our pipeline systems. We also follow detailed operating, maintenance and communication plans to ensure the safety of our pipelines.

Our highly trained employees monitor our system 24 hours a day. They then notify field personnel if an abnormal condition is detected.

We perform regular maintenance to ensure proper pressure control, odorization and reliable service. In addition, all new gas service installations include excess flow valves to stop the flow of gas in the event a service line is hit or ruptures.

Our employees receive extensive, ongoing training to ensure the safe transportation of natural gas. Our workers must pass rigorous testing and follow the National Fuel Gas Code, the Ameren Operations and Maintenance Manual and Ameren Gas Standards.

In accordance with federal regulations, Ameren Illinois has developed an Integrity Management Program, a supplemental hazard assessment and prevention program. This program deals with "high consequence areas" near pipelines, such as highly populated areas and difficult-to-evacuate facilities.

For Additional Information

For a list of companies with pipelines in your area and their contact information, or to apply for PIMMA access, go to www.npms.phmsa.dot.gov/.

For additional information about Ameren Illinois, go to amerenillinois.com or call **1.800.755.5000**. If you are interested in having a representative from Ameren Illinois meet with you at your location please contact us.

PRODUCTS TRANSPORTED

PRODUCTS TRANSPORTED IN YOUR AREA

PRODUCT	LEAK TYPE	VAPORS
NATURAL GAS	Gas	Lighter than air and will generally rise and dissipate. May gather in a confined space and travel to a source of ignition.
HEALTH HAZARDS	Will be easily ignited by heat, sparks or flames and will form explosive mixtures with air. Vapors may cause dizziness or asphyxiation without warning and may be toxic if inhaled at high concentrations. Contact with gas or liquefied gas may cause burns, severe injury and/or frostbite.

AMRNIL

INFORMACIÓN IMPORTANTE ACERCA DE LAS LÍNEAS DE TUBERÍAS DE GAS EN SU ÁREA

Acerca de la compañía Ameren Illinois

Ameren Illinois es una compañía regulada de electricidad y de gas basada en Collinsville, Illinois. Ameren Illinois le da servicio de gas a aproximadamente 840,000 clientes, convirtiéndonos en el tercer distribuidor de gas más grande del estado. Proveemos servicio de gas natural en más de 550 comunidades en la parte central y del sur de Illinois. Nuestro extenso sistema de entrega incluye 18,000 millas de líneas de tuberías de transmisión y distribución de gas natural y 12 campos subterráneos de almacenamiento de gas natural.

¿Qué hace Ameren Illinois si ocurre una fuga?

Para estar preparados en caso de una fuga, Ameren Illinois se comunica, planea y entrena regularmente con los respondedores locales de emergencias. La compañía ofrece talleres gratuitos para el personal de los bomberos y de la policía, los paramédicos, empleados de servicios de utilidades públicos y otras personas cuyos trabajos pueda que envuelvan trabajar alrededor de gas natural.

El personal de Ameren Illinois y los respondedores de emergencias están entrenados para proteger vidas, propiedades e instalaciones en caso de una emergencia.

Al ser notificados de un incidente o de una fuga, Ameren Illinois enviará inmediatamente a un personal cualificado para responder a la emergencia. Nosotros respondemos en el plazo de una hora – día y noche – con un promedio de tiempo de respuesta de 23 minutos.

En caso de una emergencia, Ameren Illinois tomará los pasos necesarios para minimizar la cantidad de gas que se esté escapando y aislar la emergencia en la línea de tuberías.

Manteniendo la seguridad y la integridad de las líneas de tuberías

La compañía Ameren Illinois invierte una cantidad considerable de tiempo y capital para mantener la calidad e integridad de sus sistemas de líneas de tubería. También seguimos planes detallados de operaciones, mantenimiento y de comunicación para asegurar la seguridad de nuestras líneas de tuberías.

Nuestros empleados altamente entrenados monitorean nuestro sistema las 24 horas del día. Ellos le notifican al personal de campo si se detecta una condición anormal.

Nosotros realizamos un mantenimiento constante para asegurar un control de presión apropiado, odorización y un servicio confiable. Además, todas las instalaciones de servicios de gas nuevas incluyen válvulas de exceso de flujo para detener el flujo de gas en caso que una línea de servicio sea golpeada o se rompa.

Nuestros empleados reciben un entrenamiento extensivo y constante para garantizar la transportación segura del gas natural. Nuestros trabajadores deben pasar una prueba rigurosa y seguir los Códigos Nacionales de Combustible de Gas, el Manual de Operaciones y Mantenimiento de Ameren y los Estándares de Gas de Ameren.

En conformidad con las regulaciones federales, Ameren Illinois ha desarrollado un Programa de Manejo de Integridad, el cual es un programa suplementario de evaluación y prevención de peligros. Este programa aborda las "áreas de alta consecuencia" que se encuentran cerca de las líneas de tuberías, tales como las áreas altamente pobladas y las instalaciones que son difíciles de evacuar.

Para obtener información adicional

Para una lista de las compañías que tienen líneas de tuberías en su área junto con la información de contacto, o para aplicar para acceso al PIMMA, visite www.npms.phmsa.dot.gov/.

Para obtener información adicional acerca de Ameren Illinois, visite amerenillinois.com, o llame al **1.800.755.5000**. Si usted está interesado en que un representante de Ameren Illinois lo visite en su ubicación

PRODUCTOS TRANSPORTADOS

PRODUCTOS TRANSPORTADOS EN SU AREA

PRODUCTO	TIPO DE FUGA	VAPORES
GAS NATURAL	Gas	Es más liviano que el aire y generalmente se eleva y se disipa. Se puede acumular en espacios confinados y viajar hasta fuentes de encendido.
PELIGROS PARA LA SALUD	Son muy fáciles de incendiarse con el calor, chispas o llamas y forman una mezcla explosiva con el aire. Los vapores pueden causar mareos o asfixia sin dar ningún aviso y pueden ser tóxicos si se inhalan en concentraciones grandes. El contacto con gas o con gas líquido puede causar quemaduras, heridas graves y/o congelamiento.

PURGING

October 1, 2022

PURG 1 Requirements**1.0 Purpose**

This document specifies requirements for purging gas mains and pipelines, including for abandonment purposes, and the venting of gas.

All requirements in this document are in accordance with 49 CFR §§ 192.629 and 192.727.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Service Lines](#)[6.0 Transmission Lines and High-Pressure Distribution Mains](#)[7.0 Abandonment](#)

Appendices

[Appendix A - Purge Plan and Documentation Requirements for Abandonment Table](#)[Appendix B - Purge Stamp](#)**3.0 Target Audience**

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Distribution Design Specialist
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Tech Service (GTS) Personnel
- Gas Storage Engineer (GSE)
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Control

4.0 General

4.1 Gas Engineering, Gas Tech Engineering (GTE) or Gas Storage Engineering (GSE) will provide detailed purging plans developed in accordance with AGA Purging Principles and Practices prior to blowdown or purging operations for:

4.1.1 Transmission mains 100 feet and longer in length

4.1.2 High-pressure distribution mains 100 feet and longer in length

4.1.3 Service lines 2 inches and larger, that meet the following requirements:

1. 100 feet or longer in length

AND

2. Operating at more than 100 psig.

4.1.4 Project utilizing an air mover.

UNCONTROLLED IF PRINTED

- 4.1.5 Joint abandonment of distribution mains and services.
- 4.2 When planning projects, consider options to eliminate hazards and minimize the release of natural gas. See [MAIN 1 Section 18.0](#) Design Considerations.
- 4.3 Prior to the purge, when a large volume of gas is to be released to atmosphere:
 - 4.3.1 If the system to be purged is remotely monitored, include Gas Control for planning and scheduling.
 - 4.3.2 Notify public officials, such as police or fire departments.
 - 4.3.3 Monitor weather for air inversions and wind conditions to ensure that release of gas does not migrate towards:
 - 1. Schools
 - 2. Businesses
 - 3. Homes
 - 4. Highways, etc.
 - 4.3.4 Notify AIC Dispatch Center.
- 4.4 During purging, keep blowoff area clear to avoid property damage or personal injury.

Liquids or debris can be ejected into the blowoff gas stream and land downwind.

Be aware of the wind direction/speed and the presence of potential sources of ignition, especially overhead power lines.

- 4.5 For purge monitoring, use a Combustible Gas Indicator (CGI) at or near outlet of purge and at or near top of pipe being purged.
- 4.6 If purge pipe is used, the pipe shall be:
 - 4.6.1 Made of metal.
 - 4.6.2 Of sufficient length to prevent hazards to:
 - 1. The public
 - 2. PersonnelOR
 - 3. Adjacent property.
 - 4.6.3 Grounded to prevent static charge.
- 4.7 Verify that gauges used to monitor pressure during purging are operating properly.
- 4.8 Purging operations are not considered working in a gaseous environment.

5.0 Service Lines

- 5.1 Service lines 2 inches and larger and 500 feet or longer in length are to be purged in the same manner as mains. See [PURG 2, Subsection 7.1](#).

- 5.2 In lieu of a purge pipe, service lines smaller than 2 inch and 500 feet or shorter in length can be vented through the service riser.

6.0 Transmission Lines and High-Pressure Distribution Mains

- 6.1 Coordinate with Gas Control when transmission lines or HP distribution mains are either permanently or temporarily taken out of service or reduced in pressure. See [ABND 1, Section 4.0](#), Pre-Abandonment Planning.
- 6.2 Release of large volumes of gas into atmosphere, when practical, shall be minimized by transferring (drawdown) as much gas as possible from the pipeline to be purged to other parts of the system.
- 6.3 Consider noise levels and potential gas leak calls during purging or blowing down transmission lines or HP distribution mains.

Use of masking agent may be a solution to mitigate potential gas leak calls.

- 6.4 Turn blow-down valves fully open as quickly as possible to minimize possible erosion to a blow-down valve during high-flow situations.
- 6.5 If flaring is used, GTE will include procedures in the purging plan. See [PURG 2, Section 14.0](#), Flaring of Gas.

7.0 Abandonment

- 7.1 The table shown in [Appendix A](#) lists purge plan and documentation requirements for abandonment.
- 7.2 [Appendix B](#) shows the Purge Stamp (Basic) and Purge Form (Field) which are used to document completion of purging for abandonment.
- 7.2.1 The Purge Stamp (Basic), Form 01, will be on the engineered plans which involve abandoning gas facilities primarily coming from the Design Centers. See [PURG 3](#) Form 01.
- 7.2.2 The Purge Form (Field), Form 02, is a standalone form that is to be printed and used to document purging of abandoned gas facilities on any project which does not contain a Purge Stamp (Basic). Typically, these projects will be associated with non-engineered projects such as a minor relocation or replacement project, maintenance or leak repairs. See [PURG 3](#) Form 02.
- 7.3 In lieu of Purge Stamp, the Construction Plan purge plan can contain purge point table with sign-off for each point.
- 7.4 Service lines purged together with a main or transmission line as a unit for abandonment require a purge plan.

End of Instructions.

Operator Qualification (OQ) Required?

YES

0301: Manually Opening and Closing Valves

0311: Adjust and Monitor Flow or Pressure - Manual Valve Operation

UNCONTROLLED IF PRINTED

- 1371: Operate Gas Pipeline – System Control Center Operations
- 1381: Operate Gas Pipeline – Local Facility Remote Control Operations
- 1631: Launching and/or Receiving Internal Devices (Pigs) with a temporary launcher and/or receiver for Lines Out of Service
- 1641: Launching and/or Receiving Internal Devices (Pigs) for Lines In-Service
- 1651: Purge - Flammable or Inert Gas
- A002: Abandonment

Document Rescission

PURG 1 Purging: Requirements, December 15, 2021

Revision Notes

Location of Changes	Summary of Changes
Subsection 4.1 – Operations requiring a Purge Plan	Added Paragraph 4.1.5 – Joint abandonment of distribution mains and services.
Subsection 4.8 – Purging operations	Terminology update – working in gaseous environment replaced working in blowing gas.
Subsection 6.2 – Release of large volume of gas	Added "drawdown" as a method for transferring gas from pipeline being purged to other parts of the system.

Appendix A - Purge Plan and Documentation Requirements for Abandonment Table

A-1. Purge Plan and Documentation Requirements for Abandonment Table

Operating Pressure	Facility Type	Size	Length	Purge Plan Required?	Document Purge was Completed?	
100 PSIG or Less	Service Line	Less than 2"	Less than 500 ft	No	Not applicable due to small volume of gas	
			500 ft or Greater	No	Complete purge stamp	
		2" and Larger	All	No	Complete purge stamp	
	Distribution Main	All	All	No	Complete purge stamp	
	Air mover utilized to purge			All	Yes	Complete purge stamp
	Joint Abandonment of Distribution Main and Services (ABND 1 Section 5.0)			All	Yes	Complete purge stamp
Greater than 100 PSIG	Service Line	Less than 2"	Less than 500 ft	No	Not applicable due to small volume of gas	
			500 ft or Greater	No	Complete purge stamp	
		2" and Larger	Less than 100 ft	No	Complete purge stamp	
			100 ft or More	YES	Complete purge stamp	
	Distribution Main OR Transmission Line	All	Less than 100 ft	No	Complete purge stamp	
			100 ft or More	YES	Complete purge stamp	
	Air mover utilized to purge			All	YES	Complete purge stamp
	Joint Abandonment of Transmission Line or HP Distribution Main and Services (ABND 1 Section 5.0)			All	YES	Complete purge stamp

PURGING

April 1, 2023

PURG 2 Methods

1.0 Purpose

This document provides procedures for the safe release of gas into the atmosphere in a controlled manner when either voiding a pipeline of natural gas or introducing natural gas into a pipeline. These include various methods for purging and venting of gas.

All procedures are in accordance with 49 CFR §§ 192.629 and 192.727.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Safety](#)[5.0 Purging of Air with Gas](#)[6.0 Purging of Gas with Air During Abandonment](#)[7.0 Using an Inert Gas Slug when Purging](#)[8.0 Required Minimum Inlet Pressures](#)[9.0 Vacuum Purge/Air Mover](#)[10.0 Purge Velocity](#)[11.0 Monitoring Purge](#)[12.0 Venting of Gas](#)[13.0 Time to Vent Pipeline](#)[14.0 Flaring of Gas](#)[15.0 Use of Compression System](#)**3.0 Target Audience**

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Distribution Design Specialist
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Engineer (GSE)
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 Safety

Purging and venting gas are dangerous operations that can result in serious consequences, such as property damage, injury or death, if all instructions and warnings are not followed.

UNCONTROLLED IF PRINTED

- 4.1 Ensure that contents of pipeline vented into atmosphere are at sufficient distance above grade to allow released gas to diffuse into air without causing hazards to personnel, property or the public. In general, this requires a vent pipe long enough to carry the gases above the heads of the workers on equipment located outdoors.
- 4.2 Pay special attention to wind direction and speed with consideration to potential sources of ignition, especially overhead power lines.
- 4.3 Ensure that fire extinguisher is on the jobsite when a main or service line is being purged.
- 4.4 Remove all potential sources of ignition, such as smoking, open flames or unrated electrical devices.

5.0 Purging of Air with Gas

- 5.1 Pipelines being purged of air with gas shall have gas released into one end of the line in a moderately rapid and continuous flow. See [Table 3](#) and [Table 4](#) for minimum inlet pressures to ensure adequate flow.

If the amount of gas available is insufficient to prevent hazardous mixture of gas and air, a slug of inert gas shall be injected in the line before gas. See [Section 7.0](#).

- 5.2 Purge is complete when CGI readings reach 90% gas-in-air or greater and the smell of gas is present if gas is odorized.
 - 5.2.1 Alternatively, purging may also be considered complete at 90% gas-in-air when:
 1. Engineering has prepared a pipeline conditioning (pickling) plan.
 2. Pipeline is not required to be odorized and does not have odorized gas.
- 5.3 Service lines 2 inches and smaller AND equipped with Excess Flow Valves (EFV): Slowly open the meter valve to purge air until gas is detected at the outlet, then close the meter valve.

6.0 Purging of Gas with Air During Abandonment

- 6.1 Check for zero pressure at risers used as a purge point, at the site of injection, before introducing the purge medium.
- 6.2 Pipelines being purged of gas with air shall have air released into one end of the line in a moderately rapid and continuous flow.
 - 6.2.1 For a disconnected line do not exceed the established MAOP of the line.
 - 6.2.2 When control fittings are used to shut-off flow to the section being purged, do not exceed the Operating Pressure at time of the Stop. Adhere to manufacturer's published operating pressure limits of the control fittings and stopping equipment.

Pipeline liquids and solids are typically combustible and may remain combustible after purging. Spontaneous ignition can occur if adequate air supply is available to items that may con-

tain pipeline liquids and solids, such as filter and separator elements.

- 6.3 If the amount of air available is insufficient to prevent hazardous mixture of gas and air, a slug of inert gas shall be injected in the line before air. See [Section 7.0](#).
- 6.4 Purge until a combustible mixture is no longer present, 2% LEL or less, measured with a CGI. Keep in mind that purging only removes gaseous material.
- 6.5 Seal ends of abandoned pipelines after purging. Refer to [ABND 2.1, Section 5.0](#), Transmission Lines and Distribution Mains and [ABND 2.1, Section 6.0](#), Services.

7.0 Using an Inert Gas Slug when Purging

- 7.1 When purging mains 8 inches or larger, 100 feet or longer in length AND **operates** at more than 100 psig, separate air/gas interface with an injected slug of inert gas. Connect the inert gas hose to a fitting for injection.
- 7.2 The slug of inert gas shall be long enough to prevent air/gas from mixing during the purge. Determine inert gas volume by the length and diameter of the pipe being purged. See Table 1.

Table 1: Volume of Inert Gas Slug (cu ft)

Pipe Size (inches)	Length of Pipe (feet)						
	500	1,000	2,000	5,000	10,000	20,000	50,000
4	40	40	50	55	60	80	100
6	60	60	60	80	100	140	200
8	140	140	160	180	240	320	400
10	260	280	300	360	460	560	700
12	360	400	440	500	540	580	740
16	700	800	900	1,060	1,140	1,220	1,320
20	1,080	1,200	1,360	1,540	1,660	1,780	1,960
22	1,460	1,720	1,920	2,200	2,400	2,600	2,800
24	2,600	3,000	3,400	4,000	4,400	4,600	5,200

Cubic Feet - includes 100% factor of safety.

To determine the number of large cylinders, divide the volume by 200.

- 7.3 If practical, insert a poly pig so the inert gas can be admitted ahead of the pig and the air or natural gas admitted behind the pig.

If a poly pig is used, the volume of nitrogen/carbon dioxide can be reduced by 50%.

- 7.4 After the inert gas has been injected into the pipeline, begin flow of natural gas or air as soon as practical.
 - 7.4.1 Delays in purging after injection of inert gas may make the slug ineffective.

7.4.2 If there is a delay between injection of inert gas and air/gas greater than 3 minutes, inject a new slug.

7.4.3 If a pipeline is 100% filled with inert gas, time lag is no longer a factor.

7.5 Natural gas or air shall continue to flow until purge is complete.

7.6 Seal ends of abandoned pipelines after purging. Refer to [ABND 2.1](#).

8.0 Required Minimum Inlet Pressures

8.1 Table 3 and Table 4 provide minimum inlet pressure required to maintain minimum flow during purging. Do not exceed MAOP. Adhere to manufacturer's published operating pressure limits and practices, when using control fittings.

8.2 Consult with Gas Tech Engineering (GTE) for pipe sizes not shown in Table 3 or Table 4.

Table 3: Minimum Inlet Pressure Required to Maintain Minimum Flow During Purge

Length of Pipeline (feet)	Minimum Inlet Pressure (psig) With:				
	2" Blowdown Valve			4" Blowdown Valve

9.0 Vacuum Purge/Air Mover

9.1 An alternative to purging gas from a line is to use a vacuum purge to extract gas from the system, replacing gas with fresh air. See [PURG 3 for MBW Vapor Extraction Unit \(VEU\) Manual](#).

9.1.1 Vacuum/air mover is typically connected to one or more locations using vacuum to extract the gas from the system while opening other points of the system to allow air intake from atmosphere.

9.1.2 Air movers displace gas with large volumes of fresh air, connected to one point of the system with another point downstream opened to atmosphere.

9.2 When air movers are used for pipeline purging, Gas Engineering, GTE or Gas Storage Engineer will provide a purging plan, using AGA's Purging Principles and Practices as general basis for the plan.

It is critical that a good seal exists between the air mover and purge stack for proper operation.

9.3 Ground clamp or wire from air mover to ground is required to dissipate static electricity buildup.

9.4 The type of valve that air movers are mounted on can significantly reduce air flow, such as plug valves that cause 40% reduction in flow. GTE will factor this into the purge plan.

9.5 Typically, before an air mover/vacuum purge operation, a slug of inert gas is injected through a closed loop to separate air from gas. See [Table 1](#) in [Section 7.2](#).

9.6 Once the air mover is started, ensure fresh air is being drawn into the main (i.e. verify vacuum is established at location where air is to be introduced).

Prior to cutting with a torch or using a grinder, reduce air mover flow rate to minimize spark travel.

9.7 When a CGI indicates a combustible mixture is no longer present and 2% LEL or less exists in the pipeline at the site of the first "Cold" cut, then the cutting operations can begin (wheel cutting, guillotine, etc.).

9.7.1 After the initial cut and air is introduced via vacuum, a torch can be used for cutting.

10.0 Purge Velocity

10.1 To minimize mixing gas and air, the velocity of the purge shall be high enough to create a turbulent flow.

10.2 As velocity increases, turbulence increases, which reduces risk of creating a long section of combustible air-gas mixture.

11.0 Monitoring Purge

11.1 Install pressure gauges of the appropriate pressure range at the inlet and outlet of the purge to continuously monitor the pressure to assure adequate flow.

11.2 Continuously monitor inlet valves and maintain constant communication, radio or telephone, with other areas of the purge operations to control and limit purge velocity.

11.3 Maintain a moderately rapid and continuous flow by utilizing the control valves in purge stack.

11.4 Purge pipeline completely from one end to the other especially when purging air with gas.

11.5 Monitor pressures at defined points using gauges during purging to ensure the correct pressures are maintained.

12.0 Venting of Gas

When gas is vented into atmosphere, all potential sources of ignition (such as smoking, open flames, unrated electrical devices and overhead power lines) shall be removed from the area or de-energized.

12.1 Contents of pipeline vented into atmosphere shall be at sufficient distance above grade to allow released gas to diffuse into air without causing hazards to personnel, property or the public. In general, this requires a vent pipe long enough to carry the gases above the heads of the workers on equipment located outdoors.

12.2 Refer to [ACIG 2](#) Work Area Protection for placement of VEU or Compression System, such as ZEVAC, away from ignition sources.

12.3 Shut off all vehicles and unrated equipment in the area where gas is released.

12.4 The extension stack shall be metallic and grounded to draw off static electrical charges. See Section 12.1 for stack requirements.

12.5 Prior to welding or cutting, use a gas detection instrument to thoroughly check for presence of a combustible gas mixture. See [ACIG 2](#).

13.0 Time to Vent Pipeline

13.1 CGI shall be used as the final determination method. See Table 5 below.

Table 5: Time Required to Vent (minutes/mile)

Line Pressure (psig)	Time Required to Vent (minutes/mile) With:								
	2-inch Blowdown Valve		4-inch Blowdown Valve				6-inch Blowdown Valve		
	Line Size (inches)		Line Size (inches)				Line Size (inches)		
	4	6	6	8	10	12	12	14	16
100	1.03	2.32	0.58	1.03	1.61	2.32	1.03	1.41	1.84
200	1.32	2.97	0.74	1.32	2.07	2.97	1.32	1.80	2.35
300	1.50	3.37	0.84	1.50	2.34	3.37	1.50	2.04	2.66
400	1.63	3.66	0.91	1.63	2.54	3.66	1.63	2.21	2.89
500	1.73	3.88	0.97	1.73	2.70	3.88	1.73	2.35	3.07
600	1.81	4.07	1.02	1.81	2.82	4.07	1.81	2.46	3.21
700	1.88	4.22	1.06	1.88	2.93	4.22	1.88	2.56	3.34
800	1.94	4.36	1.09	1.94	3.03	4.36	1.94	2.64	3.44
900	1.99	4.48	1.12	1.99	3.11	4.48	1.99	2.71	3.54
1,000	2.04	4.59	1.15	2.04	3.19	4.59	2.04	2.78	3.62
1,100	2.08	4.69	1.17	2.08	3.25	4.69	2.08	2.83	3.70
1,200	2.12	4.77	1.19	2.12	3.32	4.77	2.12	2.89	3.77

13.2 Calculation Method

$$T = \left[\frac{D_L^2 \times L}{45,789 D_B^2} \right] \ln \frac{P}{12.2}$$

T=Time,minutes

D_L=Internal Diameter of Line Pipe,inches

L=Length of Line Segment,feet

D_B=Internal Diameter of Blow Down,inches

P=Initial Pressure,psia

13.2.1 *Example:* Calculate the time required to vent a 12" gas pipeline, 5 miles long, under 400 psig pressure, through a 4" diameter riser.

T=Time,minutes

D_L=12 inches

L=5 miles ×5,280 feet/mile=26,400 feet

D_B=4 inches

P=400 psig+14.4 psi atmospheric pressure=414.4 psia

$$T = \left[\frac{(12 \text{ in})^2 \times 26,400 \text{ ft}}{45,789 (4 \text{ in})^2} \right] \ln \frac{414.4 \text{ psia}}{12.2} = 18.3 \text{ minutes}$$

14.0 Flaring of Gas

14.1 An alternative to venting gas into the open air is to burn the gas through a flare.

14.2 Prior to flaring gas, a procedure shall be developed outlining:

14.2.1 Volume of flare gas.

14.2.2 Maximum flaring pressure and pressure control method.

14.2.3 Flare ignition and relight system.

14.2.4 Notifying public officials, fire and police authorities.

14.2.5 Open burning permit.

15.0 Use of Compression System

15.1 As determined by engineering, a compression system, such as a ZEVAC system, may be used to reduce the amount of natural gas released to the atmosphere. See **PURG 3 for ZEVAC Manuals**.

15.2 Only rated compressors may be used.

15.3 Prior to compressing gas, engineering shall develop procedures outlining:

15.3.1 Volume of gas.

15.3.2 Expected time for drawdown.

15.3.3 Expected final pressure.

15.3.4 Pressure monitoring plan.

15.3.5 Connection points

End of Instructions.

Operator Qualification (OQ) Required?

YES

0301: Manually Opening and Closing Valves

0311: Adjust and Monitor Flow or Pressure - Manual Valve Operation

QUALITY ASSURANCE PROGRAM

October 1, 2022

QUAL 1 Requirements

1.0 Purpose

This section outlines the Ameren Illinois' (AIC) Quality Control and Quality Assessment methods of the Quality Assurance Program.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Objective](#)

[5.0 Program](#)

[6.0 Quality Assurance Bulletin](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Personnel
- Gas Storage Field Supervisors
- Gas Construction Services Personnel
- Gas Construction Service Supervisors
- Gas Quality Assurance Consultants

4.0 Objective

- 4.1 AIC Gas Operations can be improved by reviewing field activities, work processes, and taking corrective action when deficiencies are identified.
- 4.2 The overall objectives of the Quality Assurance Program are to:
- 4.2.1 Observe AIC Gas Field Personnel to ensure compliance with the Gas Operating and Maintenance (O&M) Plan to comply with Federal and State codes and regulations.
 - 4.2.2 Observe work performed with respect to safe work practices.
 - 4.2.3 Review records and documentation for compliance.
 - 4.2.4 Analyze deficiencies for trends and contributing causes to recommend corrective action.
 - 4.2.5 Identify and implement corrective actions when required in order to:
 - 1. Re-direct focus on proper procedures.

UNCONTROLLED IF PRINTED

2. Improve procedures, training, and Operator Qualification testing to improve overall quality.
 3. Promote the addition of new procedures/training to improve quality.
- 4.2.6 Provide coaching to operations as appropriate to assist with change management related to procedure changes and with refresher training on existing procedures.

5.0 Program

- 5.1 The Quality Assurance Program is composed of both Quality Control and Quality Assessment.
- 5.2 Quality Control is comprised of the tasks performed to provide quality products / services. Quality Control includes Apprentice Training, Operator Qualification, and other training/qualifications.
- 5.3 Quality Assessment is comprised of the tasks used to confirm that the AIC Quality Control system is satisfactory. These external tasks include field inspections, records audits, and periodic evaluations of Quality Control processes.
- 5.4 Quality Assessments are performed by Quality Assurance Consultants based on assessment plans. Assessment plans for the Quality Assurance Consultants are generated by the Superintendent of Gas Quality Assurance and include the review of:
- 5.4.1 Construction, Maintenance, and Operations activities being performed by in-house and contractor personnel.
 - 5.4.2 Compliance records and documentation of work performed.
 - 5.4.3 Leak management activities.
 - 5.4.4 As built conditions of facilities.
 - 5.4.5 Support systems and tasks.
- 5.5 Quality Assessments conducted by Quality Assurance Consultants will be documented in LocusView.
- 5.6 Quality Assurance Consultants will verbally communicate the results of the assessment to the local Supervisor.
- 5.6.1 Communication of assessment results with the local Superintendent will take place when deficiencies are discovered during assessments, AND
 - 5.6.2 With Gas Compliance and OQ Staff where deficiencies involve improper performance of a covered task.
- 5.7 The QA Assessment report includes (as applicable)
- 5.7.1 Summary of the assessment.
 - 5.7.2 Safety results observed.
 - 5.7.3 OQ Covered Tasks observed.
 - 5.7.4 Positive results observed.
 - 5.7.5 Deficiencies noted.
 - 5.7.6 Immediate corrective action taken.
 - 5.7.7 Corrective action plans where required.
 - 5.7.8 Other Issues Discussed or Observed (Shared Learning Opportunities).

UNCONTROLLED IF PRINTED

5.7.9 Documents reviewed during the assessment.

5.7.10 Pictures taken during the assessment.

5.7.11 Name of Local Supervisor that the results were communicated to at the end of the assessment.

6.0 Quality Assurance Bulletin

6.1 Significant issues identified that could impact AIC Gas Operations will be shared through a written Quality Assurance Bulletin.

6.2 These bulletins will summarize the issue observed, reference the pertinent section of the Gas O&M Plan or Federal/State regulations, and provide any additional information related to the issue.

6.3 Gas Operations shall discuss this information with their local areas of responsibility.

End of Instructions.

REPR 1 Requirements**1.0 Purpose**

This document prescribes the methods for repairing transmission and high-pressure distribution pipelines, steel distribution pipe/mains, polyethylene (PE) mains, and service lines by Ameren Illinois (AIC). All work is to comply with 49 CFR Part 192, Subpart E, Subpart G (specifically §§ 192.309 and 192.311), and Subpart M.

2.0 Scope

This document addresses the following:

- Contract Construction Inspectors
- Contract Welding Inspectors
- Gas Control

UNCONTROLLED IF PRINTED

- Gas Tech Services (GTS) Technicians

4.0 General

- 4.1 Any pipeline facility that is damaged, deteriorated, or contains an imperfection that impairs serviceability, or a pipeline that is leaking shall be:
 - 4.1.1 Removed and replaced with a section of pipe of equal or greater design strength, OR
 - 4.1.2 Repaired by one of the approved methods specified in this document.
- 4.2 When determining the type of repair to make, consider the following:
 - 4.2.1 Type of pipe,
 - 4.2.2 Type of defect or damage,
 - 4.2.3 Leaking or non-leaking,
 - 4.2.4 System MAOP,
 - 4.2.5 Personnel and public safety, AND
 - 4.2.6 Availability of repair fittings.
- 4.3 To protect the public and personnel, consider controlling gas flow before making repairs or be prepared to control gas, if necessary, while repairs are being made. Methods of controlling the flow may include:
 - 4.3.1 Throttling or shutting off main and service line valves,
 - 4.3.2 Using line stopping equipment,
 - 4.3.3 Changing regulator set points,
 - 4.3.4 Running down the tap on service line tees, OR
 - 4.3.5 Activation of excess flow valves (EFV).
- 4.4 Consult with Gas Control to verify if the affected system is remotely monitored. If monitored, request their assistance in monitoring the system during the repair operation.
 - 4.4.1 Establish communications and determine at what point Gas Control should issue a warning of potential system problem.
 - 4.4.2 Once repair has been completed and system returned to normal operation, verify with Gas Control that operating parameters indicate back to normal operation.
- 4.5 If any imperfection or damage is discovered and determined to be unsafe, then a plan shall be identified / implemented to make the situation safe by considering:
 - 4.5.1 Reducing pressure as part of planned action,
 - 4.5.2 Isolating and shutting down the damaged sections, OR
 - 4.5.3 Constructing a bypass and shutting down the damaged section.
- 4.6 See [SAFT 1, Section 4.0](#), Regulatory Requirements for safety related condition (SRC) reporting that may be required to PHMSA and the ICC.
- 4.7 If affected facility is a transmission or high-pressure distribution line with MAOP greater than 100 psig, notify GTE, Pipeline Integrity Management, or GSE of the situation before performing repairs.

- 4.8 When measuring / evaluating damage or corrosion on steel pipe, the appropriate Operator Qualified (OQ) personnel should complete a Corrosion and Steel Damage Evaluation form. See [CORR 2.9](#).
- 4.9 When steel pipe repair includes replacing a cut-out section of damaged or deteriorated pipe with PE pipe, consult corrosion control personnel to ensure adequate cathodic protection (CP) for the affected pipeline segment.
- 4.10 For defects on curved pipe, consult GTS, GTE, or GSE to determine appropriate repair options.
- 4.11 All permanent repairs shall be made by an approved method specified in:
- 4.11.1 [Appendix A](#) - Transmission & High-Pressure Distribution Pipe Repairs,
 - 4.11.2 [Appendix B](#) - Steel Distribution Pipe Repairs,
 - 4.11.3 [Appendix E](#) - PE Pipe Repair, OR
 - 4.11.4 If necessary, by reliable engineering test and analyses to ensure restoring serviceability of the pipe.
- 4.12 If not feasible to make a permanent repair on steel mains or services at the time of discovery, then complete a "Make Safe" repair. A permanent repair shall be completed within 90 calendar days.
- 4.12.1 Exceptions:
- 1. A Class 1 leak within 5 feet of a foundation shall be *permanently repaired at the time of discovery*.
 - 2. Compression couplings shall be repaired *within 30 calendar days* (see [REPR 2.1](#)).
- 4.12.2 Initiate a leak repair in ClickMobile and include a note indicating that it is a Make Safe repair.
- 4.12.3 Gas Supervisor is responsible for tracking the required permanent repair by creating a job order, DOJM, that includes:
- 1. Make Safe repair date.
 - 2. Permanent repair due date, no later than 90 days from the Make Safe repair date.
- 4.13 Safety considerations:
- 4.13.1 When working in a potentially hazardous gas environment, follow [WIGE 2.1](#).
 - 4.13.2 Before welding or cutting activity on any steel pipeline, take the proper precautions to eliminate any chance of accidental ignition. See [ACIG 2, Section 6.0](#), Welding and Other Hot Work.
 - 4.13.3 A fire extinguisher shall be at the location of the work when there is a potential for an ignition

5.0 Leak Repairs

- 5.1 Any facility that is leaking to the extent that an immediate hazard exists (Class 1 leak) shall be repaired immediately.
- 5.2 If the operating pressure cannot be reduced to a safe level, the affected piping system shall be taken out of service.

- 5.3 If a leak is caused by corrosion, complete a Corrosion and Steel Damage Evaluation within ClickMobile. See [CORR 2.9](#).
- 5.4 Corrosion Control personnel should determine if further investigation / testing is needed to ensure adequate CP is being maintained, all depending upon:
 - 5.4.1 Condition of the pipe,
 - 5.4.2 Pipe coating, AND
 - 5.4.3 Extent of the corrosion.
- 5.5 In a gas storage field, installing two barriers is considered a permanent repair for a leak on a storage field well. A barrier consists of installing a bridge plug, loading the well with water, or other engineered barrier method.
- 5.6 Leaks in compression couplings and fittings are covered in [REPR 2.1](#).
- 5.7 Leaks in threaded connections can be repaired by:
 - 5.7.1 Tightening the fittings,
 - 5.7.2 Disassembling and applying thread sealer or Teflon thread tape and reassembling (see [STLP 1](#)), OR
 - 5.7.3 Replacing the fittings.
- 5.8 Leaks in flange connections can be repaired by:
 - 5.8.1 Tightening the flange bolts, AND/OR
 - 5.8.2 Replacing the flange gasket.

6.0 Common Repair Considerations - Steel Pipe

6.1 Segment Cutout

Before cutting metallic gas piping, install an electrical bond and maintain it until all reconnections are completed, or a gas-free environment exists.

- 6.1.1 Repair by cutting out the defective segment of pipe and replacing with pipe that is appropriate for the Design MAOP.
 - 6.1.2 Consult with cathodic protection personnel for CP requirements on new segment of pipe.
 - 6.1.3 The minimum length of replacement segment shall be:
 - 1. *For pipe sizes up through 8-inch nominal OD:* 12-inches minimum.
 - 2. *For pipe sizes greater than 8-inch nominal OD:* At least 1-1/2 times the pipe diameter.
 - 6.1.4 When determining the length of cut-out segment, consider the size of line-up clamps, ease of alignment and fit-up, need for reinforcing sleeve over girth weld, and other construction conditions.
 - 6.1.5 New segment shall be connected to existing pipe by an approved welding procedure.
- ### 6.2 Grinding (§192.309)

6.2.1 Grinding may only be used for repairs as listed in:

1. [Appendix A](#) for Transmission & High-Pressure Distribution Pipe Repairs.

Consult with Gas Tech Engineering before grinding to repair any defect on transmission piping or high-pressure distribution piping operating above 100 psig.

2. [Appendix B](#) for Steel Distribution Pipe Repairs.

6.2.2 Use grinding only if the affected pipe material can be removed without requiring a permanent reduction in maximum operating pressure (MOP) of the piping. This can be computed using the remaining strength formula from ASME B31G (or an equivalent calculation), or the more conservative design formula in [STLP 2.2, Subsection 4.1](#).

6.2.3 Perform arc burn removal in accordance with [WELD 2.10](#).

6.2.4 During repair of a defective weld, where applicable, lower the operating pressure to less than 20% SMYS. Limit grinding of the defective area so at least 1/8-inch thickness remains in the pipe weld. Further welding shall only be with an approved procedure.

6.3 Welded Full-Encirclement **Reinforcing** Split Sleeve

6.3.1 Reinforcing sleeves are suitable for repairing pipe (non-leaking or leaking) or welds, provided leakage can be safely controlled during the pipe surface preparation and welding.

6.3.2 Full-encirclement split sleeves are suitable to reinforce the pipe for internal defects (e.g., laminations, internal corrosion), provided that:

1. Sleeve extends beyond the internal defect, AND
2. Sound metal is far enough away from defect so that localized heating will not have an adverse effect on the defect.

6.3.3 Ensure that the pressure rating of the selected split sleeve is adequate for the pipeline being repaired.

6.3.4 Clean pipe and remove existing coating material in the area where sleeve is to be welded.

1. Remove coating beyond the area to be sleeved, taking care not to remove metal from the pipe.
2. If severe corrosion is present, contact Gas Supervisor to determine if a split sleeve is appropriate. Gas Supervisor may need to confirm with Gas Engineering, GTE, GSE, and/or Corrosion Control personnel. For corrosion evaluation, see [CORR 2.9](#).

6.3.5 Welding of the full encirclement sleeve shall be in accordance with [WELD 2.4](#).

6.3.6 When the sleeve is for permanent repair, coat the sleeve with an approved coating. See [CORR 2.3](#).

6.4 PLIDCO Full-Encirclement Split+Sleeve

- 6.4.1 The Split+Sleeve is suitable for pipe repair by bridging over leaks and other defects in steel pipe, provided leakage can be safely controlled during the necessary pipe surface preparation.
- 6.4.2 The Plidco Split+Sleeve is acceptable for both Make Safe repair and permanent repair of steel pipe.
- 6.4.3 For installation procedure and material specifications, see [REPR 2.2](#).
- 6.4.4 Permanent repairs require the repair sleeve to be seal welded.

6.5 Composite Wrap Systems

- 6.5.1 These high strength carbon fiber or glass resins are a flexible alternative to repair clamps, welded sleeves, and pipe replacement.
- 6.5.2 These systems are a rehabilitation option for steel gas pipes with external corrosion, gouges, grooves, dents, and internal defects (e.g., laminations, corrosion).

Composite wrap systems are only applicable for non-leak repair.

- 6.5.3 Before specifying this type of repair, consult GTE to evaluate the pipe damage and applicability.
- 6.5.4 If composite wrap is determined to be an appropriate repair method, **follow the manufacturer's installation instructions.**

1. Approved composite wrap:

1a. Syntho-Glass XT

1b. Clock Spring

1c. OmegaWrap

2. See [REPR 3](#) for:

2a. Syntho-Glass XT Engineering Assessment Form and Installation

2b. Clock Spring Coil Pass Method Installation Manual

2c. Clock Spring Underwater Installation Guide

2d. OmegaWrap Installation Procedures

3. Before using another brand of composite wrap, it must be approved by Gas Standards & Materials in coordination with Corrosion Control and GTE.

6.6 Weld Deposition

- 6.6.1 Non-leaking weld defects may be repaired by deposition welding if the pipeline pressure can be reduced to a safe level and minimum wall thickness requirements are met.
- 6.6.2 The operating pressure must be at a safe level during the repair operation. For transmission lines, a safe level is below 20% SMYS.

6.7 Encapsulation

Full encirclement split sleeves and Plidco Split+Sleeve encapsulation are covered in [Subsection 6.3](#) or [Subsection 6.4](#).

6.7.1 Acceptable methods of encapsulation include:

1. *Approved manufactured fittings*, such as Mueller or T.D. Williamson line stopper, short stop, and save-a-valve nipple, can be used to encapsulate a leak, including leaking or abandoned fitting (or tapered screw plug).
2. *Steel pipe with a welded cap* is an acceptable means for encapsulating a leaking or abandoned fitting. This is referred to as pipe/cap method.

6.7.2 Encapsulation is not allowed over girth welds.

6.7.3 Common Encapsulation Considerations

1. Consult GTE and/or Integrity Management to determine if encapsulation is an acceptable repair option.
2. Ensure that the manufactured fitting has appropriate pressure rating for the pipeline on which it is being installed.
3. Attach manufactured fitting or pipe/cap to pipeline by an approved welding procedure. See [WELD 2.4](#) for in-service welding and [WELD 4](#) for related procedures.
4. Leak test the final weld at normal operating pressure with leak detection fluid or leak detection instrument.
5. Document the pressure test on ClickMobile leak repair form.
6. Coat fitting with an approved coating. See [CORR 2.3](#).

6.7.4 Added Considerations

1. *For manufactured fitting*, permanently attach the cap by tack-welding or strapping to prevent removal.
2. *For pipe/cap method*, pretest steel pipe at pressure that qualifies MAOP to be same as pipeline on which being attached. See [PTST 1.1 Table E](#), Fabricated Unit/Assembly or Short Section of Pipe.

6.8 Stainless-Steel Bolted Leak Clamp

- 6.8.1 The stainless-steel bolted leak clamp is limited to maximum pressure of 60 psig. Therefore, it can be used for a Make Safe repair on systems operating over 60 psig **IF** the operating pressure can be reduced to the clamp rating or less.
- 6.8.2 A permanent repair requires a full-encirclement welded split-sleeve to be installed over the clamp **IF** the pipe operating pressure is over 60 psig.
- 6.8.3 The stainless-steel bolted leak clamp is a permanent repair on pipe with MAOP of 60 psig or less.
- 6.8.4 The clamp shall be coated with approved coating when used as a permanent repair. See [CORR 2.3](#).
 1. The clamp does not have to be coated when used as a Make Safe repair.

7.0 Transmission and High-Pressure Distribution Pipe Repair

- 7.1 When any transmission line or high-pressure distribution pipeline is discovered as damaged or deteriorated such that its serviceability is impaired, the Gas Supervisor or Gas Engineer shall notify Pipeline Integrity, GTE, or GSE.

Any high-pressure service lines that might operate at or above 20% SMYS shall be repaired using one of the approved methods for transmission lines.

- 7.2 All permanent repairs of transmission facilities shall be piggable.
- 7.3 Gas Field Personnel will:
- 7.3.1 Make initial determination of the damage or leak.
 - 7.3.2 Identify extent of gas leak migration as needed.
 - 7.3.3 Classify any leaks. See [LEAK 1, Subsection 5.5](#).
 - 7.3.4 Perform required leak surveillance.
 - 7.3.5 Take appropriate measures to protect public and property until repairs are made.
 - 7.3.6 Communicate status updates with Gas Supervisor or Gas Engineer.
 - 7.3.7 Assist GTS with repairs when requested.
- 7.4 Pipeline Integrity, GTE, GSE, or Region Gas Engineer will:
- 7.4.1 Evaluate damage or deterioration of the main.
 - 7.4.2 Determine extent of repairs required.
 - 7.4.3 Determine safe operating pressure that can be maintained during repair.
 - 7.4.4 Recommend corrective action to be taken.
 - 7.4.5 Prepare corrective action plan, if necessary.
 - 7.4.6 Identify if any corrosion control measures need addressed.
 - 7.4.7 Ensure necessary material is available on/to site.
 - 7.4.8 Coordinate actual repairs to be performed by either contractor or AIC personnel.
- 7.5 Pipeline Integrity, GTE or GSE may recommend a repair method that is not currently shown in Appendix A as approved for transmission or high pressure distribution facilities.
- 7.5.1 The recommended repair method shall be:
- 1. Based on good engineering and industry practice.
 - 2. Installed or performed in accordance with manufacturer's instructions
 - 3. Performed by individuals qualified in the process.
 - 3a. AIC's Operator Qualification group shall review the method and determine if the repair method requires individuals to be Operator Qualified.
 - 4. Submitted in writing for evaluation and approved by the Supervising Engineer Gas Standards & Procedures prior to installation.

- 7.5.2 If the recommended repair method is approved, a copy of the written approval and a copy of the manufacturer's instructions shall become part of the final repair job packet and maintained for the life of the facility.

7.6 Approved Repair Methods

- 7.6.1 Imperfections or damage (e.g., gouges, grooves, dents, arc burns) to a transmission line should be closely inspected and repaired in accordance with [Appendix A](#).

1. The appendix table indicates the approved repair method for various types of defects or imperfections on transmission and high-pressure distribution piping. In addition, encapsulation of a leak (including a leaking and/or abandoned fitting) is also an approved method.

- 7.6.2 See repair coverage in [Section 6.0](#), Common Repair Considerations - Steel Pipe as follows:

1. Segment Cutout - [Subsection 6.1](#)
2. Grinding - [Subsection 6.2](#)
3. Welded Full-Encirclement Split Sleeve - [Subsection 6.3](#)
4. PLIDCO Full-Encirclement Split+Sleeve - [Subsection 6.4](#)
5. Composite Wrap Systems - [Subsection 6.5](#)
6. Weld Deposition - [Subsection 6.6](#)
7. Encapsulation - [Subsection 6.7](#)
8. Stainless Steel Bolted Leak Clamp - [Subsection 6.8](#)

7.7 High Pressure Distribution and Transmission Pipe Grinding Repair (§192.309)

Consult with Gas Tech Engineering or Gas Integrity before grinding to repair any defect on transmission piping or high-pressure distribution piping operating above 60 psig.

- 7.7.1 Grinding is an approved repair method as specified in [Appendix A](#) and approved by engineering.
- 7.7.2 For Arc Burn removal see [WELD 2.10](#)
- 7.7.3 Use grinding as a repair method only if the remaining wall meets the requirements of ASME B31G
- 7.7.4 Use 60 grit or finer abrasive wheel for grinding repairs.
- 7.7.5 Project specific procedures will specify the pressure and wall thickness requirements for grinding repairs.

Care should be taken when grinding on pre-1970 ERW pipe. The seam weld may be difficult to locate, may have low toughness, and may contain imperfections.

- 7.7.6 Ensure a minimum 10 pound dry chemical (A, B, C) fire extinguisher is present at the location of the work when grinding on an operational line.
- 7.7.7 Remove coating and abrasive blast the grinding area.
- 7.7.8 An initial and final NDT inspection is required for transmission and high-pressure distribution welding repairs.
 - 1. Perform a radiographic test for repairs on girth welds. See [WELD 2.6](#).
 - 2. Perform a magnetic particle test for repairs on fillet welds (lap and branch type). See [WELD 2.7](#).
- 7.7.9 Record the minimum wall thickness of the area around the anomaly or indication.
 - 1. If wall thickness indicates additional anomalies or wall loss, contact GTE/GSE or Gas Integrity prior to grinding.
- 7.7.10 Keep in constant motion using light to moderate pressure to prevent overheating (blueing) of the pipe.
- 7.7.11 Periodically stop grinding in order to evaluate the wall thickness.
- 7.7.12 Final surface area should have a smooth profile.
 - 1. Additional buffing/blending may be required.
- 7.7.13 Record the final wall thickness on the as-built documents.

8.0 Steel Distribution Pipe Repair

- 8.1 All repairs on steel distribution pipe shall be by one of the approved repair methods. See [Appendix B](#) and coverage below for half-sole sleeve and tapered screw plug.
- 8.2 Approved Repair Methods
 - 8.2.1 See coverage in Section 6.0, Common Repair Considerations - Steel Pipe as follows:
 - 1. Segment Cutout - [Subsection 6.1](#)
 - 2. Grinding - [Subsection 6.2](#)
 - 3. Welded Full-Encirclement Split Sleeve - [Subsection 6.3](#)
 - 4. PLIDCO Full-Encirclement Split+Sleeve - [Subsection 6.4](#)
 - 5. Composite Wrap Systems - [Subsection 6.5](#)
 - 6. Weld Deposition - [Subsection 6.6](#)
 - 7. Encapsulation - [Subsection 6.7](#)
 - 8. Stainless Steel Bolted Leak Clamp - [Subsection 6.8](#)
 - 8.2.2 Half-Sole Sleeve
 - 1. Half-sole steel repair sleeves can be used for internal and external corrosion, gouges, dents, grooves, arc burns, cracks, and laminations on distribution piping only.

Half-sole sleeve must extend beyond the area of lamination and welded to sound pipe.

2. Half-sole sleeves are available commercially in two pressure-rated steels or a single structural-grade steel.
 - 2 a. Use pressure-rated sleeves to repair non-leaking defects.
 - 2 b. Use structural-grade sleeves as reinforcement only for a defective area.
3. Half-sole sleeves can be procured in various lengths.
4. A half-sole sleeve may be made from pipe or rolled plate material of appropriate grade, equal or greater thickness, and with rounded corners.

8.2.3 Tapered Screw Plug

1. Use tapered screw plugs only to plug small non-corrosion holes in steel distribution lines.
2. **Do not** use tapered screw plugs:
 - 2 a. In lines operating over 60 psig.
 - 2 b. To repair corrosion leaks.
 - 2 c. In any pipelines that are subject to pigging.
3. See [Appendix D](#), Mueller Tapered Screw Plug for available sizes and installation procedure.

8.3 Distribution Pipe Grinding Repairs (§192.309)

Care should be taken when grinding on pre-1970 ERW pipe. The seam weld may be difficult to locate, may have low toughness, and may contain imperfections.

- 8.3.1 Grinding is an approved repair method as specified in [Appendix B](#)
- 8.3.2 For Arc Burn removal see [WELD 2.10](#)
- 8.3.3 Use grinding as a repair method only if the remaining wall thickness meets the requirements of ASME B31G.
- 8.3.4 Ensure a minimum 10 pound dry chemical (A, B, C) fire extinguisher is present at the location of the work when grinding on an operational line.
- 8.3.5 Use 60 grit or finer abrasive wheel for grinding repairs.
- 8.3.6 Remove coating and abrasive blast the grinding area.
- 8.3.7 An initial and final NDT inspection is required for in-service distribution welding repairs.
 1. Perform a radiographic test for repairs on girth butt welds. See [WELD 2.6](#).

2. Perform a magnetic particle test for repair on fillet welds (lap and branch type). See [WELD 2.7](#).
- 8.3.8 Record the minimum wall thickness of the area around the anomaly or indication.
 1. If wall thickness indicates additional anomalies or wall loss, contact Gas Engineering or Gas Integrity prior to grinding.
- 8.3.9 Keep in constant motion using light to moderate pressure to prevent overheating (blueing) of the pipe.
- 8.3.10 Final surface area should have a smooth profile.
 1. Additional buffing/blending may be required.
- 8.3.11 Record the final wall thickness on the as-built documents.

9.0 Polyethylene (PE) Pipe Repair (§192.311)

9.1 General

- 9.1.1 Any leak, imperfection, or damage that impairs the serviceability of a plastic pipe shall be repaired or removed. See [Appendix E](#) for approved repair methods for polyethylene (PE) pipe. These methods are applicable to medium-density polyethylene (MDPE) pipe and high-density polyethylene (HDPE) pipe.
- 9.1.2 Escaping gas from PE pipe can generate static electricity. For grounding procedures, see [POLY 2.2, Paragraph 5.1.3](#).
- 9.1.3 Stainless steel bolted leak clamps are not designed for use on PE pipe. Therefore, do not use for leak repairs on PE pipe.
- 9.1.4 Ensure a minimum 10 pound dry chemical (A, B, C) fire extinguisher is present at the location where the work is being performed.

9.2 Segment Cutout

- 9.2.1 Repair PE piping by cutting out the damaged section and installing pretested replacement pipe.
- 9.2.2 The new segment should be attached to the existing pipe with either butt fusion or electrofusion couplings. Service lines 1 inch and smaller may be connected with a mechanical stab coupling. See [POLY 2.6](#).

9.3 Electrofusion Repair Saddles

- 9.3.1 Repair saddles can be used on:
 1. *Non-leaking defects* such as gouges and nicks of any depth.
 2. *Leaking defects* if the line is shut down for the repair.
- 9.3.2 The maximum size defect that can be repaired with a repair saddle is 2 inches in length and width. Center repair saddle over the defect so that the defect is in the fitting "cold zone." See [Appendix F](#) for explanation of electrofusion cold zone.
- 9.3.3 Repair saddles are available for 4-inch and 6-inch PE pipe. See [POLY 2.5, Appendix A, Item A-8](#) for repair saddle stock codes.
- 9.3.4 The repair saddle comes with an under-saddle. For installation procedure, see [POLY 2.5, Subsection 10.2](#), Saddle Fittings.

9.4 Service Line Use Only

9.4.1 Mechanical Stab Coupling or Repair Couplings (see [POLY 2.6](#))

1. Stab couplings can be used as permanent repair on PE service lines ½ thru 1-inch sizes.
2. Perfection Permasert or Continental Stab Couplings are available in ½ thru 1-inch sizes.
3. Manufacturer specific chamfering tool must be used with the specific fittings.

9.4.2 Electrofusion Coupling

1. If the damaged section of PE pipe can be cut out and there is enough slack in the remaining pipe, an electrofusion coupling can be installed to rejoin pipe.
2. Install the electrofusion coupling in accordance with procedures in [POLY 2.5](#).

9.4.3 Aldyl Service Punch Tee Repair Kit

1. To repair leaking Aldyl-A tapping tee caps, use the Kerotest electrofusion repair kit.
 - 1 a. Kits are available for both standard and non-standard tapping tees.
 - 1 b. See [REPR 2.3](#) for required tooling and installation instructions.
2. Leak test the completed repair with leak detection solution or leak detection instrument at normal operating pressure.

9.4.4 Plexco Tapping Tee Replacement Cap

1. See [Appendix G](#) for a list of the stock coded Plexco tapping tee replacement caps.
2. Leak test the completed repair with leak detection solution or leak detection instrument at normal operating pressure.

10.0 Testing of Repairs

10.1 All piping repairs must be inspected and tested in accordance with 49 CFR Part 192, Subpart J and to avoid a possible de-rating of the system.

10.1.1 Test all pipe and/or fittings used to make the repair same as new construction in the same location. Test in accordance with [PTST 1](#), including any temporary piping used as a bypass.

10.1.2 Where not feasible to pressure test a repair section after installation, the pipe and fittings shall be pressure tested before installation.

10.1.3 For permanent leak repair, leak test the full encirclement split sleeve (i.e., welded, Plidco, or Dresser) at the pipe operating pressure as a minimum. Check for leaks using a soap test or gas leak detector.

10.1.4 For tie-in welds or flanged connections that cannot be pressure tested, use a leak detection solution and leak test them together with the piping facility at operating pressure.

10.1.5 *Service line test requirements:*

1. Each line that is physically disconnected shall be tested in the same manner as a new service line before being reinstated.

2. Each line that is temporarily disconnected from the main for any reason shall be tested from the disconnection point to meter valve in the same manner as a new service line.
3. If provisions are made to maintain continuous service during the test (e.g., installing a bypass), then it is not necessary to test any part of the original service line that is used to maintain service. Refer to [RNST 1, Section 5.0](#), Reconnection of Temporarily Disconnected Services.
4. Each line disconnected from the supply source due to third-party damage shall be leak surveyed from the point of disconnection or damage to the main with a FI unit, gas detection instrument, or bar testing with CGI.

10.2 Testing Weld Repairs

- 10.2.1 Each weld shall be visually inspected by a qualified welding inspector, including welds on full encirclement split sleeve for non-leak repair.
- 10.2.2 If MAOP of the main is more than 20% SMYS and the pipe is greater than 6-inch diameter, then each weld shall be nondestructively tested. See requirements as addressed in [WELD 1, Section 9.0](#), Inspection and Test of Welds, and [WELD 1, Section 10.0](#), Nondestructive Testing.

11.0 Repair Records

11.1 Pressure Tests

- 11.1.1 If pipe, fittings, or an assembly requiring pressure testing per [PTST 1](#) is used to repair a leak, record the actual test pressure and duration on the Leak Repair Form within ClickMobile. This includes pre-testing and post-installation information.
 1. Retain record in Maximo for repairs associated with the gas leak.
- 11.1.2 Record repairs on the appropriate Leak Test Form (LTF) or Leak & Strength Test Form (LSTF). See [PTST 3](#) for forms. Retain a copy with the DOJM/WO job packet as follows:
 1. *Leak repair on a main*: Record the required pressure test information for the pipe, fittings, or an assembly used to repair the leak.
 2. *Components installed*: Record the leak test in order to complete repair on a main or service line.
 3. If using pipe, fittings, or an assembly to repair a non-leak defect that requires pressure testing per [PTST 1](#), record the actual test pressure and duration on appropriate form. This includes pre-testing and post-installation test information.
- 11.1.3 Tie-in connections that are leak tested at the normal line operating pressure should be recorded as:
 1. Repair Successfully Leak Tested on the Leak Repair Form in ClickMobile,
OR
 2. Tie-In Joints Tested on the Leak Test Form (LTF) or Leak & Strength Test Form (LSTF) as appropriate for non-leak repairs.

11.2 Repair records should include the date, location, and description of each repair made to the pipe including the pipe-to-pipe connection.

- 11.2.1 *Leak repairs*: Maintain records in Maximo for life of the facility.

UNCONTROLLED IF PRINTED

11.2.2 *Non-leak repairs*: Maintain records in the job packets for life of the facility.

11.3 Weld Tests

11.3.1 The test reports and non-destructive testing (NDT) inspection reports shall be retained in the job packets for life of the pipeline.

11.3.2 The radiographic films will be identified and retained in the job packet for 3 years, subject to disposal as established in [WELD 2.6, Subsection 10.2](#).

End of Instructions.

Operator Qualification (OQ) Required?

YES

0641: Visually Inspect Pipe and Components Prior to Installation

0681: Joining of Plastic Pipe - Stab Fittings

0751: Joining of Plastic Pipe - Butt Heat Fusion: Manual

0761: Joining of Plastic Pipe - Butt Heat Fusion: Hydraulic Machine

0781: Joining of Plastic Pipe - Electrofusion

0801: Welding

0811: Visual Inspection of Welding and Welds

0861: Installation of Steel Pipe in a Ditch

0901: Installation of Plastic Pipe in a Ditch

0981: Backfilling

0991: Coating Application and Repair - Brushed or Rolled

1011: External Coating Application and Repair - Wrapped

1041: Install Mechanical Clamps and Sleeves - Bolted

1051: Fit-Up of Weld Type Repair Sleeve

1061: Install Composite Sleeve

1071: Repair of Steel Pipe by Grinding

1141: Squeeze Off Plastic Pipe

1201: Temporary Isolation of Service Lines and Service Discontinuance

1371: Operate Gas Pipeline – System Control Center Operations

Revision Notes

Location of Changes	Summary of Changes
2.0 Scope	Appendix C – Remove "Dresser"
Subsection 6.3	Updated title and revised – Welded Full-Encirclement Reinforcing Split Sleeves. Remove the general sentence under the section name.
Paragraph 6.5.4	Added – follow manufacturer's installation instructions. Added - AIC approved composite wraps: Syntho Glass XT, Clock Spring, and OmegaWrap. Referenced REPR 3 for the manufacturer's installation instructions.
Appendices	Appendix C – Reinforcing Split Sleeve = Removed Dresser
Appendix A – Transmission & High-Pressure Distribution Pipe Repairs	Header – Reinforcing Split Sleeve replace Type B Sleeve (Dresser 110 or 220)
Appendix B – Steel Distribution Pipe Repairs	Header – Reinforcing Split Sleeve replace Type B Sleeve (Dresser 110 or 220)

Appendix A - Transmission & High-Pressure Distribution Pipe Repairs

UNCONTROLLED IF PRINTED

Type of Defect Or Imperfection	Segment Cut-Out	Grinding	Reinforcing Sleeve	Composite Wrap	Weld Deposition	Plidco Split+Sleeve

Non-leaking weld defect	Permanent	Permanent ³	Permanent	N/A	Permanent ⁵	Permanent ⁶
Leaking weld	Permanent	NO	Permanent	NO	NO ⁷	Permanent ⁶

Notes:

1. A "smooth" dent:
 - Between 2% and 6% of pipe diameter deep *should be* evaluated by Pipeline Integrity or GTE for fatigue cracking and repaired if appropriate, OR
 - Deeper than 6% of pipe diameter *must be* repaired or replaced, OR
 - On pipe with Design MAOP ≥ 40% SMYS, the dent or depression *must be* repaired or replaced if having:
 - Depth > 2% of pipe diameter on > 12-inch (nominal OD) pipe.
 - Depth > ¼ inch on 12-inch and smaller (nominal OD) pipe, OR
2. Acceptable repair only if internal defect or corrosion cannot grow beyond acceptable limits.
3. Grinding requirements to be specified by engineering. See [Subsection 7.6](#).
4. Repair may be used for defects < 80% of wall thickness deep provided that the damaged area has been removed by grinding and the defect removal has been verified by NDT inspection.
5. The defect should be removed by grinding and the area non-destructively tested before and after welding.

6. Plidco Split+Sleeve is approved as a Make Safe repair but shall be seal welded for permanent repair.
7. Weld deposition is an acceptable repair method only if the pipeline is taken out of service during repair. See [WELD 2.3. Section 10](#)
8. See [Section 6.7](#) for encapsulation considerations.

Appendix B - Steel Distribution Pipe Repairs

Type of Defect or Imperfection	Cut-Out	Grinding	Reinforcing Sleeve or Half-Sole or Plidco Split+Sleeve	Composite Wrap	Weld Deposition	Stainless Steel Bolted Leak Clamp
Reference	Sect. 6.1	Sect. 6.2	Sect. 6.3 Sect. 6.4	Sect. 6.5	Sect. 6.6	
Leak on steel pipe from any cause	Permanent	NO	Permanent ⁵	NO	NO	Permanent
Any internal or external defect > 80% wall thickness	Permanent	NO	Permanent ^{2,5}	NO	NO	NO
Any defect internal or external > 10% and < 80% wall thickness ¹	Permanent	Permanent ³	Permanent ^{2,5}	Permanent ²	NO	Permanent ²
Internal or external corrosion > 70% wall thickness	Permanent	NO	Permanent ^{2,5}	NO	NO	NO
Non-leaking weld defect	Permanent	Permanent ³	Permanent ⁵	NO	Permanent ⁴	Permanent
Leaking weld	Permanent	NO	Permanent ⁵	NO	NO ⁶	NO

Notes:

1. A defect includes any dent, crack, gouge, wrinkle, or collapse on steel distribution piping.
2. Acceptable repair only if internal defect or corrosion cannot grow beyond acceptable limits.
3. The remaining wall thickness after grinding must be equal to or greater than the nominal wall thickness required for the design pressure of the pipeline. See [Subsection 8.3](#).
4. The defect should be removed by grinding and the area non-destructively tested before and after welding. Minimum wall thickness requirements for welding must be observed.
5. Plidco Split+Sleeve is approved as a Make Safe repair but shall be seal welded for permanent repair.
6. Weld deposition is acceptable repair only if line is taken out of service during repair. See [WELD 2.3. Section 10.0](#).
7. See [Section 6.7](#) for encapsulation considerations.

Appendix C - Reinforcing Split Sleeves

C-1. Dresser Style 110 Sleeves

C-1.1 See Figure 1 for view and Table 1 for Style 110 sleeve data.

Notes:

- * Sizes 2" and 3" have minimum yield strength of 36,000 psi; Otherwise, sleeves have minimum yield strength of 50,000 psi.
- Pressure ratings listed are based on a Class 3 design factor of 0.50.
- Pressure rating can be adjusted for Class 1, Class 2, or Class 4 locations. Design factor for Class 1 is 0.72, for Class 2 is 0.60, and Class 4 is 0.40. Contact Engineering before adjusting pressure rating.

C-3. Dresser Style 220S Sleeves

C-3.1 See Figure 3 for view and Table 3 for Style 220S sleeve data.

Figure 3: Dresser Style 220S Sleeve

Table 3: Dresser Style 220S Sleeve Data

Nominal Pipe Size (inches)	AIC Stock No.	Diameter "A" & Pipe Diameter (inches)	Inside Diameter (inches)	Inside Length (inches)	Overall Length (inches)	Thickness "T" (inches)	Pressure Rating (psig)	Manufacturer Part No.
3/4	19 15 569	1-1/8	4-5/8	10	16-1/2	3/16	350	0220-0111-015P
1-1/4	19 23 510	1-3/4	4-5/8	10	16-1/2	3/16	350	0220-0113-015P
2	19 23 512	2-7/16	4-5/8	10	16-1/2	3/16	350	0220-0115-015P

Notes:

- Minimum yield strength of 35,000 psi.
- Pressure ratings listed are based on a Class 3 design factor of 0.50.

3. Pressure rating can be adjusted for Class 1, Class 2, or Class 4 locations. Design factor for Class 1 is 0.72, for Class 2 is 0.60 and Class 4 is 0.40. Contact Engineering before adjusting pressure rating.

Appendix D - Mueller Tapered Screw Plug

D-1. Mueller Tapered Screw Plug

- D-1.1 The screw plugs are self-threading.
- D-1.2 Material is heat treated steel alloy.
- D-1.3 For available sizes, see Table 1.

Table 1: Mueller Tapered Screw Plugs

Hex Size (inches)	Stock Number	Length (inches)	Mueller Part Number
3/8	19 83 110	1-1/4	514258
5/8	19 83 111	2-1/8	514259
7/8	19 83 112	2-3/4	514260
1		3-1/4	514261

D-2. Installation Procedure

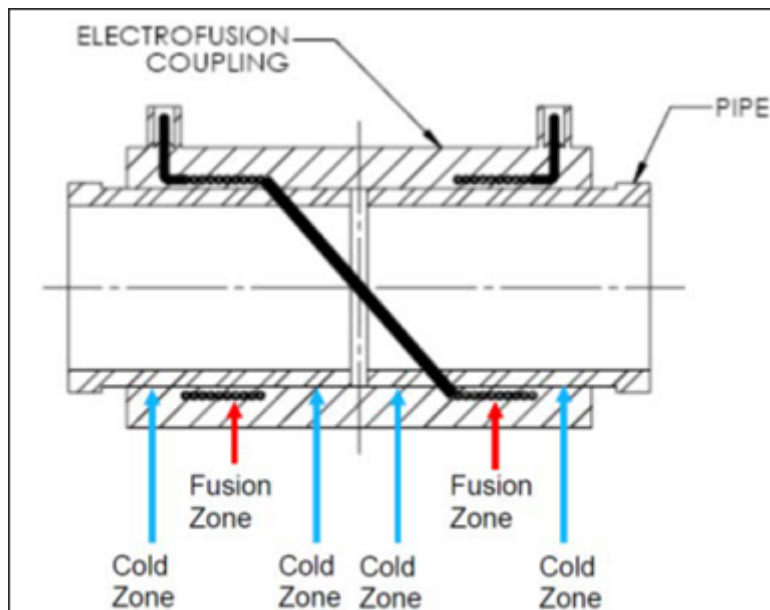

- D-2.1 Reduce the system operating pressure when possible to facilitate repair.
- D-2.2 Use non-sparking hammers and wrenches, if available, to turn the self-tapping plug into the hole.
- D-2.3 Fillet weld the plug to the pipe.
- D-2.4 Cut off head of plug flush with weld.
- D-2.5 Weld over top of plug to further seal or encapsulate with a pressure rated cap. See [Subsection 6.7](#) for encapsulation.

Appendix E - PE Pipe Repairs

Cut PE pipe	Permanent	NO	N/A	Permanent	NO	NO
Leaking Aldyl service tee cap	Permanent	NO	N/A	NO	Permanent	NO
Leaking Plexco service tee cap	Permanent	NO	N/A	NO	NO	Permanent

Appendix F - Electrofusion "Cold Zones"

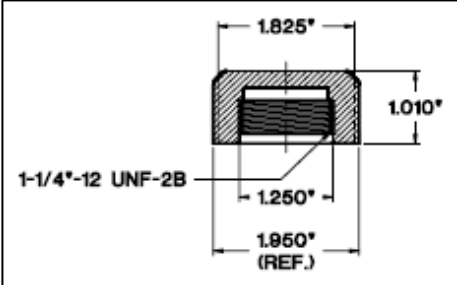

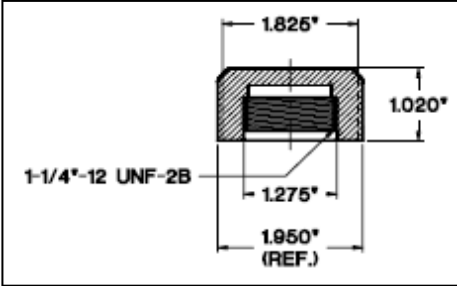

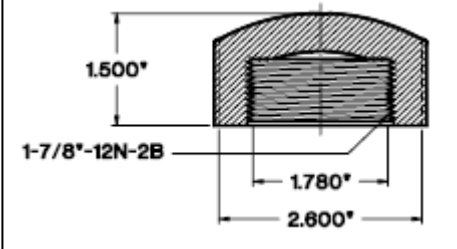

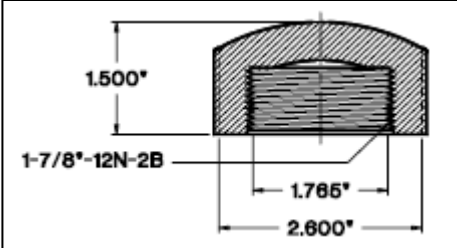

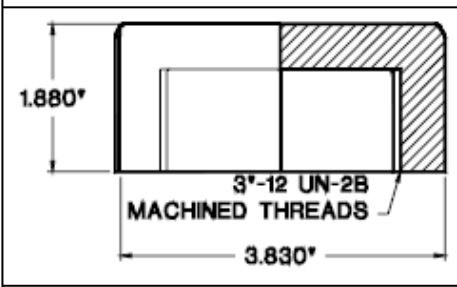

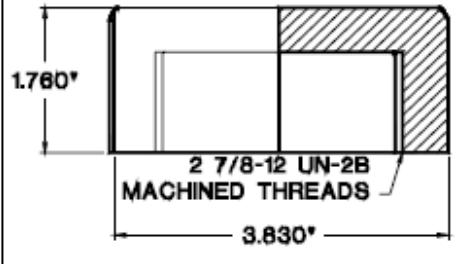

Explanation of electrofusion process and related "cold zones":

The expanding melt reaches "cold zones" within the fitting where the leading edges of melt flow cool and solidify, thereby blocking any further melt movement or escape. The heating process continues for a predetermined time so that substantial pressure is reached through continued melt expansion in the contained melt pool of the pipe and fitting surfaces.

The molten surfaces under pressure will join at the molecular level. Upon completion of the heating phase, the assembly is held stationary by external clamps as the melted materials begin to immediately cool and co-crystallize into a single homogenous monolithic structure between the pipe and fitting. Once completely cooled, the surfaces are permanently joined and cannot be separated.

REPAIRS

December 1, 2020

REPR 2.1 Compression Couplings

1.0 Purpose

This document addresses the repair of various compression couplings and compression type joints, plus the related testing of such repairs, by Ameren Illinois (AIC).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Repair Methods for Below Grade Compression Couplings](#)

[6.0 Compression Joints on Steel Tees and Valves](#)

[7.0 Testing of Repairs](#)

[8.0 Records](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Supervisors
- Gas Field Personnel
- Gas Field Personnel - Welders
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Technicians
- Gas Construction Services Supervisors
- Contract Gas Construction Company Supervisors
- Contract Construction Inspectors
- Contract Welding Inspectors

4.0 General

- 4.1 Leaking compression couplings may leak or fail due to pull out of pipe or leakage through the elastomer seal between coupling and pipe.
- 4.2 Pull out of the pipe may be caused by 3rd party damage, thermo cycling, soil stresses, or soil shifting associated with ground movement.
- 4.3 The elastomer seal leakage may be the result of material degradation of the seal or misaligned pipe segments.
- 4.4 This procedure outlines the approved *methods for repairing* below grade leaking compression couplings on both mains and service lines, plus compression joints on tees and valves installed in mains. No new compression couplings are permitted for below ground service. See [POLY 2.6, Section 7.0](#).

5.0 Repair Methods for Below Grade Compression Couplings

The following repair procedures apply to *both mains and service lines unless otherwise noted*:

- 5.1 Plastic-to-Plastic

UNCONTROLLED IF PRINTED

5.1.1 Remove compression coupling, AND

5.1.2 Replace with a new section of pipe connected by an approved fusion procedure.

5.2 Plastic-to-Steel

5.2.1 For main:

1. Remove compression coupling, AND
2. Replace with a plastic-to-steel transition fitting that is welded to the steel and fused to the plastic pipe with approved procedures.

5.2.2 For service line:

1. If the steel portion of the service line is isolated from the cathodic protection system, replace the service line.
2. If the service line is connected to a steel main with a compression coupling, remove the coupling and replace with a plastic-to-steel transition fitting that is welded to the steel and fused to the plastic pipe with approved procedures OR replace the service tee.

5.3 Steel-to-Steel

5.3.1 If the compression coupling is within 5 feet of a foundation wall:

1. Tighten and encapsulate the compression coupling with a full encirclement welded split sleeve, OR
2. Remove the coupling and replace with a new section of pipe connected by an approved welding procedure, OR
3. Replace the service line.

5.3.2 If the compression coupling is greater than 5 feet from a foundation wall, visually inspect for indications of the pipe pulling out of the coupling:

1. Wrap shows evidence of being stretched.
2. Pipe shows evidence of being pulled or is out of normal alignment with coupling.
3. Once wrap is removed, pipe next to coupling is cleaner or shinier than the rest of the pipe.

5.3.3 If pull out *is detected*:

1. Tighten and encapsulate the compression coupling with a full encirclement welded split sleeve at the time of the leak repair, OR
2. Remove the coupling and replace with a new section of pipe connected by an approved welding procedure, OR
3. Replace the service line.

5.3.4 If pull out *is not detected*:

1. Attempt to tighten compression coupling to repair leak, AND
2. Following repair by tightening, Gas Supervisor shall create a DOJM for work completion within 30 calendar days to either:
 - 2 a. Encapsulate the compression coupling with a full encirclement welded split sleeve,

- 2 b. Remove the coupling and replace with a new section of pipe connected by an approved welding procedure, OR
- 2 c. Replace the service line.

6.0 Compression Joints on Steel Tees and Valves

- 6.1 If the compression joint tee or valve is within 5 feet of a foundation wall:
 - 6.1.1 Replace the tee, OR
 - 6.1.2 If leak is eliminated, install a minimum of 2 welded straps across the joint, equally spaced around the joint (see [MAIN 2.3, Section 5.3](#)), AND
 - 6.1.3 Remove the tee or valve and replace with a new section of pipe, tee, or valve connected by an approved welding procedure, doing such *within 30 calendar days*.
- 6.2 If the compression joint tee or valve is *greater than 5 feet* from a foundation wall, visually inspect for pipe pull out from the compression joint.
 - 6.2.1 If pull out *is detected* (see [Paragraph 5.3.2](#) for indicators):
 1. Tighten the compression joint.
 2. If leak is eliminated, install minimum of 2 welded straps across the joint, equally spaced around the joint (see [MAIN 2.3, Section 5.3](#)), AND
 3. Schedule the replacement of compression tee or valve with a weld-in section of pipe and tee or valve.
 - 3 a. Gas Supervisor shall create a DOJM to replace the compression joint *within 30 calendar days*.
 4. If leak is not eliminated, replace the tee or valve with a section of pipe and tee or valve using an approved welding procedure.
 - 6.2.2 If pull out *is not detected*:
 1. Attempt to tighten the compression joint to eliminate leak.
 2. Following repair by tightening, the Gas Supervisor shall identify if that section of main is scheduled for replacement within the next 36 months as part of a coupled steel main replacement program.
 3. If replacement is not scheduled, the Gas Supervisor shall create a DOJM to replace the compression joint with a new section of pipe, tee, or valve connected by an approved welding procedure.
 - 3 a. The DOJM shall be completed within 30 calendar days.
 4. If leak is not eliminated, replace the tee or valve with a section of pipe and tee or valve using an approved welding procedure.

7.0 Testing of Repairs

- 7.1 All piping repairs must be inspected and tested in accordance with 49 CFR Part 192, Subpart J and to avoid a possible de-rating of the main and service line.
- 7.2 *Mains*: If necessary to replace a section of main, the replacement pipe shall be pre-tested (i.e., tested before installation or tied into the existing pipeline) to the pressure of a new main in the same location.

- 7.3 **Service Lines:** When a service line is physically disconnected from the supply source, the replaced portion, and the remaining portion of service line from disconnection point to the meter valve shall be pressure tested in the same manner as a new service line.
- 7.4 All tie-in welds, fusions, or mechanical fittings shall be visually inspected, and leak tested at the pipe operating pressure with leak detection fluid or leak detection instrument.

8.0 Records

- 8.1 Document the actual test pressure and test duration on the leak repair form within Click-Mobile.
- 8.2 Actual Pressure and test duration for main segments shall be recorded on the appropriate pressure test forms. See [PTST 1 Section 14](#). The completed form is to be placed in the job packet.
- 8.3 Maintain records addressing leak repairs AND pressure tests for life of the facility.
- 8.4 Record location of compression couplings that have been:
- 8.4.1 Repaired but not encapsulated.
 - 8.4.2 Strapped compression joint tees and valves.

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0641: Visually Inspect Pipe and Components Prior to Installation
- 0751: Joining of Plastic Pipe - Butt Heat Fusion: Manual
- 0781: Joining of Plastic Pipe - Electrofusion
- 0801: Welding
- 0811: Visual Inspection of Welding and Welds
- 0861: Installation of Steel Pipe in a Ditch
- 0901: Installation of Plastic Pipe in a Ditch
- 0981: Backfilling
- 0991: Coating Application and Repair - Brushed or Rolled
- 1011: External Coating Application and Repair - Wrapped
- 1041: Install Mechanical Clamps and Sleeves - Bolted

REPR 2.2 Plidco Split+Sleeve

1.0 Purpose

This document addresses the use of split sleeves for steel pipe repair.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Material Storage](#)

[6.0 Installation](#)

[7.0 Seal Welding](#)

Appendices

[Appendix A - Plidco Split+Sleeve Reference and Dimensional Data](#)

[Appendix B - Torque Values for Studs/Nuts](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Supervisors
- Gas Field Personnel
- Gas Field Personnel - Welders
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Technicians
- Gas Construction Services Supervisors
- Contract Gas Construction Company Supervisors
- Contract Construction Inspectors
- Contract Welding Inspectors

4.0 General

- 4.1 The Plidco Split+Sleeve is suitable for pipe repair by bridging over leaks and other defects in the steel pipe, provided leakage can be safely controlled during necessary pipe surface preparation. See Figure 1.
- 4.2 This repair sleeve may be used for Make Safe and permanent repair of steel pipe.
- 4.3 Permanent repairs require the sleeve to be seal welded.

Figure 1: Plidco Split+Sleeve

UNCONTROLLED IF PRINTED

- 4.4 Seal welding shall be performed by an In-Service qualified welder using approved In-Service welding procedures. See [WELD 2.4, In-Service Welding](#).
- 4.5 For product and dimensional data, see [Appendix A](#).

5.0 Material Storage

- 5.1 Store Plidco Split+Sleeves in a dry environment to prevent the unpainted surfaces from rusting and at temperature not exceeding 120 °F.
- 5.2 Store fittings with a dark polyethylene cover to keep direct sunlight from the packing, thus, to protect seal material from becoming brittle and losing ability to seal.
- 5.3 It is recommended that elastomer seals, studs, nuts, screws, and/or threaded fasteners be coated with a heavy grease to prevent rusting and deterioration caused from environmental conditions (see Table 1 for compatibility to seal material).

Table 1: Compatibility of Greases on Seals

Seal Type	Petroleum Based Grease	Silicone Based Grease	Glycerine Based Grease	Super Lube® Grease
Aflas	✓	✓	✓	✓
Buna-N	✓	✓	✓	✓
Hycar	✓	✓	✓	✓
Kevlar	✓	✓	✓	✓
Neoprene		✓		✓
Silicone			✓	✓
Teflon	✓	✓	✓	✓
Viton	✓	✓	✓	✓

- 5.4 Table 2 indicates the shelf life of the different elastomer seals. The shelf life will vary with the precautions taken to protect the seals as specified above.

Table 2: Shelf Life of Seals

Type Seal	Shelf Life
Buna-N & Hycar	up to 5 years
Neoprene	up to 10 years
Aflas, Silicone, & Viton	up to 20 years

6.0 Installation

- 6.1 Remove all coating, rust, and scale from the pipe surface where the Split + Sleeve will be installed. The cleaner (i.e., smoother) the surface under the seal, the more positive it will seal. Installation will proceed faster with lower bolt stress required to seal. The seal can tolerate minor surface irregularities up to ± 1/32 inch.
- 6.2 See manufacturer's installations instructions in [REPR 3](#).
- 6.3 Handle seals and "girder rings" carefully so not to damage. Lifting devices such as chains, cables, or lift truck forks should not contact the seals or rings. Contact can result in the seals being pulled from their grooves.

- 6.4 Coat all exposed seal surfaces with a heavy grease that is compatible. See [Table 1](#). This will allow the circumferential packing to slide around the pipe instead of binding during the tightening process.
- 6.5 Clean and lubricate all studs and nuts with a high-grade graphite oil thread lubricant, or a light-weight machine oil. Before installation, check that nuts moves freely and easily.

Excessive lubrication may contaminate weld.

- 6.6 Install sleeve as follows:
 - 6.6.1 Assemble the fitting halves loosely around the pipe to one side of the leak and matching the yellow painted ends of the fitting.
 - 6.6.2 Slide the loose assembly over the leak or defect being careful not to damage the girding or packing.
 - 6.6.3 Center the fitting over the damaged area, as much as possible, and hand tighten the nuts on the studs.
 - 6.6.4 Uniformly torque all studs and nuts as specified in [Appendix B](#). For best results, maintain an equal gap all around between side bars while tightening bolts.
- 6.7 Recheck all studs for the recommended torque.
- 6.8 Gap in the side bars is approximately 1/8 inch when the sleeve is fully tightened.
- 6.9 Strap fitting if piping is partially or completely unrestrained to prevent pullout. See [MAIN 2.3](#) for strapping requirements.
- 6.10 Leak test by pressurizing the piping; do not exceed the maximum working pressure.
- 6.11 Resume normal operations. Re-pressurize the pipe slowly and steadily without surges that could vibrate the pipeline and fitting.

7.0 Seal Welding

- 7.1 Use approved welding procedure for seal welding. For in-service welding, see [WELD 2.4](#). Also, see Figure 2 for sketch.

Figure 2: Seal Welding the Split+Sleeve

- 7.2 Use dry low-hydrogen electrodes for seal welding due to their resistance to moisture pick-up and hydrogen cracking.

- 7.3 Carefully control the size and shape of the circumferential fillet welds. Size should be at least 1.4 times wall thickness of the pipe.
 - 7.3.1 Strive for a concave faced fillet weld, with streamlined blending into both members. Avoid notches and undercuts. The smoother and more streamlined the weld, the greater the resistance to fatigue failure.
 - 7.3.2 The worst possible shape is a heavy reinforced convex weld with an undercut. Improper weld shape can lead to rapid fatigue failure which can cause leakage or rupture.
- 7.4 Shielded metal arc welding (SMAW) filler metals listed in API Std 1104 include the cellulose coated electrodes (E-XX10 series) which are typically preferred because of excellent downhill welding characteristics. **Cellulose coated electrodes (E-XX10) are not recommended for seal welding the studs and nuts.**

Use caution so welding does not overheat the seals.

- 7.5 Monitor the heat generated by welding or preheating, particularly near the area of the seals.
 - 7.5.1 Monitor temperature by using temperature crayons or probe thermometers (direct reading or infrared).
 - 7.5.2 Sequence the welding so that heat is not concentrated in one area.
 - 7.5.3 If the heat generated approaches the temperature limit of the seal material which is indicated on the label, then:
 - 1. Sequence the welding to another part of the fitting so that the affected area has a chance to cool, OR
 - 2. Discontinue welding.
- 7.6 Re-torque the studs and nuts periodically during field welding because weld contraction will cause them to loosen.
- 7.7 Seal weld the studs (Grade B-7) of the Plidco Split+Sleeve. This is more difficult welding since the studs are made of AISI 4140 steel (high carbon equivalence).
 - 7.7.1 Use low hydrogen electrodes (E-XX18) and a modest preheat (do not exceed 200 °F) to reduce hydrogen cracking and pin holes.
 - 7.7.2 The preheat will dry out any moisture, oil dampness, or thread lubricant that may be present in the seal weld area.
- 7.8 Seal weld the sleeve per the following sequence:
 - 7.8.1 Fillet weld the ends of sleeve to pipe.
 - 7.8.2 Seal weld side openings on fitting.
 - 7.8.3 Re-torque studs and nuts.
 - 7.8.4 Seal weld around bottom of nuts to side bar of fitting.
 - 7.8.5 Seal weld nuts to studs.

End of Instructions.

2-1/2	3-7/8	2,340	4,231

B-1. Notes for Table:

1. Studs are ASTM A 193 Grade B7.
2. Nuts are ASTM A 194 Grade 2H.
3. Torque values shown in table represent 2 different coefficients of friction (COF), 0.08 and 0.15. It is assumed that studs & nuts are clean, free running, free of obvious sur-

face flaws, and lubricated. The 0.08 COF assumes studs have been lubricated with a high-grade graphite-oil thread lubricant. The 0.15 COF assumes that studs have been lubricated with a light-weight machine oil. Torque values are safe minimums and represent approximately 25,000 psi bolt pre-stress.

REPR 2.3 Leaking Aldyl-A Tapping Tee Caps

1.0 Purpose

This document addresses the material, tooling, and installation instructions for repairing the original caps on leaking DuPont Aldyl-A tapping tee.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Repair Kit Components](#)

[6.0 Tools](#)

3.0 Target Audience

- Superintendent Technical Training - Operations
- Superintendent Technical Training -- Welding
- Gas Training Supervisors
- Operator Qualification Personnel
- Quality Assurance Personnel
- Gas Standards & Procedures Personnel
- Gas Engineering
- Gas Integrity Management Personnel
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Services Supervisors
- Contract Gas Construction Company Supervisors
- Contract Construction Inspectors
- Contract Welding Inspectors

4.0 General

- 4.1 This procedure uses the Kerotest electrofusion repair kit to repair leaking DuPont Aldyl-A tapping tee caps.
- 4.2 DuPont manufactured a standard and non-standard tapping tee in which the stack diameters were different. The standard tees had a stack diameter of 1.67 inches and the non-standard tee had a diameter of 1.57 inches.
- 4.3 Repair kits are stocked for both stack sizes.
- 4.4 Installation instructions are in [POLY 2.5](#) Electrofusion.

5.0 Repair Kit Components

- 5.1 Each Kerotest repair kit is packaged in a sealed polyethylene bag and includes the following components:

- Innogaz Electrofusion Coupling
- Insert, Repair Fitting
- Plug, Repair fitting
- O-ring Seal, Repair Fitting

- 5.2 The repair kit for the standard tapping tees (Stock No. 19 72 134) uses a 1.25-inch IPS electrofusion coupling and insert.
- 5.3 The repair kit for the non-standard tapping tees (Stock No. 19 72 153) uses a 40-mm electrofusion coupling and insert.

6.0 Tools

6.1 The following tool is required for installing the Kerotest repair kit.

6.1.1 125 Scraper/Peeler with handles, for use with standard tees (Part No. 88416226).

6.1.2 40M Scraper/Peeler with handles, for use with non-standard tees (Part No. 88410040).

6.1.3 Insert Holding Tool (Part No. 72770524).

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

REGULATOR STATIONS

October 1, 2021

REGS 1 Requirements

1.0 Purpose

This procedure describes the requirements for regulator station inspections, engineering evaluations, and associated records. This procedure complies with 49 CFR §§ 192.201, 192.740, and 192.743.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Regulator Station Inspection Schedule](#)[5.0 Regulator Station Engineering Evaluations](#)[6.0 Records](#)**3.0 Target Audience**

- Gas Engineer
- Gas Field Personnel
- Gas Supervisor
- Gas Tech Services (GTS) Supervisor
- Gas Tech Engineering (GTE)

4.0 Regulator Station Inspection Schedule

- 4.1 Each regulator station shall have an inspection once each calendar year not to exceed 15 months.
- 4.1.1 The Supervisor Gas Tech Services or Gas Supervisor is responsible for ensuring the annual inspection is completed.
- 4.1.2 The inspection shall include an operational inspection of the station facilities.
- 4.2 All regulator stations that serve more than approximately 250 customers shall, at a minimum, receive a primary inspection during the 10th calendar year (see [REGS 2.1](#)). The primary inspection should be performed while conducting the operational inspection.
- 4.3 At the discretion of the Supervisor Gas Tech Services or Gas Supervisor, a regulator station can be identified to have a primary inspection on a more frequent interval of 1 or 5 years.
- 4.4 The Supervisor Gas Tech Services or Gas Supervisor shall consider the following operational conditions when identifying regulator stations that warrant a more frequent inspection.
- 4.4.1 Regulator bodies subjected to erosive service conditions.
- 4.4.2 Construction and hydrostatic testing upstream of the regulator station.
- 4.4.3 Abnormal changes in operating conditions or unusual flows/velocities.
- 4.4.4 Abnormal pressures imposed on regulator or flow devices.

5.0 Regulator Station Engineering Evaluations

UNCONTROLLED IF PRINTED

- 5.1 Engineering shall perform an evaluation of each regulator station once each calendar year not exceeding 15 months.
- 5.2 The Gas Tech Engineering or Gas Engineer is responsible for ensuring the evaluation is performed.
- 5.3 The engineering evaluation verifies that the station relief valve capacity is sufficient to provide adequate overpressure protection.
 - 5.3.1 If the station relief valve capacity is insufficient, a new or additional relief device must be installed to provide sufficient capacity.
 - 5.3.2 In addition, any change to the regulator station equipment require an engineering evaluation to be performed.

6.0 Records

- 6.1 Maintain all regulator station equipment data, inspection information, and engineering evaluation history in Maximo.
- 6.2 Retain all information for the life of the regulator station.

End of Instructions.

REGULATOR STATIONS

October 1, 2021

REGS 2.1 Regulator Station Inspections

1.0 Purpose

This procedure provides the minimum requirements for the inspection of Ameren Illinois (AIC) gas regulator stations. This procedure is in compliance with 49 CFR §§ 192.740 and 192.743.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Resources or Equipment](#)

[6.0 Operational Inspection](#)

[7.0 Primary Inspection](#)

[8.0 Acoustical Inspection](#)

[9.0 Atmospheric Corrosion Inspection](#)

[10.0 Gas Leakage Inspection](#)

[11.0 Gas Regulator Station Signage](#)

3.0 Target Audience

- Gas Engineer
- Gas Field Personnel
- Gas Supervisor
- Gas Tech Services (GTS) Supervisor
- Gas Tech Engineering (GTE)
- Gas Control

4.0 General

- 4.1 Each regulator station is scheduled for an annual inspection. See [REGS 1](#).
- 4.2 Annual inspection requires, at a minimum, an Operational Inspection which:
- 4.2.1 Ensures that each regulator is:
1. In good mechanical condition.
 2. Set to control at the correct pressures at or below the MAOP.
- 4.2.2 Verifies that the equipment is operating properly.
- 4.2.3 Verifies the overpressure protection equipment (OPP) activates at the equipment set point that is in ClickMobile/Maximo.
- 4.2.4 Identify and schedule any repairs that are needed.

Operational Inspections do not require the disassembly of regulators or OPP equipment.

UNCONTROLLED IF PRINTED

- 4.3 The Gas Technical Service (GTS) Technician, at their discretion, may conduct a Primary Inspection with the Operational Inspection.
- 4.4 Use ClickMobile as a guide when performing inspections for each station.
- 4.5 GTS Technician responsible for performing regulator station inspection at regulator stations equipped with SCADA or an Electronic Pressure Recorder (ERX), shall contact Gas Control:
 - 4.5.1 Prior to beginning inspection so Gas Control is aware of the work being performed.
 - 4.5.2 After completing the inspection and before leaving the site to verify SCADA and/or ERX have returned to normal operation.
- 4.6 Document the Operational and Primary Inspections in ClickMobile.

5.0 Resources or Equipment

- 5.1 The following shall be available, as needed, to perform the inspection:
 - 5.1.1 Combustible gas indicator.
 - 5.1.2 Test gauge, of sufficient range to display station maximum inlet pressure, for measuring downstream pressure.
 - 5.1.3 Manufacturer's instruction manual for each regulator and OPP equipment.
 - 5.1.4 O&M Manual
 - 5.1.5 PPE & Safety Equipment

6.0 Operational Inspection

- 6.1 Visual Inspection
 - 6.1.1 Upon arriving at the station site verify:
 - 1. Area is secure.
 - 1 a. Fence gates are locked, if station is inside a fenced area.
 - 1 b. Building doors are locked, if station is inside a building.
 - 1 c. Critical valves are tamper resistant, if station is in open area.
 - 2. Appropriate signage/line markers are:
 - 2 a. In place.
 - 2 b. Legible.
 - 2 c. Contain accurate information such as company name and phone number.
 - 2 d. See [PMRK 2](#) for further information.
 - 6.1.2 Perform a visual assessment of all equipment or devices that are critical to safety, gas delivery, and system reliability.
 - 1. Anomalies and abnormalities discovered during the visual assessment shall be immediately repaired or reported.
- 6.2 Valve Operation.
 - 6.2.1 Remove existing locking or security devices on valves necessary for performing station inspection.

6.2.2 During the station inspection ensure valves are:

1. Accessible.
2. Visually identified.
3. Operable.
4. Valve operators are in correct position.

6.2.3 Exercise valves to the extent necessary to verify proper operations:

1. Station inlet, outlet, and bypass valves
2. Overpressure protection equipment isolation valves
3. Control, sensing, and supply line valves.

6.3 Regulator Station with Relief Valve.

6.3.1 Check regulator station equipment for leaks before and after inspection.

1. A leak investigation shall be initiated within ClickMobile and is required for all leaks found during annual station inspection.

6.3.2 Install pressure gauge where needed to verify and monitor system pressure during the inspection.

6.3.3 Verify regulators and relief valve installed at the station matches the equipment listed in Maximo.

6.3.4 Confirm pressure settings indicated within Maximo.

6.3.5 Any discrepancy in equipment or changes that are made to the documented pressure settings shall be verified with the GTS Supervisor and indicated on the inspection form within ClickMobile.

6.3.6 Check operation of regulator

1. While performing the Operational Inspection, stations with parallel runs shall have one run verified as operational and available at all times, unless there are multiple feeds or other options that can maintain adequate system pressure.
2. The following inspection shall be performed on each station regulator run:
 - 2 a. Close the outlet valve to the station or station run, where applicable.
 - (i) Take care to monitor the outlet system pressure and if necessary operate bypass valves to maintain adequate system pressure. See [REGS 2.2](#).
 - 2 b. Use test gauge to:
 - (i) Verify set point.
 - (ii) Verify regulator lock-up, if designed to do so.
 - (iii) Verify pressure settings with a test gauge or calibrating test gauge. See [METR 2.4](#).
 - 2 c. Verify regulator is in good working order:
 - (i) Controls pressure at set point.
 - (ii) Operates properly.

UNCONTROLLED IF PRINTED

(iii) Locks-up below the gas system MAOP.

2 d. If Operational Inspection does not confirm acceptable operation, then perform a Primary Inspection of the regulator. See [Section 7.0](#).

2 e. After the regulator passes inspection, return regulator to service.

6.3.7 Check the relief valve set point

1. GTS Technician shall monitor the downstream pressure gauge while the relief valve is taken out of service to ensure downstream system pressure does not exceed MAOP.
2. Install Test Gauge where needed to monitor the pressure at which the relief valve activates.
3. Ensure the relief valve's isolation valve is closed.
4. Test for the correct relief set point by applying gas pressure or nitrogen to the test connection.
5. Monitor the test gauge and verify the set point where:
 - 5 a. The direct operated relief valve moves off seat.
 - 5 b. The pilot operated relief valve begins to bleed from the pilot.
6. Verify relief valve is in good working order:
 - 6 a. Relieves at set point.
 - 6 b. Operates properly.
 - 6 c. Confirm main valve moves off seat.
7. If acceptable operation is not obtained during the Operational Inspection, then perform an internal inspection of the relief valve.
8. Remove gas pressure or nitrogen from the test connection, open the relief valve's isolation valve and verify the relief valve closes and stops relieving.
9. Verify that vent stacks are clear and unobstructed.
10. Verify that rain caps are in place and operating freely.
11. Verify the isolation valve to the relief valve is in the open position and locked, secured or operator removed to prevent unauthorized operation.

6.3.8 Final Inspection

1. If pressure monitoring devices are installed on the station, verify the correct pressures are being registered.
2. Verify all valves are in the correct position for normal operation.
3. Verify bypass valves are closed, isolation valve to the relief valve is open and the valves are locked, secured or operator removed to prevent unauthorized operation.

Heater by-pass valves may be left open or closed seasonally. These valves should be verified for correct seasonally position during final inspection. Refer to [REGS 2.4](#) Heaters

- 3 a. In lieu of locking devices, control line valve operator handles can be removed to prevent unauthorized operation.
4. Document within ClickMobile the maintenance work performed or that needs to be scheduled.
5. Ensure required signage is properly displayed and tags denoting set pressures are installed, where needed.
6. Make final check
7. Secure access to fenced area or buildings surrounding the station to prevent unauthorized entry.

6.4 Passive Monitor Regulator Station (both upstream and downstream).

- 6.4.1 Regulator station equipment should be checked for leaks before and after inspection.
 1. A leak investigation shall be initiated within ClickMobile and is required for all leaks found during annual station inspection.
- 6.4.2 Install pressure gauge where needed to verify and monitor system pressure during the inspection.
- 6.4.3 Verify regulator and monitor installed at the station matches the equipment listed in Maximo.
- 6.4.4 Confirm pressure settings indicated within Maximo.
- 6.4.5 Any discrepancy noted in equipment or any changes made to documented pressure settings should be verified with the GTS Supervisor and indicated on the inspection form within ClickMobile.
- 6.4.6 Check operation of the "working" regulator.
 1. While performing the Operational Inspection, stations with parallel runs shall have one run verified as operational and available at all times, unless there are multiple feeds or other options that can maintain adequate system pressure.
 2. Perform the following inspection on each station regulator:
 - 2 a. Close the outlet valve to the regulator station or station run, where applicable.
 - (i) Care shall be taken to monitor the outlet system pressure and, if necessary, operate bypass valves to maintain adequate system pressure. See [REGS 2.2](#).
 - 2 b. Use test gauge to:
 - (i) Verify set point.
 - (ii) Verify regulator lock-up, if designed to do so.
 - (iii) Verify pressure settings with a test gauge or calibrating test gauge. See [METR 2.4](#).
 - 2 c. Verify "working" regulator is in good working order:
 - (i) Controls pressure at set point.
 - (ii) Operates properly.

UNCONTROLLED IF PRINTED

(iii) Locks-up below the gas system's MAOP.

2 d. If Operational Inspection does not confirm acceptable operation, then perform a Primary Inspection of the regulator. See [Section 7.0](#).

6.4.7 Check the operation of the "monitor" regulator.

1. While performing the Operational Inspection, stations with parallel runs shall have one run verified as operational and available at all times, unless there are multiple feeds or other options that can maintain adequate system pressure.
2. Use test gauge to verify the pressure at which the "monitor" regulator assumes control and achieves lock-up.
3. Verify "monitor" regulator is in good working order:
 - 3 a. Controls pressure at set point.
 - 3 b. Operates properly.
 - 3 c. Locks-up below the gas system Maximum Emergency Pressure (MEP).
4. If acceptable operation is not determined during the Operational Inspection, a Primary Inspection of the "monitor" regulator should be performed

6.4.8 Return regulator station to normal operation.

6.4.9 Final Inspection. See [6.3.8](#).

6.5 Working Monitor Regulator Station.

6.5.1 Check regulator station for leaks before and after inspection.

1. A leak investigation shall be initiated within ClickMobile and is required for all leaks found during annual station inspection.

6.5.2 Install pressure gauge where needed to verify and monitor system pressure during the inspection.

6.5.3 Confirm pressure settings indicated within Maximo.

6.5.4 Any discrepancy noted in equipment or any changes made to documented pressure settings should be verified with the GTS Supervisor and indicated on the inspection form within ClickMobile.

6.5.5 Check the operation of the first and second cut regulators.

1. While performing the Operational Inspection, stations with parallel runs shall have one run verified as operational and available at all times, unless there are multiple feeds or other options that can maintain adequate system pressure.
2. Close the outlet valve to the regulator station/station run, where applicable.
3. Take care to monitor the outlet system pressure and, if necessary, operate bypass valves to maintain adequate system pressure. See [REGS 2.2](#).
4. Use test gauge to verify the pressure where the first and second cut regulators lock-up.
5. Verify pressure settings with a test gauge or calibrating test gauge. See [METR 2.4](#).
6. Verify first and second cut regulators are in good working order:

UNCONTROLLED IF PRINTED

- 6 a. Controls pressure at set point
- 6 b. Operates properly
- 6 c. Lock-up below the gas system's MAOP
- 7. If Operational Inspection does not confirm acceptable operation, then perform a Primary Inspection of the regulator. See [Section 7.0](#).
- 6.5.6 Check the operation of the "monitor pilot" on the first cut regulator.
 - 1. Use test gauge and record the pressure the "monitor pilot":
 - 1 a. Controls pressure at set point
 - 1 b. Operates properly
 - 1 c. Lock-up below the gas system MEP
 - 2. If Operational Inspection does not confirm acceptable operation, then perform a Primary Inspection of the regulator. See [Section 7.0](#).
- 6.5.7 Return regulator station to normal operation.
- 6.5.8 Final Inspection. See [6.3.8](#).
- 6.5.9 Use this same inspection on all regulator runs.

7.0 Primary Inspection

- 7.1 When required, a Primary Inspection will be performed in conjunction with the Operational Inspection.
- 7.2 In addition to following the Operational Inspection procedures in [Section 6.0](#), a Primary Inspection will involve examination of the internal components of the regulator.
- 7.3 Isolate the regulator requiring an internal inspection.
 - 7.3.1 Take care to monitor the outlet system pressure and if necessary operate bypass valves to maintain adequate system pressure.
 - 7.3.2 Safely vent gas in the isolated segment to atmosphere.
 - 7.3.3 Examine the regulator for:
 - 1. Obstructions
 - 2. Liquids
 - 3. Debris
 - 4. Damage to internal components
 - 7.3.4 Examine the pilot supply filter; clean, and replace as needed.
 - 7.3.5 Examine the regulator components and install replacement parts as needed.
 - 7.3.6 Diaphragm cases may be disassembled as part of the Primary Inspection.
- 7.4 Follow recommended manufacturer start-up procedures and check for proper operations.
 - 7.4.1 Regulator takes control of the flow of gas.
 - 7.4.2 Regulator demonstrates proper lock-up as required by Operational Inspection.
- 7.5 Set the regulator to the set-point identified within Maximo.

UNCONTROLLED IF PRINTED

- 7.6 Check station filters, drips, strainers, and knock-out drums for reliable service. This may include opening or other techniques.
- 7.7 Final Inspection. See [6.3.8](#).

8.0 Acoustical Inspection

An acoustical inspection is the verification of regulator function by lowering the regulator set point until noise from the regulator becomes inaudible, thus indicating no flow or shutoff. **This should not be confused with monitoring the noise level of the regulator station.**

- 8.1 A station not designed to accommodate or support an Operational or Primary regulator station inspection shall require Acoustical Inspection.
- 8.2 Install pressure gauges where needed then lower the set point of the regulator being inspected until the flow through the regulator becomes inaudible and the downstream test gauge indicates a steady or decreasing delivery pressure.
 - 8.2.1 This will verify that the regulator is locked-up and that the regulator will control the flow of gas to meet downstream demand below the gas system MAOP.
- 8.3 If the Acoustical Inspection does not confirm acceptable operation, then perform a Primary Inspection of the regulator. See [Section 7.0](#).
- 8.4 Notify supervision if a planned outage is required due to a failed acoustical test.
 - 8.4.1 A plan for an outage or other supply options shall be evaluated.
 - 8.4.2 System affected shall be manned and pressure monitored at all times until regulator performance is corrected and station is returned to normal service.

9.0 Atmospheric Corrosion Inspection

- 9.1 Check the above-grade station piping and equipment for atmospheric corrosion.
- 9.2 See [CORR 1](#) for detailed information on Atmospheric Corrosion evaluation.
- 9.3 Check for disbonded coating on the risers and piping.
- 9.4 Document on the ClickMobile inspection form whether or not atmospheric corrosion or disbonded coating is found on above-grade piping.

10.0 Gas Leakage Inspection

- 10.1 Check the regulator station for the presence of gas by sampling the atmosphere surrounding the station, station piping, equipment vents, and the outlet of relief valve vent stacks. See [LEAK 2.6](#).
 - 10.1.1 Stations located within a fenced area: Station piping includes all above-grade and below-grade piping within the fence.
 - 10.1.2 Stations outside of fenced area: Station piping is referred to as above-grade. Above-grade piping is all piping above the pipe to soil interface.
 - 10.1.3 Exposed piping and equipment inside pits and vaults will be leak surveyed in accordance with [LEAK 2.6](#).

10.2 Use leak classification and verification methods in accordance with procedures in [LEAK 1](#).

10.3 Documentation of leak survey results is dependent on Class Location of the station:

10.3.1 For fenced stations in a Class 1 or Class 2 location: Document on the ClickMobile pressure control station inspection form.

10.3.2 For fenced stations in a Class 3 location, Bi-annual (twice per year) leak surveys are issued through Maximo and should be documented within ClickMobile. See [LEAK 2.6](#).

10.4 Any below-grade gas leak that is identified during the inspection shall be documented within ClickMobile by initiating a leak investigation or completing a leak surveillance on an existing leak.

10.5 Above-grade Class 3 leaks repaired at the time of the inspection shall be documented within ClickMobile by initiating a leak investigation.

10.6 A separate leak investigation is required for an above-grade Class 1 leak identified during the inspection. See [LEAK 1](#).

11.0 Gas Regulator Station Signage

11.1 General

11.1.1 Gas regulator stations shall be properly identified with company name and phone number.

11.1.2 Gas regulator stations accessible to the public shall be identified with a pipeline marker or as sign shown in [PMRK 2](#).

11.1.3 Gas regulator stations not accessible to the public (locked fence or enclosure) shall be identified with the following signs, installed on the regulator station fence or enclosure:

1. Danger sign indicating company name and phone number
 - 1 a. Stock Number 16-02-285 shown in 11.2 OR
 - 1 b. Stock Number 16-02-605 shown in [PMRK 2 Appendix B-2](#).

11.2 Danger Sign

Stock No. 16 02 285

UNCONTROLLED IF PRINTED

This will remain a valid sign posted at regulator stations and does not need to be changed until the condition dictates replacement. Once the current supply of signs is depleted, the sign shown below will be the replacement stock.

Stock No. 16 02 285

New sign that will be available after existing supply of current sign, shown above, is depleted.

End of Instructions.

REGS 2.1 Regulator Station Inspections, October 1, 2020

Revision Notes

Location of Changes	Summary of Changes
Target Audience	Added Gas Control
Paragraph 6.2.1	Expanded – Remove existing locking or security devices on valve.

<p>Paragraph 6.3.7 - Item 11</p>	<p>Revised – Verify the isolation valve to the relief valve is in the open position and locked, secured or operator removed to prevent unauthorized operation.</p>
<p>Paragraph 6.3.8 – Item 3</p>	<p>Revised– Verify bypass valves are closed, isolation valve to the relief valve is open and the valves are locked, secured or operator removed to prevent unauthorized operation.</p> <p>Added NOTE: Heater by-pass valves may be left open or closed seasonally. These valves should be verified for correct seasonally position during final inspection. Refer to <u>REGS 2.4</u> Heaters</p>
<p>Operator Qualifications</p>	<p>Added:</p> <p>1371 Operate Gas Pipeline – System Control Center Operations</p> <p>1381 Operate Gas Pipeline – Local Facility Remote Control Operations</p>

1.0 Purpose

This procedure provides guidelines for bypassing a gas regulator station through a bypass valve.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Bypass Operation](#)

Appendices

[Appendix A - Gas Regulator Station Schematic](#)

3.0 Target Audience

- Gas Engineer
- Gas Field Personnel
- Gas Supervisor
- Gas Tech Services (GTS) Supervisor
- Gas Tech Engineering (GTE)
- Gas Control

4.0 General

- 4.1 Gas Control shall be included in the planning and execution of the bypass operation if the affected system is remotely monitored.

The improper bypassing of these pressure regulators exposes the distribution system to pressures that may exceed the MAOP, and can cause catastrophic pipeline failures, which could result in the loss of property and/or life.

Properly installed and operating pressure regulators are designed to hold system pressure at or below the established MAOP.

- 4.2 Because it is a complex procedure, comprehensive planning and careful execution are required when bypassing pressure regulators.
- 4.3 If time allows, prepare a written plan and consider the following:
- 4.3.1 Identify the maximum and minimum pressures allowed on both the downstream and upstream piping.
- 4.3.2 The bypass of regulators feeding a distribution system with an MAOP of 14 inches w.c. or less is strictly prohibited, unless a properly-sized over pressure protection device, such as relief valve, remains active.

UNCONTROLLED IF PRINTED

- 4.3.3 Review the regulator station design and ensure that all drawings are accurate and correct.
- 4.3.4 Note other regulator stations that may also feed the downstream distribution system and be familiar with their operations. **Know where they are located.**
- 4.3.5 Consider lowering upstream pressures to the MAOP of the downstream pipe.
- 4.3.6 Field-identify all emergency valves and their location that would be used should an emergency situation develop as a result of the bypass operation.
- 4.3.7 Make sure 2 gauges are appropriately placed to measure actual upstream and downstream pipeline pressures without being isolated by valves during the actual bypass operation. Refer to [Appendix A](#).
- 4.3.8 During unregulated bypass operation, a minimum of 2 gas field personnel should be present at all times while performing station maintenance or operational/primary inspections.
- 4.3.9 Develop specific instructions for the gas field personnel performing the bypass operation.

5.0 Bypass Operation

- 5.1 The Gas Supervisor or GTS Technician shall be responsible for reviewing the bypass plan with the gas field personnel.
- 5.2 Assign one individual (bypass operator) to operate the bypass valve and to monitor the installed pressure gauges.
 - 5.2.1 The bypass operator shall remain at the bypass valve throughout the procedure and continuously monitor the system pressure.

If bypass operator needs to leave the site contact supervisor for replacement and remain at the site until replacement arrives.

- 5.3 Install the pressure gauges used to monitor upstream and downstream pressures.
 - 5.3.1 These gauges must be in good condition, verified for accuracy, and not be isolated by a valve during the actual bypass operation.
 - 5.3.2 Ensure the pressure tap valve is in open position and gauge is showing the correct pressure.
 - 5.3.3 These gauges should be visible at all times by the bypass operator responsible for operating the bypass valve.
- 5.4 The system pressure shall be maintained between the established maximum and minimum limits.
- 5.5 Locate and operate the valves that will be used in the bypass procedure.
- 5.6 Place the bypass valve in operation. Allow the system to stabilize before starting work on the regulator.
- 5.7 If at any time during the bypass operation, the bypass operator cannot maintain the pressure within the prescribed limits, the GTS Technician or gas field personnel assigned to the bypass operation shall:
 - 5.7.1 Place the regulator back in operation and return the system to normal operation.

UNCONTROLLED IF PRINTED

1. If it is not possible to return the system to normal operation, the GTS Technician or gas field personnel shall:
 - 1 a. Turn off gas to the system
 - 1 b. Immediately notify the Gas Supervisor or GTS Supervisor of the emergency.
 2. If a pipeline emergency has been declared, then the Emergency Plan shall be implemented.
- 5.8 After completing the work, return the regulator station to normal operation.
- 5.8.1 Ensure that the bypass valve is closed and locked.
 - 5.8.2 The GTS Technician or gas field personnel shall observe the regulator station operation to ensure that all equipment is properly operating and that the equipment set points are correct.
- 5.9 If Gas Control was involved in monitoring the operation, GTS Technician shall contact them to verify that operating parameters have been returned to normal operations.

End of Instructions.

Operator Qualification (OQ) Required?

YES

0301: Manually Opening and Closing Valves

0311: Adjust and Monitor Flow or Pressure - Manual Valve Operation

REGS 2.2 Regulator Stations: Bypass Operations, October 1, 2020

Revision Notes

Location of Changes	Summary of Changes
---------------------	--------------------

Target Audience	Added Gas Control
Operator Qualifications	Added – 1371 – System Control Center Operations

Appendix A - Gas Regulator Station Schematic

REGULATOR STATIONS

October 1, 2021

REGS 2.3 Troubleshooting Common Regulator Problems**1.0 Purpose**

This procedure provides guidance in troubleshooting gas regulator and relief valve problems.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Common Causes of Regulator Failure](#)[6.0 Blowing Relief Valve](#)[7.0 Low System Pressure](#)[8.0 Before Leaving the Regulator Station](#)**3.0 Target Audience**

- Gas Engineer
- Gas Field Personnel
- Gas Supervisor
- Gas Tech Services (GTS) Supervisor
- Gas Tech Engineering (GTE)

4.0 General

- 4.1 This section contains guidelines that could be used to determine possible regulator problems.
- 4.2 To troubleshoot a regulator station, personnel need to know the following:
- 4.2.1 Normal operating pressure,
- 4.2.2 Maximum allowable operating pressure (MAOP) of the system,
- 4.2.3 Maximum emergency pressure (MEP) of the system,
- 4.2.4 Number of feeds into the system,
- 4.2.5 Proper equipment pressure settings for the regulator station.
- 4.3 MAOP and MEP are defined in Table 1 and 49 CFR §192.201.

Table 1 MAOP and MEP

Pressure Class	System MAOP	Maximum Emergency Pressure (MEP)
Low Pressure	4" w.c. to 14" w.c.	27.6 w.c.
Distribution Pressure 1	1 PSIG to 12 psig	MAOP + 50%
Distribution Pressure 2	12 PSIG to 60 psig	MAOP + 6 psig
High Pressure Distribution & Transmission	Over 60 psig	MAOP + 10% or 75% SMYS whichever is lower.

- 4.4 When a relief valve has been taken out of service, or when using an unregulated bypass, the system pressure shall be continuously monitored.

UNCONTROLLED IF PRINTED

- 4.4.1 The pressure should be maintained at or below the MAOP of the system and shall be maintained below the system MEP.

5.0 Common Causes of Regulator Failure

5.1 Regulator body:

- 5.1.1 Dirt

- 5.1.2 Weld slag

- 5.1.3 Distillates

- 5.1.4 Other debris

- 5.1.5 Orifices or valve seats that are not properly secured inside the regulator body

5.2 Valves worn from debris passing through the regulator.

5.3 Orifices or valve seats nicked, cracked, or worn by debris.

5.4 Moisture inside the diaphragm case (generally caused by flooding or condensation) can freeze, preventing the regulator from controlling the pressure.

This condition can cause an above or below normal pressure situation.

5.5 Ruptured diaphragm in regulator.

This situation can cause gas to exhaust through the vent on the diaphragm case.

5.6 Vents plugged by insects, mud, or other foreign matter.

5.7 Damaged or torn elastomeric element (found in boot type regulators).

6.0 Blowing Relief Valve

6.1 **DO NOT** shut off the valve to the relief valve until proper steps have been followed as outlined below.

6.2 Check the pressure with the appropriate pressure indicating gauges to verify the operating pressure on the system.

6.2.1 If the pressure is at normal operating pressure, the blowing relief valve may be faulty.

1. SLOWLY close the valve on the inlet side of the relief valve, while watching the pressure gauge on the system to be certain over-pressurization of the system does not occur.

- 1 a. Immediately reopen the valve if the system pressure increases and shows no sign of leveling off at a pressure below the MAOP.

- 1 b. Close the valve in the relief valve pilot sensing line, if necessary, to isolate the relief valve.

UNCONTROLLED IF PRINTED

2. Continuously monitor the system pressure shall be by observing the pressure indicating gauges while the relief valve is out of service.
 3. After the relief isolation valve has been closed and the relief valve has stopped blowing, re-pressurize the relief valve through the test tee using nitrogen or natural gas. This is to determine the relief valve set point and to clear any debris that may be caught under the seat.
 - 3 a. If the relief valve now appears to be operating satisfactorily, slowly crack open the isolation valve ahead of the relief.
 - 3 b. If the relief valve operation is satisfactory, fully open the isolation valve.
 - 3 c. If the relief valve operation is not satisfactory, the relief valve shall be repaired or replaced before putting the station back into service.
 4. After repairs, the relief valve can be returned to service.
 - 4 a. Slowly crack open the isolation valve ahead of the relief.
 - 4 b. Remember to lock this valve in an open position before leaving the station.
- 6.2.2 Check the regulator if the pressure is above normal operating pressure. Check the system to determine if it is served by multiple regulator stations.

DO NOT close the relief shutoff valve.

1. An overpressure condition exists if the pressure exceeds the system MEP.
 - 1 a. In the event that the system pressure has exceeded the MEP, the Gas Supervisor will immediately contact Gas Compliance.
2. If the regulator station contains more than one run:
 - 2 a. Install pressure gauges in the intermediate and the downstream system.
 - 2 b. Verify which runs are feeding gas.
 - 2 c. Slowly close the primary run inlet valve while observing the outlet system pressure, noting if the relief closes and the outlet pressure decreases to the correct system pressure or secondary set point.
 - 2 d. Verify correct operation of the secondary run before proceeding with repairs.
 - 2 e. Shut-in the primary run by closing the outlet valve (inlet valve is already closed), depressurize, and proceed with regulator repairs.
 - 2 f. After repairs are completed, return primary run to service by following the manufacturers recommended procedure.
 - 2 g. Raise the set point of primary run to appropriate system set point, ensuring that it has taken control back from the secondary run and that the secondary run is no longer feeding.
 - (i) If secondary run is not a full capacity secondary run, system pressures shall be monitored to prevent a low pressure situation.

UNCONTROLLED IF PRINTED

3. If the regulator station has single regulator run and is the only source of gas to the system:
 - 3 a. Using the bypass valve.
 - (i) Slowly open the bypass valve until a slight pressure increase is seen.
 - (ii) Slowly close the inlet valve to the regulator, watching the pressure gauge closely to make sure the bypass is holding the pressure near the normal system operating pressure.
 - (iii) This process may require opening of the bypass valve more on an unregulated bypass, as the inlet valve to the regulator is being closed.
 - 3 b. Follow procedures in [REGS 2.2](#) during bypass operations.
 - 3 c. After the inlet valve has been closed, observe the station operation to ensure proper pressure is maintained through the bypass.
 - (i) The relief valve should stop blowing as the pressure in the system returns to normal.
 - (ii) Close the regulator outlet valve.
 - (iii) After the regulator outlet valve is closed, shut off the control line.
 - (iv) The isolated section can then be depressurized and the regulator repaired or replaced.
4. System with more than one regulator station feeding:

The regulator station where the relief valve is blowing may not be the problem. It could be any of the regulators in the system causing the problem.

- 4 a. Begin at the station where the relief valve is blowing.
 - (i) Slowly close the regulator inlet valve while watching the pressure indicating gauges.
 - (ii) If the pressure does not decrease as valve is closed, the problem is likely to be a different regulator.
 - (iii) Slowly reopen the regulator inlet valve.
 - (iv) Check the other regulators in the same pressure system in a similar fashion until the faulty regulator is found.
- 4 b. After the faulty regulator is found, proceed to close the regulator inlet valve slowly, watching the pressure gauge closely to ensure that other regulators in the system can maintain an acceptable pressure level.
 - (i) If the system does not stabilize at an acceptable pressure, the bypass provision may have to be used while repairs are being made.

There may be other portions of the system that are experiencing a lower pressure than is seen at the station.

- (ii) If it is necessary to bypass the station, slowly crack open the bypass valve to stabilize the pressure near the normal system operating pressure.
- 4 c. Follow procedures in [REGS 2.2](#) during bypass operations.
- 4 d. After the regulator inlet valve has been closed, observe the station operation to be sure an acceptable pressure is maintained through the bypass, then:
 - (i) Shut off the regulator outlet valve.
 - (ii) After the outlet valve is closed, shut off the regulator control line, **if equipped**.
 - (iii) The isolated section of piping can be depressurized and the regulator can be repaired or replaced.
- 6.2.3 After repairs have been made to the regulator, return the regulator to service by following the manufacturer's recommended procedure.
 - 1. When opening a valve do it slowly.
 - 2. If a bypass has been used, slowly close the bypass valve while watching the pressure indicating gauges to make sure the regulator operates correctly.
 - 3. After the bypass is closed, adjust the regulator to the proper operating pressure.
- 6.2.4 If the relief valve was blowing at another location, recheck the relief valve to ensure that it has reseated properly after the system pressure has been returned to normal.

7.0 Low System Pressure

- 7.1 Check the inlet and outlet pressure at the regulator station, with pressure indicating gauges, to verify the problem is at the regulator station and not a problem elsewhere.

A pressure of 2 psig on a distribution system or 2" w.c. at the outlet of a customer's meter is considered the minimum allowable pressure, short of interrupting service.

- 7.2 Follow procedures in [EMER 2.4.9](#) "Low Pressure Situation" for situations involving low pressure or complete loss of pressure.
- 7.3 If the inlet pressure is near normal, try to adjust the regulator to increase the outlet pressure.
 - 7.3.1 Observe the inlet pressure gauge to make sure the inlet pressure does not drop off during this operation.
 - 7.3.2 Verify operation of secondary run (if present) by raising secondary set point to bring secondary run into operation.

UNCONTROLLED IF PRINTED

- 7.3.3 If the pressure cannot be raised in this manner, the bypass may have to be operated to increase the outlet pressure to temporarily eliminate the low pressure problem, provided the inlet pressure is sufficient.
- 7.4 Follow procedures in [REGS 2.2](#) during bypass operations.
- 7.5 During this bypass operation, the regulator may be inspected for proper operation.
- 7.6 If the inlet pressure to the regulator is lower than it should be, the capacity of the regulator may be affected.
 - 7.6.1 If present, verify operation of secondary run.

Secondary run may provide enough additional gas to temporarily eliminate the low pressure problem.

- 7.6.2 Operating the bypass may temporarily eliminate the low pressure problem, provided the inlet pressure is high enough to allow gas to pass through the bypass.
 - 7.6.3 Observe the inlet pressure indicating gauge to make sure the inlet pressure does not drop off during this operation.
- 7.7 Gather and record all operating pressures (inlet and outlet), flow conditions, temperatures, etc. for use in permanently correcting the situation.
- 7.8 Contact Gas Tech Service's Supervisor, Gas Engineering, or Gas Tech Engineering if equipment replacement, system flow study, or station rebuild is required.

8.0 Before Leaving the Regulator Station

- 8.1 Before leaving the regulator station, make sure it is secure and back to normal operation.
 - 8.1.1 Verify regulator shutoff and that the set pressure is correct.
 - 8.1.2 Verify station inlet and outlet valves are open.
 - 8.1.3 Verify bypass valves are closed and secured.
 - 8.1.4 Verify control line valves are open and secured.
 - 8.1.5 Verify outlet pressure is correct for the system.
 - 8.1.6 Verify the relief valve is on, set pressure is correct and the isolation valve is open, locked, secured or operator removed to prevent unauthorized operation.

End of Instructions.

Operator Qualification (OQ) Required?

YES

Revision Notes

Location of Changes	Summary of Changes
Paragraph 8.1.6	Verify the relief valve is on, set pressure is correct and the isolation valve is open, locked, secured or operator removed to prevent unauthorized operation.

1.0 Purpose

This procedure provides guidance in operating, maintaining, and trouble-shooting indirect and catalytic heaters.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Types of Heaters](#)

[6.0 Indirect Heaters](#)

[7.0 Catalytic Heaters](#)

Appendices

[Appendix A - Antifreeze Requirements](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisor
- Gas Tech Services (GTS) Technicians
- Gas Tech Services (GTS) Supervisors

4.0 General

- 4.1 Cold temperatures, along with high humidity, accentuate the problems caused by external freezing, and by equipment failures or line shutoff due to freeze-up.
- 4.2 Internal gas freezing can cause regulator valves to freeze and stop up pilot lines causing loss of flow through the regulator station.
- 4.3 Pilot-loaded gas regulators are highly vulnerable to internal freeze-up in pilot valves.
 - 4.3.1 When pilot gas is taken from the main gas stream, regulated in one or more stages, it becomes much colder than before regulation and can cause previously vaporized liquids in the gas stream to fall out in the form of free liquids.
 - 4.3.2 The additional throttling within the pilot valve itself can cause the valve to freeze internally.
- 4.4 The moisture content of gas can exceed the 7 lb./MMCF contract limit if dehydration equipment fails OR if a line has been placed in service after being tested with water as a test medium.
 - 4.4.1 The addition of an inhibitor, such as methanol, may be needed on a temporary basis to minimize the possibility of hydrate (ice) formation and stoppage of the regulators or gas lines. See Figure 1.

Figure 1: Pipeline hydrates

- 4.5 For every 100 psi pressure differential across a regulator station there is approximately a 7 °F drop in gas temperatures or 1 °F temperature drop per atmosphere (14-15 psig) of pressure drop.
- 4.5.1 Minimum gas temperatures encountered in gas systems during cold weather may be as low as 35 °F.
- 4.5.2 Hydrates (ice) may form in the gas stream under various combinations of:
1. Pressure
 2. Pressure drop
 3. Gas temperature
 4. Moisture content of the gas.
- 4.5.3 Hydrates may form at temperatures above 32 °F.
- 4.5.4 External ice formation on piping and valves may also form because of excessive gas cooling caused by the cooling effect of the gas expansion.

5.0 Types of Heaters

- 5.1 When hydrates form under normal operating conditions, consider using either an indirect heating system or catalytic type heater.
- 5.2 Indirect heater is used where large volumes of gas passes through the regulator station.

Water bath type indirect heater is used to heat the entire gas stream before the gas is regulated.

- 5.3 Catalytic type heater is used, where gas flow is not great and regulators are relatively small or pilot loaded, to heat the equipment externally area. Avoid preheating the entire gas stream in small stations.

6.0 Indirect Heaters

- 6.1 General
- 6.1.1 Indirect heaters are water bath type natural gas heaters.
- 6.1.2 These indirect heaters are generally used at town border stations (city gate), delivery stations (sales point), or for industrial customers where larger volumes of gas move through the station.

- 6.1.3 Indirect heaters preheat the entire gas stream before regulation to keep the final temperature after regulation above 32 °F, or even up to 50 °F for internal hydrate control.
- 6.1.4 Expansion tanks should be installed on heaters to keep coils covered with antifreeze/water solution at all times.

6.2 Operation

- 6.2.1 Fuel gas is burned within the horizontal "U" shaped fire box immersed in the lower portion of the water bath. Heat released by the burning fuel gas is quickly transmitted through the firebox wall to the water bath. See Figure 2.

Figure 2: Indirect Water Bath Heater

- 6.2.2 The gas to be heated is directed through the process coil of the heater which is immersed in the upper portion of the water bath.
 - 1. Heat is transmitted from the hot water bath through the tube wall to the gas inside the flow coil.
- 6.2.3 The heater temperature controller maintains the water bath temperature at the desired level by controlling the fire box fuel gas supply.
 - 1. The optimum temperature of water bath is 140 °F.
 - 2. At temperatures above 160 °F, water loss can be expected to increase. Normal bath temperatures are 135 -140 °F.

6.3 Typical Spring Shutdown

- 6.3.1 Obtain small sample of glycol solution to be tested annually prior to shutdown.
- 6.3.2 Turn off main fuel supply valve so residual gas in the manifold will bleed off and burn.
- 6.3.3 Shut off pipeline heater that is not needed for summer time operation.
- 6.3.4 Where heater bypass provision exists:
 - 1. Open bypass valve to heater.

UNCONTROLLED IF PRINTED

2. Monitor downstream system pressure with pressure gauge.
3. Close inlet valve at heater so gas does not pass through heater coil.

6.4 Typical Fall Start-Up

- 6.4.1 Check and clean all other controls.
- 6.4.2 Check fire tube for rust and carbon buildup or damage.
- 6.4.3 Remove and clean flame arrestor and air inlets.
- 6.4.4 Remove burner and pilot from heater. Clean and inspect for damage. Replace main burner and/or pilot, if necessary (size orifice to burner). Replace thermocouple as required.
- 6.4.5 Check fluid levels and adjust as necessary after getting analysis back from the lab.
- 6.4.6 Clean and adjust mixing chamber for proper flame.
- 6.4.7 Check safety valve for proper operation and shutdown.
- 6.4.8 Check regulator burner valve for shut-off and operation. Set pressure.
- 6.4.9 Check setting and operation of thermostat control.
- 6.4.10 Check on/off operation.
- 6.4.11 Periodically check regulators and relief valves for proper operation
- 6.4.12 Check insulation skin cover. Maintain watertight from weather.
- 6.4.13 Check insulation condition and paint, as necessary.
- 6.4.14 Check and clean strainers or filters.
- 6.4.15 Check pressure gauge:
 1. Check accuracy of pressure gauges (deadweight, calibrating gauge).
 2. Remove and replace defective gauges.
- 6.4.16 Clean inside of fire tube, if necessary:
 1. Scrape tube and vacuum (If using a vacuum, ensure no gas is present).
 2. Check for leaks in fire tube.
- 6.4.17 Where heater bypass provision exists:
 1. Monitor downstream system pressure with pressure gauge.
 2. Open inlet valve at heater so gas passes through the heater coil.
 3. Verify heater outlet valve is in the open position and close bypass valve to heater.

6.5 Lighting Indirect Heaters (Typical)

- 6.5.1 Read the specific instructions for all valves and instruments before attempting to light an indirect heater.
- 6.5.2 Close the isolation valves ahead of the main burner and pilot.
- 6.5.3 Open the inlet valve to the fuel gas manifold and adjust the pressure regulators to provide manufacturer specified operating pressure to the main burner.
- 6.5.4 Before lighting, make sure main burner valve is closed.

UNCONTROLLED IF PRINTED

- 6.5.5 Turn on pilot valve if heater is equipped with thermocouple safety. Depress safety, light pilot, and hold safety for 45 seconds.
- 6.5.6 After pilot has remained lit, turn on main burner valve very slowly until fully opened
- 6.5.7 Set the thermostat at the normal temperature.

Never stand in front of the heater when lighting.

- 6.5.8 Regulate the primary air adjustment on the mixer to obtain a blue flame.

A yellow flame indicates insufficient air.

- 6.5.9 When there is more than one burner, adjust each burner sequentially. Repeat steps [6.5.4](#) through 6.5.8 if there is more than one fire tube.
- 6.5.10 When the desired water bath temperature is reached, adjust the thermostat until the control valve closes.

6.6 Typical Extended Maintenance

- 6.6.1 If performance and operation indicate unsatisfactory heater condition, it may be necessary to perform extended maintenance.
 - 1. When extended maintenance is advisable, it shall be scheduled as soon as practical but can be adjusted based on:
 - 1 a. Weather conditions.
 - 1 b. System operating conditions.
 - 1 c. Observable heater conditions.
 - 1 d. Heater performance.
 - 2. Extended maintenance can be performed on site or off site.
- 6.6.2 Extended maintenance may consist of the following:
 - 1. Fire tube removal and inspection.
 - 1 a. Remove fire tube from tank and check for corrosion and wall thickness pitting.
 - 2. Gas pressure bundle removal and inspection.
 - 2 a. Remove pressure coils from tank and check for corrosion and wall thickness pitting.
 - 3. Internal heater shell inspection.
 - 3 a. Check internal shell walls for corrosion and pitting.
 - 3 b. Check pressure coil and fire tube brace structure (beams, angle irons) for cracks or damaged and worn supports.
 - 4. Perform corrective action on any unacceptable items found.

7.0 Catalytic Heaters

7.1 General

- 7.1.1 Catalytic heaters may be used in hazardous areas to prevent failure of equipment due to both internal and external freeze-up.
- 7.1.2 They are light in weight, require little or no maintenance, and do not have moving parts to replace.
- 7.1.3 The catalytic heater is an option for eliminating equipment freeze-up problems by concentrating external heat upon the instruments and instrument piping without preheating the entire gas stream.
- 7.1.4 Catalytic heaters can be used on pilot regulators and supply lines to pilot operated regulators, and to directly heat self-operated regulator bodies.

Figure 3: Catalytic Heaters

7.2 Typical Operation

- 7.2.1 The catalytic heater is a flameless gas explosion-proof heater that produces radiant heat by the reaction of combustible gases with oxygen or air.

Figure 4: Catalytic Heater Diagram

7.2.2 The normal ignition temperature of natural gas in air at atmospheric pressure is 1202-1382 °F.

1. In the presence of the catalyst, the reacting takes place with sufficient velocity to start a chain reaction at a temperature of 225 °F.
2. If natural gas is brought into contact with the catalyst at 225 °F in the presence of oxygen, it is oxidized to carbon dioxide and water.
3. Sufficient heat is generated to raise the temperature of the bed, and oxidation continues if as gas and oxygen are supplied.

No flame is produced under these conditions since the gases are well below the ignition temperature.

7.3 Maintaining Temperature

7.3.1 The temperature attained in the catalyst bed is determined by the flow of gas to the bed, and the rate at which oxygen diffuses through the bed to replace that used up in the reaction.

1. If the rate of gas flow is **too high**, then there is not enough oxygen to completely burn the gas.
2. If the rate is **too low**, the gas is burned deeper in the bed and the surface becomes cooler.

3. Temperature is self-limiting. A properly designed unit will have a maximum and minimum gas flow with a maximum and minimum operating temperature, respectively, and can operate as long as there is sufficient gas flow to maintain the chain reaction
4. Overheating cannot occur, because gas flow is too high and will blanket the catalyst and exclude oxygen.

7.3.2 Since there is no flame, heater will not ignite even the most flammable material.

7.3.3 The heater will operate stably for long periods of time with no attention if gas and air are supplied.

7.4 Typical Installation/Mounting Position

7.4.1 Catalytic heaters take in combustion air from the atmosphere. For peak efficiency, it is recommended to install the heater so that its face (radiating surface) is in a near-vertical position.

7.4.2 When it is necessary to install a heater above the item to be heated, mount it at a minimum of 15° from the horizontal position.

7.4.3 If reflectors are used in a position other than vertical, drill holes along the side of the reflector attached to the heater, to allow proper circulation.

7.4.4 When used outdoors, mount heaters in an enclosure for protection from rain, wind, and snow.

7.5 Operation with Manual Control

7.5.1 Typical Start-Up

1. Turn gas valve off.
2. Energize electrical preheat supply connecting to heater terminals first, then to power supply.
3. Wait 20 minutes. In extremely cold weather, allow more time.
4. Turn on gas valve.
5. Wait 3 minutes.
6. Turn off electrical preheat supply.
7. Repeat if temperature does not rise sufficiently. In extremely cold weather, allow more time for step 3.

7.5.2 Typical Shut Down

1. Turn off gas supply valve.

7.6 Operation with Safety Shutoff Control

7.6.1 Typical Start-Up

1. Turn on gas valve.
2. Energize electrical preheat supply connecting to heater terminals first, then to power supply.
3. Wait 20 minutes.
4. Depress red button on control valve and release immediately. Button should return to original position.

5. If temperature does not rise, wait 5 additional minutes and repeat step 4.
6. When temperature rises (3-5 minutes) turn off electrical preheat supply.

7.6.2 Typical Shut-Down

1. Turn off gas supply valve.

7.7 Typical Use of Thermostats

7.7.1 Heater output temperatures can be controlled by installing a factory-preset thermostatic control valve between the final fuel-gas pressure regulator and the heater.

7.7.2 When the thermostat set point has been reached, the control valve closes and allows only a minimum of gas to flow through the bypass orifice inside the valve body.

1. Bypass must be factory-set for a specific flow.
2. This allows the heater to operate at a reduced temperature, eliminating the need to restart electrically.

Do not change the fuel-gas orifice, supplied with each heater, which has been properly sized to allow the correct amount of gas to each square foot of heater surface.

7.7.3 Fuel-gas pressure regulators are available, from the manufacturer, preset to provide natural gas at 3-1/2" w.c. (regulators for LP gas models are preset at 11" w.c.).

1. If regulators are obtained from any other source, it is extremely important that outlet pressure meet the above requirements.

7.7.4 Contact the factory before changing from one fuel to another (LP to natural gas, or natural gas to LP).

1. A proper replacement orifice can be substituted.
2. Replace or revise the name tag to indicate the change to a different fuel.

7.8 Typical Maintenance

7.8.1 Protect the face of the heater (the catalyst) when cleaning since high-pressure air or water can damage or destroy the catalyst.

7.8.2 When the heater is not in use, it should be protected so dirt and other materials do not collect on the catalyst surface.

7.9 Typical Troubleshooting Checklist

Figure 5: Catalytic Heater Control Schematic

7.9.1 If the heater will not start or fails to maintain temperature:

1. Check gas supply pressure between regulator and heater.
 - 1 a. It should be 3-1/2" - 4" w.c. for natural gas, 11" w.c. for LP gas.
2. Check orifice for obstructions.
3. Check mounting position of heater.
 - 3 a. *Face up* -- Condensation on heated surface may have saturated catalyst, or debris may have caked on face of heater.
 - 3 b. *Face down* -- Products of combustion may be starving heater from sufficient combustion air to support catalytic reaction.
4. Check for saturation of catalyst pad.
 - 4 a. If saturated with water, it will not function until the moisture is dried out.
 - (i) Drying can be accomplished by placing the heater face up in a conventional oven, at 250 °F for about 2 hours.
5. Oil or any hydrocarbon spilled on heater face normally will not damage the catalyst.
 - 5 a. Minor amounts, in most cases, will be absorbed in the combustion process.
 - 5 b. If oil saturation is heavy, return heater to the factory for cleaning or renovation.
6. Check safety shutoff control.
 - 6 a. Preheat electrically for 20 minutes, then depress red reset button and release.
 - 6 b. A pressure gauge or manometer located upstream of the safety valve will lower slightly if the valve is good.
 - 6 c. Downstream of the valve, pressure will rise from 0" - 3-1/2" w.c. when open.
7. Check millivolt output of the thermocouple by disconnecting from safety valve and attaching a millivolt meter.
8. Check electrical preheat elements for continuity as follows (see [Figure 6](#)):

UNCONTROLLED IF PRINTED

- 8 a. For 12V or 120V models, single element: Connect continuity meter to A and B.
- 8 b. For 12V or 120V models, two element:
 - (i) Remove external wiring and connect continuity meter to A and B.
 - (ii) Remove jumper bars from terminals A and C, then connect continuity meter to A and B.
 - (iii) Connect meter to terminals A and C.
 - (iv) Lack of continuity , in either check, indicates a defective element.
- 8 c. For 240V models: Remove external wiring and connect meter to A and C.
 - (i) Lack of resistance indicates a defective element.
9. If all the above checks indicate nothing is wrong with the heater, contact factory for further information.

Figure 6: Catalytic Heater Preheat Terminals

10. Do not disassemble heaters in the field.
 - 10 a. Special tools, equipment, and expertise are required to repair and test catalytic heaters.
 - 10 b. Repairs can only be accomplished at the factory.

1.0 Purpose

This document provides the minimum requirements for regulators station design in accordance with 49 CFR Part 192, Subpart D.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 General Guidelines and Requirements](#)

[6.0 Standardized Design Features](#)

[7.0 Standardized Regulator Station Drawings](#)

Appendices

[Appendix A - Regulator Station Specifications](#)

3.0 Target Audience

- Gas Engineer
- Gas Tech Engineering (GTE)
- Corrosion Control
- Gas Tech Services (GTS)

4.0 General

- 4.1 This document has been prepared to provide designs for gas distribution regulator stations.
- 4.2 Standardized design stations were developed for commonly used design conditions.
- 4.2.1 Regulator stations should be designed by Gas Tech Engineering (GTE).

5.0 General Guidelines and Requirements

- 5.1 Standardized regulator stations include all material from inlet riser to outlet riser.
- 5.1.1 Designer is responsible for specifying and ordering inlet and outlet piping and emergency valves.
- 5.2 Inlet and outlet emergency valves, where required, shall be provided as recommended in [VALV 2.1](#).
- 5.3 Standardized distribution regulator stations are designed to supply an outlet system MAOP of 60 psig or lower. Contact GTE for an outlet system MAOP over 60 psig.
- 5.4 Operating pressure limits shall be determined by ANSI design class (piping) or equipment ratings (regulator/relief valve), whichever is lowest.
- 5.5 Cathodic protection isolation insulator is normally installed on the outlet side of the station before a block valve.
- 5.5.1 Above the ground insulation is normally provided by using flanges and an insulating flange kit.

- 5.5.2 Install welded bolts and jumper wire/flange fink on one run. See [CORR 2.8](#) Flange Fink Test Station for installation details.
- 5.5.3 When required, below the ground insulation should be provided by a weld-end insulator.
- 5.5.4 Ensure that insulation fittings are properly rated for the system MAOP.
- 5.5.5 For outlet systems that use PE pipe, insulation normally shall not be installed.
 - 1. Tracer wire shall not be bonded to the station.
 - 2. Terminate tracer wire in a cathodic protection test station.
- 5.5.6 Cathodic protection design for station should be reviewed by Corrosion Control, GTE, or Region Engineering personnel. Refer to [CORR 2.1](#) for additional cathodic protection details.
- 5.6 Strength and leak tests shall be performed in accordance with [PTST 1 Section 10.0](#) - Testing. Do not test through regulators or relief valves.
- 5.7 GTE shall be responsible for providing all sizing, set points, and capacities for standardized gas regulator stations.
- 5.8 GTE and GTS are responsible to determine the need for an indirect pipeline heater and/or for adding provisions for adding a heater in the future.
- 5.9 GTE and GTS should determine if a catalytic heater should be considered to heat the pilot gas. Refer to [REGS 2.4](#).
 - 5.9.1 If catalytic heat is required, it is recommended that single coil catalytic heaters be used. See [Figure 1](#).

Use of a catalytic heater is most important on pilot operated monitor regulator stations.

- 5.9.2 A pilot gas supply filter is recommended upstream of the supply regulator for the heater. See [Figure 2](#).

Figure 1: Single Coil Catalytic Heater

Figure 2: Pilot Supply Filter

6.0 Standardized Design Features

Internal relief or internal monitor regulators shall not be used in the standard regulator piping design.

- 6.1 To reduce noise, pipe shall be sized so the velocity of the gas does not exceed 200 fps above ground and 400 fps below ground.
- 6.2 Where total pressure drop across the station is 300 psig or greater, consider installing heaters (catalytic or indirect) to prevent equipment freeze-up. Refer to [REGS 2.4](#).

UNCONTROLLED IF PRINTED

For every 100 psig pressure differential across a regulator station, there is approximately 7 °F drop in gas temperature.

- 6.3 Every system supplied by more than one regulator station shall be equipped with telemetering or recording pressure gauges to indicate the system gas pressure. Refer to [PRES 1 Subsection 5.1](#) Pressure Monitoring Locations.
- 6.4 Control lines must be of sufficient size to allow for proper operation of the equipment.
- 6.4.1 Installation of control lines above the ground is recommended.
1. Short runs, above ground, of 10 feet or less should be 3/8" stainless steel tubing.
 2. Longer runs, above ground, 3/4" black steel piping or 1/2" stainless steel tubing should be used.
- 6.4.2 Minimize installation of below grade control lines whenever possible.
1. New below grade control lines shall be 3/4 inch cathodically protected coated steel pipe separated to avoid damage from a single excavation and back-filled with sand padding.
 2. Install "Caution Gas Pipeline Buried Below" warning tape (16 06 958) over the control line approximately 12 inches below the surface.
 3. Clearly documented new below grade control lines on the as-built construction prints.
- 6.5 When using pilot operated equipment, a filter shall be provided in the pilot supply line. In some cases, the required filter is part of the pressure regulating equipment. See [Figure 2](#).
- 6.6 Control line connections shall be made in a straight run of pipe, if possible, 8-10 pipe diameters downstream of areas of turbulence such as:
- 6.6.1 Elbows.
- 6.6.2 Valves.
- 6.6.3 Tees.
- 6.7 Control lines may require the addition of insulating fittings to provide electrical insulation for cathodic protection.
- 6.8 Each control line shall have a shutoff valve installed as near as practical to the point of connection to the regulator station piping.
- 6.9 Common control line taps are not allowed. Each individual regulator supply and sensing line shall have a unique tap location that is drilled with the largest tap allowed by the fitting.
- 6.10 Inlet and outlet steel risers shall be coated in accordance with [CORR 2.3 Subsection 4.6](#) - Soil to Air Interface Zone.
- 6.11 Support inlet and outlet risers as necessary on compacted or undisturbed earth.
- 6.12 Provide additional layer of protection (wrapping, FRP, rock shield, etc.) on all pipe in contact with below grade pipe supports. For above grade pipe supports, see [CORR 2.7 Subsection 12.3](#) Preformed FRP Spacers - Type 120.

6.13 For above grade pipe supports, I-Rod spacers or Nu-Bolts are the preferred method for providing protection against atmospheric corrosion and electrical short. Refer to [CORR 2.7 Subsection 12.2](#).

6.14 Evaluate, new or replaced above the ground, regulator stations for the need of protection from accidental damage by vehicular traffic or other similar causes.

6.14.1 If protection is needed place the facility at a safe distance from traffic.

OR

6.14.2 Install protective barricades.

6.15 When determining a safe distance between the above ground regulator station and vehicular traffic consideration shall be given to the following relevant factors:

6.14.1 Type of roadway.

6.14.2 Type of driveway.

6.14.3 Distance from highway/street.

6.14.4 Off Road activity.

6.14.5 Speed Limit.

6.14.6 Direction of traffic.

6.14.7 Natural or other barriers.

6.14.8 Weather and Environmental hazards.

6.16 Security fencing to prevent unauthorized entry shall be considered for new or replaced above the ground regulator stations with:

6.15.1 Exposed regulator control lines.

6.15.2 High pedestrian traffic area.

6.15.3 High crime area.

6.15.4 Near school grounds.

6.17 Relief stacks should be supported, as necessary. The top of any relief stack should be a minimum of 6 feet above ground level.

6.18 All regulator station valves and control line valves shall be protected from unauthorized use. See Figure 3.

Figure 3: Regulator Station Locking Devices

- 6.19 Consideration should be given to installing multiple regulator cuts per run at differential pressures greater than 300 PSIG.
- 6.20 For additional protection on a boot style monitor regulator station, the outlet token relief valve should be a Fisher 1" 289P or 1" 289H (or equivalent) to provide additional failure protection in the event of liquid build up on the flexible boot element. (See Figures 4 and 5).

Figure 4 Relief Valve - 289P

Figure 5 Relief Valve - 289H

7.0 Standardized Regulator Station Drawings

- 7.1 The tables in [Appendix A](#) lists the standardized regulator station designs included in this section of the O&M Plan.
- 7.2 Standard construction drawings of the regulator stations listed in Appendix A are available in [REGS 4](#).

REGS 3 Regulator Stations: Regulator Station Design, October 1, 2020.

Revision Notes

Location of Changes	Summary of Changes
Subsection 6.3	Added reference to PRES 1 Subsection 5.1 for pressure monitoring locations
Subsection 6.13	Introduced the I-Rod spacers and Nu-Bolts as the preferred method for protecting the pipe from atmospheric corrosion and electrical shorts on above grade pipe supports. Changed the referenced to CORR 2.7 Subsection 12.2.

Appendix A - Regulator Station Specifications

A-1. Series RS100 Compact Stations (3/4" Farm Tap Style Regulator)

Station Number & Type	Risers (Inlet x Outlet)	ANSI Class	Inlet MAOP PSIG	Outlet MAOP PSIG
RS110 - Single Cut Horizontal	3/4" x 2"	300	740	60
RS120 - Double Cut Horizontal	3/4" x 2"	300 - 600	740 - 1480	60
RS130 - Single Cut Vertical	2" x 2"	300	740	60
RS140 - Double Cut Vertical	2" x 2"	300 - 600	740 - 1480	60

1. Inlet and outlet pressure ratings listed are for station piping only.
2. Regulators, relief valves, and inlet/outlet systems may further limit station operating pressure ratings.
3. Maximum outlet flow ratings are determined at 60 psig and 200 feet per second gas velocity in outlet piping.
4. Outlet pressures below 60 psig will reduce station capacity below listed flow rate.

A-2. Series RS200 Convertible Stations (3/4" Farm Tap Style - Future Conversion to RS300/RS400)

Station Number & Type	Risers (Inlet x Outlet)	ANSI Class	Inlet MAOP PSIG	Outlet MAOP PSIG
RS210A - Convertible Single Cut (Compact)	2" x 2"	150 FF	285	60
RS210B - Convertible Single Cut (Extended)	2" x 2"	150 FF	285	60

UNCONTROLLED IF PRINTED

RS220A - Convertible Single Cut (Compact)	2" x 2"	300	740	60
RS220B - Convertible Single Cut (Extended)	2" x 2"	300	740	60
RS230A - Convertible Double Cut (Compact)	2" x 2"	300	740	60
RS230B - Convertible Double Cut (Extended)	2" x 2"	300	740	60
RS240A - Convertible Double Cut (Compact)	2" x 2"	600	1,480	60
RS240B - Convertible Double Cut (Extended)	2" x 2"	600	1,480	60

1. Inlet and outlet pressure ratings listed are for station piping only.
2. Regulators, relief valves, and inlet/outlet systems may further limit station operating pressure ratings.
3. Maximum outlet flow ratings are determined at 60 psig and 200 feet per second gas velocity in outlet piping.
4. Outlet pressures below 60 psig will reduce station capacity below listed flow rate.

A-3. Series RS300 Wide-Open (Passive) Monitor

Station Number & Type	Risers (Inlet x Outlet)	ANSI Class	Inlet MAOP PSIG	Outlet MAOP PSIG
RS310A - Wide-Open Monitor (Compact)	2" x 2"	150 FF	285	60
RS310B - Wide-Open Monitor (Extended)	2" x 2"	150 FF	285	60
RS320A - Wide-Open Monitor (Compact)	2" x 2"	300	740	60
RS320B - Wide-Open Monitor (Extended)	2" x 2"	300	740	60
RS330A - Wide-Open Monitor (Compact)	2" x 4"	150 FF	285	60
RS330B - Wide-Open Monitor (Extended)	2" x 4"	150 FF	285	60
RS340A - Wide-Open Monitor (Compact)	2" x 4"	300	740	60
RS340B - Wide-Open Monitor (Extended)	2" x 4"	300	740	60

1. Inlet and outlet pressure ratings listed are for station piping only.
2. Regulators, relief valves, and inlet/outlet systems may further limit station operating pressure ratings.
3. Maximum outlet flow ratings are determined at 60 psig and 200 feet per second gas velocity in outlet piping.
4. Outlet pressures below 60 psig will reduce station capacity below listed flow rate.

A-4. Series RS400 Working Monitor Stations

Station Number & Type	Risers (Inlet x Outlet)	ANSI Class	Inlet MAOP PSIG	Outlet MAOP PSIG
-----------------------	-------------------------	------------	-----------------	------------------

UNCONTROLLED IF PRINTED

RS410A - Working Monitor (Compact)	2" x 2"	300	740	60
RS410B - Working Monitor (Extended)	2" x 2"	300	740	60
RS420A - Working Monitor (Compact)	2" x 2"	600	1,480	60
RS420B - Working Monitor (Extended)	2" x 2"	600	1,480	60
RS430A - Working Monitor (Compact)	2" x 4"	300	740	60
RS430B - Working Monitor (Extended)	2" x 4"	300	740	60
RS440A - Working Monitor (Compact)	2" x 4"	600	1,480	60
RS440B - Working Monitor (Extended)	2" x 4"	600	1,480	60

1. Inlet and outlet pressure ratings listed are for station piping only.
2. Regulators, relief valves, and inlet/outlet systems may further limit station operating pressure ratings.
3. Maximum outlet flow ratings are determined at 60 psig and 200 feet per second gas velocity in outlet piping.
4. Outlet pressures below 60 psig will reduce station capacity below listed flow rate.

REINSTATING OF FACILITIES

October 1, 2021

RNST 1 Requirements and Reinstating Mains and Service

1.0 Purpose

This document specifies requirements for re-testing temporarily deactivated mains and services prior to reinstatement, in accordance with 49 CFR §§ 192.517 and .§192.725.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Reconnection of Temporarily Disconnected Services](#)[6.0 Reconnection of Temporarily Disconnected Farm Tap Services](#)[7.0 Reconnection of Temporarily Disconnected Mains](#)[8.0 Reinstating Service in Abandoned Mains](#)[9.0 Records](#)**3.0 Target Audience**

- Corrosion Control
- Region Engineering
- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Distribution Design Specialist
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Supervisors
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Technicians

4.0 General

4.1 In general, previously abandoned gas facilities that have been physically disconnected from the source of gas, purged, sealed and are no longer maintained should not be considered for reinstatement without a thorough engineering evaluation to verify the facilities' integrity and serviceability. Gas engineering shall approve reinstatement plans for previously abandoned facilities. Refer to [Section 8.0](#) Reinstating Service in Abandoned Mains as a guide for an engineering evaluation.

4.2 Service lines

- 4.2.1 Previously abandoned service lines shall not be placed back in service without gas engineering approval
- 4.2.2 If a gas service line has been physically disconnected from the main supplying it, then the service line shall be tested as a new service line at that location before reinstatement

4.3 Mains

- 4.3.1 *Reinstalling a temporarily deactivated main:* Only new pipe installed within the segment of main requires testing in accordance with [PTST 1](#), before main can be put back in service. See [Section 7.1](#) for details.

UNCONTROLLED IF PRINTED

4.3.2 *Repairing a damaged section of main:* If a new section of pipe is installed to repair a damaged section of main, the new section shall be tested in same manner as a new main.

1. The new section of pipe can be pretested prior to installation. See [REPR 1 Section 10.0](#).

4.3.3 Reinstating previously abandoned mains: Refer to [Section 8.0](#) Reinstating Service in Abandoned Mains.

5.0 Reconnection of Temporarily Disconnected Services

- 5.1 Any service line physically disconnected from main must be tested in the same manner as a new service line before reconnecting. See [PTST 1.1](#), to select appropriate test pressure and test duration table. Refer to 49 CFR §192.725.
- 5.2 If the gas service line is damaged such that it has to be temporarily disconnected from its supply, the service line shall be tested from the point of disconnection to the meter valve. See [REPR 1 Subsection 10.1.5](#) Service line test requirements.
 - 5.2.1 Perform flame ionization (FI) or gas detection instrument survey or sufficient bar testing from main to the damaged section, using a combustible gas indicator to check for leakage.
- 5.3 If there is any indication of physical movement caused by damage, the entire service shall be re-tested.
- 5.4 If provisions are made to maintain continuous service (e.g. installation of a by-pass), then it is not necessary to test the part of the original service line that is used to maintain continuous service.
- 5.5 If a service line has been taken out of service by closing a valve on the service line, then the line is still considered connected and does not need to be retested.

6.0 Reconnection of Temporarily Disconnected Farm Tap Services

- 6.1 When possible, it is recommended that only the regulator head be removed, leaving the regulator body connected to the farm tap piping.
 - 6.1.1 Using this method will not require testing the service line before reinstalling the regulator head, since service line is still connected to the gas source.
- 6.2 If the regulator is completely removed from the farm tap piping, then the service line is considered disconnected from the gas source and must be retested before reinstating the service.
 - 6.2.1 *Farm taps with one regulator:* Outlet piping from regulator to meter valve shall be pressure tested as specified in [PTST 1.1 Appendix F](#).
 - 6.2.2 *Downstream (second cut) regulators removed from farm tap with two-stage regulation:* Outlet piping from second cut regulator to meter valve shall be pressure tested as specified in [PTST 1.1 Appendix G](#).
 - 6.2.3 *Upstream (first cut) regulators removed from farm tap with two-stage regulation:* Piping between first cut regulator and inlet to second cut regulator shall be pressure tested as specified in [PTST 1.1 Appendix G](#).
- 6.3 Regulators and relief valves shall be removed during testing.
- 6.4 After reinstating service, regulator and relief valve connections shall be leak tested using leak detection fluid or instrument at current operating pressure.

7.0 Reconnection of Temporarily Disconnected Mains

- 7.1 Mains temporarily disconnected from their supply source shall be tested in accordance with the following requirements before they can be reconnected:
- 7.1.1 *Facilities Not Disturbed*: Temporarily-disconnected mains do not need not be re-tested if they have not been disturbed.
 - 7.1.2 *Facilities Moved within a Trench*: Mains which are moved within a trench, but not lifted out of the trench, shall be visually inspected to ensure that all joints are sound and that no damage has been done to the pipe. Pressure testing is not required.
 - 7.1.3 *Facilities Lifted from a Trench*:
 - 1. *Mains which are lifted out of a trench and returned to the same trench*: Pipe shall be visually inspected to ensure that all joints are sound and that no damage has been done to the pipe. Pressure testing is not required.
 - 2. *Mains which are lifted out of a trench and placed in a different location*: Pressure test in the same manner as new lines in their final location.
 - 2 a. See [PTST 1.1](#) to select the appropriate test pressure and test duration table.
 - 2 b. The pipe shall be visually inspected to ensure that all joints are sound and that no damage has been done to the pipe.
 - 7.1.4 *Facilities Cut into Sections*: New main segments installed between undisturbed main sections shall be tested in the same manner as new main in that location.
 - 1. All new welds shall be inspected as required for new facilities. See [WELD 1](#) and [WELD 2.3](#).
 - 2. See [PTST 1.1](#) to select the appropriate test pressure and test duration table.
- 7.2 When reconnected to the undisturbed section, tie-in joints shall be leak tested with leak detection fluid or leak detection instrument with the main under current operating pressure.

8.0 Reinstating Service in Abandoned Mains

- 8.1 A previously abandoned main/facility may be returned to service in accordance with the following requirements:
- 8.1.1 An in-depth evaluation must be performed to determine if integrity of main/facility is or can be made suitable for reinstatement.
 - 1. Evaluation should be performed by personnel from various groups such as:
 - 1 a. Gas Tech Engineering (GTE)
 - 1 b. Region Engineering
 - 1 c. Gas Tech Services (GTS)
 - 1 d. Corrosion Control
 - 1 e. Other applicable groups
 - 8.1.2 The abandoned main/facility shall meet all requirements of a new facility installed at that location. The main/facility shall be tested in the same manner as a new line being installed in same location. See [PTST 1.1](#).

8.1.3 Perform cathodic protection survey of steel lines. See [CORR 1](#).

8.1.4 Check the previously abandoned main for internal obstruction (i.e. debris or liquids) by either pigging or purging.

9.0 Records (49 CFR §192.517)

9.1 All pressure test information will be maintained in Maximo or in the As Built Construction File.

9.2 All pressure test information shall be retained for the life of the facility.

End of Instructions.

Operator Qualification (OQ) Required?

YES

0151: Visual Inspection of Buried Pipe and Components when Exposed

0201: Visual Inspection of Installed Pipe and Components for Mechanical Damage

0561: Pressure Test - Nonliquid Medium - MAOP Less than 100 PSI

0571: Pressure Test - Nonliquid Medium - MAOP Greater than or Equal to 100 PSI

0581: Pressure Test - Liquid Medium

0591: Leak Test - Operating Pressure

0641: Visually Inspect Pipe and Components Prior to Installation

3.0 Target Audience

- Gas Compliance Personnel
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel
- Gas Tech Engineering (GTE)
- Gas Technical Services (GTS) Superintendents
- Gas Technical Services (GTS) Supervisors
- Gas Tech Service(GTS) Technicians
- Gas Storage Engineering (GSE)
- Gas Storage Field Superintendents
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Control Personnel

4.0 Regulatory Requirements (49 CFR §191.23)**4.1 Definition:**

UNCONTROLLED IF PRINTED

- 4.1.1 A safety-related condition (SRC) is a situation that affects the operation of a pipeline and is required to be repaired or reported within 5 working days after determination or 10 working days after discovery, whichever comes first.
- 4.1.2 If a transmission pipeline's maximum emergency pressure (MEP) is exceeded, a report is required to be filed within 5 days of the occurrence. See [Section 7.0](#) Transmission MAOP Exceedance Report.
- 4.1.3 Refer to [Attachment 1](#) Determination of Reporting Requirements for Safety-Related Conditions for Pipeline Facilities Other Than Underground Natural Gas Storage Facilities for determining the requirements to report SRCs to PHMSA and the ICC.

4.2 **Pipeline facilities:** Situations that may result in an SRC are as follows:

- 4.2.1 Refer to [Attachment 2](#) Determination of Reporting Requirements for Safety-Related Conditions for Underground Natural Gas Storage Facilities for determining the requirements to report SRCs to PHMSA, and IDNR
- 4.2.2 General corrosion on a pipeline that operates at 20% SMYS or greater and has reduced pipe wall thickness to less than that required for the maximum allowable operating pressure (MAOP), or localized corrosion pitting to degree where leakage might result.
- 4.2.3 Unintended movement or abnormal loading by environmental causes, such as earthquake, landslide, or flood that impairs the pipeline serviceability.
- 4.2.4 Any material defect or physical damage that impairs serviceability of a pipeline that operates at 20% SMYS or greater.
- 4.2.5 Equipment malfunction or operating error that causes pressure of a distribution line to rise above its MAOP plus allowable buildup (MEP) for pressure limiting or control devices.
- 4.2.6 For equipment malfunction or operating error that causes pressure of a transmission pipeline to rise above its MAOP plus allowable buildup (MEP) for pressure limiting or control devices; see [Section 7.0](#) that addresses "Transmission MAOP Exceedance Report".
- 4.2.7 A pipeline leak that constitutes an emergency.
- 4.2.8 Any condition that could lead to an imminent hazard and causes a 20% or more reduction in operating pressure or pipeline shutdown.

4.3 **Underground storage facilities:** Situations that may result in an SRC are as follows:

Underground natural gas storage facilities include injection, withdrawal, monitoring, or observation wells under Illinois Department of Natural Resources' jurisdiction.

- 4.3.1. General corrosion that has reduced the wall thickness to less than that required for the maximum well operating pressure, or localized corrosion pitting to degree where leakage might result.
- 4.3.2. Unintended movement or abnormal loading by environmental causes, such as earthquake, landslide, or flood that impairs structural integrity or reliability.
- 4.3.3. Any crack or other material defect that impairs structural integrity or reliability.

- 4.3.4. Any material defect or physical damage that impairs the serviceability.
- 4.3.5. Any malfunction or operating error that causes pressure to rise above its maximum well-allowable operating pressure plus allowable buildup for pressure limiting or control devices.
- 4.3.6. A leak that constitutes an emergency.
- 4.3.7. Any condition that could lead to an imminent hazard and:
 - 1. Causes a 20% or more reduction in operating pressure, or
 - 2. Results in a facility shutdown.

5.0 Handling Responsibilities

- 5.1 Gas field personnel or Gas Storage Field Operators will report to the Gas Supervisor or Supervisor Gas Storage all SRCs that might affect the operation of AIC pipeline facilities.
- 5.2 Gas Supervisor or Supervisor Gas Storage shall notify Gas Compliance of all SRCs and any corrective actions taken.
- 5.3 Gas Control remotely monitors many of the AIC gas systems/facilities and inter-connections with interstate pipelines. Various duties include the following:
 - 5.3.1. Gas Control shall respond to the associated alarm if safety-related parameters are violated regarding:
 - 1. Pressure,
 - 2. Flow, or
 - 3. Odorization.
 - 5.3.2. If Gas Control cannot remedy situation by using the SCADA system, responsibility will be turned over to the appropriate:
 - 1. Gas Supervisor, or
 - 2. Gas Technical Services (GTS) Supervisor.AND
 - 3. Gas Control will remain in a supportive role.
 - 5.3.3. The Gas Supervisor or GTS Supervisors do one of the following:
 - 1. Provide Gas Control with additional instructions,
 - 2. Call-out gas field personnel or GTS Technician to investigate, or
 - 3. Assume responsibility for addressing the situation.
 - 5.3.4. Communications shall be maintained with Gas Control through-out the event and gas field personnel or GTS Technician shall report their findings and how the situation was resolved.
 - 5.3.5. Gas Control shall maintain a record of how the alarm was handled and how SRC was returned to normal.
- 5.4 All applicable actions to correct SRCs shall be scheduled immediately.

6.0 Reporting SRCs

- 6.1 Working day does not include Saturday, Sunday or Federal Holidays.

- 6.2 SRCs meeting the reporting requirements shall be reported to OPS by email to: InformationResourcesManager@dot.gov or by fax to (202) 366-7128 if not corrected or cleared within the established time.
- 6.3 Separate conditions may be described in a single report if they are closely related.
- 6.4 Gas Compliance shall concurrently submit a report to the ICC.
- 6.5 See [Appendix A](#) for preamble to Amendment 191-7 to CFR Part 191, which addresses "Interpretation and Statement of Policy Regarding Discovery of Safety-Related Conditions by Smart Pigs and Instructions to Personnel". It addresses discovery vs. determination of a condition.

7.0 Transmission MAOP Exceedance Report (49 CFR 191.25)

- 7.1 For transmission pipelines that exceed MAOP plus buildup (MEP) allowed for operation of pressure limiting or control devices, a MAOP Exceedance Report is required to be received by the PHMSA Associate Administrator *within 5 calendar days of the occurrence*. The report shall be emailed to: InformationResourcesManager@dot.gov or faxed to (202) 366-7128.
- 7.2 Gas Compliance shall file the report as outlined in 49 CFR 191.25
- 7.3 **A MEP pressure exceedance is to be reported even if the condition is corrected within the reporting timeframe and regardless of location.**
- 7.4 The reporting requirement for an exceedance is calendar days, as opposed to the basic safety-related condition requirement of working days (that does not include Saturdays, Sundays, or federal holidays).

End of Instructions

Operator Qualification (OQ) Required?

YES

Attachment 2 Determination of Reporting Requirements for Safety-Related Conditions for Underground Natural Gas Storage Facilities

Appendix A - Preamble Statement

The preamble to Amendment 191-7* ("Interpretation and Statement of Policy Regarding Discovery of Safety-Related Conditions by Smart Pigs and Instructions to Personnel") states:

"Discovery of a potentially reportable condition occurs when an operator's representative has adequate information from which to conclude the probable existence of a reportable condition. An operator would have adequate information for each anomaly that is physically examined. Absent physical examination, discovery may occur after the data are calibrated if the "adequate information" test is met. However, the adequacy of the information that pig data provide about anomalous conditions is contingent on a concurrent indication from a number of factors from which an operator could conclude the probable existence of a reportable condition. Among these are the sophistication of the pig being used, the reliability of the data, the accuracy of data interpretation, and any other factors known by the operator relative to the condition of the pipeline."

* Reference Amendment 191-7 to 49 CFR §191.25, published in Vol. 54, FR page 32342 on August 7, 1989.

SAFT 1: Attachment 1

DETERMINATION OF REPORTING REQUIREMENTS FOR SAFETY-RELATED CONDITIONS FOR PIPELINE FACILITIES OTHER THAN UNDERGROUND NATURAL GAS STORAGE FACILITIES^{1,2,3}

Location	Time Factor	Type	Effect on Facility Operation	Report Required ¹
Within 220 yards of a building intended for human occupancy or outdoor place of assembly or within the right-of-way of an active railroad, street or highway	Will not be corrected within 5 working days ³ after determination <u>or</u> 10 working days ³ after discovery, whichever comes first	General Corrosion	Causes the MAOP to be reduced	Yes ⁴
			Does not cause the MAOP to be reduced	No
		Localized Corrosion Pitting	Leakage might result	Yes ⁴
			Leakage unlikely to result	No
		Unintended Movement or Loading	Impairs serviceability	Yes
			Does not impair serviceability	No
		Material Defect or Damage	Impairs serviceability	Yes ⁴
			Does not impair serviceability	No
		Malfunction or Operating Error	Causes pressure to increase above MAOP + allowable buildup	Yes ²
			Does not cause pressure to increase above MAOP + allowable buildup	No
		Leak	Creates an emergency	Yes
			Does not create an emergency	No
		All Other Conditions	Could lead to an imminent hazard and causes a) 20% or more pressure reduction <u>or</u> b) shutdown	Yes
			All others	No

	Will be corrected within 5 working days ³ after determination or 10 working days ³ after discovery, whichever comes first	General Corrosion	Causes the MAOP to be reduced		Yes ⁴	
			Does not cause the MAOP to be reduced		No	
		Localized Corrosion Pitting	Leakage might result	Effectively coated & cathodically protected	No	
				All other coating/cathodic protection conditions	Yes ⁴	
		Leakage unlikely to result		No		
All Other	All	No				

All Other Areas No SRC Report Required, however, see Note 2 below.

Notes:

- 1 An event which has been reported as an incident (191.5) is not reportable as a safety-related condition. Report is not required for any safety-related condition that exists on a master meter system or a customer-owned service line.
- 2 For transmission facilities that have exceeded MAOP plus buildup allowed for operation of pressure limiting or control devices, **a MAOP Exceeding Report is required to be reported within 5 calendar days**. All such MAOP exceedances on transmission facilities must be reported regardless of location or time factor relative to condition correction, See guide material under 191.23.
- 3 Working day does not include Saturday, Sunday, or federal holidays.
- 4 Does not pertain to pipelines operating at less than 20% SMYS.

Note: From ANSI GPTC Z380.1-2018 (Catalog Number Z380118), Guide for Gas Transmission, Distribution, and Gathering Piping Systems by Gas Piping Technology Committee (© American Gas Association, reprinted with permission); update pending

SAFT 1: Attachment 2

DETERMINATION OF REPORTING REQUIREMENTS FOR SAFETY-RELATED CONDITIONS FOR UNDERGROUND NATURAL GAS STORAGE FACILITIES

Location	Time Factor	Type	Effect on Facility Operation	Report Required ¹
Downhole facilities including wells, casings or wellbore tubing at an underground natural gas storage facility that connects the surface equipment with the storage reservoir	Will not be corrected by repair or replacement within 5 working days ² after determination or 10 working days ² after discovery, whichever comes first	General Corrosion of the Production Casing or Tubing	Wall thickness reduces to less than required for the maximum well operating pressure. Results in the well being removed from active service by killing the well, setting temporary plug, or some other means of stopping the connection between the well and the reservoir	Yes
			Wall thickness not reduced to less than required for maximum well operating pressure. Well can remain in service	No

		Localized Corrosion Pitting of the Production Casing or Tubing	Leakage likely to result. Results in the well being removed from active service by killing the well, setting temporary plug, or some other means of stopping the connection between the well and the reservoir	Yes
			Leakage unlikely to result and well can remain in service	No
		Unintended Movement or Loading	Impairs structural integrity or reliability of the wellhead or flow string and results in the well being removed from active service by killing the well, setting a temporary plug, or some other means of stopping the connection between the well and the reservoir	Yes
			Does not impair structural integrity or reliability and well can remain in service	No
Downhole facilities including wells, casings or wellbore tubing at an underground natural gas storage facility that connects the surface equipment with the storage reservoir	Will not be corrected by repair or replacement within 5 working days ² after determination or 10 working days ² after discovery, whichever comes first	Crack, Material Defect or Damage of the Production Casing or Tubing	Impairs structural integrity or reliability and results in the well being removed from active service by killing the well, setting a temporary plug, or some other means of stopping the connection between the well and the reservoir	Yes
			Does not impair structural integrity or reliability and well can remain in service	No
		Malfunction or Operating Error	Results in a pressure increase above the maximum well operating pressure	Yes
			Does not result in a pressure increase above the maximum well operating pressure	No
		Leak	Creates an emergency and results in the well being removed from active service by killing the well, setting a temporary plug, or some other means of stopping the connection between the well and the reservoir	Yes
			Does not create an emergency and well can remain in service	No
		All Other Conditions	Could lead to an imminent hazard and results in the well being removed from active service by killing the well, setting a temporary plug, or some other means of stopping the connec-	Yes

			tion between the well and the reservoir	
			All others: Well can remain in service	No
	Will be corrected by repair or replacement within 5 working days ² after determination or 10 working days ² after discovery, whichever comes first	All	All	No

Table 2

Table 2 Notes:	
¹	An event which has been reported as an incident (§191.5) is not reportable as a safety-related condition.
²	Working day does not include Saturday, Sunday, or federal holidays.

SAFETY-RELATED CONDITIONS

October 1, 2021

SAFT 1.1 Reporting Requirements**1.0 Purpose**

This document is to ensure that reporting requirements are followed by Ameren Illinois (AIC) in alignment with 49 CFR Part 191, specifically Section §191.22, National Registry of Operators.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 Reporting Requirements Related to Gas Storage and Company](#)****3.0 Target Audience**

- Gas Compliance Personnel
- Gas Superintendents
- Gas Supervisors
- Gas Storage Engineering (GSE)
- Gas Storage Field Superintendents
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Control Personnel

4.0 Reporting Requirements Related to Gas Storage and Company Changes

- 4.1 Not later than 60 days before the event occurs, AIC must notify PHMSA electronically through the National Registry of Operators at <https://portal.phmsa.dot.gov> of the following events in accordance with 191.22:
- 4.1.1. Construction of any planned rehabilitation, replacement, modification, upgrade, uprate, or update of a facility, other than a section of line pipe, that costs \$10 million or more. If 60-day notice is not feasible because of an emergency, an operator must notify PHMSA as soon as practicable;
 - 4.1.2. Construction of 10 or more miles of a new pipeline;
 - 4.1.3. Construction of a new LNG plant, LNG facility, or Underground Natural Gas Storage Field (UNGSF).
 - 4.1.4. Maintenance of a UNGSF that involves the plugging or abandonment of a well, or that requires a workover rig and costs \$200,000 or more for an individual well, including its wellhead.
 1. If 60-days' notice is not feasible due to an emergency, an operator must promptly respond to the emergency and notify PHMSA as soon as practicable
- 4.2 Ameren Illinois must notify PHMSA of any of the following events not later than 60 days after the event occurs:
- 4.2.1. A change in the primary entity responsible (i.e., with an assigned OPID) for managing or administering a safety program required by this part covering pipeline facilities operated under multiple OPIDs;
 1. A change in the name of the operator.

UNCONTROLLED IF PRINTED

2. A change in the entity (e.g., company, municipality) responsible for an existing pipeline, pipeline segment, pipeline facility, UNGSF, or LNG facility;
3. The acquisition or divestiture of 50 or more miles of a pipeline or pipeline system subject to part 192.
4. The acquisition or divestiture of an existing UNGSF, or an LNG plant or LNG facility subject to part 193.
5. Changes must be communicated to with advance notice to AIC Gas Pipeline Safety Compliance who will make the notifications to PHMSA.
6. Ameren Illinois must use the Operator ID assigned by PHMSA for reporting requirements, which is 32513.

SECURITY PLAN

May 15, 2022

SECR 1 Requirements

1.0 Purpose

This document is to ensure that any threats of damage or disruption by outside parties are recognized and that reasonable and prudent measures are taken by Ameren Illinois (AIC) to protect its gas facilities and to maintain normal operations.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Responsibilities - Employees, Contractors, and Service Providers](#)[6.0 Direct Threats](#)**3.0 Target Audience**

- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services Supervisor
- Gas Control Supervisor
- Gas Control Personnel
- Security Supervisor
- Security Personnel

4.0 General

- 4.1 Corporate Security and AIC have designated certain assets as "Critical Gas Facilities." Corporate Security maintains a list of these facilities and has identified specific risk and vulnerability control measures that will be taken should these facilities be threatened.
- 4.2 Corporate Security has an *Ameren Gas Facilities Corporate Security Plan* that outlines the appropriate risk control measures to be taken depending on Threat Alert Level for AIC.
- 4.3 The range of measures to be taken varies with specificity and severity of the threat received.

5.0 Responsibilities - Employees, Contractors, and Service Providers

- 5.1 If there is an imminent threat, such as suspicious person, activity, or device, or a credible threat, personnel should first notify local law enforcement (911) to initiate an immediate response to the suspected threat. Then, immediately call the Ameren Security Operations Center, which is staffed 24/7.
- 5.2 Any suspected or confirmed Physical Sabotage Incident must be reported immediately to the Security Operations Center (SOC) by the observing person.

Call the Decatur Security Operations Center at
(217) 424-8256.

UNCONTROLLED IF PRINTED

5.3 Actions for attention:

- 5.3.1 Employees should first act with safety in mind and then make every attempt to preserve physical evidence.

It is best to NOT touch, walk through, or disturb any evidence, unless essential for safety, until the proper authorities have arrived on scene to investigate.

- 5.3.2 Take notes - document who, what, where, when, why, and how. Document the witnesses or vehicles in the area, including license plate numbers.
- 5.3.3 When possible, take photographs of area without disturbing the scene. Photos should be preserved, and copy submitted promptly to Corporate Security.
- 5.3.4 Employees shall also follow their respective Departmental procedures, if any, for responding to such incidents or events.

6.0 Direct Threats

- 6.1 A direct threat may be received that is specifically focused on the AIC gas system. Such a threat might be received by:
 - 6.1.1 JULIE Call Center.
 - 6.1.2 Gas Control.
 - 6.1.3 Employee.
 - 6.1.4 Corporate Security.
- 6.2 A threat may be either general or specific in nature (e.g., an employee discovers a threat to facilities; statements such as "I planted bombs at 6 of your gas facilities"; or, "I planted a bomb at your XYZ gas facility").
- 6.3 When a threat is received that is directed toward the AIC gas system, it shall be communicated directly to Corporate Security.
- 6.4 Corporate Security will:
 - 6.4.1 Evaluate information and determine the appropriate AIC threat alert level.
 - 6.4.2 Notify the appropriate Gas Operations & Gas Control personnel.
 - 6.4.3 Communicate information regarding a direct threat within AIC and to outside entities, such as governmental or law enforcement agencies.
- 6.5 The Director with responsibility for the targeted area(s) will initiate the risk control measures identified in this document for the Critical Gas Facilities according to threat alert level that is determined and issued by Corporate Security.

End of Instructions.

SERVICE LINE INSTALLATION

April 1, 2023

SERV 1 Requirements

1.0 Purpose

This document describes the requirements for installing gas service lines.

The installation of gas services must meet the minimum requirements of 49 CFR §192 Subpart H and Subpart J.

2.0 Scope

This document addresses the following

[3.0 Target Audience](#)[4.0 Depth of Service Line](#)[5.0 Support and Backfill](#)[6.0 Underground Clearances](#)[7.0 Location](#)[8.0 Valve Requirements \(including EFV's\)](#)[9.0 Main Connection](#)[10.0 PE Service Lines](#)[11.0 Pressure Testing](#)[12.0 New service Lines not in Use](#)[13.0 Back Flagging](#)[14.0 Records](#)

Appendices

[Appendix A - Service Line Location](#)[Appendix B - Riser and Pipe Technical Drawings](#)**3.0 Target Audience**

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services personnel

4.0 Depth of Service Line (49 CFR §192.361)

4.1 Service line depth for service lines smaller than 2 inch shall be a minimum of 18 inches from top of pipe to finished grade and should be a minimum of 24 inches for service lines 2 inch and larger on:

- 4.1.1 Private property
- 4.1.2 Public streets
- 4.1.3 Public roads

UNCONTROLLED IF PRINTED

Or

4.1.4 Depth listed on any easement or highway, railroad or street permit

Service lines 2 inch and larger, the minimum depth of cover as the service line approaches the service riser will be determined by the maximum bury depth shown on the service riser.

4.2 Service Tees shall have a minimum depth of 24 inches cover.

4.3 When the above minimums cannot be maintained the following actions shall be taken:

4.3.1 Service tee: Safety Barrier Tape shall be installed approximately twelve (12) inches below the surface to provide advance warning to excavators.

4.3.2 Service line: Safety Barrier Tape shall be installed approximately six (6) inches below the surface to provide advance warning to excavators.

4.3.3 Note location of service lines buried with less than 18 inches of cover on the Gas Service Card Form within ClickMobile.

4.4 Underground structure conflicts with service line location

4.4.1 Contact Gas Supervisor for remedy

1. Relocate to a location where 18 inches can be achieved
2. If relocation not possible, then
3. Contact Engineering for design changes to protect the service line from external loads, such as:
 - 3 a. Inserting plastic service line inside metallic pipe.
 - 3 b. Install concrete pad above the service line, with four (4) inch spacing between the pad the service line.

4.5 Service lines shall be installed at a depth which will protect them from:

4.5.1 Excessive external loading

4.5.2 Local activities such as:

1. Loaded truck traffic
2. Material storage
3. Gardening or farming operations

4.6 Prior to plowing or boring in a service line:

4.6.1 Inspect the proposed service line route for public and privately buried facilities such as sewer laterals, water lines, electric power lines, telephone lines, and CATV lines that may conflict with the gas service line.

4.6.2 Buried facilities that cross or are with eighteen (18) inches of the proposed plow path should be exposed or verified not to be in conflict with the plow path and depth.

5.0 Support and Backfill (49 CFR §192.361)

5.1 Support

- 5.1.1 Each gas service line must be properly supported on undisturbed or well-compacted soil or sand.
- 5.1.2 Bridging, sleeving, granular fill (screened granular material less than or equal to ¼ inch) or other suitable methods shall be used to support pipe installed in or across previously excavated areas or in unstable soil

5.2 Backfill

5.2.1 Service lines smaller than 2 inches in diameter

- 1. First, a minimum layer must be installed, approximately six (6) inches thick, of:
 - 1 a. Clean construction material
 - 1 b. Granular material equal to or less than ¼ inch
or
 - 1 c. Sand

If suitable material is not available to initially cover the pipe, a rock shield such as Tuff-N-Nuff or a rigid sleeve can be installed around the service line may be used in lieu of material listed in 5.2.1 1 1a, 1b, or 1c.

- 1 d. Gas engineering may specify other approved means or materials that can be used.

Then

- 2. Excavated material containing rock, gravel or cinders is placed in the excavation.
- ### 5.2.2 Service lines two (2) inches and larger
- 1. Backfilling should be done in the same manner as a gas main. Refer to [MAIN 1](#).
- ### 5.2.3 Excavated material used for backfill must be free of:
- 1. Rocks larger than two (2) inches
 - 2. Construction debris
 - 3. Concrete or asphalt chunks
 - 4. Brush
 - 5. Pipeline Skids
 - 6. Other materials that could damage the pipe or its coating

6.0 Underground Clearances

- 6.1 Twelve (12) inches of underground clearance must be maintained vertically or horizontally between service lines and buried electric lines or steam pipes.

If the minimum clearance is not possible, a shield such as a sleeve, Tuff-N-Nuff, rubber matting, fiberglass or PVC shield or a casing pipe should be installed around the service line.

Note the reduced clearance in the comment section on the Gas Service Card Form within ClickMobile.

- 6.2 Six (6) inches between service lines and other buried utilities, water, sewer, telephone or CATV.
- 6.3 See [MAIN 2.1](#) Joint Trench Installation for additional clearances associated with joint trench installations

7.0 Location

7.1 Services

- 7.1.1 New residential service lines should be installed on the most direct route from the main to the proposed meter location. (Refer to Appendices [A-1](#) and [A-2](#)).
- 7.1.2 New, relocated, or replaced service lines shall not be installed under buildings unless:
 1. Installation is approved by Gas Engineering, AND
 2. Service line is installed in a gastight casing to prevent gas leakage into the building, AND
 3. Service line and casing must extend into a normally usable and accessible part of the building, AND
 4. The casing vented to a nonhazardous atmosphere outside the building with a rain or insect resistant fitting.

7.2 Branched Service

- 7.2.1 Any branch service, installed on or after October 1, 2022, shall only serve 2 service risers from a single service line tap.
- 7.2.2 Each of the service lines shall meet the same requirements as a single service line.
- 7.2.3 [SERV 2.2 Paragraph 4.1.2](#) addresses EFV requirements for branch services.

7.3 Service Risers

- 7.3.1 The preferred location for the meter riser is within 2 to 5 feet of the front corner of the structure as long as the clearance requirements in Table 1 "Meter Riser Clearance Requirements" can be achieved.
- 7.3.2 Alternate location requires Supervising Engineer approval.
- 7.3.3 A plastic sleeve should be installed around newly installed gas risers that are planned to be encased in a hard surface. The sleeve should extend above the hard surface.

Table 1 Meter Riser Clearance Requirements

Activity	Located within 2-5 feet from front corner	12 inches from windows and/or vents	3 feet from source of ignition	Under Fire Escapes or Downspouts ¹
New Home Construction	Yes	Yes	Yes	No
Conversion from Propane	Not Required	Yes	Yes	No
Conversion from Electric	Not Required	Yes	Yes	No
Replace existing service	Not Required	Yes	Yes	No
Relocate Riser/Meter	Not Required	Yes	Yes	No
Riser Replacement	Not Required	Yes	Yes	No
Relocate Portion of Service	Not Applicable	Not Applicable	Not Applicable	Not Applicable

1. Refer to [METR 1](#)
- 7.3.4 Gas meter can be installed on the front side of the home if agreed upon by and the property owner.
- 7.3.5 Meter riser locations for the following should be located in accordance with Table 1 "Meter Riser Clearance Requirements".
 1. Propane/electric conversion
 2. Existing service line that is being replaced or relocated
 3. Existing service riser being replaced
- 7.3.6 Areas of where settlement can occur due to disturbed or uncompact soil:
 1. Install a flex riser and house bracket
Or
 2. Meter stake
 3. Refer to Appendix [B-1](#) or [B-3](#) for more information.
- 7.3.7 A rigid riser should be considered if:
 1. Ground conditions are stable and settling is not anticipated. (Refer to Appendices [B-2](#) or [B-4](#) for more information).
- 7.3.8 A rigid riser with either a house bracket or meter stake should be used for a multiple meter header. Decision is based on field conditions.
- 7.3.9 Flex or rigid riser modification:
 1. Casing pipe on flex or rigid riser should not be shortened under any circumstances due to the potential of damaging the carrier pipe.
 2. The riser's twelve (12) inch pigtail can be shortened but there must sufficient length remaining to allow for proper installation of the electrofusion coupling.
- 7.3.10 Residential service riser location is determined based on ensuring the gas meter set location has taken into consideration:
 1. Public safety

2. Sources of ignition
3. Possible air intakes into a building

7.4 Meters

- 7.4.1 Refer to Ameren document [METR 1](#).

8.0 Valve Requirements (including EFV's) (49 CFR §§ 192.363, 192.365, 192.383)

8.1 New service line valve requirement

8.1.1 Meter Valves

- 1 a. Single meter location
 - (i) Valve shall be lockable
 - (ii) Valve shall be located before the regulator and meter
- 1 b. Multiple meter location
 - (i) Valve shall be lockable
 - (ii) Valves shall be located before each meter
- 1 c. Inaccessible meter valves
 - (i) If the meter valve(s) are not readily accessible, a second readily accessible valve shall be installed.
 - (ii) A manual service line shut-off valve installed at the property line will meet this requirement.

8.1.2 Excess Flow Valve (EFV)

1. Refer to [SERV 2.2](#) Service Line Installation: Excess Flow Valves or Manual Shut-off Valves for specific requirements and exceptions.

8.2 Existing service line valve requirements

8.2.1 If service line doesn't have an outside service line shutoff valve

1. Valve shall be installed any time there is construction on the service line.
2. The valve must be in a readily accessible location for safe operation of the valve.
3. If installed below ground, must be in a covered durable valve box that is supported independently of the service line.

9.0 Main Connection (49 CFR §192.367)

9.1 All service line to main connections shall be located:

9.1.1 On top of the main

If not practical, then

9.1.2 Side of the main

or

9.1.3 Bottom-out fitting if suitable protection is provided to minimize the possibility of dust and moisture being carried from the main into the service line.

10.0 PE Service Lines (49 CFR §192.321 49 CFR §192.375)

10.1 PE Service Line installation

10.1.1 PE service line must be permanently installed below ground

10.1.2 PE service line may terminate above ground level if its:

1. Installed in an anodeless steel service riser.
2. Protected against deterioration and external damage.
3. Not used to support external loads.

10.1.3 PE service lines shall not be installed inside a building.

10.1.4 PE service lines must be installed so as to minimize shear or tensile stresses.

10.1.5 PE service lines that are not encased must have an electrically conductive wire or other means of locating the underground pipe.

1. The tracer wire should not be wrapped around or taped to the pipe.
2. Contact with the pipe should be minimized but is not prohibited.

10.2 PE service lines installed in a vault or pit must be:

10.2.1 Completely encased in a gas tight metal pipe and with fittings that are adequately protected from corrosion.

10.3 PE service pipes installed in a conduit must be:

10.3.1 Inserted into the conduit pipe in a manner that will protect the pipe. Refer to [SERV 2.6 Section 7.0](#) Conduit and Sleeve Insertion Procedures

10.3.2 The leading end of the PE pipe must be closed before insertion.

10.4 Service lines installed by plowing or boring.

10.4.1 Refer to [Section 4.6](#) of this document, [BORE 2.1](#) - Pipe Installation, and [POLY 1](#).

10.5 Standard residential service line installation is 1" CTS. 1/2" CTS service lines should only be installed for the following reasons and with engineering approval:

10.5.1 Insertion into an existing steel service line. Refer to [SERV 2.6](#) Insertion.

10.5.2 Repair or replacement of an existing service line.

10.5.3 Service line installation for a mobile home.

11.0 Pressure Testing (49 CFR §192.511, §192.513)

11.1 All of the following shall be pressure tested in accordance with [PTST 1 Section 10.0](#) Testing:

11.1.1 New service lines

11.1.2 Replaced service lines

11.1.3 Reinstated service lines

11.1.4 Transferred service lines

11.2 Partially replaced service lines

11.2.1 The replaced portion of the service shall be pressure tested.

UNCONTROLLED IF PRINTED

11.2.2 The portion of the service from the point of disconnect to the meter valve shall be pressure tested.

11.3 Service line being pressure tested shall be disconnected from the meter set or customer piping while the line is under test, until the test pressure has been released.

11.4 The results of the pressure test shall be recorded on the Service Card in ClickMobile.

11.5 Refer to [PTST 1](#) Pressure Testing: Requirements for pressure testing requirements and [RNST 1](#) for reinstating of service lines.

12.0 New service Lines not in Use (49 CFR §192.379)

12.1 Each service line not placed in service upon completion of installation must comply with one of the following until customer is supplied with gas:

12.1.1 Install a locking device in the closed valve to prevent opening of the valve by unauthorized persons.

12.1.2 Install a mechanical device or fitting that will prevent the flow of gas.

12.1.3 Disconnect the customer's piping from the gas supply and seal the open pipe ends.

13.0 Back Flagging

13.1 Newly installed AIC gas facilities shall be "back-flagged" as stated in [DAMG 1 Section 11.0](#)

14.0 Records

14.1 The following shall be recorded on the Gas Service Card form within ClickMobile:

14.1.1 Service Line installations

14.1.2 Service Line repairs

14.1.3 Service Line retirements

14.2 All completed Gas Service Cards recorded with ClickMobile shall be retained within Maximo.

14.3 Gas Services shall be mapped in the electronic mapping system within ninety (90) days after submittal to the Poster. (Refer to [SERV 2.8](#) Gas Service G/Tech Mapping)

End of Instructions.

Operator Qualification (OQ) Required?

YES

0561: Pressure Test - Nonliquid Medium- MAOP Less than

0591: Leak Test at Operating Pressure

0901: Installation of Plastic Pipe in a Ditch

0981: Backfilling

1291: Locate Underground Pipelines

1341: Provide or Assure Adequate Pipeline Support During Operator Initiated Excavation Activities

Document Rescission

SERV 1 Service Line Installation: Requirements, October 1, 2022

Revision Notes

Location of Changes	Summary of Changes
---------------------	--------------------

UNCONTROLLED IF PRINTED

Paragraph 7.3.3 – Service Riser	New - A plastic sleeve should be installed around newly installed gas risers that are planned to be encased in a hard surface. The sleeve should extend above the hard surface.
Appendix A-3 – Residential Meter Set Locations Restrictions	Replaced the picture with the one from AIC's Gas Service Installation brochure.
Appendix B-1 – ½" PE Service Line, Flex Riser – Installation	Removed reference to PE2406/PE2708 since AIC no longer purchases 1/2"CTS PE2406/PE2708 pipe. All 1/2"CTS service lines are now PE4710 pipe.
Appendix B-1 – ½" PE Service Line, Flex Riser – Material Tables	Eliminated the PE2406/PE2708 table, Expanded the PE4710 Table to include the larger service tees that were in the PE2406/PE2708 table. Removed PE3408 from the Table.
Appendix B-2 – ½" PE Service Line, Rigid Riser – Installation	Removed reference to PE2406/PE2708 since AIC no longer purchases 1/2"CTS PE2406/PE2708 pipe. All 1/2"CTS service lines are now PE4710 pipe.
Appendix B-2 – ½" PE Service Line, Rigid Riser – Material Tables	Eliminated the PE2406/PE2708 table, Expanded the PE4710 Table to include the larger service tees that were in the PE2406/PE2708 table. Removed PE3408 from the Table.
Appendix B-3 – 1" PE Service Line, Flex Riser – Installation	Update pipe designation to PE2708 and PE4710 to match Performance Pipe designation. Grammatical change – PE4710 service line shall be utilized on 1-inch service lines with an MAOP of between 61 and 125 psig, PE4710 can also be used in systems with MAOP less than 61 psig.
Appendix B-3 – 1" PE Service Line, Flex Riser – Material Lists	Removed PE3408 from the Table.
Appendix B-4 – 1" PE Service Line, Rigid Riser – Installation	Update pipe designation to PE2708 and PE4710 to match Performance Pipe designation. Grammatical change – PE4710 service line shall be utilized on 1-inch service lines with an MAOP of between 61 and 125 psig, PE4710 can also be used in systems with MAOP less than 61 psig.
Appendix B-4 – 1" PE Service Line, Rigid Riser – Material List	Removed PE3408 within the tables
Appendix B-5 – 2" PE Service Line, Rigid Riser - Installation	Update pipe designation to PE2708 and PE4710 to match Performance Pipe designation. Added Note 10. The EFV shall be installed in accordance with SERV 2.2 Excess Flow Valves or Manual Shut-off Valves.

Appendix B-5 – 2" PE Service Line, Rigid Riser -Material List	Removed PE3408 within the tables.
---	-----------------------------------

Appendix A - Service Line Location

A-1. Standard Service Line Location

A-2. Standard Residential Farm Tap Service Line Location

A-3. Residential Meter Set Locations Restrictions

Meter Location on Right Side of House

Meter Location on Left Side of House

Note: A 15 feet horizontal radius from the relief vent is required for gas risers greater than 2" IPS (2.375 inches in diameter).

Appendix B - Riser and Pipe Technical Drawings

B-1. 1/2" PE Service Line, Flex Riser

Installation

1. PE4710 service line is utilized for all 1/2-inch PE service lines with a MAOP of 125 psig or less.

2. The EFV shall be installed in accordance with [SERV 2.2](#).
3. A protective sleeve [POLY 3.1 Appendix B](#), shall be placed over the connection between the tee and the service pipe.
4. The flexible portion of the riser shall not be bent more than the minimum bending radius of the PE pipe specified in [POLY 1](#).
5. A meter stake should be used where conditions do not allow for the use of a riser bracket.
6. The tracer wire should be taped to the riser and a 12" pigtail brought up next to the riser bracket. If additional protection is needed, the tracer wire may be brought up through a short section of ½" PE tubing taped to the riser.
7. The bottom of the riser bracket should be installed 2" above final grade.
8. The riser should typically be placed 8" from the foundation.
9. The tracer wire shall be attached to steel mains and the connection coated in accordance with [CORR 2.8 Appendix B](#).

B-2. 1/2" PE Service Line, Rigid Riser

Installation

1. PE4710 service line is utilized on all 1/2-inch PE service lines with a MAOP of 125 psig or less.
2. The EFV shall be installed in accordance with [SERV 2.2](#).
3. A protective sleeve, [POLY 3.1 Appendix B](#), shall be placed over the connection between the tee and the service pipe.
4. The flexible portion of the riser shall not be bent more than the minimum bending radius of the PE pipe specified in [POLY 1](#).
5. The tracer wire should be taped to the riser and a 12" pigtail brought up next to the riser bracket. If additional protection is needed, the tracer wire may be brought up through a short section of 1/2" PE tubing taped to the riser.
6. The riser should typically be placed 8" from the foundation.
7. The tracer wire shall be attached to steel mains and the connection coated in accordance with [CORR 2.8 Appendix B](#).
8. A riser bracket (62-54-019) or meter post (62-54-287) should be installed if the meter set assembly is not tied into the customer piping or a multiple meter header is installed.

X - Number of feet required for specific installation.

B-3. 1" PE Service Line, Flex Riser

Installation

1. PE2708 service line shall be utilized on distribution systems with a MAOP between 0 and 60 psig.
2. PE4710 service line shall be utilized on **1-inch service lines** with a MAOP between 61 and 125 psig. **PE4710** can also be installed in systems with MAOP less than 61 psig.
3. PE4710 service line shall require a **PE4710** riser that is SDR 7.0, Stock Number 19 72 139
4. PE2708 riser shall not be used on a PE4710 service.
5. Caution: Electrofusion coupling is the **ONLY** approved means of connecting PE4710 service line, wall thickness 0.101, equivalent to SDR 11.1 with the PE4710 riser, SDR 7. Butt fusion is not allowed when connecting two pipe sections with a wall thickness difference that exceeds one SDR value.
6. The EFV shall be installed in accordance with [SERV 2. 2.](#)
7. The EFV can be butt fused to the service tee outlet and the PE 2708 or PE 4710 service line.
8. A protective sleeve, [POLY 3.1 Appendix B.](#) shall be placed over the connection between the tee and the service pipe.
9. The flexible portion of the riser shall not be bent more than the minimum bending radius of the PE pipe specified in [POLY 1.](#)
10. A meter stake should be used where conditions do not allow for the use of a riser bracket.
11. The tracer wire should be taped to the riser and a 12" pigtail brought up next to the riser bracket. If additional protection is needed, the tracer wire may be brought up through a short section of 1/2" PE tubing taped to the riser.
12. The bottom of the riser bracket should be installed 2" above final grade.
13. The riser should typically be placed 8" from the foundation.
14. The tracer wire shall be attached to steel mains and the connection coated in accordance with [CORR 2.8 Appendix B.](#)

B-4. 1" PE Service Line, Rigid Riser

Installation

1. PE2708 service line shall be utilized on distribution systems with a MAOP between 0 and 60 psig.
2. PE4710 service line shall be utilized on 1-inch service lines with a MAOP between 61 and 125 psig. PE4710 can also be installed in systems with MAOP less than 61 psig.
3. PE4710 service line shall require a PE4710 riser that is SDR 7.0, Stock Number 19 72 140
4. PE4710 riser shall not be used on a PE4710 service.
5. Caution: Electrofusion coupling is the ONLY approved means of connecting PE4710 service line, wall thickness 0.101, equivalent to SDR 11.1, with the PE4710 riser, SDR 7. Butt fusion is not allowed when connecting two pipe sections with a wall thickness difference that exceeds one SDR value.
6. The EFV shall be installed in accordance with [SERV 2. 2](#).
7. The EFV can be butt fused to the service tee outlet and the PE 2708 or PE 4710 service line.
8. A protective sleeve, [POLY 3.1 Appendix B](#), shall be placed over the connection between the tee and the service pipe.
9. The tracer wire should be taped to the riser and a 12" pigtail brought up next to the riser bracket. If additional protection is needed, the tracer wire may be brought up through a short section of 1/2" PE tubing taped to the riser.
10. The riser should typically be placed 8" from the foundation.
11. The tracer wire shall be attached to steel mains and the connection coated in accordance with [CORR 2.8 Appendix B](#).
12. A riser bracket (62-54-019) or meter post (62-54-287) should be installed if the meter set assembly is not tied into the customer piping or a multiple meter header is install

B-5. 2" PE Service Line, Rigid Riser

Installation

1. PE2708 service line shall be utilized on **2-inch service lines** with a MAOP between 0 and 60 psig.
2. PE4710 service line shall be utilized on **2-inch service lines** with a MAOP between 61 and 125 psig. **PE4710** can also be installed in systems with MAOP less than 61 psig.
3. PE4710 service line shall require a PE4710 riser that is SDR 7.0, Stock Number 19 72 154
4. PE2708 riser shall not be used on a PE4710 service line.
5. Caution: Electrofusion coupling is the **ONLY** approved means of connecting PE4710 service line, SDR 11, with the PE4710 riser, SDR 7. Butt fusion is not allowed when connecting two pipe sections with a wall thickness difference that exceeds one SDR value.
6. A protective sleeve, [POLY 3.1 Appendix B](#), is optional for 2 inch and larger service lines. If a protective sleeve is installed it, shall be placed over the connection between the tee and the service pipe.
7. The tracer wire should be taped to the riser and a 12" pigtail brought up next to the riser bracket. If additional protection is needed, the tracer wire may be brought up through a short section of 1/2" PE tubing taped to the iser.
8. The tracer wire shall be attached to steel mains and the connection coated in accordance with [CORR 2.8 Appendix B](#).
9. Notice: The manufacturer of the 2 inch IPS riser, 19 17 238, says the threaded end of the riser cannot be removed to allow for welding of any kind on the riser. There is insufficient space between transition area of the riser and the weld to avoid heat damage to the inserted PE pipe.
10. The EFV shall be installed in accordance with **SERV 2.2 Excess Flow Valves or Manual Shut-off Valves**.

1.0 Purpose

This document provides requirements for sizing a gas service line.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Determining Service Line Capacity](#)

[5.0 Service Line sizing example](#)

Appendices

[Appendix A - Gas Customer Load Information form](#)

[Appendix B - Estimated Demand of Gas Appliances](#)

[Appendix C - Pressure System Classification/Allowed Pressure Drop: Services](#)

[Appendix D - Demand Diversity Factor for Appliance](#)

[Appendix E - Service Line Capacity Tables](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representative
- Gas Field Personnel
- Gas Supervisors

4.0 Determining Service Line Capacity

4.1 To determine service line size, the following factors must be determined:

4.1.1 Customer load demand

1. Refer to data from the "Gas Customer Load Information Form". A copy of a blank form is in [Appendix A](#).
2. If the Gas Customer Load Information is not available, use the appliance demand table in [Appendix B](#) to estimate the demand.

4.1.2 System allowed pressure drop for services

1. Refer to Table "Pressure System Classification/Allowed Pressure Drop for Services" in [Appendix C](#).

4.1.3 Demand Diversity Factor for Appliances is used to estimate total design loads for multiple residence housing units.

1. Refer to "Diversity Factor for Appliances" in [Appendix D](#).

4.1.4 Service line length; from gas main to meter location.

4.2 Service line demand load Calculation

UNCONTROLLED IF PRINTED

4.2.1 Appliance Design Load = Estimated Appliance Demand ([Section 4.1.1](#)) x Demand Diversity Factor ([Section 4.1.3](#)) x # of Customers.

4.2.2 Total Design Load for a housing unit is the sum all of the Appliance Design Loads.

4.3 Service Line Size

4.3.1 Service line size is determined by using the capacity tables in [Appendix E](#) and the following:

1. Service Line inlet pressure
2. System allowed pressure drop ([Section 4.1.2](#))
3. Service Line Length ([Section 4.1.4](#))
4. Service line load ([Section 4.2](#))

5.0 Service Line sizing Example

5.1 The following is an example of service line sizing using the charts in Appendices [B](#), [C](#), [D](#), and [E](#).

5.1.1 Known information (example):

1. 100 customers on the service (an apartment building)
2. 1 cooking range per customer
3. 1- 30 gallon hot water heater per customer
4. Space Heater/5 radiant heaters per customer
5. Distance from main to meters: 100 ft. of gas service
6. Service line inlet pressure: 50 psig

5.1.2 Table information (example)

1. Cooking range demand from [Appendix B](#): 60 CFH
2. Space heater demand from [Appendix B](#): 11 CFH
3. 30 gallon hot water heater demand from [Appendix B](#): 33 CFH
4. Demand diversity factors from [Appendix D](#):
 - 4 a. Cooking Range: .20
 - 4 b. Space Heating: .76
 - 4 c. Water Heater: .33
5. Allowed pressure drop for a 50 psig main from [Appendix C](#): 5 psig

5.1.3 Calculated demand:

1. Cooking Range demand: 100 customers x .20 diversity x 60 CFH/customer = 1200 CFH
2. Space heating demand: 100 customers x .76 diversity x 11 CFH = 836 CFH
3. Water heating demand: 100 Customers x .33 diversity x 33 CFH = 1089 CFH
4. Total demand = 1200 CFH + 836 CFH + 1089 CFH = 3125 CFH

5.1.4 Required service line size from tables in [Appendix E](#):

1. Comparing 100 ft. length, 50 psig, and a demand of 3125 CFH in each table in Appendix E results in the following:

½" CTS PE	998 CFH	Under capacity
1" CTS PE	5780 CFH	Approximately Correct size
1 ¼" CTS PE	14827 CFH	Over capacity
2" IPS PE	42308 CFH	Over capacity
¾" Steel	3794 CFH	Approximately Correct size
1 ¼" Steel	48244 CFH	Over capacity
2" Steel	48244 CFH	Over capacity

2. From the above information either 1" CTS PE or ¾" Steel would be the appropriate service line sizes.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Notes:

1. Capacity of service lines in CFH for actual length of service. Equivalent footages for fittings have been added.
2. Service Inlet Pressure should equal lowest expected pressure on main that is likely to occur at the service tap

SERVICE LINE INSTALLATION

April 1, 2023

SERV 2.2 Excess Flow Valve or Manual Shut-off Valve

1.0 Purpose

This document provides the requirements for the installation of Excess Flow Valves (EFV) and manual service line shut-off valves on residential and commercial services. This document meets the requirements of 49 CFR §§ 192.381, 192.383, 192.385.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Requirement for EFV Installation](#)[5.0 EFV Installation and Location](#)[6.0 EFV Sizing](#)[7.0 Requirements for Manual Service Line Shut-off Valve Installation](#)[8.0 Manual Service Line Shut-Off Valve Installation](#)[9.0 Inspection and Maintenance of Manual Shut-Off Valve](#)[10.0 EFV and Manual Shut-Off Valve Identification](#)

Appendices

[Appendix A - EFV Locations](#)[Appendix B - EFV Sizing Tables](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Gas Field personnel
- Gas Construction personnel
- Gas Supervisors
- Gas Construction Services personnel

4.0 Requirement for EFV Installation (49 CFR §192.383)

4.1 Single Family Residence (SFR) services installed after April 14, 2017

4.1.1 EFV's are required on all new or replaced SFR services prior to activation. See [Appendix A-1](#).

4.1.2 EFV's are required on all new or replaced branch services to SFR's prior to activation.

1. If both services are installed at the same time then the EFV may be installed either on the primary service line, see [Appendix A-2](#), or on the primary service line close to the main and another EFV installed on the branch service line, see [Appendix A-3](#).
2. If a new installed branch service is installed off of an existing service line that does not have an EFV, then an EFV shall be installed on the branch service line. See [Appendix A-4](#).

UNCONTROLLED IF PRINTED

- 4.2 Multi-family residence service installed or replaced after April 14, 2017:
 - 4.2.1 EFV's are required, when available and approved by AIC, prior to activation.
 - 4.2.2 If EFV is not available and approved by AIC, refer to [Section 7.0](#) for manual shut-off valve requirements.
- 4.3 Single small commercial service installed or replaced after April 14, 2017:
 - 4.3.1 EFV's are required, when available and approved by AIC, prior to activation.
 - 4.3.2 If EFV is not available and approved by AIC, refer to [Section 7.0](#) for manual shut-off valve requirements.
 - 4.3.3 For branch service, an EFV shall be on each service line to a small commercial customer.
- 4.4 Residential and commercial farm taps
 - 4.4.1 Refer to [4.1](#) and [4.3](#) above for EFV requirements on the outlet side of the farm tap.
- 4.5 Schools, hospitals or nursing homes
 - 4.5.1 Each single service line one (1) inch and larger shall have a properly sized EFV installed, if it is available and approved by AIC.
 - 4.5.2 A manual service line shut-off valve shall be installed.
- 4.6 Replaced service line includes:
 - 4.6.1 Replacement of service tee or fitting that connects the service line to the main.
 - 4.6.2 Replacement of the service line from the service tee or fitting to the service riser.
 - 4.6.3 Replacement of a section of service line near the main where an EFV is typically installed
- 4.7 Exceptions to requirement for EFV
 - 4.7.1 Service line does not operate at a pressure of 10 psig or greater throughout the year.
 - 4.7.2 Gas mains that have experienced contaminants in the gas stream that could interfere with the operation of this EFV or cause loss of service to the customer.
 - 4.7.3 EFV could interfere with necessary operation or maintenance activities such as blowing liquids from the line.
 - 4.7.4 EFV meeting the required performance standards of 49 CFR §192.381 is not available.
- 4.8 Customer Request to Install an EFV
 - 4.8.1 Existing natural gas customers shall receive annual notification of their right to request an EFV to be installed on their existing service line. Annual notification is through the direct mailing of electronic billing insert of the Natural Gas Safety Flyer, see [PUBL 3](#) for the Flyer.
 - 4.8.2 Installation of an EFV at the customer's request will be at the customers expense.
 - 4.8.3 An EFV requested by a customer will not be installed on customer service line with a rated meter capacity greater than 1,000 SCFH.

Or

UNCONTROLLED IF PRINTED

4.8.4 The service line inlet pressure drops below 10 psig.

4.8.5 Customer's request cannot be fulfilled because of [4.8.3](#) or [4.8.4](#) above they shall be notified why their request is denied.

5.0 EFV Installation and Location (49 CFR §192.381)

5.1 Single family residence, multi-meter, commercial services, and farm taps.

5.1.1 EFV shall be installed as close as practical to the outlet of the service tee. Exceptions must be approved by Engineering. See [Appendix A-1](#).

5.1.2 EFV shall be installed with the arrow pointing toward the meter, indicating the direction of flow.

5.1.3 Care should be taken not to allow dirt or debris to get into the EFV.

5.1.4 Care should be taken on steel installations to keep wrenches and welding flames away from the center of the EFV assembly to prevent possible damage of the mechanism.

1. A wet rag shall be placed over the center of the EFV when the valve is being welded in place.

5.2 Farm Tap

5.2.1 On a residential or commercial farm tap serving no more than two (2) service risers:

1. Install a 3/4 inch steel EFV at the outlet of the high pressure distribution service tee. See [Appendix A-5](#).
2. A second properly sized EFV shall be installed at the outlet riser(s) of the farm tap for the primary service line(s). See [Appendix A-5](#).
3. If there is a branch service line off of the primary service line, a separate properly sized EFV can be installed on the branch as stated in [4.1.2](#) above.

5.3 Pressure Testing with an EFV

5.3.1 The pressure test for service with an EFV can be applied from the service tee or the riser termination.

5.3.2 Pressure shall be applied slowly.

If applied too quickly from the service tee, the EFV may trip.

5.3.3 If the EFV closes

1. The pressure downstream of the EFV will eventually equalize due to the small bleed-by feature built into the EFV.
2. The pressure equalization could take as long as 10 minutes depending on the test pressure and service line length.
3. The test may resume when the pressure has equalized.

5.3.4 After a successful pressure test:

1. The main can then be tapped and the service purged.

2. The service tee punch should be withdrawn slowly from the main to control the gas flow and prevent tripping the EFV.

5.3.5 Perform a functional flow test

1. Close the meter valve and disconnect between the meter valve and regulator.
2. Pressurize the service line up to the meter valve.
3. Rapidly open the meter valve to exhaust the pressure.
4. Excessive surge in flow will activate the EFV if properly installed.
5. After activation, close the meter valve.
6. Reconnect the meter set.
7. Initiate gas service to the customer.

5.3.6 Resetting the EFV

1. If an EFV is activated due to a service line break it will reset after the service line pressure is equalized as a result of squeezing off the service line upstream of the break or reconnecting the service line. See [5.3.3](#) for more information.

6.0 EFV Sizing

- 6.1 The EFV diameter size should match the size of the service line.

- 6.1.1 As an example, ½ inch EFV on a ½ inch service.

Service line shall not be reduced in size downstream of the EFV to the inlet of the service riser.

- 6.2 For existing odd size service lines such as 1-1/4", 1-1/2" or 3", Gas Engineering will evaluate the service and determine if there is a smaller size EFV that would meet the service specifications and load requirements at that location.

- 6.2.1 Examples may include:

1. 1/2" CTS EFV on a 3/4" IPS PE service line.
2. 1" CTS EFV on a 1-1/4" IPS PE service line.
3. 2" IPS EFV on a 3" IPS PE service line.
4. 3/4" IPS Steel EFV on a 1-1/2" IPS steel service line.

- 6.3 Using the tables in [Appendix B](#) select the appropriate EFV based on

- 6.3.1 Service line size

- 6.3.2 Maximum capacity of the meter being specified

- 6.3.3 Service line inlet pressure

- 6.3.4 Length of service line

- 6.3.5 Select an EFV with a trip flow that is greater than the customers load (maximum capacity of the meter) on the service line.

UNCONTROLLED IF PRINTED

1. Example:
 - 1 a. ½" CTS service line
 - 1 b. 60 psig inlet pressure
 - 1 c. Maximum meter capacity of 530 SCFH
 - 1 d. EFV selected from [Table B-1](#) has a capacity of 570 SCFH, but the maximum service line length can only be 960 ft.

If the service line length is greater than 960 ft. then the service line and EFV must be increased in size to ¾" IPS or 1" CTS depending on the actual service length.

6.4 Service line sizing for EFV

- 6.4.1 Any proposed new ½ inch service that may, at any point, have an inlet pressure of less than 20 psig should be upgraded to a 1 inch service and EFV.
- 6.4.2 A ½ in PE pipe may be inserted into the existing steel service line with the following criteria:
 1. Inlet pressure less than 20 psig
 2. Existing service line length of 120 feet or less
 3. Meter capacity of 330 SCFH or less
 4. Under the above conditions upgrading to a 1 inch service line would not be required.

7.0 Requirements for Manual Service Line Shut-off Valve Installation (49 CFR §192.385)

- 7.1 A manual service line shut-off valve shall be installed on any new or replaced residential multifamily or commercial service where an EFV is not available or approved by AIC.
- 7.2 A manual service line shut-off valve shall be installed on high pressure distribution service to any new or replaced farm tap service single family or residential branch service where a steel EFV is not available or approved by AIC.

8.0 Manual Service Line Shut-Off Valve Installation

- 8.1 The location of the manual service line shut-off valve shall be:
 - 8.1.1 As close as practical to the fitting that connects the service line into the main
AND
 - 8.1.2 Safely and easily accessible for operation and maintenance.
- 8.2 If the service line connection to the main is under a roadway, the valve should be located in the nearest area, downstream of the connection, where the valve can be safely accessed and operated.
- 8.3 The shut-off valve shall be installed in a valve box with a lid marked "GAS".
 - 8.3.1 The valve box shall not be supported by the service line.
 - 8.3.2 The valve box shall be aligned to allow easy access for a valve wrench.

- 8.4 On a farm tap, in lieu of a below grade valve an above grade manual shut-off valve can be installed on the outlet of the farm tap to shut off the gas flow on the service line.

9.0 Inspection and Maintenance of Manual Shut-Off Valve (49 CFR §192.385)

- 9.1 The manual service line shut-off valve installed after April 14, 2017 shall be subject to regular scheduled inspection/maintenance with the results documented in Maximo.
- 9.2 Manual service line shut-off valves shall be inspected once every five (5) calendar years not to exceed 63 months.
- 9.3 Inspection shall include ensuring the valve box is accessible, properly aligned and free of debris such that a valve wrench will fit on the valve operator.

The valve does not have to be operated.

10.0 EFV and Manual Shut-Off Valve Identification (49 CFR 192.381)

- 10.1 Locations where an EFV is installed will be identified through the following actions.
- 10.1.1 The service record shall identify that an EFV was installed.
- 10.1.2 The meter set at the residence shall be tagged to identify that an EFV was installed.
- 10.1.3 The riser at the farm tap shall be tagged to identify that an EFV was installed.
- 10.2 The location of manual service line shut-off valves shall be identified on the Gas Service Card Form within ClickMobile and retained in Maximo.

End of Instructions.

Operator Qualification (OQ) Required?

YES.

1191: Maintenance of Service Valves Upstream of Customer Meter

1201: Temporary Isolation of Service Lines and Service Discontinuance

SERV 2.2 Service Line Installation: Excess Flow Valves or Manual Shut-off Valves, December 15, 2021

Revision Notes

Location of Changes	Summary of Changes
Paragraph 4.3.3 – Small Commercial Customer	Revised- For branch service, an EFV shall be installed on each service line to a small commercial customer
Paragraph 4.9.1 – Customer Request to Install an EFV	Added notification language. Existing natural gas customers shall receive annual notification of their right to request an EFV to be installed on their existing service line. Annual notification is through the direct mailing or electronic billing insert of the Natural Gas Safety Flyer, see PUBL 3 for the Flyer.
Paragraph 4.9.2	Grammatical correction – "customer's" replaces "customers"
Paragraph 4.9.5	Updated Paragraph reference links – 4.8.3 and 4.8.4.

B-6. Reducer Coupling with EFV for Meter Upgrades

Friastop EF Coupling w/EFV, GS15B, 1" CTS x 1/2" CTS Stock Code 39 22 635		
Inlet Pressure PSIG	Maximum Design Flow	Maximum Length Feet
10	496	119
20	588	225
30	668	328
40	739	430
50	803	533
60	863	636
80	972	846
100	1069	1060
125	1180	1333

- 1) Knowing the customer's connected load is important when doing a meter upgrade.
- 2) This EFV should be sized for connected load, not meter capacity.
- 3) This EFV is not approved for any meter above an AL425 at inches water column delivery.

SERVICE LINE INSTALLATION

October 1, 2022

SERV 2.3 Farm Tap Installation

1.0 Purpose

This document provides the requirements Farm Taps. This document meets the requirements of 49 CFR §§ 192.381, 192.382, 192.383, 192.385, 49 CFR Part 192 Subpart J.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Farm Requirements](#)[5.0 Farm Tap Locations](#)[6.0 Farm Tap Installations](#)[7.0 Farm Tap Capacity](#)[8.0 Inlet Valves](#)[9.0 Testing](#)

Appendices:

[Appendix A - Farm Taps](#)[Appendix B - Farm Tap Location](#)[Appendix C - Farm Tap Capacity Tables](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design
- Gas Field personnel
- Gas Construction personnel
- Gas Supervisors
- Gas Construction Services personnel

4.0 Farm Requirements

- 4.1 A farm tap is required when the supply source has a MAOP over 125 psig.
- 4.2 A new farm tap shall only be installed within a service line that serves no more than two (2) service risers.
- 4.3 A newly installed gas main shall not be connected to the downstream end of a farm tap.
- 4.4 Once three (3) or more service risers are connected, the existing service line can no longer be classified as a service.
 - 4.4.1 The line shall either be upgraded to a main or replaced with a new main and the farm tap changed to a regulator station.
 - 4.4.2 An upgraded line shall meet the requirements contained in [MAIN 1](#).
- 4.5 Farm tap on a gas pressure system with a Design MAOP greater than 1000 psig shall be designed or reviewed by Gas Tech Engineering (GTE).

UNCONTROLLED IF PRINTED

- 4.6 Pressure containing facilities similar to a farm tap located within gas storage fields and compressor plants shall be designed by Gas Storage Engineering (GSE).
- 4.7 GTE or Integrity Management (IM) may specify that an inspectable farm tap be installed. In which case, GTE shall include the design plans, regulator and relief valve set points and bill of materials in the Job Packet.

5.0 Farm Tap Locations

- 5.1 Farm tap installations shall normally be placed on the customer's property at or near the property line.
- 5.2 When the installation of a service line results in it crossing an adjacent property line, an easement is normally required for the service line.
 - 5.2.1 If that easement allows, the farm tap can be placed on that property.

The main goal is to not have a farm tap installed on public right-of-way.

- 5.3 On a long side service, the farm tap should be placed on the customer side of the road.

If a private easement is obtained, the farm tap may be placed on the same side of the road as the gas main.

- 5.4 Farm taps should be located away from:
 - 5.4.1 Paved areas
 - 5.4.2 Sidewalks
 - 5.4.3 Building entrances
 - 5.4.4 Areas that have heavy vehicular traffic.
- 5.5 Guard posts should be installed around the farm tap if additional protection from vehicular or other forms of damage is needed.
 - 5.5.1 Protective Barricades are available with 2" legs (62 05 159) and 4" legs (62 05 160).
- 5.6 Pipeline markers should be installed at farm taps located in areas where vegetation growth may inhibit visibility. See [PMRK 1](#)
- 5.7 Refer to [Appendix B](#) Farm Tap Location for a typical installation.

6.0 Farm Tap Installations

- 6.1 Farm Tap Type
 - 6.1.1 Single-Cut: 60-450 PSIG inlet MAOP with outlet pressure between 15 and 20 psig. Refer to [Appendix A-1](#)
 - 6.1.2 Double-Cut: 451-1000 PSIG inlet MAOP. 1st step outlet pressure of 100 psig and 2nd step outlet pressure between 15 and 20 psig. Refer to [Appendix A-2](#)
- 6.2 Regulator Set points

6.2.1 Single-cut farm tap the regulator set point shall be between 15 psig and 20 psig.

6.2.2 Double-cut farm tap

1. First cut - 100 psig
2. First cut relief valve - 120 psig
3. Second cut - 20 psig
4. Second cut relief valve - 30 psig

6.3 Farm tap EFV - refer to [SERV 2.2](#) Excess Flow Valves or Manual Shut-off Valve.

6.4 Installation Notes:

6.4.1 The ¾" steel inlet riser can be field bent with a minimum bending radius of 13".

6.4.2 Tracer wire for a plastic service line should be brought above ground at the outlet riser from the farm tap.

6.4.3 Install a 5 lb. anode on the tracer wire near the farm tap outlet.

6.4.4 Do not bond the tracer wire to the farm tap piping.

6.4.5 All welded joints, valves, and the punch tee shall be coated and wrapped according to [CORR 2.3](#) Coatings.

6.4.6 Install the 627R regulator so that the relief is vented downward.

6.4.7 For the maximum flow rates and bleed rates of the EFVs, see [SERV 2.2](#) for excess flow valves (EFV) sizing.

7.0 Farm Tap Capacity

7.1 The tables in this section indicate the flow capacities for the regulators and EFVs in the standard farm tap installations. When checking that a farm tap will have enough capacity, the following items need to be considered:

7.1.1 MAOP of the inlet line from the tapped main or transmission line.

7.1.2 The current operating pressure of the tapped main or transmission line.

7.1.3 The customer's peak gas load.

7.1.4 The maximum flow rate of the inlet (HP) EFV.

7.1.5 The maximum flow rate of the outlet (IP) EFV (if installed).

7.2 Refer to [Appendix C](#) Farm Tap Capacity Tables for determining farm tap capacities.

8.0 Inlet Valves

8.1 The single-cut and double-cut farm taps shall have an above-ground valve located upstream of the regulator.

8.2 The options available for installing additional below grade inlet valves, depends on the size of the transmission or high pressure distribution supply line, location, ease of access and customer being served, are:

8.2.1 For all farm tap designs, an optional weld Mueller H-17900 valve can be installed in the service line.

See [Appendix A-1](#) Single Cut or [Appendix A-2](#) Double Cut farm tap.

This valve shall be installed in a location as close to the main as practical and in an area where a valve box can be maintained and easily located.

Or

- 8.2.2 Install a Mueller H-17656 valve tee at the service tap on the main in lieu of a Mueller H-18101 (AUTOPERF) tee.

The valve tee would have to be uncovered in order to shut-off the gas flow.

Or

- 8.2.3 Install a Mueller H-17800 curb valve tee as the service tap on the main in lieu of an AUTOPERF tee or H-17656 valve tee.

For easy access, a valve box can be installed over this valve.

Where the wall thickness of the pipe cannot be verified to be 0.281 inches or less, a Mueller H-17656 valve tee or Mueller H-17800 curb valve tee shall be used in place of an AUTOPERF tee.

- 8.3 If there is a future possibility of upgrading the farm tap to a regulator station, install either a Mueller H-17900 or H-17800 as a station valve.

- 8.3.1 The valve should be located a minimum of twenty (25) feet upstream of the farm tap inlet riser.

9.0 Testing

- 9.1 Farm tap piping shall be tested in accordance with the following tables

9.1.1 Single-Cut: Ameren document [PTST 1.1](#).

9.1.2 Double-Cut: Ameren document [PTST 1.1](#).

- 9.2 Once the farm tap has been installed, the outlet pressure should be

9.2.1 Checked and adjusted as needed.

9.2.2 On a double-cut farm tap, the outlet pressure of the first cut regulator should also be checked and adjusted.

Pressure gauges should be removed when completed.

- 9.3 All connections between the inlet riser and outlet riser shall be checked for leaks with leak detection fluid or leak detection instrument at current operating pressure after regulator(s) and relief valve are installed.

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0301: Manually Opening and Closing Valves
- 0311: Adjust and Monitor Flow or Pressure - Manual Valve Operation
- 0861: Installation of Steel Pipe in a Ditch
- 0871: Installation of Steel Pipe in a Bore
- 0901: Installation of Plastic Pipe in a Ditch
- 0911: Installation of Plastic Pipe in a Bore
- 0941: Install Tracer Wire
- 0951: Installation of Pipe Above Ground
- 0961: Above-Ground Supports and Anchors: Inspection, Preventative, and Corrective Maintenance
- 0981: Backfilling
- 1081: Tapping a Pipeline (Tap Diameter 2 in. and Less)
- 1161: Installation of Customer Meters and Regulators - Residential and Small Commercial.
- 1171: Installing Customer Meters: Large Commercial and Industrial
- 1191: Maintenance of Service Valves Upstream of Customer Meter

SERVICE LINE INSTALLATION

October 1, 2020

SERV 2.4 Yardlines

1.0 Purpose

This document defines what a yardline is and provides a uniform practice for the installation, operation and maintenance of existing underground residential customer fuel lines that are considered to be yardlines. This document meets the requirements of 220 ILCS 20/2.02.5 and 2.03 of the Illinois Gas Pipeline Safety Act and 49 CFR §192.723 (b)(2).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Yardline Definition](#)[5.0 Yardline Operation and Maintenance](#)[6.0 Yardline Installations](#)[7.0 Yardline Elimination](#)[8.0 Yardline Records](#)**3.0 Target Audience**

- Gas Engineering
- Gas Field personnel
- Gas Supervisor
- Gas Construction personnel
- Gas Supervisors

4.0 Yardline Definition

- 4.1 A yardline is an underground primary fuel line for a residential customer that transports gas from the service line (meter outlet) to the customer's building, including manufactured homes and multiple unit buildings.
- 4.1.1 If multiple buildings are served from one meter, "building" means the first building nearest to the service line connection.
- 4.1.2 If the meter is located within three (3) feet of a building being served by the meter, the meter shall be considered at the building and no yardline exists. Refer to 220 ILCS 20/2.02.5
- 4.1.3 If the meter is greater than three (3) feet from the residential building wall, the underground fuel line from the meter to the entrance into the nearest building served by that meter shall be considered a yardline.
- 4.2 Underground commercial or industrial fuel lines where the meter is located more than three (3) feet from the building being served by the meter are not considered yardlines.

5.0 Yardline Operation and Maintenance

- 5.1 The Illinois Commerce Commission requires Ameren Illinois to operate all yardlines defined in [Section 4.0](#).

- 5.2 Ameren Illinois shall perform a leak survey of all yardlines every three (3) calendar years not to exceed thirty-nine months. Refer to 49 CFR §192.723 (b)(2)

6.0 Yardline Installations

- 6.1 Ameren Illinois will require all new residential meter sets to be installed within three (3) feet of the building, including manufactured homes and multiple unit buildings, avoiding the creation of new yardlines.

7.0 Yardline Elimination

- 7.1 Ameren Illinois' long-term objective is to eliminate all yardlines, with longer and older yardlines being eliminated first.
- 7.2 The Gas Supervisor shall use all available opportunities to eliminate existing yardlines.

A Yardline from a single meter to a residential dwelling can be eliminated by relocating the service riser and meter to within three (3) feet of the dwelling provided the yardline pipe can be connected to the existing service line pipe and passes the required leak test.

- 7.3 When a yardline is eliminated Maximo shall be updated with the removal.

8.0 Yardline Records

- 8.1 The Gas Supervisor shall maintain a list of all existing yardlines in Maximo.
- 8.2 The yardlines shall be leak surveyed in accordance with [Section 5.2](#) and [LEAK 2.7](#).
- 8.3 Yardline survey information will be entered within ClickMobile and maintained in Maximo. Refer to [LEAK 2.8](#).

End of Instructions.

SERVICE LINE INSTALLATION

October 1, 2020

SERV 2.5 Inactive Services

1.0 Purpose

This document provides a uniform practice of tracking, reporting, assessing, and retiring inactive gas services. 49 CFR §192.727.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Inactive Service Definition](#)

[5.0 Maintenance of Inactive Services](#)

[6.0 Tracking and Reporting of Inactive Services](#)

[7.0 Inactive Service Retirements](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisor
- Gas Service personnel
- Gas Construction personnel

4.0 Inactive Service Definition

4.1 Inactive Service - A gas service is considered to be inactive when there is no longer a customer of account.

When there is a customer of account, the service is considered to be active.

5.0 Maintenance of Inactive Services

5.1 All inactive gas services shall be maintained and operated in the same manner as an active gas service.

5.2 Maintenance includes:

5.2.1 Performing leak surveys

5.2.2 Cathodic protection readings (if applicable)

5.2.3 Atmospheric corrosion surveys

5.2.4 Any other applicable code compliance inspections or surveys as defined in the Ameren Illinois O&M Plan.

6.0 Tracking and Reporting of Inactive Services

6.1 The identification and location of inactive services will be tracked and maintained within the Ameren Illinois Customer Service System (CSS).

UNCONTROLLED IF PRINTED

- 6.2 CSS maintains the gas meter removal date which identifies when a gas service became inactive.
- 6.3 A report will be generated from CSS each year, or more often if requested, that identifies gas services that have been inactive for eight years, nine years, and ten or more years.
- 6.4 The report will be provided to the Gas Supervisor in each Region by Gas Operation and Services.

7.0 Inactive Service Retirements

- 7.1 The Gas Supervisor is responsible for reviewing the CSS inactive service report once each year to identify any services that have been inactive for ten or more years.
- 7.2 Each service that is identified as being inactive for ten or more consecutive years should be:
 - 7.2.1 Retired (cut-off) within one year
 - Or
 - 7.2.2 Assessed to determine if the inactive service still has value and should remain tied to the gas system.
 - 1. The assessment should be documented and include the following:
 - 1 a. Leak survey the inactive service line. Refer to [LEAK 2.4](#) and [LEAK 2.8](#).
 - 1 b. Perform a pipe to soil reading, if applicable, for acceptable cathodic protection. Refer to [CORR 2.8](#).
 - 1 c. Assess the condition of the inactive service riser including looking for evidence of atmospheric corrosion, corrosion at the pipe to soil interface, or disbonded coating. Refer to [LEAK 2.4](#) and [CORR 1](#).
 - 1 d. Review riser accessibility including an undesirable location such as an inside meter. Refer to [SERV 1](#).
 - 1 e. Verify the inactive service is documented and being maintained in the same manner as an active service; i.e. service record card, CSS record, AM/FM premise, etc.
- 7.3 If an inactive service is determined to have value and will not be retired or removed then:
 - 7.3.1 A reassessment should be performed and documented every five years after the initial assessment.
 - 7.3.2 The date of the inactive service assessment must be recorded in CSS.
- 7.4 An inactive service may be retired before ten consecutive years of inactivity at the discretion of the Gas Supervisor.

End of Instructions.

Operator Qualification (OQ) Required?

SERVICE LINE INSTALLATION

October 1, 2021

SERV 2.6 Insertion

1.0 Purpose

The purpose of this document is to provide procedures for gas service line insertions.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General Requirements](#)[5.0 Tracer Wire Installation](#)[6.0 Dead Service Line Insertion Procedures](#)[7.0 Conduit or Sleeve Insertion Procedures](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialists
- Gas Field personnel
- Gas Construction personnel
- Gas Supervisors
- Gas Construction Services personnel

4.0 General Requirements

4.1 Supervisory approval is required for use of PE service line insertion.

Consideration should be given to the added difficulty of leak detection on inserted PE service line as well as the increased difficulty of locating a buried inserted line.

4.2 PE services lines may be inserted individually or as a part of a replacement project.

4.3 Inserted PE service lines shall meet all of the requirements of a new service. See [SERV 1](#) Service Line Installation: Requirements.

4.3.1 Existing services shall meet the depth requirements as outlined in [SERV 1](#) at the locations where the inserted pipe enters and exits the casing, conduit or sleeve.

4.3.2 For any entry and exit locations that do not meet the depth requirements of [SERV 1](#), a new location should be found to enter and exit the casing or the new service shall not be inserted.

4.4 Installing a larger PE carrier service pipe, than needed, in the old steel service line minimizes the possibility of the PE service line being squeezed by freezing. See [Table 1](#) for recommended casing sizes.

Water expands by approximately 9-10 percent as it freezes.

UNCONTROLLED IF PRINTED

Table 1

Recommended Maximum Casing Size for Inserted Services	
Inserted Service Size	Maximum Casing Size
1/2" CTS	1-1/4" IPS
1" CTS	2" IPS
1-1/4" IPS	3" IPS
2" IPS	4" IPS

The casing should be a least two nominal pipe sizes large than the service line pipe to ease insertion of the service line pipe.

- 4.5 Link seals shall be used to prevent water from entering the casing pipe, if the proper sizes are available. See [STLP 2.2](#) Casing Pipe Installation
- 4.6 The casing pipe should be inspected at each opening for debris or damage that may damage the carrier pipe during the insertion.

5.0 Tracer Wire Installation

- 5.1 A 12 gauge solid copper tracer (Stock Code 18 66 208/18 66 369) wire should be pulled through the old service line with the new pipe if possible. If there is not adequate space for 12 gauge wire, a 14 gauge solid copper tracer wire (Stock Code 18 66 677) may be used.
- 5.2 Casing size or configuration that do not allow a tracer wire to be pulled through the casing with the new service, shall use one of the following for tracer wire installation:
 - 5.2.1 Steel main with PE service inserted into a coated steel service line:

Bond connections shall be done prior to inserting PE pipe.

1. Bond tracer wire to the steel main at the service tap. See [Figure 1](#).
2. Bond to both ends of the casing and terminate above grade at the new riser. See [Figure 1](#).
3. See [CORR 2.8 Appendix B](#) Test Lead Wire Attachment for attachment procedures for the bond connection on the steel pipe. Cold applied tape or wax tape should be used to coat the connections.

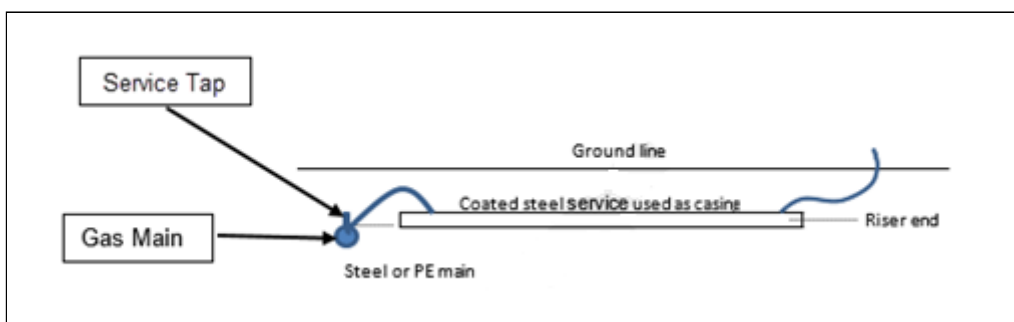

Figure 1. Bonding to Casing

5.2.2 Steel main with a PE service inserted into a bare steel pipe:

1. This may also be used as an option with a PE main or a coated steel service.
2. Install a five (5) pound anode near the service tap location on the service side of the main and attach it to the tracer wire for the inserted service. See Figure 2.

Figure 2. Anode Installation for Casing

Bond connections shall be done prior to inserting PE pipe.

3. Do not bond tracer wire to the steel main or tracer wire of the PE main.
4. Bond the tracer wire to both ends of the casing and terminate above grade at the new riser.
5. An optional test station may also be brought up to ground level at the tap location to aid in locating the main.
6. See [CORR 2.8 Appendix B](#) Test Lead Wire Attachment for attachment procedures for the bond connection on the steel pipe. Cold applied tape or wax tape should be used to coat the connections.

5.2.3 PE main with PE service inserted into a coated steel service line:

1. Connect the service line tracer wire to the tracer wire of the PE main at the service tap. See [Figure 3](#).
2. Bond connections shall be done prior to inserting PE pipe.
3. Bond to both ends of the casing and terminate above grade at the new riser.
4. See [CORR 2.8 Appendix B](#) Test Lead Wire Attachment for attachment procedures for the bond connection on the steel pipe. Cold applied tape or wax tape shall be used to coat the connections.

UNCONTROLLED IF PRINTED

Figure 3. Bonding to Casing and PE main.

6.0 Dead Service Line Insertion Procedures

- 6.1 Excavate the main at the service tap location.
- 6.2 Excavate:
 - 6.2.1 Service riser if the meter is outside
 - 6.2.2 Proposed riser location if the meter is to be moved outsideOr
 - 6.2.3 The location where the new service line will tie in the existing service line going into the building.

The service tee, valve, line stopper or squeeze off can be used to temporarily shut off the gas supply.

- 6.3 Shut off gas at the main.
- 6.4 Remove a section of the existing service line close to the main.
 - 6.4.1 Provide adequate clearance for inserting the new pipe and connecting to service tee, i.e. EFV and transition fitting if required.
- 6.5 Disconnect the piping at the customer end of the service and remove pipe as necessary.

Adequate space should be provided for the installation of new facilities.

- 6.6 Purge the abandoned section of pipe according to [ABND 2.1](#) Abandonment of Gas Facilities and [PURG 2](#) Purging: Methods.
- 6.7 Inspect all open ends of the casing pipe.
- 6.8 Ream any open ends of the casing pipe with a pipe reamer or file to remove sharp edges. All steel casings should be reamed.
- 6.9 PE pipe shall be protected at the entry openings of the casing pipe during insertion. See Table 2 for a list of available pipe protectors.

Table 2. Plastic Pipe Protectors

Plastic Pipe Protectors	
Size	Stock Code
3/4" x 1/2"	19 65 205
1-1/4" x 1/2"	19 65 207
1-1/4" x 1"	19 65 206

- 6.9.1 Place PE pipe protectors or other protective material in between the casing and the carrier pipe at locations where the inserted pipe enters or exits the casing.
- 6.9.2 Wrap the ends of the insertion and the plastic pipe protectors with tape to hold them in place. If using an insertion shrink sleeve, pull the sleeve over the pipe at this point instead of wrapping the ends.
- 6.10 Lay out the new PE service line as straight as possible in order to reduce the drag inside the old service line
- 6.11 When inserting larger PE pipe in larger casing, appropriate means shall be used to protect the carrier pipe from damage, such as but not limited to:
 - 6.11.1 Rock guard
 - 6.11.2 Plastic sleeves, etc.
- 6.12 If using an insertion shrink sleeve, place the sleeve on the casing prior to insertion. See Table 3 for a list of available shrink sleeves.

Table 3. Shrink Sleeves

Insertion Shrink Sleeves			
Steel Casing Pipe Size	PE Pipe Size	Stock Code	3M Product Number
3/4" IPS	1/2" CTS	19 35 280	PS - 2
1" IPS	1/2" CTS	19 35 280	PS - 2
1-1/4" IPS	1/2" CTS	19 35 281	PS - 3
1-1/4" IPS	1" CTS	19 35 281	PS - 3

- 6.13 Seal the leading end of the pipe being inserted to keep out dirt, debris or water.
- 6.14 If the inserted PE pipe is being pulled through the casing pipe, a weak link shall be used. Refer to [POLY 2.3 Section 10.0](#) Weak Link.
- 6.15 Insert the PE pipe through the casing pipe.
- 6.16 After insertion is complete, inspect the leading edge of PE pipe for damage.
 - 6.16.1 If the pipe is damaged, remove and discard the damaged pipe then repeat steps [6.8](#) through 6.13.
 - 6.16.2 If another attempt is unsuccessful abandon old service, casing. See [ABND 2.1](#) Abandonment of Gas Facilities.
 - 6.16.3 Install a new service line.
- 6.17 The steel service riser for an existing outside meter shall be removed and should not be used during the insertion.
- 6.18 The steel riser should be cut off at a distance from the building that would allow adequate space for a new anodeless riser to be installed. See [SERV 1](#) for meter location requirements.
- 6.19 Connect the inserted pipe to the new service riser with an approved connection. See [POLY 2.5](#) Electrofusion.
- 6.20 If the existing service line enters the building below grade, the preferred method for terminating the inserted PE service line is to install anodeless riser outside the foundation wall.

At a minimum, meter valve and service regulator should be installed on the riser. See [SERV 1](#) for meter location requirements.

- 6.21 If the preferred method is not possible, the following option may be utilized:
 - 6.21.1 PE service line can be installed through the outer foundation provided that the plastic service is inserted inside of piping material permitted for use in buildings and an indoor service head adapter is used to seal against the possibility of gas

entering the structure. See Table 4 for a list of available Indoor Service Head Adapter.

Table 4. Service Head Adapter

Indoor Service Head Adapters		
Size (Casing x Service)	Outlet	Stock Code
1-1/4" x 1"	1-1/2" MNPT	19 33 686
3/4" x 1/2"	1" MNPT	19 33 687

6.21.2 The least desirable option is connecting the service line to a transition fitting installed immediately outside the foundation using approved connections. [POLY 2.4](#) Butt Fusion or [POLY 2.5](#) Electrofusion and [WELD 2.4](#) In-Service Welding.

1. This option shall be considered as a last resort

This option leaves an isolated section of steel through the foundation wall which will require scheduled CP monitoring and compliance.

2. The Gas Supervisor shall consult with Corrosion Control personnel prior to installation.
3. Corrosion Control personnel shall determine the appropriate measures to be taken in order to monitor CP on the isolated section.
4. The location shall be recorded as an Isolated Service and added to the appropriate CP monitoring schedule.

6.21.3 Regardless of which method is used, a readily accessible valve shall be installed in the service line outside of the foundation. See [SERV 1](#).

6.21.4 If the existing service tee does not meet the current Standards, then a new tee shall be installed and the existing tee retired. See [ABND 2.1](#) Abandonment of Gas Facilities.

Examples of service tees not meeting standard are:

UNCONTROLLED IF PRINTED

1. Homemade tees
2. Tees without the internal parts
3. Tees that cannot be shut-off

6.21.5 If using a new service tee the service tee should be connected to the main and service line using an approved fusion or welding procedure. See [POLY 2.4](#) Butt Fusion or [POLY 2.5](#) Electrofusion or [WELD 4](#).

1. If a new service tee and/or new service line is installed, see [SERV 1](#) and [SERV 2.2](#) for EFV requirements.
2. Pressure test the service as required in [PTST 1](#) prior to tapping the service tee.

6.21.6 If using the existing service tee:

1. Pressure test the service line prior to connecting the service line to the existing service tee. See [PTST 1.1 Table A](#).
2. Refer to [SERV 2.2](#) for EFV requirements.
3. Connect the service line to the service tee using an approved fusion or welding method. See [POLY 2.5](#) Electrofusion and [WELD 4](#).
4. Introduce gas to the new service line and test the tie-in to the existing service tee with leak detection solution or leak detection instrument.

6.22 Rebuild the meter set as necessary.

6.23 Backfill as required in [SERV 1](#).

6.24 Records for the inserted PE service shall indicate that the service is inserted.

7.0 Conduit or Sleeve Insertion Procedures

- 7.1 Locate and excavate each end of the conduit or sleeve. The conduit or sleeve should meet the depth requirements as outlined in [SERV 1](#).
- 7.2 Inspect the conduit/sleeve for damage or debris that may damage the inserted pipe during installation.
- 7.3 If the conduit/sleeve needs to be shortened for any reason, it should be inspected again prior to the insertion.
- 7.4 Ream any open ends of the steel conduit/sleeve with a pipe reamer or file to remove sharp edges as necessary.
- 7.5 Place plastic pipe protectors at all openings where the inserted pipe will be entering and exiting the steel conduit/sleeve during the insertion, if the proper sizes are available. See [Section 6.9](#).

A short section of pipe may be pulled through as a dry run to minimize the risk of damage occurring to the actual carrier pipe during the installation. If the dry run pipe is damaged inspect the conduit again and take measures as necessary to prevent damage to the inserted pipe.

- 7.6 Seal the leading end of pipe being inserted to keep out dirt, debris, or water.
- 7.7 Insert the carrier pipe through the conduit or sleeve. Tracer wire shall be installed with PE carrier pipe.
- 7.8 After insertion is complete, inspect the leading edge of carrier pipe for damage. If the pipe is damaged, remove the inserted pipe and repeat steps [7.2](#) through 7.7.

Do not reuse any damaged pipe from a previous insertion attempt.

- 7.8.1 If a steel pipe is the carrier pipe and damage is limited to the coating on the leading end, coating can be repaired in accordance with [CORR 2.3 Appendix K](#) Coating Inspection.
- 7.8.2 If the leading end of the steel carrier pipe is gouged it shall be evaluated and repaired in accordance with [REPR 1](#).
- 7.8.3 If the damaged coating or pipe extends into the conduit or sleeve:
 - 1. Remove a sufficient length that coating and/or pipe damage can be repaired
 - Or
 - 2. Remove the entire section of pipe.
 - Then
 - 3. Evaluated the extent and nature of the damage to determine if the conduit/sleeve can be used or if the conduit/sleeve should be abandoned.
- 7.9 Seal both ends of the carrier pipe until it is tied into the remainder of the new service line to prevent water or debris from entering the pipe.
- 7.10 Pressure test the service as required in [PTST 1](#) prior to tying the inserted pipe into an existing service line.
- 7.11 Tie into the existing service line using approved connections and fittings. See [POLY 2.4](#) Butt Fusion or [POLY 2.5](#) Electrofusion.
- 7.12 Leak test the tie in connection at normal operating pressure with leak detection fluid.
- 7.13 Backfill as required in [SERV 1](#).
- 7.14 Records for the service shall indicate that the service is inserted through a conduit or sleeve.

End of Instructions.

SERV 2.7 Gas Service Card Form and Gas Sketch Card

1.0 Purpose

The purpose of this document is to provide instructions for completing the Gas Service Card Form within ClickMobile and Gas Sketch Card, which contain information to comply with 49 CFR §§ 191.11 and 192.383.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Gas Service Card Form](#)

[5.0 Service Sketches](#)

[6.0 Gas Sketch Card Completion Instructions](#)

[7.0 Distribution - Gas Sketch Card](#)

Appendices:

[Appendix A - Sample - Gas Sketch Card](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 Gas Service Card Form (49 CFR§191.11, 49 CFR§192.383)

- 4.1 The Gas Service Card Form shall be completed within ClickMobile by gas field personnel:
- 4.2 The following list identifies the most common instances when a Gas Service Card Form should be completed by gas field personnel.
- 4.2.1 **New Installation** of gas service line.
- 4.2.2 **Replacement** of a gas service – total or partial
- 4.2.3 **Extension** of a gas service
- 4.2.4 **Repair** of a gas service by installing a fitting or a new pipe section
- 4.2.5 **Retirement** of a gas service
- 4.3 Some of the information on the card is required to comply with 49 CFR §§ 191.11 and 192.383.
- 4.3.1 AIC must annually report to PHMSA, the number of services installed and retired.
- 4.3.2 EFV or manual service line shut-off valve installations measures shall be included in the annual report to PHMSA.
- 4.4 GIS Discrepancy in ClickMobile is used to correct existing service attributes such as:

UNCONTROLLED IF PRINTED

4.4.1 Pipe size.

4.4.2 Pipe material.

4.4.3 Connection to the correct gas main.

4.5 This information may also be used by Operations, Engineering, Corrosion Control and DIMP for future design, maintenance or risk analysis.

5.0 Service Sketches

5.1 Service Sketch shall be completed within ClickMobile to record and/or clarify work for all service installations that are:

5.1.1 New

5.1.2 Replaced - total or partial.

5.1.3 Relocated

5.1.4 Extended existing service line

5.1.5 Repaired when new section of pipe is installed

5.1.6 Partially retired when 18 inches or longer of existing pipe remains connected to source of gas.

5.2 The following information shall be provided in ClickMobile:

5.2.1 Address if the service - required field

5.2.2 City or town - system populates

5.2.3 Premise Number - required field

5.2.4 DOJM Number - required field in P1/open field in P3

5.2.5 Name of the person responsible for performing the work - system populated

5.2.6 Employee Number of the person responsible for performing the work - system populated

5.2.7 Contractor Company if an outside contractor performed the work - Enter

5.2.8 Date the work was performed - system generated/required if modification is needed

5.2.9 Remarks - Enter if needed

5.2.10 Measurement indicating the overall service length shall be included on the sketch.

5.2.11 A minimum of two measurements from the service tee to the other points of reference shall be included on the sketch.

1. Acceptable points of reference include:

1a. Corner of a house or permanent building.

1b. Centerline (CL) of the street and/or the nearest cross street.

1c. Edge of pavement (EOP) or curblineline (CB) for the street/nearest cross street.

1d. Sewer man hole covers (MH) and storm sewer drain (SD).

UNCONTROLLED IF PRINTED

- 1e. Fire hydrant (FH).
- 1f. Utility pedestal (Ped) or electric transformer (PM). If pedestal or transformer has visible identification number, please notate that on the sketch or in the remarks.
- 1g. Edge of driveway or sidewalk.
- 1h. Include text on the sketch to indicate what point of reference is being used.
- 1i. It is acceptable to write out the measurements in words in the remarks section of the sketch. ([See Example 2](#))

In lieu of a sketch being made in ClickMobile, the sketch can be made on a copy of the Service Sketch Card then scanned and attached to the Work Order task assigned.

The sketch should include the information listed in 5.2.10 and 5.2.11 at a minimum.

Example 1

Example 2

UNCONTROLLED IF PRINTED

6.0 Gas Sketch Card Completion Instructions

- 6.1 The ClickMobile Gas Service Form contains required fields that must be accurately completed.

It is good practice to record all information that is known about the service.

- 6.2 If a hand drawn sketch is being used for the service sketch, the information listed in [Subsection 5.0](#) Service Sketches Service Sketches, shall be included on the sketch.

7.0 Distribution - Gas Sketch Card

- 7.1 An email will be sent the appropriate poster who will access Maximo and retrieve the Service Request task and Service Sketch.
- 7.2 The poster will post a service in AIC's electronic mapping system when necessary and maintain the Maximo Service Asset number for the service in ESRI.
- 7.3 The Gas Service Card Form information will be maintained in Maximo.

End of Instructions.

SERV 2.7 Service Line Installation Gas Service Card Form and Gas Sketch, May 15, 2022

Revision Notes

Location of Changes	Summary of Changes
Paragraph 5.1.6 – Service Sketch	Grammatical – Partially retired when 18 inches or longer of existing pipe remains connected to source of gas.
Subsection 5.2	Revised – The following information shall be provided in Click-Mobile. Information is not required on sketch.
Paragraph 5.2.1 through 5.2.9	Indicated what information is required and which is system populated.
Subsection 5.2 – NOTE:	Added reference to what information is required on a hand drawn sketch that is being attached to the Work Order.
Appendix A	Added Information listed below should be entered within Click-Mobile.

Appendix A, Sample - Gas Sketch Card

Ameren ILLINOIS Service Sketch Card

Address: _____ (1)
City: _____ (2)
Premise#: _____ (3)
DOJM#: _____ (4)
Name: _____ (5)
Empl#: _____ (6)
Date: _____ (8)
Contractor Company (if applicable):
_____ (7)
Remarks: _____ (9)

Indicate Direction With Arrow

ROW

ROW

Stock No. 374-1375 F5850

10/16

Note: Sketch shall follow the instructions in Paragraph 5.2.10 and Paragraph 5.2.11

Key: Information listed below should be entered within ClickMobile.

1. Address of the service
2. City or town
3. Premise Number
4. DOJM Number
5. Name of the person responsible for performing the work
6. Employee Number of the responsible person performing the work
7. Contractor Company, if an outside contractor performed the work
8. Date the work was performed
9. Remarks

SERVICE LINE INSTALLATION

October 1, 2020

SERV 2.8 Gas Service GTech Mapping

1.0 Purpose

The purpose of this document is to provide instruction for mapping Gas premises, gas service lines, and meters in G/Tech.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Mapping - General](#)

[5.0 Mapping a Premise](#)

[6.0 Mapping Meter Points](#)

[7.0 Mapping a Gas Service](#)

[8.0 Mapping a Farm Tap Service](#)

[9.0 Mapping a Branch Service](#)

[10.0 Mapping a Replaced Service](#)

[11.0 Mapping a Retired Service](#)

[12.0 Mapping a Stub Service](#)

[13.0 Mapping a Transferred Service](#)

3.0 Target Audience

- Gas Distribution Design - Posters
- Gas Engineering
- Gas Field Engineering Representatives

4.0 Mapping - General

- 4.1 All gas premises and new gas service lines shall be symbolically mapped in G/Tech.
- 4.2 Service attributes are collected on a Gas Service Card Form within ClickMobile and retained in Maximo. Refer to [SERV 2.7](#) Service Line Installations: Gas Service Card Form and Gas Sketch Card.

Maximo maintains the official service attributes record and gas service drawing.

- 4.3 G/Tech will maintain the relationship between the Customer Service System (CSS) Service Drop number and the Maximo Asset number.

5.0 Mapping a Premise

UNCONTROLLED IF PRINTED

- 5.1 Place premise symbol () represents a gas premise.
- 5.2 The peak of the house in the premise symbol will point north. It is not necessary to rotate the symbol.

The Gas Service Card Form drawing will portray the premise's actual location and direction.

- 5.3 The premise symbol shall be located in the middle of the lot unless more location information is known.
- 5.4 The house number should be perpendicular to the centerline of the street and on the far side of the premise symbol from the main. See Figure 1.

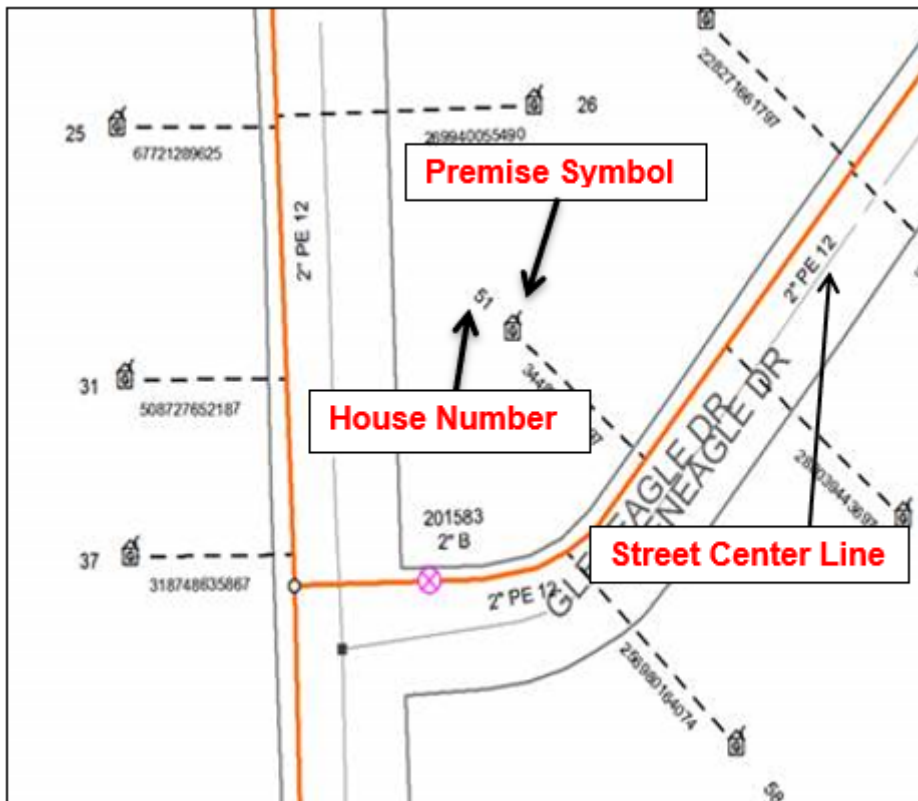

Figure 1. House number location

- 5.5 The house number and unit/apartment number shall be shown for the premise, if applicable.
- 5.6 The premise symbols for two or more premises served from one service pipe (not a branch service) shall be mapped at one location as follows:
 - 5.6.1 Place the premise symbols on top of one another. See Figure 2.
 - 5.6.2 All house numbers should be listed next to the premise symbol. See Figure 2.

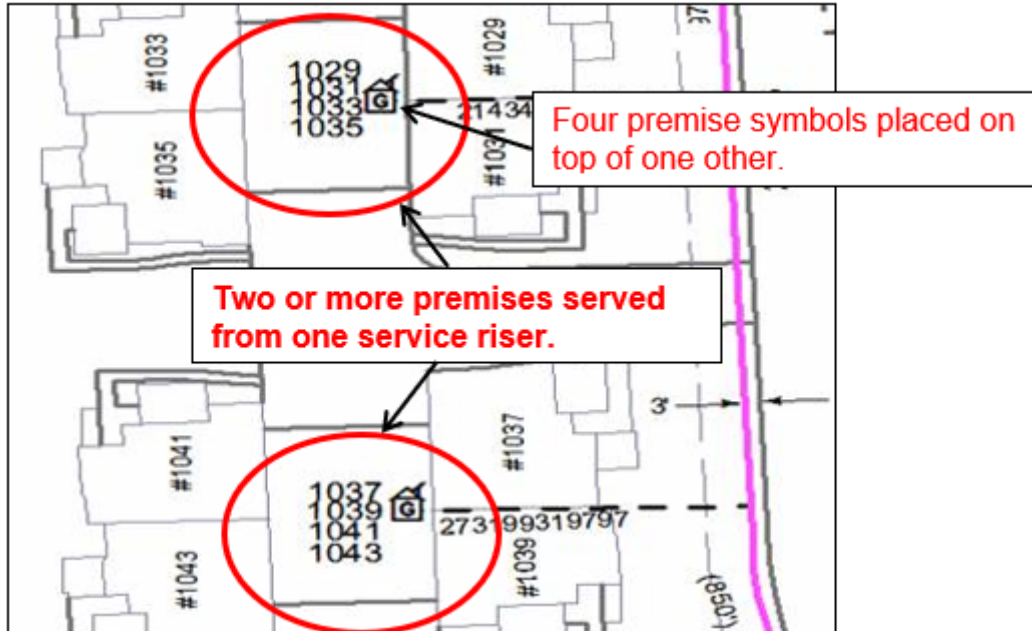

Figure 2. Premises on top of one another

6.0 Mapping Meter Points

- 6.1 Each active gas meter point shall be associated as an attribute of a premise in G/Tech.
- 6.2 Each active gas meter point shall be associated to the main it is served from.

7.0 Mapping a Gas Service

- 7.1 Gas service and their ownership to a main are maintained in G/Tech.
- 7.2 Gas service attributes are maintained in Maximo.
- 7.3 All new gas services shall be mapped in G/Tech.
- 7.4 The graphical representation of a service line is not the physical path to the premise.

The physical path, dimensions, material, and other service attributes are captured on the Gas Service Card Form. Refer to [SERV 2.7](#) Service Line Installation: Gas Service Card Form and Gas Sketch Card.

- 7.5 Service line should be drawn from the appropriate main to the center of the premise symbol. See Figure 3 for examples.

Figure 3

- 7.6 Service line shall be mapped at the appropriate location in relation to main valve, fittings, tees, etc.
- 7.7 Service line shall show ownership (relationship) to the correct main.
- 7.8 For service lines being mapped, the correct CSS Service Drop number and the correct Maximo Service Asset number should be associated to the service.
- 7.9 Excess flow valves, curb valves, valve tees, and other fittings should not be mapped in G/Tech.

The gas fitting information is maintained in Maximo.

8.0 Mapping a Farm Tap Service

The physical path, dimensions, material, and other service attributes are captured on the Gas Service Sketch within Click Mobile.

- 8.1 The entire service line from the main to the premise will be posted as one graphic service line and follow gas service mapping. Refer to [Section 7.0](#).
- 8.2 A Farm Tap symbol () will be placed on the service line as close as practical to the actual location in the field.
- 8.3 Farm taps shall be associated to both the gas main and the gas service.
- 8.4 Ownership shall be established from the farm tap to the main.
- 8.5 Any gas service with a farm tap that is served from a high pressure distribution or transmission main must be owned by a farm tap and a main.

If service line operates at line pressure with no farm tap, special posting is required.

- 8.6 Gas service(s) placed and served from a farm tap will need a structure ownership established to a farm tap and gas ownership established to a main.
- 8.7 The gas service is considered a “Child” to the “Parent” farm tap and main. See Figure 4.

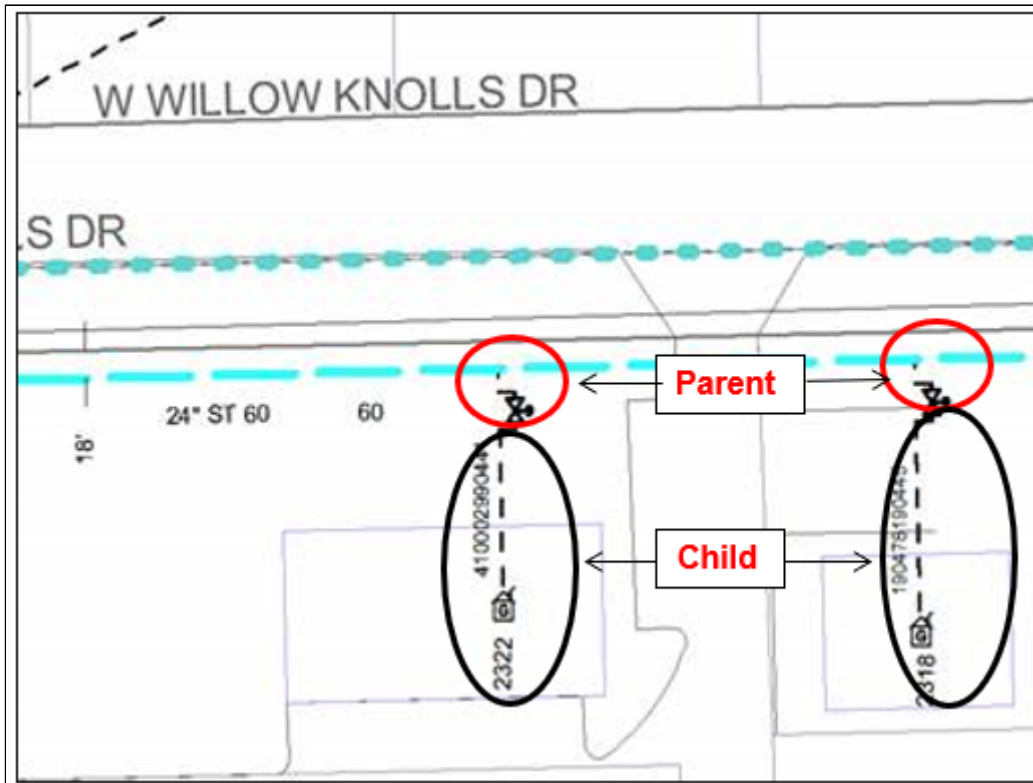

Figure 4. Child and Parent illustration

9.0 Mapping a Branch Service

- 9.1 Each section of a branch service shall be associated to the main servicing it.
- 9.2 Branch services should be graphically drawn to accurately represent its point of origin, off of the existing or primary service line, to its premise.
- 9.3 Care should be taken to assign the proper Service Drop number and Maximo Service Asset number to the correct service segment. See Figure 5.

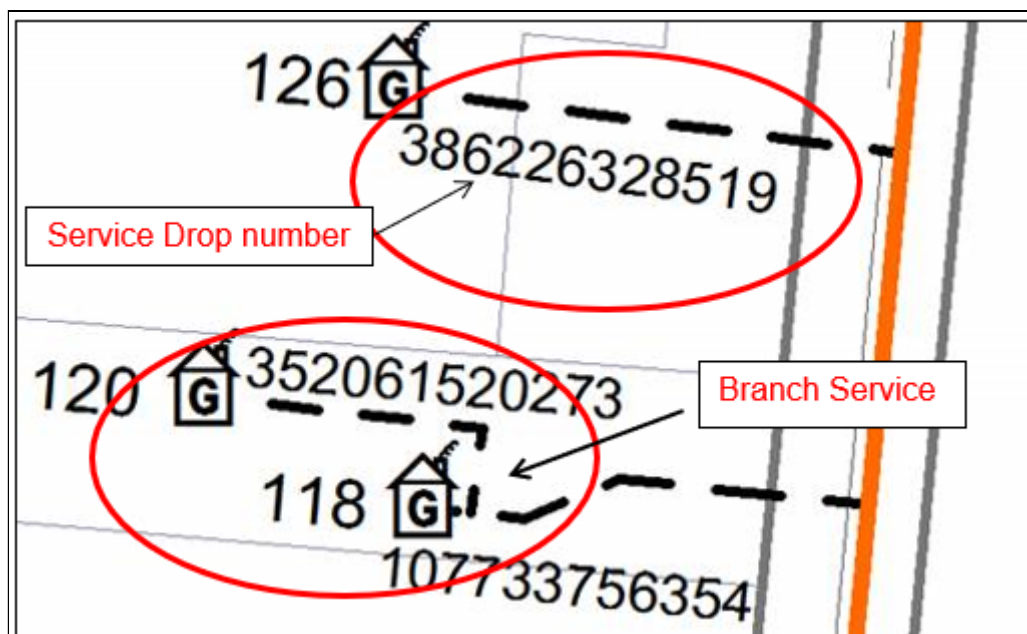

Figure 5. Service Drop Number

10.0 Mapping a Replaced Service

10.1 If a service that has previously been mapped in G/Tech is replaced, no mapping changes are required in G/Tech.

10.2 If the replaced service is being attached to a new or different main a mapping change is required. See [Section 13.0](#).

10.3 If a service is replaced that has not been mapped in G/Tech. follow the steps for mapping a new gas service.

11.0 Mapping a Retired Service

11.1 A service that has been retired will be mapped as an abandoned service.

11.2 Maximo will maintain the attributes and retirement date for the retire service.

11.3 The Service Drop number and Maximo Service Asset number shall stay with the retired service to maintain relationship to the service attribute record in Maximo.

12.0 Mapping a Stub Service

12.1 Each stub service shall be mapped according to [ABND 2.1](#).

12.2 An existing service drop number and Maximo Service Asset number should remain associated with the stub service.

This will allow a reference for tapping information, location dimensions and material records.

12.3 If no service drop number exists for the stub service, then enter zero, "0", for the service drop number.

13.0 Mapping a Transferred Service

13.1 When the service connection changes to a different main, the ownership of the service shall be changed to the new main.

13.2 When the service connection changes to a different main, the gas meter point association on the premise attribute shall be corrected to the new main.

End of Instructions.

Revision Notes

Location of Changes	Summary of Changes
STLP 2.3	New Section – Squeeze-off Steel Pipe
STLP 4	New Section – Forms and Reference Materials

STLP 1 Requirements

1.0 Purpose

The purpose of this document is to prescribe the requirements for installing steel pipe for transmission lines, high pressure distribution and distribution mains, and service lines in accordance with 49 CFR Part 192 Subpart B and Subpart C.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Joining](#)

[6.0 Bends and Elbows \(49 CFR §192.313\)](#)

[7.0 Casing Requirements \(49 CFR §192.323\)](#)

[8.0 Pipe Coating and Corrosion Control](#)

[9.0 Damage During Construction](#)

[10.0 Buried Pipe Examination](#)

[11.0 Corrosion and Steel Damage Evaluation](#)

[12.0 Pipe Thread Sealers](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Construction Services Personnel
- Construction Inspectors

4.0 General

4.1 Steel Pipe Design

4.1.1 For steel pipe design and determination of design pressure, see [STLP 2.2](#).

4.1.2 For steel pipe stock code tables, see [STLP 2.2 Appendix A](#).

4.2 Steel Pipe Design Records (49 CFR §192.127)

4.2.1 For steel transmission pipelines, Ameren Illinois (AIC) shall maintain records which document the pipe design and design pressure for the life of pipeline.

4.2.2 For steel transmission pipelines installed on or before July 1, 2020, if AIC does not have the appropriate records to verify a pipeline's MAOP, a reconfirmation of the MAOP may be required.

4.2.3 GTE and Integrity Management will ensure the records are properly maintained and will make the determination of which transmission pipeline segments will require MAOP reconfirmation.

4.3 Material Identification and Verification

4.3.1 Steel pipe, coated or bare, shall have permanent markings in accordance with the specification in which it was manufactured and that are included in Ameren Illinois (AIC) steel pipe specifications. If these markings have faded and are no longer readable, the steel pipe shall not be installed.

4.3.2 Heat number is typically located on both ends of the pipe. If the section of pipe containing the heat number is removed, the heat number shall be manually transferred to the outside of the remaining pipe segment. A permanent marker shall be used to record the heat number.

4.3.3 Transmission pipelines shall have traceable, verifiable and complete records that document the physical characteristics of the pipe to include:

1. Pipe diameter,
2. Wall thickness,
3. Seam type,
4. Yield strength,
5. Ultimate tensile strength,
6. Chemical composition of pipe material.

4.3.4 Transmission pipeline records shall also include tests, inspections and attributes required by the manufacturing specifications at the time the pipe was manufactured or installed.

Chemical composition and other tests are recorded on the Mill Test Reports (MTRs).

4.3.5 Valves installed on transmission pipelines shall have records documenting the manufacturing standard and pressure rating to which each valve was manufactured and tested.

4.3.6 Flanges, fittings, branch connections, extruded outlets, anchor forgings and other components installed on transmission pipelines after December 31, 2020 with material yield strength of 42,000 psi (X42) or greater and nominal diameter greater than 2 inches shall have records documenting the manufacturing specifications in effect at the time of manufacturing including:

1. Yield strength,
2. Ultimate tensile strength, and
3. Chemical composition.

Records for fittings 2 inches and smaller should be kept when available.

4.3.7 These material records shall be retained for the life of the pipeline.

4.3.8 Transmission pipelines installed on or before July 1, 2020 which do not have the records necessary to establish the MAOP of the pipeline segment may require reconfirmation of MAOP as determined by Integrity Management.

4.4 For additional construction requirements, see [MAIN 1](#) for main installations and [SERV 1](#) for service line installations.

5.0 Joining

5.1 Welding is the preferred method for joining steel pipe. See [WELD 2.3](#) Construction of Pipelines and Piping Systems and [WELD 4](#) for acceptable welding processes and procedures.

5.2 Threading is acceptable for joining steel pipe that is used for aboveground assemblies such as meter sets, pressure control stations, odorization stations, compressor stations, etc.

5.3 Threaded caps are approved for use in abandoning gas facilities. See [ABND 2.1](#).

6.0 Bends and Elbows (49 CFR §192.313)

6.1 A field bend in steel pipe must not impair the serviceability of the pipe.

6.2 Make bends before joining the lengths of steel pipe together.

6.3 Each bend must be free from buckling, cracks, or any other mechanical damage.

6.3.1 When bending steel pipe, ensure that the coating is not damaged, and the pipe is not kinked. **Wrinkle bends are prohibited.**

6.3.2 When bending coated pipe, place belting between the bending shoe and the pipe.

6.4 On pipe containing a longitudinal weld, the longitudinal weld must be as near as practicable to the neutral axis of the bend unless:

6.4.1 The bend is made with an internal bending mandrel, or

6.4.2 The pipe has outside diameter of 12 inches or less, or diameter-to-wall thickness ratio less than 70.

6.5 The minimum bending radius for steel pipe is 12 times the outside diameter. See Table 1 for minimum bend radius.

Table 1: Minimum Bend Radius

Steel Pipe Size	Minimum Bend Radius
3/4"	13"
1 1/4"	20"
2"	29"
3"	42"
4"	54"
6"	80"
8"	104"
10"	129"

- 6.6 After the bending process, nondestructive testing must be performed on each circumferential weld located where stress during bending causes a permanent deformation in the pipe.
- 6.7 Fittings should be used when bending the pipe is not feasible or possible.
- 6.8 Wrought steel welding elbows and transverse segments of these elbows may not be used for changes in direction on steel pipe that is 2 inches or more in diameter unless the arc length, as measured along the crotch, is at least 1 inch.

7.0 Casing Requirements (49 CFR §192.323)

- 7.1 See [STLP 2.1](#) for casing installation requirements.

8.0 Pipe Coating and Corrosion Control

- 8.1 See [CORR 2.3](#) for approved pipe joint coatings and proper application of coatings.
- 8.2 See [CORR 1](#) for corrosion control requirements.
- 8.3 All 2-inch and larger coated steel pipe installations greater than 100 feet in length, including field coated and wrapped joints, shall have the coating tested ("jeeped") with a "holiday detector". See [CORR 2.3](#) for coating testing requirements.
- 8.4 All defects found in the pipe's protective coating shall be repaired. See [CORR 2.3](#) for coating repair methods.

9.0 Damage During Construction

- 9.1 Each imperfection or damage that impairs the serviceability of a segment of steel pipe must be repaired or removed.
- 9.2 See [REPR 1](#) for repair requirements.

10.0 Buried Pipe Examination

- 10.1 A Buried Pipe Examination form must be completed whenever an existing gas carrying steel main or service is exposed and will be left in service after the DOJM/WO project has been finalized. See [CORR 1](#).

11.0 Corrosion and Steel Damage Evaluation

- 11.1 Whenever there is corrosion or damage to an existing gas carrying steel main or service, a Corrosion and Steel Damage Evaluation must be completed by the Corrosion Control person for the area or a person qualified to evaluate corrosion or damage to the steel pipe. See [CORR 1](#) for instructions.

12.0 Pipe Thread Sealers

- 12.1 All threaded connections should be made using an approved pipe thread sealer or gas thread tape.

Table 2: Approved Pipe Thread Sealers

Stock No.	Product	Maximum Pressure	Temperature Rating	Shelf Life	HMS (Table 3)
4922421	J.C. Whitlam T-U Type 555, 8 oz	3,000 psig	-50°F thru 400°F	None	H0, F2,

UNCONTROLLED IF PRINTED

	Note (1)				R0, PA
3052500	Bakerseal, 16 oz Note (2)	No max pressure	0°F thru 600°F	2 years	H1, F1, R0, PB
3052532	Hercules Real-Tuff	2,600 psig	-200°F thru 550°F	2 – 3 years	H0, F0, R0, PA

Revision Notes

Location of Changes	Summary of Changes
Section 12.0	Removed Subsection 12.2 which was specifications for thread sealer. Specifications are the responsibility of Gas Standards and do not need to be in O&M

STLP 2.1 Casing Pipe Installation

1.0 Purpose

This document specifies the requirements and design for a casing pipe installation.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Casing Installation](#)

[6.0 Link-Seal Installation](#)

[7.0 Gel Filled Casing](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Field Personnel
- Gas Supervisors
- Corrosion Control Supervisors
- Corrosion Control Specialist
- Gas Construction Services personnel

4.0 General

- 4.1 Casings are installed when required for a railroad or highway crossing in order to allow the section of pipe under the crossing to be replaced without disturbing the facility being crossed.
- 4.2 Casing installations, for the purpose of this document, involve:
- 4.2.1 A steel or PE carrier pipe, and
- 4.2.2 A steel casing pipe.

Carrier pipe (gas main) must be coated and protected steel. Bare steel pipe is recommended for casing pipe but steel pipe with old coating can also be used.

- 4.3 Casings must be designed to withstand external loads.

5.0 Casing Installation

- 5.1 Refer to [Figure 1](#) for typical casing installation. Refer to [Table 1](#) for casing pipe sizes and required number of end seal links (Link Seals, [Figure 2](#)) for a given carrier pipe size.
- 5.2 Install vents before installing carrier pipe. The vents shall be a minimum of 2" pipe. If vents are installed on a casing, then the casing must be vented away from potential

sources of ignition. The vent termination must be protected to prevent rain water, insects, etc. from entering the casing.

- 5.3 Pipe insulators for steel carrier pipe must be installed in accordance with manufacturer's specifications to separate the carrier pipe from the casing. See [Figure 3](#).
- 5.4 If a steel carrier pipe is installed in a steel casing, the carrier pipe and casing must be electrically isolated. If a steel carrier pipe is installed in a steel casing, the carrier pipe and casing shall be electrically isolated. Attach 2 tracer wires to the carrier pipe ([Figure 1](#)) and terminate the wires above ground in a test box. Refer to [CORR 2.7 Section 10.0](#) Short Investigation and Clearing Shorted Pipelines, Casings.
- 5.5 The ends of the casing pipe must be sealed using end seals (Link Seals).
- 5.6 When backfilling, maintain clearance between vent pipe and carrier pipe.
 - 5.6.1 Support casing end and carrier pipe extending from casing with concrete blocks, as necessary, to maintain alignment during backfilling.
 - 5.6.2 Use fiberglass insulators or approved material to protect coated carrier pipe.
- 5.7 Install pipeline signs on each casing vent.

Figure 1: Typical Casing Installation

Figure 2: Link Seal

Figure 3: Insulator

Table 1: Casing Sizes, End Seals (Link Seals) and Insulators

Carrier Pipe Size	Casing Pipe Size	Links Required	Link Seal Number	Link Seal Stock No.	Insulator Stock No.
3/4"	3"	4	LS-300-C	19 12 049	
1 1/4"	3"	4	LS-300-C	19 12 049	25 59 108
2"	4"	6	LS-300-C	19 12 049	25 59 057
4"	8"	7	LS-475-C	19 12 051	25 59 086
6"	10"	10	LS-475-C	19 12 051	25 59 061
8"	12"	12	LS-475-C	19 12 051	25 59 062
10"	14"	10	LS-425-C	19 12 050	25 59 115
12"	16"	12	LS-425-C	19 12 050	

6.0 Link-Seal Installation

- 6.1 Link-seals are packaged preassembled in 10-link units. Add or subtract links as required. See [Table 1](#) for required number of links.
- 6.2 *3/4" Carrier in 2" Casing only:* Use 2" casing for 3/4" carrier pipe by belling out ends to accommodate end seals. See Figure 4.

Figure 4: 3/4" Carrier in 2" Casing

- 6.3 Connect the first and last links to form a loose belt around the carrier pipe.
- 6.4 Each nut fits into a special pocket in its pressure plate which prevents the nut from turning when the bolt head is tightened. Make sure a pressure plate is installed under each bolt head and nut. See Figure 5.

Figure 5: Link assembly

- 6.5 Slide the assembled link-seal into the angular space between the carrier pipe and casing.
- 6.6 Tighten the bolt heads. The elongated pressure plates compress the rubber links which expand to form a continuous seal between carrier pipe and casing.
- 6.7 Coat exposed bolt heads on seal with an approved coating material.

7.0 Gel Filled Casing

- 7.1 Gas Tech Engineering, in consultation with Corrosion Control personnel, will provide detailed plans and instructions on gel filling procedures. See Figure 6.

Figure 6: Typical Casing Gel Filler Details

- 7.2 The enclosure and vent valve shown (Figure 7) are samples of the equipment that Gas Tech Engineering or Corrosion Control may want to install on the casing vent stacks.

Enclosure for Probe, Cable, and Connector

Casing Stack Vent Valve

4.0 General	Added 4.3 – Casing must be designed to withstand external loads.

STEEL PIPE

May 15, 2022

STLP 2.2 Design Pressure**1.0 Purpose**

This document specifies the design formula, design parameters and typical values applicable to steel pipeline design in accordance with 49 CFR §192.105.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 Procedures](#)**

Appendices

[Appendix A - Steel Pipe Stock Code Table](#)**3.0 Target Audience**

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)

4.0 Procedures**4.1 Design Formula (49 CFR §192.105)**

The design pressure for steel pipe is determined in accordance with the following formula:

$$P = (2St/D) \times F \times E \times T$$

P = Design pressure in psig

S = Yield strength in psi

D = Nominal outside diameter of the pipe in inches

t = Nominal wall thickness of the pipe in inches

F = Design factor (see [4.4](#) below).

E = Longitudinal joint factor (see [4.5](#) below)

T = Temperature derating factor (see [4.6](#) below)

4.2 Nominal Outside Diameter

Table 1 shows the nominal outside diameter (D) for commercial pipe in accordance with ASTM A53 and API 5L.

Table 1: Pipe Size and Nominal Outside Diameter (D)

Nominal Pipe Size (NPS)	Nominal Outside Diameter (inches)	Nominal Pipe Size (NPS)	Nominal Outside Diameter (inches)	Nominal Pipe Size (NPS)	Nominal Outside Diameter (inches)
3/4	1.050	5	5.563	22	22.000

UNCONTROLLED IF PRINTED

1	1.315	6	6.625	24	24.000
1-1/4	1.660	8	8.625	26	26.000
1-1/2	1.900	10	10.750	28	28.000
2	2.375	12	12.750	30	30.000
2-1/2	2.875	14	14.000	32	32.000
3	3.500	16	16.000	34	34.000
3-1/2	4.000	18	18.000	36	36.000
4	4.500	20	20.000	42	42.000

4.3 Nominal Wall Thickness (49 CFR §192.109)

4.3.1 Nominal wall thickness (t) is shown in [Appendix A](#), Steel Pipe Stock Code Table. Wall thickness for pipe not listed can be found in Pipe Fitters Handbook, ASTM A53, or API 5L.

4.3.2 If the wall thickness is not known, refer to procedures in 49 CFR §192.109 that describe how to obtain the wall thickness through actual measurements.

4.3.3 Additional wall thickness required to protect the pipe from anticipated external pressure or loads may not be included in computing design pressure.

4.4 Design Factor (49 CFR §192.111)

4.4.1 Use Table 2 to determine the design factor to be used in the design formula, unless there is an exception ([Section 4.4.2](#)):

Table 2: Class Location and Design Factor (F)

Class Location	Design Factor (F)
1	0.72
2	0.60
3	0.50
4	0.40

4.4.2 Exceptions:

1. A design factor of 0.60 or less must be used for steel pipe in Class 1 locations that:
 - 1 a. Crosses the right-of-way of an un-improved public road, without a casing;
 - 1 b. Crosses without a casing, or makes a parallel encroachment on the right-of-way of; a hard-surfaced road, a highway, a public street, or a railroad.
 - 1 c. Is supported by a vehicular, pedestrian, railroad, or pipeline bridge; or
 - 1 d. Is used in a fabrication assembly, (including separators, mainline valve assemblies, cross-connections, and river crossing headers) or is used within five pipe diameters in any direction from the last fitting of a fabricated assembly, other than a transition piece or an elbow used in place of a pipe bend which is not associated with a fabricated assembly.

2. For Class 2 locations, a design factor of 0.50 or less must be used for uncased steel pipe that crosses the right-of-way of a hard-surfaced road, a highway, a public street, or a railroad.
3. For Class 1 and Class 2 locations, a design factor of 0.50 or less must be used for:
 - 3 a. Steel pipe in a compressor station, or measuring station, and
 - 3 b. Steel pipe, including a pipe riser, on a platform located in inland navigable waters.

4.4.3 A design factor for Class 3 or Class 4 locations should be used for Ameren Illinois' gas systems.

4.5 Longitudinal Joint Factor (49 CFR §192.113)

4.5.1 Use [Table 3](#) to determine the longitudinal joint factor to be used in the design formula. If the type of longitudinal joint cannot be determined, the joint factor must not exceed that designated for "Other."

Table 3: Longitudinal Joint Factor (E)

Specification	Pipe Class	Longitudinal Joint Factor (E)
ASTM A53/A53M	Seamless	1.00
	Electric resistance welded	1.00
	Furnace butt welded	0.60
ASTM A106	Seamless	1.00
ASTM A333/A333M	Seamless	1.00
	Electric resistance welded	1.00
ASTM A381	Double submerged arc welded	1.00
ASTM A671	Electric-fusion-welded	1.00
ASTM A672	Electric-fusion-welded	1.00
ASTM A691	Electric-fusion-welded	1.00
API 5L	Seamless	1.00
	Electric resistance welded	1.00
	Electric flash welded	1.00
	Submerged arc welded	1.00
	Furnace butt welded	0.60
Other	Pipe over 4 inches	0.80
	Pipe 4 inches or less	0.60

4.6 Temperature Derating Factor (49 CFR §192.115)

4.6.1 Use Table 4 to determine the temperature derating factor to be used in the design formula:

Table 4: Temperature Derating Factor (T)

Gas Temperature	Temperature Derating Factor (T)
250°F or less	1.000
300°F	0.967

350°F	0.933
400°F	0.900
450°F	0.867

4.6.2 For intermediate gas temperatures, the derating factor is determined by interpolation.

4.7 Steel Pipe Stock Code Table

4.7.1 See [Appendix A](#).

4.8 Dual Coat Steel Pipe

4.8.1 Dual coated pipe shall be coated with Fusion Bonded Epoxy (FBE) and with an Abrasive Resistant Overlay (ARO) in accordance with [CORR 2.3 Section 4.1.2](#) Directional Drilling Installation.

4.8.2 Mil thickness of ARO varies significantly between pipe manufacturers depending on current orders. The total coating thickness must be measured with a dry film coating thickness detector in order to determine inspection voltage. See [CORR 2.3 Section 11.0](#) Coating Inspection.

4.8.3 All stock coded dual coated pipe is X-52 pipe and double random length.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Notes:

- (1) Pipe Manufacturers classify this wall thickness as Non-Schedule pipe.
- (2) All design calculations must use Class 3 design factor.
- (3) Yield (psi) - Yield strength shown in table is minimum strength.
- (4) Multi-stenciled pipe will indicate a range of yield strengths and pipe grades. Pipe shall be inspected prior to use to ensure it meets yield strength requirements for its planned MAOP.
- (5) Coating - FBE is Fusion Bonded Epoxy, ARO - Abrasive Resistant Overlay
- (6) AIC-approved pipe specifications can be found on the Gas Standard and Procedures SharePoint site under Specifications & Standards or by clicking on the following link: [HERE](#)

STEEL PIPE

October 1, 2022

STLP 2.3 Steel Pipe Squeeze Off

1.0 Purpose

The purpose of this document is to prescribe the basic procedures for squeezing steel pipe in an emergency situation when an immediate shut-down of gas flow is required to minimize an imminent hazard to life or property.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Safety](#)

[5.0 Preparation](#)

[6.0 Squeeze-Off Operation](#)

[7.0 Squeeze-Off Removal](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS)
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Construction Services Personnel
- Construction Services Personnel
- Construction Inspectors

4.0 Safety

- 4.1 Extreme caution must be used when squeezing steel pipe that is under pressure due to potential of the pipe splitting through a weld seam especially in the older vintage steel pipe.
- 4.2 The squeeze-off point should be in a non-hazardous environment. If the squeeze off is to be performed in a hazardous gas environment, gas field personnel should follow procedures in [WIGE 2.1](#) Hazardous Environment
- 4.3 Sufficient qualified manpower shall be on-site to:
 - 4.3.1 Keep unauthorized personnel from accessing the work area.
 - 4.3.2 Minimize the number of people around the area of the squeeze-off.
 - 4.3.3 Operate a fire extinguisher located upwind of but near where the squeeze-off is being performed.
- 4.4 Prior to beginning a squeeze-off operation:
 - 4.4.1 A second squeeze-off point location should be identified and made accessible. The location should be in a non-hazardous environment in the event the pipe splits at the first location. OR
 - 4.4.2 An isolation valve should be located and accessible. OR

UNCONTROLLED IF PRINTED

- 4.4.3 A line stopper fitting is either on-site or can be on-site within a reasonable time along with qualified installation personnel.

If there is concern that the pipe would split, Do Not attempt the squeeze

5.0 Preparation

- 5.1 The individual performing the squeeze-off shall be operator qualified, experienced in squeezing steel pipe and in operating the squeeze-off tool.
- 5.2 Ensure the squeeze-off tool is the proper size for the pipe being squeezed.
- 5.3 Ensure the squeeze-off tool will operate properly by inspecting for evidence of misuse, oil leaks, corrosion and lack of freedom of all moving parts.
- 5.4 Follow manufacturer's operating instructions. See to [STLP 4](#) Forms and Reference Materials.
- 5.5 Clean the area and inspect the pipe for physical damage or corrosion. Do not operate tool if any damage or corrosion is identified.

6.0 Squeeze-Off Operation

- 6.1 Locate the squeeze point a minimum of 3 pipe diameters from a girth weld or a fitting.

When locating squeeze point, remember that the squeezed-off point section of pipe will have to be isolated, removed and replaced with new section of pipe before initializing normal flow

- 6.2 If applicable, remove the locking pin allowing the yoke to swing freely.
- 6.3 Center the squeeze tool on the pipe.
- 6.4 Close the yoke and insert pin completely through the yoke.
- 6.5 Ground the squeeze tool.
- 6.6 Engage pump controls and pressurize the squeeze tool steadily against the pipe.
- 6.7 Pump the squeeze tool until flow control, typically a manageable leak rate of approximately 2%, has been achieved. 100% bubble tight closure should not be expected.

7.0 Squeeze-Off Removal

- 7.1 Before the squeeze-off tool can be removed, that portion of pipe will have to be isolated, removed and replaced before initializing normal flow.

Install electric bonding cable across the proposed cut location prior to cutting and separating the steel pipe. Reference [ACIG1-Paragraph 4.3.1](#)

7.2 Once the segment is isolated, release the pressure and confirm uniform squeeze blade retraction to full-up position.

7.3 Remove the squeeze tool from the pipe.

7.4 The removed pipe segment shall be in accordance with [REPR 1 Paragraph 6.1.3](#) minimum length of replacement segment.

Operator Qualification (OQ) Required?

YES

1.0 Purpose

This document describes the requirements and design considerations for weld fittings, weld transition fittings, and weld end insulators approved for use at Ameren Illinois (AIC).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Weld Fittings \(49 CFR §192.149\)](#)

[5.0 Weld Transition Fittings](#)

[6.0 Weld End Insulators](#)

Appendices:

[Appendix A - Elbows and Returns](#)

[Appendix B - Reducing Elbows](#)

[Appendix C - Tees](#)

[Appendix D - Reducing Tees and Concentric Tees](#)

[Appendix E - Caps](#)

[Appendix F - Unions](#)

[Appendix G - Quick Opening Closures](#)

[Appendix H - Weld Transition Fittings](#)

[Appendix I - Weld End Insulators](#)

3.0 Target Audience

- Gas Engineering
- Gas Field Personnel - Welders
- Gas Supervisors
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Supervisors
- Gas Storage Field Operators
- Gas Construction Services Supervisors
- Contract Welders
- Welding Inspectors

4.0 Weld Fittings (49 CFR §192.149)

4.1 The term "Weld Fitting" applies to butt weld fittings such as elbows, tees, caps, return bends, reducers, crosses, laterals, and factory welded extensions and transition sections common to line pipe interconnection.

4.2 Design Considerations

4.2.1 All weld fittings installed shall have a wall thickness consistent with the requirements for design stress and welding procedure. They shall be pressure rated or

have the capability of being pressure tested to at least meet the MAOP of the pipe the fitting is being attached.

4.2.2 Heavier wall fittings may be welded to thinner wall line pipe by tapering the joint area per [WELD 2.3 Appendix A](#) or by reboring, provided the chemical and physical properties of the pipe and fitting are comparable, and the remaining minimum wall thickness meets stress requirements.

4.2.3 Fittings intended to mate with hi-test line pipe must be so specified on requisition and the pipe specification, wall thickness, and MAOP given. Fittings of these higher stress levels may be tapered or special bored only by the manufacturer. Tapered transition pieces, machined to the proper dimensions, are to be used when tapering or reboring is not recommended.

4.3 See the following Appendices for stock codes for approved weld fittings.

4.3.1 [Appendix A - Elbows and Returns](#)

4.3.2 [Appendix B - Reducing Elbows](#)

4.3.3 [Appendix C - Tees](#)

4.3.4 [Appendix D - Reducing Tees and Concentric Tees](#)

4.3.5 [Appendix E - Caps](#)

4.3.6 [Appendix F - Unions](#)

4.3.7 [Appendix G - Quick Opening Closures](#)

5.0 Weld Transition Fittings

5.1 Special tapering is required on steel line pipe butt welds when adjoining wall thicknesses exceed the maximum allowable offset as follows:

5.1.1 3/32" (0.094") for hoop stress equal to or greater than 20% SMYS, or

5.1.2 1/8" (0.125") for hoop stress less than 20% SMYS.

5.2 When a transition taper is required in the pipe and/or fitting, it shall be made using a mechanical end preparation machine or by manual preparation.

5.3 The transition fitting shall be manufactured from pipe having a yield strength equal to that of the pipe or fitting to be mated to the tapered end. The minimum wall thickness after tapering must meet the MAOP requirements determined for the pipeline by the design formula.

5.4 See [Appendix H](#), Weld Transition Fitting Specifications.

6.0 Weld End Insulators

6.1 See [Appendix I](#) for stock codes for approved weld end insulators.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Note (1): Wall thicknesses shown in the tables are manufacturer's standard insulator wall thicknesses which are kept in stock. Specific wall thicknesses other than those shown above can be requested with the understanding there may be a significant lead time.

STEEL PIPE

STLP 3.2 Reinforcing Saddles

1.0 Purpose

This document describes the requirements and design considerations for reinforcing saddles, regular and full-encirclement, approved for use at Ameren Illinois (AIC) and in accordance with 49 CFR §192.155.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Installation](#)

Appendices:

[Appendix A - Saddles](#)

3.0 Target Audience

- Gas Engineering
- Gas Field Personnel – Welders
- Gas Supervisors
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Supervisors
- Gas Storage Field Operators
- Gas Construction Services Supervisors
- Contract Welders
- Welding Inspectors

4.0 General

- 4.1 Reinforcing saddles are **not** required when the maximum allowable operating pressure (MAOP) is less than 100 psig and the opening is 2" or smaller with a branch to header ratio less than 25%.
- 4.2 Regular type reinforcing saddles are required for MAOPs greater than 100 psig and when the branch to header ratio is between 25% and 50%.
- 4.3 Full encirclement reinforcing saddles are required for MAOPs greater than 100 psig and when the branch to header ratio is 50% or greater.

For pressure greater than 350 psig, contact Gas Tech Engineering.

- 4.4 Refer to Table 1 as a guide for choosing reinforcing saddles for MAOPs greater than 100 psig.

Table 1: Selection of Reinforcing Saddles for MAOPs Greater than 100 psig

Nominal Header	Nominal Branch
----------------	----------------

	1 1/4	2	3	4	6	8	10
2	F	F					
3	R	F	F				
4	R	F	F	F			
6	--	R	F	F	F		
8	--	R	R	F	F	F	
10	--	--	R	R	F	F	F
12	--	--	R	R	F	F	F
14	--	--	--	R	R	F	F
16	--	--	--	R	R	F	F
	--	Reinforcing not normally required.					
	R	Regular type reinforcing saddle required.					
	F	Full Encirclement reinforcing saddle required.					

- 4.5 Weldolets that meet ASME B31.8 requirements for reinforcement area are an approved substitute for both a regular and a full encirclement reinforcing saddle for all pressure ranges and all sizes and ratios of header and branches.
 - 4.5.1 Weldolets are designed so that they have enough area in the fitting itself to meet the requirements for extra reinforcement area that is not provided by the branch and header pipe walls.
 - 4.5.2 Weldolets must be selected according to the specifications and requirements set forth in the manufacturer's catalog.
 - 4.5.3 Weldolets may also be used on branches that do not require additional reinforcement as their shape allows for more efficient fluid flow.

5.0 Installation

Reinforcing saddles are not intended to retain internal pressure.

- 5.1 Regular and full encirclement saddles ([Appendix A](#)) are installed over a shaped nipple initially welded to the header piping.
- 5.2 Any required non-destructive testing (NDT) shall be performed on fitting welds prior to installing reinforcing saddles.
- 5.3 Regular Type Reinforcing Saddle
 - 5.3.1 A regular type reinforcing saddle is installed as follows ([Figure 1](#)):
 1. Weld shaped nipple to header piping.
 2. Weld reinforcing saddle to header piping with a full fillet weld.
 3. Weld reinforcing saddle to shaped nipple outlet with a full fillet weld.
 4. **Do not** weld vent hole close. Vent prevents gas build-up under the reinforcing saddle.
 5. Coat with an approved coating material. See [CORR 2.3](#) Coatings.

Figure 1: Regular Type Reinforcing Saddle - Typical Installation

5.4 Full Encirclement Reinforcing Saddle

5.4.1 A full encirclement reinforcing saddle is installed as follows ([Figure 2](#)):

1. Weld shaped nipple to header piping.
2. Clamp saddle in position and weld longitudinal seams. There should be an approximately equal progression of welding down each side seam until completion, i.e., make a pass down one side then down the other side. See [WELD 4](#) for approved In-Service Welding (IS) procedures and joint designs.
3. Weld full encirclement reinforcing saddle to the carrier pipe with a full fillet circumferential weld. Weld one end at a time and allow the weld to cool before welding the other end.
4. Weld full encirclement reinforcing saddle to shaped nipple outlet with a full fillet weld after the saddle end welds have cooled.
5. Do not weld vent hole closed. Vent prevents gas build-up under the reinforcing saddle.
6. Coat with an approved coating material. See [CORR 2.3](#) Coatings.

Figure 2: Full Encirclement Reinforcing Saddle - Typical Installation

End of Instructions.

Operator Qualification (OQ) Required?

YES

1.0 Purpose

This document describes the requirements for steel flanges and flange assembly, approved for use at Ameren Illinois (AIC) in accordance with 49 CFR §192.147.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Flange Assembly](#)

[6.0 Tightening Sequence](#)

Appendices:

[Appendix A - Weld Neck - Raised Face](#)

[Appendix B - Weld Neck - Flat Face](#)

[Appendix C - Screwed - Flat Face](#)

[Appendix D - Blind](#)

[Appendix E - Lap Joint](#)

[Appendix F - Flange Stud Bolts](#)

[Appendix G - Gaskets](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Construction Services Supervisors
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 General

- 4.1 Flanges, due to additional stress requirements for their configurations and bolted connections, are entities which require separate consideration from other fittings for technical reasons.
- 4.2 Two types of weld neck flanges are available:
- 4.2.1 Regular double-taper type (ANSI B16.5) in sizes 1/2" to 24" nominal.
- 4.2.2 Single-taper type (MSS SP-44) in sizes 12" nominal and larger. Although material specifications and manufacturing processing are identical, the addition of metal in the weld neck area of the single-taper design favors their use on all hi-test line pipe installations 12" and larger.

- 4.3 Flanges installed in the AIC gas system are either iron or steel. Steel flanges may be referred to by any of the following designations. All have the same meaning: "Class 150" or "Series 15" or "A.S.A. 150" or "150 pound" or "150 lb".
- 4.4 Table 1 provides maximum allowable operating pressure for the various flanges.

Table 1: Maximum Allowable Operating Pressure for Flanges

Steel (ANSI B16.5) All Sizes		Iron (ANSI B16.1) Sizes 1 thru 12	
Class	Maximum Operating Pressure (psig)	Class	Maximum Operating Pressure (psig)
150	285	125	200
300	740	250	500
400	985	Contact Engineering for iron pipe sizes 14 thru 24 inch.	
600	1,480		
900	2,220		

MAOP rating for steel flanges decreases when flange temperature exceeds 100°F. MAOP rating for iron flanges decreases when flange temperature exceeds 150°F. Contact Div. Engineer, GTE or GSE for MAOP at higher temperatures.

- 4.5 Maximum operating pressure of a flange assembly is that of the weaker component.

Exercise care when assembling iron flanges to steel flanges to avoid breaking the relatively brittle iron flange.

- 4.5.1 Class 150 steel flanges may be bolted to Class 125 iron flanges.
- 4.5.2 Class 300 steel flanges may be bolted to Class 250 iron flanges.
- 4.5.3 Flanged end iron or semi-steel valves may have ratings higher than those given above for iron flanges. If valves are rated higher than the iron flanges shown above, bolt to steel flange.
- 4.6 See the following Appendices for stock codes for approved flanges, flange stud bolts and gaskets.
 - 4.6.1 [Appendix A](#) - Weld Neck - Raised Face
 - 4.6.2 [Appendix B](#) - Weld Neck - Flat Face
 - 4.6.3 [Appendix C](#) - Screwed - Flat Face
 - 4.6.4 [Appendix D](#) - Blind
 - 4.6.5 [Appendix E](#) - Lap Joint
 - 4.6.6 [Appendix F](#) - Flange Stud Bolts
 - 4.6.7 [Appendix G](#) - Gaskets

5.0 Flange Assembly

- 5.1 When assembling the flanges, ensure that the flange gasket seating surface and gasket are free of dirt, metal shavings, weld slag or any other debris which could cause an uneven seat.
- 5.2 Line up the gasket evenly with the inside bore of the flange. No portion of the gasket should extend into the bore of the flange.
- 5.3 The size and length bolts or stud bolts are dependent on the flange type and pressure class. The tables in [Appendix F](#), Flange Stud Bolts, provide the size and minimum bolt length for pressure class 150, 300 and 600 and flange sizes through 12 inch.
 - 5.3.1 For flange sizes not listed, the bolt sizes and minimum length may be found in Pipe Fitters Handbook, flange manufacturer's instructions, or by contacting Gas Engineering, GTE, or GSE.
- 5.4 The bolts or stud bolts shall extend completely through the nuts. Where clearance or safety is an issue, avoid excessive bolt protrusion. **Do not** use washers to reduce the protrusion.
- 5.5 Tighten bolts, ensuring that flange faces are parallel and the bolts are tightened uniformly. Refer to [Section 6.0](#) Tightening Sequence, for the correct sequential order for tightening bolts, depending on the number of bolts.
 - 5.5.1 On the first pass, lightly tighten the first bolt then move directly across or 180° for the second bolt, then move ¼ turn around the circle or 90° for the third bolt and directly across for the fourth. Continue this sequence until all bolts are tightened.
 - 5.5.2 **Do not** snug up bolts on the first pass. This can tilt the flanges out of a parallel seat.
 - 5.5.3 When using an impact wrench, set the wrench at about ½ the final torque for the first pass.

6.0 Tightening Sequence

TAPPING AND STOPPING

October 1, 2021

TAPS 1 Requirements

1.0 Purpose

This document to provide necessary information to ensure personnel perform tapping and stopping procedures on steel lines in a safe, efficient manner, and in accordance with 49 CFR §192.627.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Equipment](#)[6.0 Planning Requirements](#)[7.0 Pre-Job Conference](#)[8.0 Identification of Pipe Before Tapping](#)[9.0 Gauge, Blow-down, and By-pass Fittings](#)[10.0 Testing](#)[11.0 Completion of Tapping / Stopping Operation](#)

Appendices

[Appendix A - Tapping Request Form](#)[Appendix B - Drilling and Stopping Machines - Typical. Images](#)[Appendix C - Testing Consideration - Tapping / Stopping Operation](#)**3.0 Target Audience**

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Supervisors
- Gas Field Personnel
- Gas Field Personnel - Welders
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Technicians
- Gas Construction Services Supervisors
- Contract Gas Construction Company Supervisors
- Contract Construction Inspectors
- Contract Welding Inspectors
- Gas Control

4.0 General

- 4.1 Gas field personnel and contractor personnel must be qualified to perform tapping and stopping operations on a pressurized (live) pipeline.
- 4.2 A Tapping Request Form (see [Appendix A](#)) is required for each hot tapping and/or stopping operation to be performed by contractor, Gas Tech Service (GTS) personnel,

UNCONTROLLED IF PRINTED

or AIC personnel from another Operating Area. It applies to all sizes of steel transmission and high-pressure distribution pipelines, or 2-inch and larger distribution pipelines. The Tapping Request Form can also be found in [TAPS 3](#).

- 4.3 A Qualified Individual shall be present while the stopping equipment is being assembled, installed, tested, and during the stopping operations.
 - 4.3.1 A Qualified Individual should remain with stopping equipment until such time that the monitored pressure variations are found to be satisfactory.

Never leave an open-ended pipeline unattended while stopping equipment is in operation.

- 4.4 Pipe ends shall have an approved weld cap (rated for the pipeline pressure) installed at the end of each day's work so that the stopping equipment can be:
 - 4.4.1 Raised,
 - 4.4.2 Tapping valve closed, AND
 - 4.4.3 Equipment left unattended overnight.
- 4.5 When a valve is being used to isolate the pipeline, the open ends shall be capped as outlined above.
- 4.6 All welding shall be by an in-service welding qualified welder using an approved welding procedure. For in-service welding, see [WELD 2.4](#).
- 4.7 When larger than 12 inch diameter hydraulic stopping equipment is utilized it can be left in operation unattended overnight when:
 - 4.7.1 The pipe has not been cut, OR
 - 4.7.2 The pipe has been capped utilizing approved welding procedures, see [WELD 2.4](#).

5.0 Equipment

- 5.1 Ensure that the tapping and stopping equipment is in good operating condition prior to beginning tapping and stopping operations. See [Appendix B](#) for images of drilling and stopping machines.
 - 5.1.1 Conduct a dry run before beginning a tapping and/or stopping operation.
 - 5.1.2 Any malfunctioning equipment should be tagged out-of-service and properly repaired before being used again.
- 5.2 Mueller and T.D. Williamson (TDW) fittings and equipment are used for all taps and stops for steel pipe sizes from $\frac{3}{4}$ inch through 12 inch. See [TAPS 2.4](#) for Mueller and [TAPS 2.5](#) for T.D. Williamson.
- 5.3 TDW and TEAM fittings and equipment are used for taps and stops *larger than 12 inches*. Ameren Illinois (AIC) gas operations personnel may assist in the installation and tapping / stopping of these fittings under the direction of TDW and TEAM qualified personnel.
- 5.4 Refer to the appropriate manufacturer's operating instructions for details regarding use of tapping and stopping equipment.

- 5.5 The Gas Supervisor or GTS Supervisor shall have access to the operating instructions for the tapping / stopping equipment and make such available for gas field personnel to reference and review prior to performing a tap.
- 5.6 See Table 1 for maximum working pressure and tapping sizes for the available drilling machines.

Table 1: Available Drilling Machines

Drilling Machine	Maximum Working Pressure(psig)	Tap Sizes (Inches)
Mueller E-4	500	1/8 - 1-1/2
Mueller E-5	500	1/8 - 1-1/2
Mueller EH-1	1,200	1/8" - 1-1/2
Mueller D-4	500	1/8 - 2-3/8
Mueller D-5	500	1/8 - 3-3/4
Mueller DH-5	1,200	1/8 - 3-3/4
Mueller C1-36	500	2 -12
T.D. Williamson T-18	1,440	1-5/16 -- 4
T. D. Williamson T-101	1,440	up to 6
T. D. Williamson T-101XL	1,440	up to 6
T. D. Williamson 660	1,440	3 -- 12
T. D. Williamson PS2000 (Plastic Only)	150	4, 6, 8

- 5.7 See Table 2 for maximum working pressure and stopping sizes for the available stopping units.

Table 2: Available Stopping Machines

Stopping Machine	Maximum Working Pressure (psig)	Tap Sizes (Inches)
Mueller Unit No. 1	125	1 - 2-1/2
Mueller Unit No. 2	100	3 -- 4
Mueller Unit No. 3	60	6 -- 8
Mueller Unit No. 3SW	275	4, 6, 8
Mueller Unit No. 3SW-500	500	4, 6, 8
Mueller Unit No. 4SW	500	10 -- 12
T.D. Williamson SHORTSTOPP	60	2 -- 12
T. D. Williamson SHORTSTOPP II	150	2 -- 6
T. D. Williamson SHORTSTOPP 275	275	1-1/2 -- 12

6.0 Planning Requirements

- 6.1 Projects that involve hot taps, bypasses, or stop-offs shall be planned to minimize customer service interruptions.
- 6.2 Brief all personnel who are involved in the project and have a clear understanding of their role during normal and abnormal operations.

- 6.3 GTE, GTS Supervisor, Region Gas Engineer, or Gas Supervisor should contact Gas Control to verify if the affected pipeline is remotely monitored.
 - 6.3.1 If monitoring capability is available for the affected system:
 - 1. Include Gas Control in the planning and scheduling process.
 - 2. Request that Gas Control closely monitor the affected pipeline during the planned project to ensure that no unplanned situation occurs.
- 6.4 When planning for stopping operations, GTE, GTS Supervisor, Region Gas Engineer, or Gas Supervisor shall identify the source of gas supply for all connected main segments.
- 6.5 If using a bypass, or if there are two or more feeds into the area, then install a pressure gauge on the live side of each stopper fitting. Monitor the gauge pressure throughout the stopping operation.
 - 6.5.1 For potential over-pressurization or service interruption, see [PRES 2.1](#).
- 6.6 Equipment Pressure Rating
 - 6.6.1 Ensure the stopper fitting is rated for Design MAOP of the pipeline.
 - 1. However, the tapping, stopping machine, and stoppers shall be rated for the actual operating pressure of the main at the time of Region tapping / stopping operation.
 - 6.6.2 If the tapping, stopping machine, and stoppers have a lower rating than the pipeline MAOP, it will be necessary to lower the actual operating pressure of the pipeline to be within operating limits of the equipment.
- 6.7 Gas Engineer or GTE Engineer will provide the purging plan that is to be included in the job packet. For purging methods, see [PURG 2](#).

7.0 Pre-Job Conference

- 7.1 Conduct a pre-job conference to review special considerations, pertinent information, and job assignments associated with tapping and stopping.
- 7.2 If Gas Control will be involved in monitoring the system during the tapping / stopping operation, establish the line of communication between on-site Gas Supervisor and Gas Control.
- 7.3 Verify the pre-job information for all taps each day prior to performing tapping / stopping operations.
- 7.4 Information to be reviewed may include items such as:
 - 7.4.1 For details on specific content of tool kits, refer to Mueller, T.D. Williamson, or TEAM operating instruction manuals.
 - 7.4.2 [PRES 2.1](#) for potential over pressurization or service interruption.
 - 7.4.3 MAOP of the facility to be tapped and the fitting to be used.
 - 7.4.4 Current operating pressure/limitations.
 - 7.4.5 Blow-down considerations.
 - 7.4.6 Re-pressurization and purge plan.
 - 7.4.7 Tool/equipment requirements.
 - 7.4.8 Responsibilities of involved personnel to include operator qualifications and span of control.

- 7.4.9 Direction and number of feeds.
- 7.4.10 Location and accessibility of isolation valve that will or could be used and method of tagging valve as out of service.
- 7.4.11 Method of communication between qualified field personnel monitoring pressures and tapping / stopping operations.

8.0 Identification of Pipe Before Tapping

- 8.1 Confirm operating pressure to ensure the appropriate tapping and stopping equipment is being used before proceeding with tapping.
- 8.2 Gas field personnel should review applicable maps and records and contact operators of other underground facilities to determine location of other lines which may be in vicinity of the pipeline for tapping.
- 8.3 Verify the line Design MAOP to ensure that the tap fitting is rated for the Design MAOP and not just the operating pressure.
- 8.4 Review the following on the exposed pipe to confirm that the pipe is the one to be tapped:
 - 8.4.1 Outside diameter.
 - 8.4.2 Wall thickness.
 - 8.4.3 Coating.
 - 8.4.4 Pipe material.
 - 8.4.5 Joint connection.
 - 8.4.6 Manufacturer's markings.
- 8.5 If necessary, to ensure the exposed pipe is the proper one, gas field personnel should consider extending the excavation or installing a small tap on the pipe to verify content and/or pressure.
- 8.6 Fitting Placement
 - 8.6.1 Locate the tap on a straight section of pipe.
 - 8.6.2 Do not tap through any girth welds.
 - 8.6.3 If the tap is going through a known longitudinal seam, see [WELD 2.4, Paragraph 6.3.5](#) for inspection requirements.
 - 8.6.4 The pipe to be tapped should be free of any significant external or known internal corrosion.
 - 8.6.5 Checking for pipe wall lamination in transmission lines and 4-inch and larger high-pressure steel distribution mains with MAOP of 100 psig or greater is covered in [WELD 2.4, Paragraph 8.2.1](#).
 - 8.6.6 Do not use tapping or drilling machines in tunnels, manholes, or other places that cannot be vented.
 - 8.6.7 To prevent damage to the stopper, place the line stopper fittings so that the minimum distances listed in Table 3 can be maintained between the fitting and any cutting and welding operations.

Table 3: Minimum Distance to Line Stopper

Line Size (Inches)	Minimum Distance (Inches)	Line Size (Inches)	Minimum Distance (Inches)
--------------------	---------------------------	--------------------	---------------------------

UNCONTROLLED IF PRINTED

	Mueller	T.D. Williamson		Mueller	T.D. Williamson
3/4	6	12		10	22
1	6	13		12	24
1-1/4	6	13		16	N/A
2	8	14		18	N/A
3	10	15		20	N/A
4	12	16		24	N/A
6	14	18		30	N/A
8	16	20			

8.7 Where not possible to maintain the recommended minimum distance between stopper face and cutting or welding operation, place auxiliary cooling means, such as wet burlap or wet rags, around the fitting to reduce the temperature.

9.0 Gauge, Blow-down, and By-pass Fittings

9.1 Fittings installed to facilitate tapping / stopping operations may potentially be reused in the future. When installing them, consider the following:

- 9.1.1 Purpose of installed control fitting.
- 9.1.2 Possible need to use control fitting to isolate main segment in an emergency.
- 9.1.3 Location of mainline valves that could be used to isolate main segment.
- 9.1.4 Accessibility of control fitting.
- 9.1.5 Potential need for relocating main segment.

9.2 Pipeline tapping and stopping operations may require installation of fittings to be used for a gauge tap, blow-down, and/or by-pass.

9.2.1 Valve tees, save-a-valve nipples, weld punch tees or other approved fittings shall be used on transmission and high-pressured distribution pipeline. When selecting a fitting, consider the following:

- 1. Pipe material.
- 2. Pipe wall thickness.
- 3. Blow-down time.
- 4. By-pass capacity.
- 5. Flow volume, cooling effect.
- 6. Pipeline Design MAOP.
- 7. Gas Tech Engineering specification.

9.2.2 After completing the tapping / stopping operation, cap the tee outlet with a threaded steel cap/plug or a weld cap/plug.

9.2.3 Leak test the cap/plug under normal operating pressure with leak detection fluid or a leak detection instrument.

9.2.4 Leave the valve tee in the closed position.

9.2.5 Leave the punch tee positioned as follows:

- 1. Up position on pipelines with MAOP greater than 60 psig.

2. Down position on pipelines with MAOP 60 psig or less.

Since these fittings are considered re-useable, they are exempt from the procedures contained in [ABND 2.1, Section 6.0](#), Services.

10.0 Testing

- 10.1 Test the fittings and associated piping prior to tapping in accordance with [PTST 1, Section 10.0](#).

Because of exposure hazards associated with a possible test failure, take precautions to remove personnel a safe distance from the immediate test site.

- 10.2 If the required test pressure for a bottom-out fitting stopper assembly might exceed the collapse pressure of the carrier pipe, see the procedures outlined in [Appendix C](#).

11.0 Completion of Tapping / Stopping Operation

- 11.1 Refer to the manufacturer's operating instructions for specific details directed to using the tapping machine, stopper unit, and completion operation.
- 11.2 When machines or fittings are removed from live mains or lines, install the completion cap as soon as possible.
- 11.3 Upon completion of tapping / stopping operation, verify with Gas Control (if applicable) that their monitoring parameters have returned to normal operation.

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0641: Visually Inspect Pipe and Components Prior to Installation
- 0801: Welding
- 0811: Visual Inspection of Welding and Welds

Appendix C - Testing Consideration - Tapping / Stopping Operation

If the required test pressure for a bottom-out fitting stopper assembly *might exceed* the collapse pressure of the carrier pipe, follow the procedures outlined below.

Step 1: All pipe and fittings shall be pretested to meet the pressure system's design MAOP before welding to the line stopper. Testing may be done with one large assembly or several smaller assemblies based upon engineering designs. Consideration should be given to minimize the number of tie in welds wherever possible.

Step 2: Cut the tested pipe assembly to make fit-up with the line stopper more manageable.

Step 3: Fit up the bottom of the line stopper to the tested tee assembly and then weld to pipeline.

Step 4: Leak test the final assembly prior to tapping at a minimum of 100 psig and a maximum not to exceed operating pressure. Leak test the tie in welds after tapping.

End of Appendix

TAPPING AND STOPPING

October 1, 2020

TAPS 2.1 Dresser Meter Valve Changer

1.0 Purpose

This document covers the Dresser Standard Pipe Stop Changer that permits changing meter valves while the service line is under pressure with no blowing gas. This enhances public and worker safety when needing to replace a leaking meter valve.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Standard Pipe Stop Changer](#)[6.0 Meter Riser Stop Changer \(5/8" O.D. Tubing\)](#)

Appendices

[Appendix A - Dresser Stop Changer Image](#)**3.0 Target Audience**

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Services Supervisors

4.0 General

4.1 Most meter valves, 2 inches and less, may be removed and replaced if:

- 4.1.1 The port opening is of sufficient size to allow passage of the plugging unit through the valve, AND
- 4.1.2 Valve outlet has iron pipe threads.

4.2 The maximum pressure to which the valve changers can be used is 60 psig.

5.0 Standard Pipe Stop Changer

5.1 This valve changer incorporates a clamping mechanism in the handle assembly for locking handle grip on the tube to prevent changer body from rotating when turning the handle. Attach the handle before installing in the valve.

5.1.1 See [Appendix A](#) for image of Dresser Stop Changer.

5.1.2 See [TAPS 3](#) for Dresser manual.

5.2 Attach handle.

5.2.1 The handle grip, which is two pieces threaded together, must be loose so the handle will slip over the body tube until the operating nut bottoms in the handle socket.

5.2.2 Screw the grip pieces tightly together to squeeze the rubber rings and clamp the grip on the body tube.

UNCONTROLLED IF PRINTED

- 5.3 Ensure that 1) changer is tightened in the valve, 2) vent valve is closed, and 3) meter valve is open. Carefully insert the plug mechanism through the valve ports and completely into the upstream pipe.
- 5.4 Tighten Plug
 - 5.4.1 Expand plug by holding handle grip and rotate the crank clockwise.
 - 5.4.2 Tighten plug until a noticeable increase in torque exists. Also, observe the shaft collar through hole in the handle arm.
 - 5.4.3 When the collar is about 3/4 inch from top of hole, slide the vent valve down slowly and partially uncover the vent hole to check for audible leakage. Continue tightening, if necessary, until audible leakage stops.
 - 5.4.4 Uncover vent hole completely and hold a finger over vent hole momentarily to check for slow leakage.
 - 1. If noticeable popping occurs in covering and uncovering the hole, tighten the plug another turn (or more) until audible popping stops.
 - 2. Avoid over tightening, as this shortens plug life.
- 5.5 When the plug is tightened securely, the handle can be removed, and changer housing removed from the valve. Carefully slide the housing off the body tube so the valve can be removed for replacement.

Do not depend on this device to stop an open pipe way unassisted, since many variables can affect the retention capabilities of a stop changer in a pipe way. Either use a restraining device or restrain the changer body by hand during the valve removal and changing operation.

- 5.6 Removal
 - 5.6.1 The vent valve must be closed. Release the plug by rotating the handle until the shaft is fully returned (i.e., operating nut engages stop collar).
 - 5.6.2 Carefully withdraw the plug assembly through the valve by oscillating or rotating the body slightly to avoid hang-up and damage to valve ports or changer.

The plug mechanism cannot be withdrawn unless the moveable plug anti-extrusion parts are fully retracted by complete return of the shaft.

6.0 Meter Riser Stop Changer (5/8" O.D. Tubing)

- 6.1 This changer does not require a handle. Use only the thumb and index finger to tighten the plug. The device seals in the riser insert.
- 6.2 Installation
 - 6.2.1 With the changer mounted in the valve and valve open, line pressure will lift the shaft and expand plug. Therefore, shaft must be depressed to insert the plug completely so that the body spool piece stops against the riser.

UNCONTROLLED IF PRINTED

6.2.2 Tighten operating nut until leakage stops and plug is firm.

Do not depend on this device to stop the riser unassisted. Restrain by hand or a fixture during the valve changing operation.

6.3 Removal

6.3.1 Close vent valve.

6.3.2 Back off operating nut against stop collar.

6.3.3 Depress shaft fully to release plug and withdraw changer from valve.

6.4 Storage - Wipe the changer with a clean rag after each usage.

End of Instructions.

Operator Qualification (OQ) Required?

YES

TAPPING AND STOPPING

October 1, 2020

TAPS 2.2 Mueller NO-BLO Valve Changer

1.0 Purpose

This document addresses the Mueller NO-BLO Valve Changer, which permits changing meter valves while the service line is under pressure with no blowing of gas. This enhances public and worker safety when needing to replace a leaking meter valve.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Equipment Models and Application](#)[6.0 Preparing the Plugging Unit](#)[7.0 Assemble Plugging Unit to Meter Valve](#)[8.0 Attach Safety Clamp to Pipe](#)[9.0 Insert and Expand Rubber Plug](#)[10.0 Remove Old Valve](#)[11.0 Rethread the Pipe](#)[12.0 Install New Meter Valve](#)[13.0 Relax Rubber Plug and Remove Equipment](#)[14.0 Replacing Rubber Plug](#)

Appendices

[Appendix A - Mueller NO-BLO Valve Changers](#)[Appendix B - Mueller Valve Changer Images by Model](#)[Appendix C - Mueller Plugging Units](#)[Appendix D - Mueller Plugging Equipment Images](#)**3.0 Target Audience**

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel

4.0 General

- 4.1 Most meter valves, 2 inches and less, may be removed and replaced if the port opening is of sufficient size to allow passage of the plugging unit through the valve AND if the valve outlet has iron pipe threads.
- 4.2 The maximum pressure to which the valve changers can be used is 60 psig.

5.0 Equipment Models and Application

UNCONTROLLED IF PRINTED

- 5.1 Valve Changers for Mueller 3/4", 1", or 1-1/4" valves - See [Appendix A](#).
- 5.2 Images of Mueller NO-BLO Valve Changer models - See [Appendix B](#).
- 5.3 Plugging Unit sizes - See [Appendix C](#).
- 5.4 Images of Mueller Plugging Equipment - See [Appendix D](#).

6.0 Preparing the Plugging Unit

- 6.1 Before using Stop Changer, remove burrs from inside of pipe by using reamers and special machine adapter nipples under pressure with the F-1 Machine.
- 6.2 Select proper plugging unit according to size of stop to be removed.
- 6.3 Close the stop to be removed.
- 6.4 Purge gas out of piping.
- 6.5 Remove enough pipe and fittings from outlet end of stop to permit easy access.
- 6.6 Examine Valve Changer for proper function. Verify rubber plug is in good condition.
- 6.7 Free-up rubber plug by partially compressing and relaxing it several times. This is done by holding the shaft tube in one hand and turning shaft crank with the other hand alternately clockwise and counterclockwise. See [Figure 1](#).
- 6.8 Lubricate the rubber plug by applying Mueller Rubber Stopper Lubricant (Part # 580657). Also, lubricate the following:
 - 6.8.1 Bleeder O-rings by applying to the outside machined surface of stuffing box and sliding the bleeder ring forward / backward while turning it slightly.
 - 6.8.2 Shaft tube by sliding the stuffing box up and down.
- 6.9 Measure the width of the port opening to ensure that it is equal to or greater than the minimum width for the appropriate rubber plugging unit listed in [Appendix C](#).

7.0 Assemble Plugging Unit to Meter Valve

- 7.1 Fully retract rubber plug into the stuffing box.
- 7.2 Thread stuffing box into outlet of the valve to be removed.
- 7.3 Close the bleeder valve by sliding bleeder ring upward, while turning it.
- 7.4 Open valve fully while carefully lining up valve key with the piping.
- 7.5 Turn the shaft tube until small arrow on tapered portion of shaft tube is lined up with valve key. This arrow locates the flat rubber plug for proper alignment to pass through port opening of the valve.

It is not necessary to locate arrow when using the H-17016 for PE risers.

8.0 Attach Safety Clamp to Pipe

- 8.1 Position safety clamp on the pipe so that locating pin is just touching inlet end of valve to be removed.
- 8.2 Tighten pipe clamp firmly using hand force only. Never use an extension on the vise handle.
- 8.3 Adjust bottom shaft tube clamp to align with keyway of valve to be replaced.
- 8.4 Move top shaft tube clamp approximately 3 inches down from top nut on the safety clamp and fasten loosely. This will help to place the rubber plug into riser.

It may be necessary to take manual measurements for proper placement.

- 8.5 *For 1-1/2" and 2" safety clamps only:* Adjust each knurled shaft clamp positioning sleeve so that shaft tube clamp is approximately in the center of threaded portion of each sleeve.

9.0 Insert and Expand Rubber Plug

- 9.1 Place shaft crank on hexagon shaft nut at top of plugging unit.
- 9.2 Push shaft tube downward through the stuffing box until its tapered portion (with the arrow) is just through the top shaft tube clamp. This will move rubber plug downward through the valve and into inlet pipe below valve.
- 9.3 Hold plugging unit in this position and tighten top shaft tube clamp vise firmly using hand force only. Never use an extension on vise handle. This vise should seat on smaller diameter portion of the shaft tube, with front edge of vise just above the tapered portion of the shaft tube. See Figure 5.

- 9.4 Remove shaft crank. Count and note number of exposed threads on shaft end. This number will be used later when the plug is relaxed. Replace shaft crank.
- 9.5 Expand the rubber plug by turning the shaft crank clockwise until end of the threaded shaft is flush with end of the shaft crank sleeve. A shutoff should be achieved at this point.

UNCONTROLLED IF PRINTED

- 9.6 Open bleeder valve by sliding bleeder ring downward and turning it slightly. Shut-off tightness be indicated by absence of continued gas flow.

The H-17016 for PE risers will not require more than a few turns to create a stop-off. Do not over expand.

- 9.7 If flow continues from the bleeder valve, a shutoff has not been achieved.
- 9.7.1 Close bleeder valve by sliding the bleeder ring upward while turning it slightly.
- 9.7.2 Rotate shaft crank slowly for one additional full turn clockwise.
- 9.7.3 Test again for tightness using bleeder valve.
- 9.7.4 If shut-off still has not been achieved, continue rotating shaft crank one turn at a time, testing with bleeder valve after each turn.

The limit of travel is when the shaft nut contacts a shoulder on the shaft, occurring when the shaft end is approximately 3/8"-1/2" beyond the shaft crank sleeve. See Figure 6.

10.0 Remove Old Valve

Do not attempt to remove the old stop without the safety clamp.

- 10.1 When a shutoff has been achieved, unthread the old valve from pipe.
- 10.2 Slide both the stuffing box with valve upward along the shaft tube. See Figure 7.

UNCONTROLLED IF PRINTED

10.3 Swing bottom shaft tube clamp into position onto shaft tube of plugging unit and secure so bottom edge of the vise is next to riser.

10.4 Tighten clamp vise firmly using hand force only. Never use an extension on the vise handle.

10.5 Remove shaft crank. See Figure 8.

10.6 Open clamp vise on top shaft tube clamp and swing it out of position.

UNCONTROLLED IF PRINTED

- 10.7 Slide stuffing box (with the valve as a unit) off the shaft tube, turning the assembly slightly as it is moved along the shaft tube. See Figure 9. Be careful not to drag stuffing box O-Rings over exposed threads.

- 10.8 Remove the old valve from stuffing box.

- 10.9 If necessary to rethread the pipe, cut off and rethread pipe end before installing new valve. Refer to Section 11.

11.0 Rethread the Pipe

- 11.1 After removing the old valve from service pipe, examine the riser threads. If threads have been damaged, thread the old meter valve back onto the pipe with stuffing box attached, then relax rubber plug.

- 11.2 Loosen safety clamp and slide it away from bottom end of valve.

- 11.3 Remove short locating pin on safety clamp and replace it with the long locating pin. Slide safety clamp upward toward bottom end of valve until locating pin touches valve. Then, tighten safety clamp securely.

- 11.4 Insert and expand rubber plug. Remove old valve as was done previously.

- 11.5 Measure back 1-3/8" from end of the service pipe.

This is maximum amount that can be cut off without damaging the rubber plug that is expanded in the service pipe.

- 11.6 Remove long locating pin and cut off the old threads. Use a 3-wheel type narrow pipe cutter to cut off threads.

- 11.7 Slide the cut off piece of service pipe and old valve upward so bottom shaft tube clamp can be attached. Once attached, disengage the top shaft tube clamp allowing the old valve and cut off pipe to be removed.
- 11.8 Place die head on the shaft tube and engage top shaft tube clamp. Disengage bottom shaft tube clamp and proceed to rethread service pipe.
- 11.9 After threads are cut, remove die head in the same manner as was done in Subsection 11.7.
- 11.10 Install new stop valve as described in Section 12.

12.0 Install New Meter Valve

- 12.1 Thread the stuffing box into the outlet end of a new Mueller valve.
- 12.2 Open the valve fully, carefully lining up valve key with piping.
- 12.3 Slide the valve with stuffing box over the end of the shaft tube, being careful not to drag stuffing box O-rings over exposed threads. Turn the assembly slightly as it is moved along the shaft tube.
- 12.4 Swing top shaft tube clamp back into position and tighten vise.
- 12.5 Open the vise of bottom shaft tube clamp and swing it out of position See Figure 10.

- 12.6 Brush and clean the threads on the end of the pipe and apply non-hardening pipe thread sealant.
- 12.7 Move meter valve with stuffing box downward and thread valve onto the end of the pipe. If possible, make a pressure tight connection, tighten valve until its key is in line with small arrow on shaft tube.

If valve contacts locating pin before making a tight pipe connection, then unthread valve from piping (without removing it from valve changer). Remove the locating pin and reassemble end valve to pipe.

12.8 Close the bleeder valve by sliding the bleeder ring upward while turning it slightly. See Figure 11.

13.0 Relax Rubber Plug and Remove Equipment

13.1 Replace shaft crank on shaft nut.

13.2 Rotate shaft crank counterclockwise until the number of threads noted in [Subsection 9.4](#) above are exposed at the end of threaded shaft.

13.3 Important: Pressure inside pipe may force the shaft tube upward. Hold down on shaft tube by placing the hand solidly against the face of shaft crank. See Figure 12. Use other hand to open vise of top shaft tube clamp and slowly slide the tube upward so rubber plug passes through the valve and fully into the stuffing box.

If necessary, turn the shaft tube so arrow is in line with valve key, which aligns the rubber plug with the port opening through valve. See [Figure 13](#).

13.4 Close valve.

13.5 Open bleeder valve by sliding the bleeder ring downward exhausting the gas from the stuffing box.

13.6 Remove the equipment.

UNCONTROLLED IF PRINTED

13.7 Reconnect the outlet piping, purge, check for leaks, and place in service.

14.0 Replacing Rubber Plug

The rubber plug is subjected to great stress and distortion in normal use. Replace when found worn or damaged.

14.1 Fully relax the rubber plug by turning shaft crank counterclockwise.

14.2 Remove shaft crank and hold the plugging unit in a vertical position with end of shaft resting on a table or similar solid support.

14.3 Grasp rubber plug with one hand and partially compress plug by pulling downward. This will disengage the locking feature between the end ferrule and locknut. See Figure 14.

14.4 Remove locknut, end ferrule, and rubber plug. See Figure 15.

UNCONTROLLED IF PRINTED

- 14.5 Clean shaft and lubricate with Mueller Rubber Stopper Lubricant (Part # 580657).
- 14.6 Slide on a new rubber plug and reinstall end ferrule.
- 14.7 Compress rubber plug approximately 1/16"-1/8" by pulling downward on the end ferrule.
- 14.8 Replace locknut and align its sides with slot in the end ferrule.
- 14.9 Relax rubber plug which will force the end ferrule into contact with the locknut and prevent it from backing off.

End of Instructions.

TAPPING AND STOPPING

December 15, 2021

TAPS 2.3 Mueller AUTOPERF Tee

1.0 Purpose

This document details the installation instructions for the Mueller AUTOPERF tee.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Views of Tee](#)[6.0 Maximum Pipe Wall Thickness for AUTOPERF Tee](#)[7.0 Installation Instructions](#)**3.0 Target Audience**

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Supervisors
- Gas Field Personnel
- Gas Field Personnel - Welders
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Technicians
- Gas Construction Services Supervisors
- Contract Gas Construction Company Supervisors
- Contract Construction Inspectors
- Contract Welding Inspectors

4.0 General

- 4.1 The tee utilizes a self-contained perforator for tapping the main.
- 4.2 The perforator retains the pipe coupon and functions as a shut-off.
- 4.3 These installation instructions should be followed to ensure a successful tap.
- 4.4 Maximum pipe wall thickness for perforator use with various sizes of AUTOPERF tees is shown in [Table 1](#).
- 4.5 If the pipe wall thickness is not known or cannot be verified through testing or experience to be less than 0.281, a Mueller valve tee, H-17656, or Mueller curb valve tee, H-17800, should be used in place of the AUTOPERF tee.
- 4.6 Refer to the manufacturer's operating instructions for details regarding use of tapping and stopping equipment. See [TAPS 3](#).

5.0 Views of Tee

Figure 1: AUTOPERF Tee and AUTOPERF Transition Tee

Figure 2: Cut Away View

6.0 Maximum Pipe Wall Thickness for AUTOPERF Tee

Table 1: Mueller AUTOPERF Tee Data

Model & Size Tip (Inch)	Size (Inch)	Maximum Wall Thickness (Inch)	Stock Code
Mueller H-18101- 5/16" perforator tip	3/4	0.281	19 23 192
Mueller H-18102 - 3/8" perforator tip	1/2 x 1/2	0.250	19 33 265
	3/4 x 3/4	0.281	19 33 268
	3/4 x 1	0.281	19 12 429
Mueller H-18104 - Transition Tee	3/4 x 1" CTS HDPE w/3/8 tip	0.281	19 12 597

Notes:

1. With exception of the 1/2" x 1/2" H-18102, maximum wall thickness is 0.281 inch.
2. [STLP 2.2, Appendix A](#). Steel Pipe Stock Code Table lists the wall thickness for the stock coded pipe.

7.0 Installation Instructions

- 7.1 Remove the completion cap and perforator from the tee body.
- 7.2 Weld the service tee to the main in accordance with Ameren Illinois (AIC) welding procedures.

Do not position over or within 1 inch either side of a girth weld.

UNCONTROLLED IF PRINTED

- 7.2.1 Ensure tee is square to the main.
- 7.2.2 There should be no gap between the service tee and top of main.
- 7.2.3 Allow weld to cool to ambient temperature. Do not quench with water or soap.
- 7.3 After tee has cooled, attach the service line to the tee.
- 7.4 Pressure test the tee and service line in accordance with [PTST 1](#).
- 7.5 Insert perforator into the tee body until top of the perforator is 1/4 inch below the top of the tee opening.

Do not apply lubricant to the perforator or the tee body.

- 7.6 Crimp the top of tee with the appropriate crimping tool (Mueller H-18092 or H-18097).
- 7.7 Using the Mueller H-18090 NO-BLOW operating wrench (or similar ratchet drive wrench), rotate the perforator and pierce the main by rotating the ratchet handle clockwise in 1/4-turn increments. Once the perforator contacts the main, continue turning in this manner until perforation is complete.

Do not stop the operation or attempt to back out the perforator before piercing the pipe.

In the event of a failed perforation, do not attempt to use a second perforator in the same tee body.

- 7.8 Once the main is pierced, continue turning the perforator clockwise until the perforator seats lightly in the main.
- 7.9 Back out the perforator by turning the ratchet handle counterclockwise until the perforator firmly contacts the crimped top of the tee, forming a metal to metal seal.
- 7.10 Using thread sealant, install the completion cap and tighten firmly.

End of Instructions.

TAPS 2.4 Mueller Tapping and Stopping Procedure

1.0 Purpose

The following is a general procedure for Mueller tapping and stopping operations. Also included are appendices showing Mueller fittings that are approved components for use on gas pipelines by Ameren Illinois (AIC).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Tapping Operation](#)

[6.0 Stopping Operation](#)

[7.0 Completion Operation](#)

Appendices

[Appendix A - Mueller Stopper Fittings](#)

[Appendix B - Mueller Tees](#)

[B-1 Service Tees](#)

[B-2 Service Stop Tees](#)

[B-3 Curb Stop Tees](#)

[Appendix C - Mueller "Save-A-Valve" Drilling Nipple](#)

[Appendix D - Mueller Pig Plug / Line Stopper Fitting Insert](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Supervisors
- Gas Field Personnel
- Gas Field Personnel - Welders
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Technicians
- Gas Construction Services Supervisors
- Contract Gas Construction Company Supervisors
- Contract Construction Inspectors
- Contract Welding Inspectors

4.0 General

4.1 For general requirements and considerations, see [TAPS 1](#).

UNCONTROLLED IF PRINTED

- 4.2 Mueller fittings and equipment are used for all taps and stops for steel pipe sizes from 3/4 inch through 12 inch. See [Appendix A thru Appendix D](#).
- 4.3 Ensure that the pressure rating of the selected component is adequate for the pipeline application.
- 4.4 For available Mueller Drilling Machines with listed maximum working pressure, see [TAPS 1, Table 1](#).
- 4.5 For general information and particulars for the Mueller AUTOPERF Tee, see [TAPS 2.3](#).
- 4.6 Refer to the manufacturer's operating instructions for details regarding use of tapping and stopping equipment. See [TAPS 3](#).
- 4.7 Ensure a fire extinguisher is present at the location where the work is being performed.
- 4.8 Shims are stock coded
 - 4.8.1 19 83 124, for use with 2" Mueller two-piece line-stopper fittings, for use on 1-1/4" IPS steel pipe.
 - 4.8.2 19 83 126, for use with 8" Mueller two-piece line-stopper fittings, for use on 7" IPS steel pipe.

5.0 Tapping Operation

- 5.1 Clean facilities in accordance with applicable joining procedures. See [WELD 1, Section 8.0](#), Preparation for Welding.
- 5.2 Attach and inspect the fitting in accordance with applicable procedures for in-service welding. See
 - 5.2.1 [WELD 2.4, Subsection 6.3](#), Hot Tap Fittings.
 - 5.2.2 [WELD 2.4, Section 8.0](#), Welding Procedures.
 - 5.2.3 [WELD 4](#) for In-Service WPSs.
 - 5.2.4 [WELD 2.4, Subsection 8.6](#), Inspection Requirements.
- 5.3 Leak test the fitting prior to tapping in accordance with applicable testing procedures. See [PTST 1, Section 13.0](#), Pressure Testing: Components.
- 5.4 Install valve that is appropriately rated for the operating pressure.
- 5.5 Perform line-up procedures for all flanged line stopper fittings.
- 5.6 Attach drilling machine with valve in open position with boring bar fully retracted.

Support tapping equipment when performing horizontal taps.

- 5.7 Close valve to ensure bit does not interfere with valve operation.
- 5.8 Open valve with bit in fully retracted position.
- 5.9 Extend bit until it contacts pipe.
- 5.10 Identify travel extent and mark the tapping assembly.

Travel specifications can be referenced in Mueller operating instructions (blue books).

- 5.11 Perform tapping operation.
- 5.12 Retract the boring bar and close valve.
- 5.13 Relieve pressure above valve.
- 5.14 Remove tapping equipment.
- 5.15 Retrieve the tapping coupon.
- 5.16 Tag the tapping coupon for material sampling.
 - 5.16.1 A tag is provided in the job packet.
 - 5.16.2 The tagged coupon shall be delivered to Integrity Management at completion of the project.

6.0 Stopping Operation

- 6.1 Apply Mueller rubber stopper lube to stoppers. Do not lubricate rounded bottoms.
- 6.2 Attach stopping machine to valve. Keep bar fully retracted.
- 6.3 Where possible with valve, equalize pressure.

Bar is still under pressure. DO NOT lean over bar.

- 6.4 Open valve completely.
- 6.5 Mark maximum stopper travel.

Travel specifications can be referenced in Mueller operating instructions (blue books).

- 6.6 Monitor gauges to ensure system pressure.
- 6.7 Compress the stopper to stop off the line. Do not over compress rubber. See Mueller operating instructions for travels required to effectively stop off.
- 6.8 Table 1 lists the recommended minimum distance from the stopper to cutting and welding operations.

Table 1: Minimum Distance from Stopper to Cutting and Welding Operations

Size (Inches)	Minimum Distance (Inches)	Size (Inches)	Minimum Distance (Inches)
3/4	6	4	12
1	6	6	14
1-1/4	6	8	16
2	8	10	18

UNCONTROLLED IF PRINTED

3	10	12	20
---	----	----	----

6.8.1 If it is not possible to maintain the recommended minimum distance, use additional means of cooling (e.g., wrap wet burlap or wet rags around the fitting) to reduce the temperature.

6.9 Relax stopper slowly and retract it. If stopper does not retract, equalize pressure on both sides of rubber stopper using natural gas or inert gas only.

6.10 Close valve.

6.11 Relieve pressure above valve and remove stop machine.

7.0 Completion Operation

7.1 Attach completion machine to valve. Keep bar fully retracted.

7.2 Where possible with valve, equalize pressure.

Bar is still under pressure. DO NOT lean over bar.

7.3 Open valve completely.

7.4 Carefully lower completion plug into stopper fitting.

7.5 Tighten completion plug into fitting by rotating clockwise.

7.6 Relieve pressure above valve and remove completion machine.

7.7 Install cap and leak test joints with leak detection solution.

End of Instructions.

TAPS 2.4 Tapping and Stopping – Mueller Tapping and Stopping Procedure, October 1, 2021

Revision Notes

Location of Changes	Summary of Changes
Subsection 4.8	New – Shims are stock code: 19 83 124, for use with 2" Mueller two-piece line stopper fittings, for use on 1-1/4" IPS steel pipe. 19 83 126, for use with 8" Mueller two-piece line-stopper fittings, for us on 7" IPS steel pipe.
Appendix B-3 – Curb Valve Tee	Added – Pictures of H-17800 and H-17900 with 2" square head.

Appendix A - Mueller Stopper Fittings

A-1. Low-Pressure Line Stopper Fitting

For Use on Schedule 40 Steel Pipe Only				
Size (Inches)	Stock No.	Mueller Part No.	Rating (psig)	Tap Size (Inches)
3/4	19 33 036	H-17190	250	13/16
1	19 33 041	H-17190	250	15/16
1-1/4	19 12 476	H-17190	250	1-1/4
2	19 12 477	H-17190	250	1-3/4
3	19 33 015	H-17190	250	2-3/4
4	19 12 479	H-17190	250	3-3/4

For Use on Thin Wall Steel Pipe Only				
Size (Inches)	Stock No.	Mueller Part No.	Rating (psig)	Tap Size (Inches)
3	19 23 147	H-17192	250	2-3/4

TAPPING AND STOPPING

October 1, 2022

TAPS 2.5 T.D. Williamson Tapping and Stopping Procedure**1.0 Purpose**

This document provides a general procedure for T.D. Williamson (TDW) tapping and stopping operations for application by Ameren Illinois (AIC). Also included are appendices showing TDW fittings that are approved components for use on gas AIC pipelines.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 General](#)****[5.0 Tapping Operation](#)****[6.0 Stopping Operation](#)****[7.0 Completion Operation](#)**

Appendices

[Appendix A - SHORTSTOPP Welding Fitting](#)**[Appendix B - SHORTSTOPP 3-Way Tee](#)****[Appendix C - SHORTSTOPP Spherical 3-Way Tee \(Standard and 300D\)](#)****[Appendix D - SHORTSTOPP 3-Way Flat-Bottomed Tee](#)****[Appendix E - Thread-O-Ring Fitting](#)****[Appendix F - SHORTSTOPP 285 Purge and Equalization Fitting](#)****3.0 Target Audience**

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Supervisors
- Gas Field Personnel
- Gas Field Personnel - Welders
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Technicians
- Gas Construction Services Supervisors
- Contract Gas Construction Company Supervisors
- Contract Construction Inspectors
- Contract Welding Inspectors

4.0 General

- 4.1 For general requirements and considerations, see **[TAPS 1](#)**.
- 4.2 For the various TDW fittings approved for use by AIC, reference the list under **[Appendices](#)**.
- 4.3 For general information and procedure on use of the TDW PE Branch Saddle Valve, see **[TAPS 2.7](#)**.
- 4.4 Ensure that the pressure rating of the selected component is adequate for the pipeline application.

UNCONTROLLED IF PRINTED

- 4.5 Refer to the manufacturer's operating instructions for details regarding use of tapping and stopping equipment. See [TAPS 3](#).
- 4.6 Ensure fire extinguisher is present at the location where the work is being performed.

5.0 Tapping Operation

- 5.1 Clean facilities in accordance with applicable joining procedures. See [WELD 1, Section 8.0](#), Preparation for Welding.
- 5.2 Attach and inspect the fitting in accordance with applicable procedures for in-service welding. See
 - 5.2.1 [WELD 2.4, Subsection 6.3](#), Hot Tap Fittings.
 - 5.2.2 [WELD 2.4, Section 8.0](#), Welding Procedures.
 - 5.2.3 [WELD 4](#) for In-Service WPSs.
 - 5.2.4 [WELD 2.4, Subsection 8.6](#), Inspection Requirements.
- 5.3 Leak test the fitting prior to tapping in accordance with applicable testing procedures. See [PTST 1, Section 13.0](#), Pressure Testing: Components.
- 5.4 Install valve appropriately rated for operating pressure.
- 5.5 Test valve to ensure it operates properly (leave valve in open position).
- 5.6 Assemble tapping equipment.
- 5.7 Take all required measurements and record on tapping card.
- 5.8 Dry run completion plug.
- 5.9 Install tapping equipment.
- 5.10 Mark "lower-in" distance on the tapping shaft.
- 5.11 Lower cutter to top of piping and back it off 1/4 turn.
- 5.12 Check "lower-in" mark on shaft.
- 5.13 Mark "tapping" distance on shaft.
- 5.14 Start tapping.
- 5.15 When pilot bit pierces the piping, turn off bleeder valve, and lower drill in by hand until shell cutter contacts piping (back it off 1/4 turn).
- 5.16 Resume tapping until "tapping" distance is reached (should be able to lower bit by hand at this point).
- 5.17 Raise tapping head out of piping and pass the valve.
- 5.18 Close valve.
- 5.19 Open bleeder valve.
- 5.20 Remove tapping equipment.
- 5.21 Retrieve the tapping coupon.
- 5.22 Tag the tapping coupon for material sampling.
 - 5.22.1 A tag is provided in the job packet.
 - 5.22.2 The tagged coupon shall be delivered to Integrity Management at completion of the project.

UNCONTROLLED IF PRINTED

6.0 Stopping Operation

6.1 For the recommended minimum distance from the stopper to cutting and welding operations, see Table 1.

Table 1: Minimum Distance from Line Stopper to Cutting/Welding Operation

Size (Inches)	Minimum Distance (Inches)
3/4	12
1	13
1-1/4	13
2	14
3	15
4	16
6	18
8	20
10	22
12	24
16	27
18	29
20	30
24	34
30	38

7.0 Completion Operation

- 7.1 Install tool to insert completion plug.
- 7.2 Open valve (on high pressure taps, the internal bypass must be opened before opening valve).
- 7.3 Install completion plug.
- 7.4 Close valve (also close internal bypass if applicable).
- 7.5 Remove completion plug tool.
- 7.6 Carefully open valve and check that completion plug is properly seated.
- 7.7 Remove valve.
- 7.8 Install cap onto stopper fitting.

End of Instructions.

Operator Qualification (OQ) Required?

YES

0591: Leak Test at Operating Pressure

0641: Visually Inspect Pipe and Components Prior to Installation

0801: Welding

0811: Visual Inspection of Welding and Welds

UNCONTROLLED IF PRINTED

- 1081: Tapping a Pipeline (Tap Diameter 2 Inch or Less)
- 1091: Tapping a Pipeline (Tap Diameter Greater Than 2 Inch)
- 1101: Tapping a Pipeline with a Built-In Cutter)
- 1111: Tapping Cast and Ductile Iron Pipe, and Low Pressure Steel Pipe
- 1131: Stopper (Stopp) Pipe

TAPPING AND STOPPING

October 1, 2021

TAPS 2.6 Supraflow Tee Tapping Procedure

1.0 Purpose

This document describes the tapping procedure for installing the Supraflow tees on PE mains.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Tapping Procedure](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Services Supervisors
- Contract Gas Construction Company Supervisors
- Contract Construction Inspectors

4.0 General

- 4.1 The Supraflow tees are shown as electrofusion fittings in [POLY 2.5, Appendix A](#).
- 4.2 To attach Supraflow tees to a PE main, use electrofusion procedures for saddle fittings. See [POLY 2.5](#).
- 4.3 The Supraflow tee shall be leak tested after fusion is completed and prior to tapping in accordance with [PTST 1, Section 13](#), Components.
- 4.4 Supraflow tees are type PE4710 with a maximum operating pressure rating of 150 psig.
- 4.5 Gas Field Personnel shall be qualified to use the Supraflow PE tapping equipment. See image below.

Groebner Supraflow Tapping Tee Equipment

- 4.6 Contact the Gas Training Center for training and use of the Supraflow PE tapping equipment.

UNCONTROLLED IF PRINTED

4.7 See [TAPS 1](#) for general operational considerations related to any tapping operation.

4.8 Ensure fire extinguisher is present at the location where the work is being performed.

5.0 Tapping Procedure

5.1 Remove PE dirt cap and steel cap with wrench provided in the tapping kit (see [Figure 1](#)).

5.1.1 Remove safety pin.

5.1.2 Place both the steel cap and safety pin inside the PE dirt cap.

5.1.3 Set the PE dirt cap aside. It will be used later at the completion of the tap.

Figure 1

5.2 Select Drill Rod (see [Figure 2](#)).

5.2.1 Check color code on the Supraflow tee.

5.2.2 Select matching color-coded drill rod.

5.2.3 Thread the drill rod onto the drill head, hand tight only. (Do not use wrench to tighten.)

Figure 2

5.3 Insert or Slide Drill Rod onto Drilling Machine (see [Figure 3](#)).

- 5.3.1 First, ensure the stopper plate on the drilling machine is all the way up (see [Figure 4](#)).
- 5.3.2 Insert or slide drill rod onto drilling machine. Silicone spray may be applied to drill rod to ease attachment.
- 5.3.3 Thread drill rod bushing onto drilling head hand tight (approximately 3 to 4 turns) to attach drilling machine to Supraflow tee. Do not use wrench to tighten.
- 5.3.4 Ensure relief valve is closed.
- 5.3.5 Attach pressure gauge.

Figure 3

5.4 Break Drill Rod Loose (see [Figure 4](#)).

- 5.4.1 Break drill rod loose from the tee housing by turning clockwise (approximately 6 to 7 complete revolutions) using wrench as provided.

Figure 4

- 5.5 Lower Drill Rod (see [Figure 5](#)).

- 5.5.1 Lower drill rod until achieving contact with gas main.

1. If cutter does not contact the main, place pin into the drill rod hole and run the drilling threads in by hand until achieving contact, OR
2. If cutter touches the main, lift the drill rod back up enough to insert locking pin into the closest hole (depending on the size of tap being made).

- 5.5.2 Mark the smooth arm with tape across from the knurled sleeve. Use this mark as reference on where to stop when retracting drill rod.

Figure 5

- 5.6 Tapping the Main (see [Figure 6](#)).

5.6.1 Using the ratchet:

1. Start ratcheting the drill rod downward (clockwise) through the gas main until knurled sleeve touches the drilling machine collar.
2. Drill rod will stop at this point as a positive stop.

Figure 6

5.7 Extracting Drill Rod (see [Figure 7](#)).

- 5.7.1 Using the ratchet, start ratcheting drill rod upward (counterclockwise) until knurled sleeve is back where it started (reference the tape mark).

Do not extend the tapping threads beyond the red machined groove marked in the tapping threads.

- 5.7.2 Begin screwing the stopper plate downward until it stops over top of the drill rod.
- 5.7.3 Pull the locking pin (located in the collar on the drill rod) to release the drill rod. Pin will remain in collar.

The stopper plate is used to safely control the drill rod action due to it now being under full line pressure.

Figure 7

- 5.7.4 Begin screwing the stopper plate upward to its upmost position (see [Figure 8](#)).
- 5.7.5 Drill rod should push up against the stopper plate as it rises. If it does not, pull the drill rod up by hand as the stopper plate moves upward.
- 5.7.6 Once the drill rod is fully extracted, thread the drill rod counterclockwise the rest of the way with wrench to set the cutter (approximately 6 to 7 complete revolutions).
- 5.7.7 Snug with wrench.

Figure 8

- 5.8 Removing Drilling Machine (see [Figure 9](#)).
- 5.8.1 Open relief valve and ensure a complete seal. If seal is not complete, unseat and reseal the cutter.
- 5.8.2 Remove the pressure gauge.
- 5.8.3 Unthread drilling machine until loose.
- 5.8.4 Slide back drill machine off the drilling rod.
- 5.8.5 Unthread drill rod bushing.

5.8.6 Remove the drilling rod.

5.8.7 Soap test for leaks.

Figure 9

5.9 Replace Caps on Supraflow Tee (see [Figure 10](#)).

5.9.1 Replace safety pin into cutter.

5.9.2 Thread on steel cap; hand tighten and then snug with wrench.

5.9.3 Soap test for leaks.

5.9.4 Attach PE cap with bolt.

5.9.5 Snug bolt with wrench.

Figure 10

End of Instructions.

TAPPING AND STOPPING

October 1, 2022

TAPS 2.7 TDW PE Branch Saddle-Valve

1.0 Purpose

This document details the material, equipment, and instructions for installing the T.D. Williamson (TDW) polyethylene (PE) branch saddle-valve fitting on polyethylene (PE) pipe.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Tapping Setup and Drilling Machine](#)[6.0 PE Branch Saddle-Valve](#)[7.0 PE Branch Saddle Fusion](#)[8.0 Preparing for Tap](#)[9.0 Tapping Operation](#)[10.0 Completion Operation](#)**3.0 Target Audience**

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Services Supervisors
- Contract Gas Construction Company Supervisors
- Contract Construction Inspectors

4.0 General

- 4.1 Gas Field Personnel shall be qualified to use the T.D. Williamson (TDW) PE tapping equipment.
- 4.2 Contact the Gas Training Center for training and use of the TDW PE tapping equipment.
- 4.3 See [TAPS 1](#) for general operational considerations related to any tapping operation.
- 4.4 Refer to the manufacturer's operating instructions for details regarding use of tapping and stopping equipment. See [TAPS 3](#).
- 4.5 TDW PE Branch Saddle-Valve can only be installed on PE systems with Design MAOP of 100 psig or less due to the manufacturer's pressure rating.
- 4.6 Ensure fire extinguisher is present at the location where the work is being performed.

5.0 Tapping Setup and Drilling Machine

- 5.0 Tapping Setup and Drilling Machine
- 5.1 [Figure 1](#) shows the full set-up. Further detail on the tapping/drilling machine is shown in [Figure 2](#).

UNCONTROLLED IF PRINTED

5.2 The TDW PE tapping machine # PS2000XL shall be used for tapping the TDW PE branch saddle-valve.

Figure 1: Tapping Setup View

Figure 2: TDW Tapping Machine

6.0 PE Branch Saddle-Valve

6.1 Branch saddle fittings are available for high density (PE3408) pipe through the MDF (Material Distribution Facility) Storeroom. See Table 1.

Table 1: TDW Branch Saddle Fittings -- Availability

Main Size (inches)	Branch Size (inches)	Stock Code	TDW Part Number	Pressure Rating (psig)
4	4	19 67 283	P6-0404-2363-23	100
6	4	19 67 282	P6-0406-2363-23	100
8	4	19 67 281	P6-0408-2363-23	100

7.0 PE Branch Saddle Fusion

- 7.1 For general reference regarding electrofusion on PE pipe, see [POLY 2.5, Section 10.0](#), Joint Assembly, and [Section 11.0](#), Fusion.
- 7.2 Clean the existing pipe where the PE branch saddle valve fitting will be fused. See [POLY 2.5, Subsection 8.1](#), Couplings, Caps, Elbows and Saddle Fittings.
- 7.3 Using the saddle as a guide, mark the existing pipe a minimum of 1/2 inch past each end of the saddle.
- 7.4 Using an approved rotary peeler, ensure that all oxidation is removed from the PE pipe at the proposed fitting location. If oxidation is not fully removed, then repeat peeling. For the allowable number of passes, see [POLY 2.5, Subsection 9.5](#), Peeling.

- 7.5 Clean the pipe and saddle fusing surface using alcohol or alcohol wipes (minimum 96% alcohol solution). Be careful not to touch or allow any contaminants to touch the fusion area of either surface.
- 7.6 Using the appropriate clamping device, clamp the PE branch saddle valve onto the scraped area.
- 7.7 Support the fitting with a fixed source (e.g., wood, ground) to ensure that the weight of fitting is not pulling against the fusion.
- 7.8 Turn on electrofusion processor and attach leads to the PE branch saddle fitting.
- 7.9 Scan the barcode on the fitting.

Some electrofusion processors may have an auto detection feature that allows the processor to determine fitting information, for some fittings, without scanning the barcode.

- 7.10 Verify the fusion time shown on the processor display by comparing it with the fusion time listed on the barcode label of the branch saddle.

DO NOT START THE FUSION if the time on the label and the processor time are not the same.

- 7.10.1 If the processor time does not match the time listed on the barcode label, it may be necessary to manually set the fusion time.

1. Refer to the electrofusion processor manual for instructions on manually setting the fusion time.

- 7.11 Once the fusion is complete, remove the leads and allow the fusion to cool the prescribed amount of time before continuing.

8.0 Preparing for Tap

- 8.1 Assemble all necessary equipment.
 - 8.1.1 Refer to the necessary tapping machine manual for instructions.
 - 8.1.2 Ensure use of the proper tapping adapter and proper cutter, which are specific to tapping PE pipe.
- 8.2 Ensure that cutter is completely retracted by turning the rapid feed outer tube and the tapping feed counterclockwise until they run out of travel.
- 8.3 Attach tapping machine to the PE branch saddle using the tapping adapter and split backup ring kit.
 - 8.3.1 Verify that the gasket is in position between tapping adapter and the flange of the PE branch saddle.
- 8.4 Support tapping machine with a fixed source to ensure proper alignment with the PE branch saddle during the tap.
- 8.5 Install testing equipment on tapping adapter for pressure test.

- 8.6 Open the valve on the PE branch saddle.
- 8.7 Leak test the fitting and tapping machine assembly for 10 minutes at the current operating pressure of the line pipe on which the fitting is attached.

The TDW PE branch saddle is pressure tested by the manufacturer and does not require a pressure test.

- 8.8 Using a leak detection solution, test the electrofusion saddle portion of the PE branch saddle.
- 8.9 Using the valve on the testing assembly, release the test medium from fitting.

9.0 Tapping Operation

- 9.1 Verify that the rapid feed outer tube is not locked.
 - 9.1.1 When unlocked, the line on locking knob is perpendicular to machine.
 - 9.1.2 If locked, pull the locking knob out and turn the knob until line on knob is perpendicular to machine.
- 9.2 Advance the rapid feed outer tube until the pilot touches the pipe. It should be full travel as the pilot touches pipe.

Be aware of the cutter possibly "catching" during the rapid feed advancement.

- 9.3 Lock the rapid feed outer tube by turning locking knob until the line on knob is parallel with the machine.
 - 9.3.1 It may be necessary to move the outer tube back and forth until the tapping feed locks.
- 9.4 Using the star handle, advance the tapping feed manually. Turn the star handle at a moderate, steady pace.

Do not use an air drive motor.

- 9.5 The handle should turn noticeably easier when the tap is complete. Be sure to constantly support the tapping machine during the tapping operation to ensure proper alignment of the cutter.
- 9.6 Once the tap is complete, unlock the rapid feed outer tube by pulling the locking knob out and turning the knob until line on knob is perpendicular to the machine.
- 9.7 Back the cutter out using the rapid feed outer tube.

DO NOT use the tapping feed first to back out the cutter.
Backing the cutter out using the tapping feed *before* the outer tube could unthread the coupon.

9.8 Once the outer tube is backed all the way out, back out the tapping feed.

10.0 Completion Operation

10.1 Using the valve on the testing assembly, purge the air from the fitting.

10.2 Close the valve on the PE branch saddle.

10.3 Using the valve on the testing assembly, bleed the pressure off the PE branch saddle.

10.4 Remove the tapping machine from the PE branch saddle.

10.5 Verify that the coupon is in the cutter. If the coupon is not in the cutter, reattach the tapping machine and repeat the Tapping Operation steps above.

10.6 Once the coupon is secured, cut the flange off the PE branch saddle, doing so at the butt fusion connecting the flange to valve.

10.7 If the PE branch saddle is connected by electrofusion, then use a Central Plastics half-moon scraper to scrape the outlet side of valve the full length of pup.

1. Currently, the Central Plastics half-moon scraper is the only scraper which will allow a full scrape of the outlet pup for an electrofusion coupling. The half-moon scraper comes with the tapping equipment and shall remain with the equipment.
2. The Central Plastic half-moon scrapers have been removed from general use in all operating areas.

10.8 Remove the clamp holding the saddle to the existing main.

10.9 Follow the proper electrofusion procedure or butt fusion procedure to tie the PE branch saddle into the new piping.

10.10 Leak test the final tie-in connection with leak detection solution or leak detection instrument. For leak testing, see [PTST 1, Section 12.0](#), Tie-In Joints.

End of Instructions.

TAPPING AND STOPPING

October 1, 2022

TAPS 2.8 Shim Installation

1.0 Purpose

This document details the material and instructions for installing shims on odd sizes of steel pipe to allow installation of standard size full encirclement line stopper fittings.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Shims](#)[6.0 Shim Placement](#)[7.0 Shim Welding](#)[8.0 Weld the Line Stopper](#)[9.0 Welding Shim to Pipe](#)[10.0 Testing](#)**3.0 Target Audience**

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Supervisors
- Gas Field Personnel – Welders
- Gas Tech Services (GTS) – Personnel
- Gas Storage Field Personnel
- Gas Construction Services Supervisors
- Contract Gas Construction Supervisors
- Contract Gas Construction Company Welders
- Contract Construction Inspectors

4.0 General

- 4.1 Ameren Illinois (AIC) has odd sizes of steel pipe installed within its gas systems, such as: 1-1/4", 1-1/2", 3" and 7".
- 4.2 Installation of standard sizes of full encirclement line stopper fittings on these odd pipe sizes requires the use of approved steel shims. Common examples are:
 - 4.2.1 2-inch line stopper on 1-1/4-inch or 1-1/2-inch pipe.
 - 4.2.2 4-inch line stopper on 3-inch pipe.
 - 4.2.3 8-inch line stopper on 7-inch-pipe.
- 4.3 Approved shims currently stocked by AIC are:

UNCONTROLLED IF PRINTED

4.3.1 2-inch shim for 1-1/4-inch pipe – Stock Code 19 83 124,

4.3.2 8-inch shim for 7 inch-pipe – Stock Code 19 83 126.

AIC does stock some 4-inch Mueller fittings that are modified to fit 3-inch steel pipe. See [TAPS 2.4 Appendix A](#) Mueller Stopper Fittings

4.4 Gas Engineering, GTE or GSE shall work with Gas Standards and Welding Administrator to get other sizes of shims approved prior to installation.

5.0 Shims

5.1 The shim shall be a split sleeve, full encirclement with a beveled longitudinal seam which provides a good root opening of $1/16" \pm 1/32"$.

5.2 Each shim half should have a 30-degree bevel on the longitudinal seam for the root opening.

5.3 One end of the shim should have a flat face and the other end can be flat or beveled. Figure 1

Figure 1

5.4 Shims shall be checked for proper thickness prior to installation

6.0 Shim Placement

6.1 The shims shall be placed on the pipe to allow sufficient space for the tapping tool to cut through the pipe without encountering the shims.

6.2 If one end of the shim is beveled, it shall be pointed inward.

6.3 The flat end of the shim shall be pointed outward.

6.4 There shall be a good root opening in the longitudinal seams. Figure 2.

Figure 2

6.5 Place the stopper fitting on the pipe.

- 6.6 The shim should extend beyond the end of the line stopper fitting to allow for a minimum of 1 inch space between the fillet weld on the end of the shim and the end of the stopper fitting. Figure 3.

Figure 3

- 6.7 There shall be a good root opening in the longitudinal seams.
- 6.8 Use backing strips when required by fitting manufacturer.
- 6.9 Mark the shim location on the pipe and fitting location on the shim.
- 6.10 Remove the stopper fitting.

7.0 Shim Welding

- 7.1 Shims shall be correctly placed on the pipe according to previous marks. Refer to [Section 6.0](#) Shim Placement.
- 7.2 Weld the longitudinal seam but **do not weld the shim to the pipe**. This allows for thermal expansion.
- 7.3 Using a grinder flush the long seam welds to the outer wall thickness of the shim. Figure 4.

Figure 4

- 7.4 **Do not fillet weld the shim ends.**

8.0 Weld the Line Stopper

- 8.1 Place the line stopper fitting over the shims.
- 8.2 Weld the longitudinal seam of the line stopper fitting.
- 8.2.1 Make a weld pass on each side until weld is completed.
- 8.2.2 This weld can go onto the shim stock. Figure 6.

Figure 6

8.3 Weld the longitudinal seams together. Figure 7.

Figure 7

8.4 Fillet weld one end of the line stopper fitting to the shim stock.

8.5 Fillet weld the other end of the line stopper fitting to the shim stock. Figure 8.

Figure 8

8.6 Do not fillet weld the shim stock to the pipe yet. Thermal expansion is still needed so allow the line stopper fitting to cool.

9.0 Welding Shim to Pipe

9.1 Clean the pipe before welding the shim to the pipe. Figure 9.

Figure 9

- 9.2 Preheat the pipe if required.
- 9.3 Fillet weld one shim to the pipe and then the other shim.
- 9.4 Clean the fillet as it is being applied and after completion.
- 9.5 Visually inspect the weld during and after application.
- 9.6 Engineering will specify if NDT is required.
- 9.7 Mark your welding ID on the weld you made.

10.0 Testing

- 10.1 Leak test the line stopper fitting connections after the fitting has cooled and before tapping. Refer to [PTST 1 Subsection 13.1](#) checking component for leaks.

Prior to tapping, confirm travel distance of tapping and stopping machine to compensate for the thickness of the shim.

- 10.2 Leak test the weld after tapping and normal operating pressure has been applied. Refer to [WELD 2.4 Paragraph 8.6.3](#) Test Time Period.

End of Instructions.

---------------------	--------------------

TURN 2.4 – Lighting Appliances	Inserted a New Section 8.0 – Residential Boilers Shifted Section 9.0 Flame Characteristics Shifted Section 10.0 Appliance Safety
--------------------------------	--

TURN 1 Requirements

1.0 Purpose

This document describes requirements for safely establishing (turn-on) and terminating (turn-off) natural gas service to Ameren Illinois (AIC) customers.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Objective](#)

[5.0 Manufactured Homes](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Meter Changers
- Meter Specialists

4.0 Objective

4.1 When gas field personnel turn on the gas service and light the appliances, they must ensure that customer's gas appliances and facilities are operating in a safe and proper manner, complying with:

- 4.1.1 NFPA 54 (National Fuel Gas Code)
- 4.1.2 HUD Title 24 (Code for Manufactured Home)
- 4.1.3 Applicable local codes

4.2 NFPA 54 Code is available in all AIC Gas Operating Centers as reference material for gas field personnel.

5.0 Manufactured Homes

- 5.1 HUD Title 24, 24 CFR Part 3280, (Code of Manufactured Home) regulates the initial manufacturing process and the initial installation of gas appliances.
- 5.2 Gas appliances initially installed, prior to first consumer sale, in a HUD approved manufactured home do not have to comply with NFPA 54.
- 5.3 Appliances installed in a manufactured home after the initial consumer sale shall be listed/or approved for installation in a manufactured home and comply with the NFPA 54 Code or the appliance manufacturer's instructions.

End of Instructions.

Operator Qualification (OQ) Required?

YES

TURN-ON TURN-OFF

TURN 2.1 Residential/Small Commercial Customer

1.0 Purpose

This document outlines the procedures for initiating gas service to a residential or small commercial customer

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Care and Handling of Meters](#)

[6.0 New Service Connect](#)

[7.0 Existing Service Connect](#)

[8.0 Low Flow and Five \(5\) Minute Shut-in Test](#)

[9.0 Regulator Set Pressure and Lockup Check](#)

[10.0 Checking Fuel Lines](#)

[11.0 Displacement of Air in Fuel Lines](#)

[12.0 Lighting Appliances](#)

[13.0 Crawl Spaces](#)

[14.0 Re-establishing Service After Flooding](#)

[15.0 Gas Meter Relight Tag](#)

[16.0 Records](#)

Appendices:

[Appendix A - Gas Meter Relight Tag](#)

[Appendix B - Door Hanger](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Meter Changers
- Meter Specialists

4.0 General

4.1 The installing contractor (or designee) shall perform first time light-up on new or repaired appliances.

5.0 Care and Handling of Meters

5.1 Meter hubs shall be coated with No-Oxide grease when meter is installed.

5.2 Meters and correcting devices removed from service shall be treated the same as those to be installed.

UNCONTROLLED IF PRINTED

5.3 See [METR 1 Section 5.0](#) Care and Handling for further discussion.

6.0 New Service Connect

- 6.1 All new service connects require a check of regulator set pressure and lock-up.
- 6.2 A gas meter should be installed at the same time as the service as long as the structure is framed out. The outlet of the meter bar should have:
- 6.2.1 A closed Customer Convenience Valve (CCV) installed and plugged with the meter valve left in the "on" position, or
 - 6.2.2 If a CCV is **not** installed, then the meter valve shall be locked in the "off" position.
- 6.3 The installing contractor (or designee) shall perform first time light-up on new or repaired appliances. Ameren Illinois (AIC) personnel should not perform this first time "light-up" on newly installed or repaired equipment.

7.0 Existing Service Connect

Stray electrical current migrating from various sources can energize meter set and customer's piping, creating a hazardous work environment.

- 7.1 Before touching the meter set, check for the possibility of AC voltage with a "volt stick".
- 7.1.1 **If voltage is detected, do not make contact.** Notify the Gas Supervisor to initiate an investigation of the voltage source before performing any additional work on energized section. See [METR 2.2 Section 7.2](#) AC Voltage on Meter Set.
- 7.2 Check the gas meter number to confirm correct address.
- 7.3 Perform Meter Header Inspection. See [METR 2.2 Section 7.0](#).
- 7.4 Customer Choice - Customer Relights Appliances

A customer **should not** be allowed the option of lighting their own appliance when there is a known documented hazard.

- 7.4.1 *Customer is home and shut-in test passes:*
- 1. Leave meter valve in the "on" position.
 - 2. Notify customer gas is on and ready for use.
- 7.4.2 *Customer is home but shut-in test fails:*
- 1. Perform an investigation to determine cause of movement.
 - 2. If leak is found, isolate in accordance with [LEAK 2.1 Section 9.0](#) Leak on Customer Facility.
 - 3. Notify the customer of the source of the leak and that they are responsible for repair.

4. If the leak is isolated at the valve downstream of the meter outlet or at the appliance control valve, then leave the meter valve in the "on" position and give customer a Meter Relight Tag. ([Appendix A](#)).

7.4.3 Customer is **not** at home or unavailable:

1. Perform a low flow test and 5-minute shut-in test on customer piping. If shut-in test passes:
 - 1 a. If there is a CCV downstream of the meter bar, turn off the valve and leave a Meter Relight Tag, or
 - 1 b. If possible, install a CCV downstream of meter bar, leave valve in off position and leave a Meter Relight Tag, or
 - 1 c. If CCV does not exist, leave off and locked at the meter valve. Leave a door hanger advising the customer to call and reschedule.
2. *If shut-in test fails*, turn off and lock the meter valve. Leave a door hanger advising the customer to call and reschedule ([Appendix B](#)).

7.5 Customer Choice - AIC Relights Appliances

7.5.1 All connected appliances shall be checked for proper installation and operation whenever the customer chooses to have AIC relight the appliances. The installing contractor (or designee) shall perform first time light-up on new or repaired appliances.

7.5.2 If the customer chooses to have AIC relight the appliances, gas field personnel shall:

1. Check to ensure access to the appliances is available. If not, leave a door tag advising customer to call and reschedule a connect.
2. Perform a low flow test and 5-minute shut-in test on customer piping. See Low Flow and Five (5) Minute Shut-in Test ([Section 8.0](#)).
3. If movement is detected, perform an investigation to determine source of movement.
4. Access the structure and inspect the piping and appliance for proper installation.
5. Light any existing appliances and check for proper operation.

8.0 Low Flow and Five (5) Minute Shut-in Test

8.1 A low flow test is performed by allowing gas to flow downstream of the meter. After confirming the meter will register low flow, proceed with the shut-in test.

8.1.1 During low flow test, if odorant is not readily detectable, verbally notify Gas Supervisor immediately for a follow-up investigation. See [ODOR 2.1 Section 9.0](#) Odorant Intensity Testing Sniff Tests.

8.2 Perform a 5-minute shut-in test using the normal delivery pressure to ensure the customer piping has no leaks. A shut-in test may be performed using a gas meter test hand or a pressure gauge assembly.

8.3 Using Gas Meter Test Hand:

8.3.1 Unlock meter valve, turn on gas. If fast movement on the test hand is detected, turn the meter valve off and check for failed safeties and/or open fuel lines.

- 8.3.2 With the test hand on the upstroke, perform the shut-in test. Refer to Section 8.3.3 for meters equipped with remote meter reading modules.
- 8.3.3 Mark position of test hand.
 1. When performing the low flow test, wait until the test hand has jumped ahead and resumed movement before tightening the outlet swivel meter nut.
 2. Note the following guidance on "slight movement" of the meter test hand and refer to [Figure 1](#):
 - 2 a. As a guide, if the quarter- or half-foot test hand moves from one tick mark, on the circle, to the next tick mark in 5 minutes or longer this would be considered slight movement.
 - 2 b. If gas field personnel feel more comfortable in turning off all pilots before conducting the 5-minute shut-in test, that is their choice.
 - 2 c. If all the pilots are turned off, then there should be no movement in the test hand.

Figure 1: Gas Meter Index (Test hands at lower left)

- 8.3.4 Perform a 5-minute shut-in test by observing the meter test hand while the gas is on and all appliances are turned off.
 1. *If slight movement of the meter test hand is detected AND the customer is home:*
 - 1 a. Ensure that customer appliances have standing pilots.
 - (i) If not, then perform an investigation to determine source of movement. Make simple repairs OR issue a **"Warning"** tag.
 2. *If slight movement of the meter test hand is detected AND the customer is not home:*
 - 2 a. Lock the meter valve and complete the order, "Red Pin".
 - 2 b. Leave a door tag so the customer knows why their service is off and whom to call to restore service.
 - 2 c. Document the finding.
- 8.3.5 Check meter set fittings for leaks and repair any leak found.

8.4 Using a Pressure Gauge Assembly:

- 8.4.1 Unlock the meter valve, turn gas on and check for movement of the test hand on the meter index.
- 8.4.2 If fast test hand movement is detected, turn the meter valve off and check for failed safeties and/or open fuel lines.
- 8.4.3 Turn meter valve off and loosen the inlet and outlet meter swivel nuts to remove the meter.
- 8.4.4 Connect the pressure gauge assembly to the inlet and outlet meter swivel nuts.
- 8.4.5 Turn the meter valve on to pressurize the assembly and customer piping.
- 8.4.6 Soap the meter set fittings and repair any leaks found.
- 8.4.7 Turn the pressure gauge valve to the off position.
- 8.4.8 Perform a 5-minute shut-in test by observing the pointer on the pressure gauge.
- 8.4.9 If a slight loss in pressure is detected, ensure that the customer appliances have standing pilots. If not, then perform an investigation and make any necessary repairs OR issue a "**Warning**" tag.
 1. *If the customer is home:*
 - 1 a. Ensure that customer appliances have standing pilots.
 - (i) If not, then perform an investigation to determine source of movement. Make simple repairs or issue a "**Warning**" tag.
 2. *If the customer is **not** home:*
 - 2 a. Lock the meter valve and complete the order, "Red Pin".
 - 2 b. Leave a door tag so the customer knows why their service is off and whom to call to have service restored.
 - 2 c. Document the finding.

9.0 Regulator Set Pressure and Lockup Check

- 9.1 If the turn on includes a service regulator change, meter change, or meter install, then include a regulator set pressure and lock-up test using the following procedure:
 - 9.1.1 Downstream of the meter, install a meter test plug or fitting that contains an orifice and a connection for an inches gauge.

Service regulators are set at 7 inches water column (W.C.) with a flow rate of 50 CFH. An orifice drilled with a #33 size bit will provide the correct CFH at 7 inches W.C.
 - 9.1.2 Turn gas on and set the delivery pressure of the regulator with gas flowing through test fitting orifice. Normal residential delivery pressure is 7 inches W.C.
 - 9.1.3 After the correct pressure has been established, check lock-up of the regulator by stopping the gas flow through the orifice with your finger.
 - 9.1.4 The regulator should lock-up at no more than 1 inch W.C. higher than the delivery set point of 7 inches W.C.

UNCONTROLLED IF PRINTED

- 9.1.5 Elevated delivery pressure customers will require a test gauge or better to set delivery pressure and check lockup of regulator. See [METR 2.6](#) Pressure Gauges and [METR 2.8](#) Pressure Factor Metering.

10.0 Checking Fuel Lines

- 10.1 Gain access to the premise. If the premise is a health or safety hazard, notify your Supervisor.
- 10.2 If accessible, check where the fuel line enters the structure.
- 10.3 Trace all visible fuel lines and check for code violations and hazards. See [TURN 2.7](#) Warning Tag.
- 10.4 All fuel lines should be supported.
- 10.5 Any fuel lines that are not connected to an appliance shall be capped or plugged.
- 10.6 Check each gas appliance for an accessible shut-off valve or a listed gas convenience outlet installed in the same room/floor and within 6 feet of the appliance it serves. Existing appliances without a shut-off valve may be lit. However, a **"Warning"** tag should be issued.
- 10.7 All water heaters and furnaces should have a sediment trap. Existing appliances without a sediment trap may be lit. However, a **"Warning"** tag should be issued.

HUD does **not** require sediment trap (drip leg) at original appliances in Manufactured Homes.

- 10.8 Check for uncoated brass appliance connectors and replace when found. See [TURN 2.9](#) Brass Appliance Connectors.

11.0 Displacement of Air in Fuel Lines

- 11.1 Before bleeding, be sure to identify and eliminate all sources of ignition, such as standing pilots, open flames, cigarettes, appliances and equipment.
- 11.2 When displacing, bleeding, air in customer fuel lines:
- 11.2.1 Do not bleed the air/gas mixture into a confined space.
- 11.2.2 All bleeding of air/gas should only be done in a well-ventilated area or by venting the air/gas into the outside atmosphere.
- 11.3 The safest way to bleed a customer fuel line is at the gas stove but if not available can be bled at the water heater or furnace by holding down the pilot button to bleed the air through the pilot.

Overriding any appliance safety is an unsafe act and shall not be performed.

- 11.4 Another option for bleeding the customer fuel line is to:
- 11.4.1 Shut off the appliance valve upstream of the fuel line union, flex connector or sediment trap.

11.4.2 Loosen the union, flex connector or drip leg cap; however, never completely disconnect the piping or remove the cap.

11.4.3 Turn on the appliance valve and bleed the air/gas mixture through the loosened fitting.

11.4.4 When gas odor is first detected, tighten the fitting and soap test for leaks. With a gas detection instrument, check the area to ensure a hazardous environment has not been created by bleeding the fuel line.

11.5 High efficiency sealed combustion units may be used to bleed the customer fuel line by cycling the appliance several times. If the appliance does not light, the unit may lock out and require the power supply to be interrupted for 60 seconds to reset the appliance controls.

12.0 Lighting Appliances

12.1 Gas range

12.1.1 Complete a visual inspection and operational check of the range. See [TURN 2.4 Section 4.0](#) Lighting Appliances: Stoves (Ranges).

12.2 Water heater

12.2.1 First verify that the water is turned on. If water does not come out of the hot- and cold-water faucet, do not light the water heater. Complete an inspection and operational check of the water heater. See [TURN 2.4 Section 5.0](#) Lighting Appliances: Water Heaters.

12.2.2 If the water in the heater is frozen, do not light. Leave off and issue "Warning" tag as Hazardous Condition.

12.2.3 If there is a possibility that the water pipes are frozen, notify the customer of possible leakage when water pipes thaw and that Ameren Illinois is not responsible for damage.

12.3 Gas furnace

12.3.1 Complete an inspection and operational check of the furnace. See [TURN 2.4 Section 6.0](#) Lighting Appliances: Furnaces.

12.4 Residential Boilers

12.4.1 Complete an inspection and operational check of the boiler. See [TURN 2.4 Section 7.0](#) Lighting Appliances: Residential Boilers.

12.5 Light any other existing gas appliances customer requests to be connected and complete an inspection and operational check of each appliance. If, at the customer's request, an appliance is not to be lit:

12.4.1 Appliance should be left off at the control valve and the lever handle valve, if one is present.

13.0 Crawl Spaces

13.1 Before entering the crawl space, check the environment at the entrance for the presence of gas, oxygen levels, carbon monoxide. See [CONF 1](#).

13.2 If crawl space cannot be safely entered to light an appliance, notify Gas Supervisor so arrangements can be made to light the appliance or to get assistance.

14.0 Re-establishing Service After Flooding

- 14.1 If meter and/or regulator were underwater, components should be replaced.
- 14.2 Appliances that were under water shall be "**Warning**" tagged as Hazardous Condition.
- 14.3 Gas field personnel should not perform the light up on repaired equipment.

15.0 Gas Meter Relight Tag

- 15.1 If customer has elected to relight their own appliance, gas field personnel will leave a Gas Meter Relight Tag when they have completed a successful shut in test. See [Appendix A](#) for a copy of the Gas Meter Relight Tag.
- 15.2 The Gas Meter Relight Tag provides the customer with instructions on how they can turn on their gas at the valve downstream of the meter outlet.

16.0 Records

- 16.1 Records associated with turning on gas service shall be recorded and maintained in Ameren Illinois CSS and OAS for at least 2 years.

End of Instructions.

Appendix A - Gas Meter Relight Tag

Stock Code 37-22-264 - Form #F5824 (Rev 8/19)

You have chosen to light your own appliances:

Please follow these steps.

1. Close all open fuel lines.
2. Slowly turn gas valve to the ON position.
3. Re-light all gas appliances.

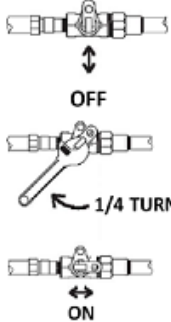

CAUTION! Any movement of the meter hands immediately after opening valve could indicate a gas leak and you should close the gas valve and call Ameren Illinois at **1.800.755.5000**

We respond 24/7 /365 at no cost to you.

TURN VALVE 1/4 TURN SO THAT THE LOCK WING IS PARALLEL TO THE PIPE TO TURN ON GAS SERVICE

****TURN VALVE SLOWLY****

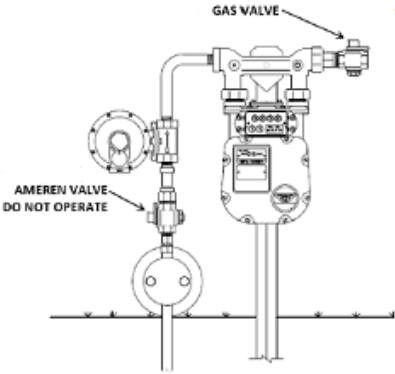

OFF

1/4 TURN

ON

Form F5943 Rev. 8/19 Stock No. 37-22-264

Ha decidido encender sus propios aparatos:

1. Cierre todas las líneas de combustible abiertas.
2. Gire lentamente la válvula de gas a la posición de encendido (ON).
3. Vuelva a encender todos los aparatos de gas.

PRECAUCIÓN! Cualquier movimiento de las agujas del medidor inmediatamente después de abrir la válvula puede indicar que existe un escape de gas y debe cerrar la válvula de gas y llamar a Ameren Illinois al 1.800.755.5000. Respondemos 24 horas al día, 7 días de la semana, 365 días del año sin costo alguno para usted.

GIRE LA VÁLVULA 1/4 DE VUELTA HASTA QUE LA ALETA DE LA LLAVE MARIPOSA ESTÉ PARALELA AL CAÑO PARA ABRIR EL SERVICIO DE GAS.

1.0 Purpose

This document outlines the procedures for initiating gas service to large commercial/industrial customers.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Care and Handling of Meters and Correctors](#)

[6.0 New Meter Installation](#)

[7.0 Existing Meter Installation](#)

[8.0 Initiating Service](#)

[9.0 Records](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors

4.0 General

- 4.1 The turn-on should be done with the assistance of the owner (or designee) who is familiar with the location and operation of all gas burning appliances.
- 4.2 Customer shall provide all necessary equipment for AIC gas field personnel to safely access the appliances for inspection and lighting. Gas field personnel are not obligated to inspect, adjust, or light appliances unless safe access is available.
- 4.3 Customer is responsible for performing light-up operations once gas field personnel have verified there are no gas leaks on customer's facilities. Gas field personnel may assist customer with the light-up when requested.
- 4.4 Gas field personnel should document on the order if customer does not provide a means of safe access or denies access to gas facilities.

5.0 Care and Handling of Meters and Correctors

- 5.1 Meters and correcting devices removed from service shall be treated the same as those to be installed.
- 5.2 See [METR 1 Section 5.0](#) Care and Handling for further discussion.

6.0 New Meter Installation

- 6.1 Large commercial/industrial installations will typically have gas loads of 15,000 scfh or greater requiring larger piping, multiple valves, larger regulators, relief valves, and possibly electronic correcting devices.

- 6.2 Newly installed meter sets shall follow standard meter set design in accordance with [METR 3.4](#) or with Gas Engineering design. Gas field personnel shall notify Gas Supervisor if this is not the case.
- 6.3 Gas field personnel shall perform a meter header inspection. See [METR 2.2 Section 7.0](#) Meter Header Inspection.
- 6.4 Gas field personnel must have information concerning the regulator set pressure, metering pressure, relief valve set pressure, meter size, and if electronic corrector is required.
- 6.5 Install the meter, if not already installed, ensuring it is level in all directions.
- 6.6 Rotary meters should be filled to the proper level with oil, or arrangements made to fill with oil shortly after turning the meter on.
- 6.7 If electronic corrector is required, it should be in place or arrangements made to have it installed as soon as meter is installed.
- 6.8 Gas field personnel should verify all connections are tight and valves are in the closed position.
- 6.9 Check vent lines for proper size and termination. See [METR 1 Section 8.0](#) Regulator Vent Lines.
- 6.10 If regulators have sensing control lines, verify they are not connected together. Each control line must have its own tap.
- 6.11 If meter is installed inside the building, ensure there is an accessible shut-off valve outside the building.
- 6.12 If regulator is installed inside the building, ensure vent line has been extended to outside the building. See [METR 1 Section 8.0](#).
- 6.13 Verify customer's shut-off valve and bypass valve (if present) are in the closed position.
- 6.14 Meter by-pass valve shall be locked in closed position.

7.0 Existing Meter Installation

- 7.1 Gas field personnel shall perform a meter header inspection. See [METR 2.2 Section 7.0](#).
- 7.2 Gas field personnel must have information concerning the regulator set pressure, metering pressure, relief valve set pressure, meter size, and if electronic corrector is required.
- 7.3 Verify all connections are tight and valves are in the closed position.
- 7.4 Check vent lines for proper size and termination. See [METR 1 Section 8.0](#).
- 7.5 If regulators have sensing control lines, verify they are not connected together. Each control line must have its own tap.
- 7.6 If meter is installed inside the building, ensure there is an accessible shut-off valve outside the building.
- 7.7 If regulator is installed inside the building, ensure vent line has been extended to outside the building. See [METR 1 Section 8.0](#).
- 7.8 Verify customer's shut-off valve and by-pass valve (if present) are in the closed position.
- 7.9 Meter by-pass valve shall be locked in closed position.

8.0 Initiating Service

- 8.1 Conduct a low flow test to ensure meter will register. Most large meter sets will have blowdown facilities downstream of meter that can be used to create flow through the meter.
 - 8.1.1 During low flow test, if odorant is not readily detectable, verbally notify Gas Supervisor immediately for a follow-up investigation. See [ODOR 2.1 Section 8.0](#) Odorant Intensity Testing Sniff Tests. Check meter set for leaks.
- 8.2 Check existing regulator pressure set point and adjust if necessary.
 - 8.2.1 If customer's gas equipment is not in operation, use blow-down facility to create flow.
 - 8.2.2 Use test gauge to set and check pressure. See [METR 2.6](#) Pressure Gauges.
 - 8.2.3 Perform a lock-up test on all new meter set installations and on existing meter sets where a new regulator has been installed.
- 8.3 If equipped with relief valve, set relief valve set pressure by either temporarily increasing regulator pressure or the use of nitrogen.

Gas field personnel should check for the presence of audible relief alarms and take necessary precautions to protect their hearing.

- 8.4 Coordinate with customer (or designee) to ensure gas appliances are in "off" position and that there are no open fuel lines.
- 8.5 Open customer valve and allow gas to fill customer's fuel lines.
- 8.6 Observe meter test hand when it stops moving. Customer's fuel line should be filled.
- 8.7 Conduct a shut-in test to check for leaks on customer's piping. It is difficult to perform shut-in test by observing the test hand of rotary meters or large diaphragm meters normally installed for large commercial/industrial customers. Rotary meters will allow an extremely low flow of gas to pass by the impellers without registering on the index. Large diaphragm meters have a larger test hand which requires a longer period of time and a higher volume of gas to pass before movement of test hand is observed.
- 8.8 For large commercial/industrial metering situations, use of a pressure gauge is the easiest method for checking customer's piping for leaks. This will require a pressure tap downstream of isolation valve.
 - 8.8.1 Once customer's fuel line has been filled, close the meter valve or the customer's shut off valve to isolate customer's piping.
 - 8.8.2 Once pressure has stabilized, record the pressure gauge reading.
 - 8.8.3 After 10 minutes, check pressure reading. A drop in pressure will indicate a leak.
- 8.9 Once no leak on customer's facilities is verified, lighting of appliances may proceed. The customer is responsible for performing light-up operations. Gas field personnel may assist customer with the light-up when requested.
- 8.10 If leakage is detected on customer facilities, issue a "**Warning**" tag.

- 8.11 If meter is operating at elevated pressure, install metering pressure tag near the meter index. See [METR 2.8](#) Pressure Factor Metering.
- 8.12 Gas Supervisor (or designee) shall notify the appropriate gas metering personnel when a rotary meter has been installed and turned-on so an initial differential test can be performed on the meter.

9.0 Records

- 9.1 Gas field personnel shall complete Gas Meter Data Sheet for all meters that operate at an elevated pressure (> 7" w.c./0.25 psig). Submit completed Gas Meter Data Sheet to Gas Supervisor for review and distribution. See [METR 2.10 Section 6.0](#) for distribution list.
- 9.2 Complete order by providing required meter information. Depending on operating procedures of the various Operating Areas, the order may be "restored" or sent to a local office OSA/OSR for completion.

End of Instructions.

Operator Qualification (OQ) Required?

YES

TURN 2.02 Turn-On Turn-Off: Large Commercial/Industrial Customer, January 1, 2016.

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

UNCONTROLLED IF PRINTED

UNCONTROLLED IF PRINTED

TURN-ON TURN-OFF

TURN 2.3 Discontinuance or Transfer of Gas Service

1.0 Purpose

This document outlines the procedures for disconnecting or transferring gas service.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Read In-Read Out](#)

[6.0 Soft Disconnect \(Leave Hot\)](#)

[7.0 Hard Disconnect \(Terminate Service\)](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Meter Specialists

4.0 General

- 4.1 AIC allows for residential gas meters to be left on for a period of time following a customer's request for disconnect when the former customer is not removing a gas appliance.
- 4.2 In the following situations, gas service is shut off and locked at the meter valve:
 - 4.2.1 The customer requesting the turn-off is moving or removing a gas appliance.
 - 4.2.2 A non-pay order is issued.
 - 4.2.3 A structure is being torn down.
 - 4.2.4 The customer no longer desires natural gas service.

5.0 Read In-Read Out

- 5.1 Service may be transferred from one customer to another customer at the same location without interruption of service.
- 5.2 The meter may be "read out" of the name of the customer terminating service and "read in" the name of the new customer without turning off the meter valve or entry into the premises.
- 5.3 When a physical reading is necessary, gas field personnel shall always verify the meter number before getting the reading.

6.0 Soft Disconnect (Leave Hot)

- 6.1 When the Customer Contact Center receives a gas turn-off request and customer reports no gas appliance is being removed, obtain a reading through AMI or issue an or-

der with an MJ-15 (read meter) trouble code. The gas meter will be read and left on for 10 calendar days.

- 6.2 Gas field personnel shall always verify the meter number when performing a physical read through to ensure that they are at the correct meter.

7.0 Hard Disconnect (Terminate Service)

- 7.1 A hard disconnect order, with a trouble code DC-TM, will be issued for the following situations:
- 7.1.1 There has been no successor connected within 10 calendar days of the initial turn-off request when no gas appliance is being moved or removed (Soft Disconnect).
 - 7.1.2 In the initial turn-off request, the Customer reported that a gas appliance was being moved or removed.
 - 7.1.3 A non-pay disconnect is issued.
 - 7.1.4 Customer has request termination of service due to demolition of or damage to the structure.
 - 7.1.5 Customer no longer has gas appliances and wants the service discontinued.
- 7.2 When disconnecting gas service, leave the gas meter in place unless the customer has indicated they no longer want gas service.
- 7.2.1 Gas field personnel should report to their Supervisor if there are any indications the structure appears to be abandoned, condemned, or severely damaged or is being torn down.
 - 7.2.2 Gas Supervisor should investigate to determine if an order needs to be generated to disconnect the service line from the main.

Stray electrical current migrating from various sources can energize meter set and customer's piping, creating a hazardous work environment.

- 7.3 Before touching the meter set, check the riser, meter and customer piping with volt stick. If volt stick alarms, see [METR 2.2 Section 7.2](#) AC Voltage on Meter Set.
- 7.4 Verify the meter number.
- 7.5 Perform meter header inspection, See [METR 2.2 Section 7.0](#).
- 7.6 Close the meter valve and lock.

If piping or meter is removed, cap or plug all open ends of piping, meter, and valves.

- 7.7 Record the meter reading on the order.

End of Instructions.

UNCONTROLLED IF PRINTED

Operator Qualification (OQ) Required?

TURN 2.3 Turn-On Turn-Off: Discontinuance or Transfer of Gas Service, April 1, 2021

Revision Notes

Location of Changes	Summary of Changes
Subsection 7.6 NOTE	Added "meter" - If piping or meter is removed, cap or plug all open ends of piping, meter and valves.

TURN 2.4 Lighting Appliances and Checking Appliance Safety

1.0 Purpose

This document specifies procedures for lighting appliances (stoves/ranges, water heaters, furnaces), installing and operating vent-free gas appliances as supplemental heat sources, and for checking the appliance safety associated with the control valve on an appliance.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Lighting Appliances: Stoves \(Ranges\)](#)

[5.0 Lighting Appliances: Water Heaters](#)

[6.0 Lighting Appliances: Furnaces](#)

[7.0 Residential Boilers](#)

[8.0 Vent-Free Appliances](#)

[9.0 Flame Characteristics](#)

[10.0 Appliance Safety](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Meter Changers
- Meter Specialists

4.0 Lighting Appliances: Stoves (Ranges)

4.1 General

- 4.1.1 This section outlines the procedure for a visual inspection and operational check of an existing stove after the fuel lines have been purged of air.
- 4.1.2 All new or repaired appliances shall be checked for proper installation, however, the installing contractor (or designee) shall light the appliance.

4.2 Visual Inspection

- 4.2.1 All new or replaced ranges shall have a shut off valve within 6 feet of the range and in same room.
 1. The valve shall be placed before the appliance connector.
 2. Existing ranges without a shut off valve may be lit. However, a **"Warning"** tag shall be issued. See [TURN 2.7](#) Warning Tag for list of Code Violations.
- 4.2.2 Check that all controls are in the "off" position.
- 4.2.3 Check for clearance at the bottom of range to allow for sufficient combustion air for the oven. See [TURN 2.5](#) Combustion and Ventilation Air.
 1. If the range is placed on carpet, the adjustable legs shall be extended to allow combustion air to reach the oven burners.

UNCONTROLLED IF PRINTED

2. Any rug placed in front of the range must not block combustion air for the oven.

4.2.4 Inspect customer's appliances for the presence of uncoated brass connectors each time entering a customer home or business in the normal course of their work. See [TURN 2.9](#) Brass Appliance Connectors.

4.2.5 Use special care when moving the range. If the range is connected with a brass connector that has soldered ends, movement of the connector could cause the ends to separate.

4.2.6 Connectors for gas appliances shall be used in accordance with the terms of their listing, and shall be in the same room as the equipment. Only one connector shall be used per appliance.

4.2.7 If the range was moved during the inspection, check behind the range with a gas detection instrument after the gas is turned on, to ensure that the range connector was not damaged and is not leaking.

4.3 Operational Check - Range Top Burners

4.3.1 Verify the burner valves are in the "off" position.

4.3.2 Light the range top pilots, clean and adjust if necessary.

1. On range tops, check each burner air shutter that is accessible and clean if necessary.

4.3.3 Light all burners.

4.3.4 Check for proper flame characteristics. Adjust air shutter if necessary to obtain proper flame characteristics. See [Section 9.0](#).

4.4 Operational Check - Oven Burner

4.4.1 Verify the oven control valve is in the "off" position.

4.4.2 For equipment with an appliance safety, check for proper operation.

Position your head close enough to observe main burner ignition, but at a safe distance to prevent injury from possible flame rollout.

1. Before the oven pilot is lit, position your head as close to the front of the oven compartment as the oven door will allow.

2. Turn the oven control to the full "on" position.

- 2 a. If you hear gas flowing through the main burner, then the safety has failed.

- (i) Turn off the range and issue a "**Warning**" tag. See [TURN 2.7](#). Do not operate an appliance with a malfunctioning safety. See [Section 10.0](#).

- 2 b. If you do not hear gas flowing through the main burner, then the safety is working.

3. Turn the oven control to the "off" position and light the oven pilot.

4. Turn on the oven burner control and check for proper ignition.

UNCONTROLLED IF PRINTED

- 4.4.3 Check for proper flame characteristics. Adjust air shutter if necessary to obtain proper flame characteristics. See [Section 9.0](#).
- 4.4.4 Ovens with electronic ignition should be cycled on and off to check for proper operation and flame characteristics.
 - 1. Clean or adjust air shutter, if needed and accessible, to obtain proper flame characteristics.
 - 2. Special care shall be taken when cleaning the oven burner runner slot on ranges with electronic ignition (glow plug).
 - 3. The glow plug is coated with ceramic and will break if touched or bumped.

5.0 Lighting Appliances: Water Heaters

5.1 General

- 5.1.1 This section outlines the procedure for inspection and operation of an existing water heater after the fuel lines have been purged of air.
- 5.1.2 All new or repaired appliances shall be checked for proper installation, however, the installing contractor or designee shall light the appliance.

5.2 Prohibited Installations

- 5.2.1 Water heaters in residential garages and in adjacent spaces open to the garage shall be installed so that all burners and ignition devices are at least 18 inches above the floor unless listed as Flammable Vapor Ignition Resistant.
- 5.2.2 No new or replaced water heater shall be installed in bathrooms, bedrooms, or any occupied rooms normally kept closed.
- 5.2.3 *Exceptions:*
 - 1. Direct vent, (sealed combustion chamber), water heaters that obtain outside combustion air and discharge flue gases to the outdoors.
 - 2. A water heater that is installed in a closet equipped with a weather-stripped door with a self-closing device, and all combustion air is obtained from the outdoors.

5.3 Existing Installations

- 5.3.1 When a water heater is found to be installed in a bedroom or bathroom, an operational inspection shall be performed with the door closed and the exhaust fan operating.
 - 1. If the water heater operates properly, it shall be tagged as a code violation and left in operation.
 - 2. If the water heater does not operate properly, it shall be turned off and tagged as a hazardous condition. See [TURN 2.7](#) Warning Tag.
- 5.3.2 Water heaters in mobile homes and manufactured housing must be listed or approved for such use.
- 5.3.3 Gas water heaters in a manufactured home shall be installed such that its combustion and ventilation air are obtained from the outside by either:
 - 1. Sealed combustion water heater, or
 - 2. Installed in an enclosure that separates the appliance's combustion system and venting system from the interior environment of the manufactured home.

UNCONTROLLED IF PRINTED

There shall not be any door, removable access panel, or other opening into the enclosure from inside the manufactured home. If an opening is found, issue Warning Tag. See [TURN 2.7](#) Warning Tag.

5.4 Visual Inspection

5.4.1 Make sure the water heater has adequate combustion and ventilation air for proper operation. See [TURN 2.5](#) Combustion and Ventilation Air and Venting Requirements.

5.4.2 Check that no combustible materials are stored near the water heater.

5.4.3 All water heaters must have a sediment trap before the control valve and a shut off valve within 6 feet and in the same room.

1. Existing appliances without a sediment trap or shut off valve may be lit, however a "**Warning**" tag for a code violation should be issued.
2. Original water heaters in HUD approved manufactured homes will not have drip legs but should have shut off valve.
3. Replacement water heaters in manufactured homes shall comply with this requirement.
4. Ensure the water heater is listed for natural gas.

5.4.4 Inspect the water heater vent system: See [TURN 2.5](#).

1. Draft diverter is securely in place.
2. Single wall pipe is used only from the draft diverter to the chimney or flue and shall not pass through any attic, inside wall, concealed space or floor.
3. Single or double wall vent pipe joints are screwed or locked in place. High temperature flue vent tape can be used to secure the vent pipe joint.
4. Horizontal sections have a minimum of ¼" per foot uphill pitch and are supported every 6 feet.
5. Inspect for corrosion or discoloration at joints. (Indication of condensation)
6. Check for vent height, termination, and vent cap.
7. Check for plastic vent. See [TURN 2.5](#) for recall information.

5.4.5 Make sure the water heater has a temperature and pressure relief valve (T&P valve).

1. The T&P valve discharge pipe must be approved for hot water distribution, terminate within 6 inches of the floor, and have no threads on outlet end.
2. The size of the discharge pipe cannot be downsized nor can a valve be installed between the T&P and the end of the discharge pipe.
3. T&P valve relief discharge piping on water heaters in manufactured housing may be plastic pipe.

5.5 Operational Check for Conventional Water Heater

5.5.1 First, verify that the water is turned on. If water does not come out of the hot- and cold-water faucet, do not light the water heater.

5.5.2 Remove outer and inner combustion doors.

5.5.3 Inspect condition of the burner assembly to ensure it is suitable for operation.

UNCONTROLLED IF PRINTED

5.5.4 Check the appliance safety in the control valve for proper operation. See [Section 10.0](#).

5.5.5 Light the pilot.

Position your head a safe distance away to prevent injury from possible flame rollout.

5.5.6 Turn the control valve to the "on" position.

5.5.7 Light the pilot and turn the control valve to the "on" position.

5.5.8 Verify that the pilot ignites the main burner completely. Check for proper flame characteristics. See [Section 9.0](#).

5.5.9 Turn the thermostat down to verify that the main burner shuts off, install inner and outer combustion doors.

5.5.10 No water heater shall be left in operation without both doors.

5.5.11 Then turn the thermostat back up to allow main burner to ignite.

5.5.12 While the main burner is operating, check for spillage at the draft hood.

1. It may take up to 5 minutes for the vent to warm up before the vent will operate properly.
2. Verify that the products of combustion are being vented outside through the use of such methods as: the hand, smoke from an extinguished match, etc.
3. If the water heater does not vent properly, the water heater shall be turned off and a "**Warning**" tag issued.

5.5.13 After the operational check is completed, return thermostat to the normal temperature setting.

5.5.14 Make sure that the Energy Cutoff (ECO) wires are not bypassed.

5.6 Operational Check for High Efficiency Water Heater

5.6.1 Water heaters with sealed combustion chambers (power vent) shall be checked for operation by turning the thermostat up to allow the water heater to operate.

5.6.2 Then by turning the thermostat back down to verify the water heater responds to the thermostat by shutting off.

5.7 Operational Check for Tankless Water Heater

5.7.1 Water heaters shall be checked for operation by turning on the hot water faucet to allow the water heater to operate.

5.7.2 Then by turning the hot water faucet off to verify the water heater responds by shutting off.

5.7.3 Verify unit is venting properly.

5.8 Flammable Vapor Ignition Resistant (FVIR) Water Heaters

5.8.1 The Consumer Products and Safety Commission found thousands of fires, injuries and deaths were related to water heaters installed in areas where flammable liquids are stored or used.

UNCONTROLLED IF PRINTED

1. All conventional residential 50-gallon and smaller water heaters manufactured after *July 1, 2003* had to comply with ANSI FVIR standards.
 2. Power vented residential water heaters, 50 gallons and smaller, manufactured after *July 1, 2006* had to comply with FVIR standards.
 3. All remaining residential water heaters manufactured after *July 1, 2007* had to comply.
- 5.8.2 A FVIR water heater should not ignite flammable vapors outside the water heater created because of improper storage or handling/spillage of gasoline on the floor near the water heater.
- 5.8.3 A FVIR water heater has the following components:
1. A device to prevent ignited vapors from passing out of the combustion chamber.
 2. A one-way intake system to control the movement of makeup air into the combustion chamber.
 3. An inner door and burner assembly to create a sealed junction with the combustion chamber, preventing combustion air and flammable vapors from entering the chamber through the front of the water heater.
 4. The pilot thermocouple used in FVIR water heaters includes a one-shot temperature switch that opens the thermocouple circuit if the water heater is not receiving adequate combustion air due to flammable vapors or insufficient room size. See [TURN 2.5](#).
- 5.8.4 If the water heater is in compliance with the FVIR standards, it does not have to be raised 18 inches in garages or similar locations, unless required by the manufacturer or local code authorities. See Figure 1.

Figure 1: FVIR-Compliant

Figure 2: Non-Compliant Water Heater

6.0 Lighting Appliances: Furnaces

6.1 General

- 6.1.1 This section outlines the procedure for inspection and operation of an existing furnace after the fuel lines have been purged of air.
- 6.1.2 All new or repaired appliances shall be checked for proper installation, however, the installing contractor (or designee) shall light the appliance.

6.2 Prohibited Installations

- 6.2.1 Furnaces in residential garages and in adjacent spaces open to the garage shall be installed so that all burners and ignition devices are at least 18 inches above the floor unless listed as Flammable Vapor Ignition Resistant.
- 6.2.2 New or replaced furnace shall not be installed in a bedroom or bathroom unless the bedroom or bathroom has the required volume of combustion and ventilation air. See [TURN 2.5](#).
- 6.2.3 Exceptions:

1. Direct vent, (sealed combustion chamber), furnace that obtains outside combustion air and discharges flue gases to the outdoors
2. A furnace that is installed in a closet equipped with a weather-stripped door with a self-closing device, and all combustion air is obtained from the outdoors.

6.2.4 Replacement furnaces in mobile homes and manufactured housing must be listed or approved and certified for such use.

6.2.5 Unvented natural gas heaters shall not be used as the sole source of heat and shall not be installed in bedrooms or bathrooms unless approved and certified for such use. See [Section 8.0](#) Vent Free Appliances.

6.3 Visual Inspection

6.3.1 Make sure the furnace has adequate combustion, ventilation and circulation air for proper operation.

1. High efficiency furnaces (sealed combustion chamber) may be installed so the combustion/ventilation air is taken from inside the structure; however, it must meet the minimum required volume. See [TURN 2.5](#).
2. Furnaces in manufactured homes shall be installed such that their combustion system and venting system has a complete separation from the interior environment of the manufactured home.

6.3.2 Check that no combustible materials are stored near the furnace.

6.3.3 All new or replaced furnaces shall have a sediment trap before the control valve and a shut off valve within 6 feet and in same room.

1. Original furnaces in HUD manufactured homes may not have a sediment trap upstream of the furnace, but should have a shut off valve.
2. Existing appliances without a sediment trap and or a shut off valve may be lit. However, a "**Warning**" tag for code violation shall be issued.

6.3.4 Inspect the furnace vent system. See [TURN 2.5](#).

6.4 Operational Check

6.4.1 Inspect air shutters, burners and runner tubes for blockage and corrosion, and clean if necessary. Look for obvious cracks, openings, or excessive corrosion in the heat exchanger.

6.4.2 Turn the thermostat up as high as possible, if not previously done, and check the safety in the control valve for proper operation. See [Section 10.0](#) Appliance Safety.

6.4.3 Verify that the appliance valve is in the "off" position.

Use the electric switch for the furnace control valve if available to control the ignition.

6.4.4 Light the pilot.

Position your head a safe distance away to prevent injury from possible flame rollout.

- 6.4.5 Turn the furnace control valve to the "on" position.
 - 6.4.6 Turn on the electric switch if used. Observe that the pilot ignites the runner tube, and that the runner tube ignites the burners end to end.
 - 6.4.7 Check for proper flame characteristics. Adjust air shutter if necessary to obtain proper flame characteristics. See [Section 9.0](#).
 - 6.4.8 While the blower is still off, continue to observe the flame characteristics from each burner.
 - 6.4.9 While the main burner is operating, check for spillage at the draft hood. It may take up to 5 minutes for the vent to warm up before the vent will operate properly.
 - 6.4.10 Verify that the products of combustion are being vented outside by using methods such as the hand, smoke from an extinguished match, etc. If the furnace is not venting properly, shut off the furnace and issue a **"Warning"** tag.
 - 6.4.11 Continue to observe the flames while the furnace is heating up, and with the blower operating. Observe the burners for distorted flames that may indicate an air disturbance in the heat exchanger.
 - 6.4.12 Check the burners a second time with the blower operating, to verify the blower does not distort the flames as pressure increases through the heat exchanger from blower operation.
 - 6.4.13 After the operational check is complete, adjust thermostat as needed to ensure furnace cycles.
 - 6.4.14 Re-install the furnace doors and return the thermostat to a normal setting for the season. Furnace doors shall always be in place when furnace is operating.
- 6.5 High Efficiency Furnaces
- 6.5.1 Furnaces with sealed combustion chambers, such as a 95+ efficient furnace, must be checked for proper operation.
 - 1. Turn the thermostat up to allow the furnace to operate with the blower on.
 - 2. Then turn the thermostat back down to verify the furnace responds to the thermostat by shutting off.

If the high efficiency furnace combustion air is not obtained from the outdoors, then the minimum room size for total BTU input is applicable. See [TURN 2.5](#) Combustion and Ventilation Air and Venting Requirements.

7.0 Boilers

7.1 General

UNCONTROLLED IF PRINTED

- 7.1.1 This section outlines the procedures for inspecting and lighting of an existing boiler after fuel lines have been purged of air.
- 7.1.2 All new or repaired appliances shall be checked for proper installation however, the installing contractor (or designee) shall light the appliance.

7.2 Prohibited Installations

- 7.2.1 Boiler in residential garages and in adjacent spaces open to the garage shall be installed so all burners and ignition devices are at least 18 inches above the floor, unless listed as FVIR. See [Subsection 5.8](#) for explanation of FVIR.
- 7.2.2 New or replaced boiler shall not be installed in a bedroom or bathroom unless the bedroom or bathroom has the required volume of combustion and ventilation. See [TURN 2.5](#) Combustion and Ventilation Air and Venting Requirements.
- 7.2.3 Exceptions
 1. Direct vent (sealed combustion chamber) boiler that obtains outside combustion air and discharges flue gas to the outdoors.
 2. A boiler that is installed in a closet equipped with a weather-stripped door with a self-closing device and all combustion air is obtained from the outdoors.

7.3 Visual Inspection

- 7.3.1 Make sure the boiler has adequate combustion, ventilation and circulation air for proper operation.
 1. High efficiency boiler (sealed combustion chamber) may be installed so the combustion/ventilation air is taken from inside the structure, however, it must meet the minimum required volume. See [TURN 2.5](#) Combustion and Ventilation Air and Venting Requirements.
 2. Boiler in manufactured homes shall be installed such that their combustion system and venting system has a complete separation from the interior environment of the manufactured home.
- 7.3.2 Check that no combustible materials are stored near the boiler.
- 7.3.3 All new or replaced boilers shall have a sediment trap before the control valve and a shut off valve is within 6 feet and in the same room.
 1. Original boiler in HUD manufactured homes may not have a sediment trap upstream of the boiler, but should have a shut off valve.
 2. Existing appliances without a sediment trap and or a shut-off valve may be lit. However, a "**Warning**" tag for code violation shall be issued.
- 7.3.4 Inspect the boiler vent system. See [TURN 2.5](#) Combustion and Ventilation Air and Venting Requirements.

7.4 Operational Check

- 7.4.1 Inspect air shutters, burners and runner tubes for blockage and corrosion, clean if necessary. Look for obvious leaks or excessive corrosion.
- 7.4.2 Turn the thermostat up as high as possible, if not previously done, and check the safety in the control valve for proper operation. See [Section 9.0](#) Appliance Safety.

UNCONTROLLED IF PRINTED

7.4.3 Verify that the appliance valve is in the "off" position.

Use the electric switch for boiler control valve if available to control the ignition.

7.4.4 Light the pilot

Position your head a safe distance away to prevent injury from possible flame rollout.

7.4.5 Turn the boiler control valve to the "on" position.

7.4.6 Turn on the electric switch, if used. Observe that the pilot ignites the runner tube and that the runner tube ignites the burner end to end.

7.4.7 Check for proper flame characteristics. Adjust air shutter if necessary to obtain proper flame characteristics. See [Section 9.0](#) Flame Characteristics.

8.0 Vent-Free Appliances

8.1 General

8.1.1 Vent-free gas appliances must be approved and installed as supplemental heat in accordance with manufacturer recommendations, the National Fuel Gas Code, and local codes if they exist.

8.2 Supplemental Heat Source Only

8.2.1 A residence must have a primary heating source before a vent-free gas appliance can be installed to provide a source of supplementary heat.

8.2.2 A primary heating source shall be permanently installed and reasonably sized for the area being heated such as a:

1. Furnace,
2. Heat pump,
3. Electric baseboard, or
4. Another type of heat source.

8.2.3 If a vent-free gas appliance is being used as the primary heating source in a residence, it shall be considered a hazardous condition. Isolate the appliance by shutting off the appliance valve or the appliance control valve and issue a **"Warning"** tag as a hazardous condition.

8.3 Installation Limits

8.3.1 The following table outlines the allowed limits for installation.

Table 1: Limits for Vent-Free Appliances

	Bathroom	Bedroom	Other	Manufactured Homes
--	----------	---------	-------	--------------------

UNCONTROLLED IF PRINTED

Minimum Room Volume	50 cubic feet per 1,000 Btu/Hr appliance	50 cubic feet per 1,000 Btu/Hr appliance	50 cubic feet per 1,000 Btu/Hr appliance	Not allowed unless marked approved for use in manufactured homes.
Maximum Appliance Input Rating	6000 Btu/Hr	10,000 Btu/Hr	40,000 Btu/Hr	Not allowed unless marked approved for use in manufactured homes.

- 8.3.2 Other locations include living rooms, family rooms, kitchens, etc. Adjoining rooms shall be considered part of the room volume if the opening between the rooms cannot be closed with a door.
- 8.3.3 If these requirements are not met, isolate the appliance by shutting off the appliance valve, appliance control valve, or the meter valve and issue a **"Warning"** tag as a hazardous condition.

9.0 Flame Characteristics

- 9.1 The flame characteristics should be burning hard, sharp, and blue in color.
- 9.2 Yellow flames may indicate insufficient combustion air and may require the adjustment of the air shutter.

Orange streaking or tipping in the flame should not be confused with yellow streaking or tipping. Dust or moisture in the air can cause orange streaking in the flame. Yellow flames indicate insufficient combustion air.

- 9.3 If the flame is lifting off of the burner or extending beyond the heating plate, there may be excessive gas pressure or combustion air. This may be corrected by adjusting gas pressure at the appliance regulator or by adjusting the burner orifice.
- 9.4 Flash back or flames rolling out of the front of a furnace when the burner is ignited may be caused by delayed ignition.
- 9.5 Floating flames, flames being pushed down or under burner, or flames rolling out the front of a furnace may indicate a plugged cell in the heat exchanger.
- 9.6 If proper flame characteristics cannot be obtained through the provided procedures, issue a **"Warning"** tag and isolate the appliance. See [TURN 2.7](#) Warning Tag for Hazardous Conditions.

10.0 Appliance Safety

10.1 General

- 10.1.1 This guideline outlines the procedure for checking the appliance safety. The safety is associated with the control valve on an appliance and is designed to prevent the flow of gas to the burner when the pilot goes out.

10.2 Appliance Safety Check

- 10.2.1 Turn the control valve to the "off" position and manually shut off any standing pilots.
- 10.2.2 If appliance has been operating, wait 5 minutes for the thermocouple to cool down.
- 10.2.3 Turn the thermostat up as high as possible.

UNCONTROLLED IF PRINTED

- 10.2.4 Position your head close enough to hear gas flow and turn the control valve to the full "on" position.
- 10.2.5 Listen for gas flowing through the orifice to the main burners or use a Combustible Gas Indicator (CGI) to verify whether or not there is gas present.
1. If background noise is present or if the gas field personnel have a hearing impairment, use a CGI or an electronic leak detector to verify the safety is working properly.
 2. If you hear gas flowing or have a CGI reading, then the safety has failed. Turn the control valve to the "off" position.
 3. If you do not hear gas flowing, then the safety is working. You may proceed with lighting procedures for the appliance.
- 10.2.6 If the safety does not operate properly, turn off the appliance and issue a "**Warning**" tag for a hazardous condition.
- 10.2.7 The appliance shall be isolated and not be operated until the control valve has been replaced.
- 10.2.8 No appliance shall be left in operation with a known defective safety.

End of Instructions.

TURN 2.5 Combustion and Ventilation Air and Venting Requirements

1.0 Purpose

This document specifies combustion and ventilation air requirements for gas appliances and venting requirements.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Combustion and Ventilation Air](#)

[5.0 Venting](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Meter Changers
- Meter Specialists

4.0 Combustion and Ventilation Air

4.1 General

Insufficient air quantities can lead to incomplete combustion, which can endanger our customers.

4.1.1 This procedure outlines the combustion and ventilation air requirements for gas appliances.

4.1.2 Adequate combustion, ventilation and circulation air for the operation of all gas appliances should be verified.

4.2 Minimum Required Volume

4.2.1 See [Table 1](#) for the minimum room size for total BTU input.

4.2.2 When the room size does not meet these minimums, air openings are required from other parts of the structure or outdoors to provide adequate combustion and ventilation air.

4.2.3 These square foot calculations are based on rooms with 8-foot ceilings.

Table 1: Minimum Room Size for Total BTU Input

BTU Input	Room Size Sq. Ft.	BTU Input	Room Size Sq. Ft.
5,000	32	100,000	625
10,000	63	120,000	750
20,000	125	140,000	875
40,000	250	160,000	1,000
60,000	375	180,000	1,125

UNCONTROLLED IF PRINTED

80,000	500	200,000	1,250
--------	-----	---------	-------

4.3 Circulating Air

- 4.3.1 The return air to a furnace shall be ducted from the furnace casing to another room whenever the circulating air is ducted to another room.
- 4.3.2 Any louver or grill that is installed in the return air duct and located in the room containing the furnace shall be sealed closed. If louver or grill is not sealed, isolate appliance by shutting off the appliance valve or the appliance control valve and issue a "**Warning**" tag as a hazardous condition.

4.4 Requirements for Combustion and Ventilation Air

4.4.1 Indoor Combustion Air

1. When air is obtained from inside the building there shall be two openings:
 - 1 a. One commencing within 12 inches of the ceiling, and
 - 1 b. One opening within 12 inches of the floor.
2. Each opening must be at least 100 square inches of net free area and larger if restricted with louvers or grills.

4.4.2 Outdoor Combustion Air

1. When air is obtained from the outdoors, there are two available options.
 - 1 a. *Option 1: Two permanent openings.* One opening commences within 12 inches of the ceiling. One commences within 12 inches of the floor.
 - 1 b. *Option 2: One larger permanent opening.* The opening commences within 12 inches of the ceiling.
2. The openings shall communicate directly with the outdoors, or through a vertical or horizontal duct to the outdoors or spaces that freely communicate with the outdoors (e.g., a ventilated crawl space or attic).
3. See [Figure 1](#) for minimum sizes of the openings.

4.4.3 If the requirements for combustion and ventilation air do not meet NFPA code as outlined in this guideline, but the appliance operates properly, a "**Warning**" tag shall be issued as a code violation.

4.4.4 If the requirements for combustion and ventilation air do not meet NFPA code as outlined in this section and the appliance does not operate properly, isolate appliance by shutting off the appliance valve or the appliance control valve and issue a "**Warning**" tag as a hazardous condition.

4.5 Louvers and Grills

4.5.1 When determining the opening size of a louver or grill, consider the restriction that is caused by the metal grid or wooden slats.

4.5.2 This restriction will reduce the free area and ability of air to flow through the louver or grill. When calculating the permanent opening to obtain air from either indoors or outdoors, the opening must be increased in size to compensate for this restriction.

1. Wood louvers have 25% free area.
2. Metal louvers or grills have 75% free area.
3. The free area of a metal grill may be stamped on the backside.

UNCONTROLLED IF PRINTED

4.6 Openings for Combustion and Ventilation Air

4.6.1 See [Figure 1](#) and [Table 2](#) to identify the size and number of air openings required for equipment located in a space that does not meet the "minimum required volume" for combustion and ventilation air.

Figure 1: Air Openings for Combustion and Ventilation Air

Table 2: Minimum Size Requirements for Air Openings

Air Opening	Minimum Size Required
Direct Vent to Outdoors (single opening)	1 sq in per 4,000 Btu
Direct Vent to Outdoors (two openings)	1 sq in per 2,000 Btu each
Vertical Duct to Outdoors or Attic	1 sq in per 4,000 Btu
Horizontal Duct to Outdoors	1 sq in per 2,000 Btu each
Opening to Another Room	1 sq in per 1,000 Btu each

5.0 Venting

5.1 General

- 5.1.1 This procedure outlines the venting requirements for gas appliances.
- 5.1.2 Qualified individuals performing routine work such as connects, meter installs, meter changes, leak investigations, etc. shall be aware of these requirements.

5.2 Definitions

- 5.2.1 A *Category 1 appliance* operates with a negative draft vent and a flue gas temperature high enough to avoid formation of condensation in the vent pipe. Appliances that are listed as Category 1 are normally referred to as "conventional appliances" and require metal venting materials.
- 5.2.2 A *Category 4 appliance* operates with a power vent that has a positive pressure and a flue gas temperature cool enough to cause the formation of condensation in the vent pipe. Appliances that are listed as Category 4 are normally referred to as "high efficiency appliances" and require plastic venting materials.

5.3 Venting Code

UNCONTROLLED IF PRINTED

- 5.3.1 Horizontal vent pipe should have a minimum of ¼" rise per foot.
- 5.3.2 No appliance designed to be connected to a vent shall be left in operation without a vent, an improper vent or a deteriorated vent system.
- 5.3.3 When two or more appliances are connected to a common vent or chimney flue, the smaller vent connector shall enter at the highest level.
- 5.3.4 Gas utilization equipment shall not be connected to a chimney flue serving a separate appliance designed to burn solid fuel.

Exception: A vent connector shall not be connected to a chimney flue serving a fireplace unless the fireplace flue opening is permanently sealed.

- 5.3.5 Single wall metal pipe shall not be used as a gas flue in dwellings and residential occupancies because it requires a large clearance to combustibles, is difficult to support and can have a short life due to condensation and exposure to elements.
- 5.3.6 Single wall pipe may only be used as a vent connector from the appliance to the chimney or Type B gas vent.
- 5.3.7 Improper installation or use of single wall pipe is a code violation unless it is passing through unprotected combustible material in which case it is a hazardous condition. See [TURN 2.7](#) Warning Tag.
- 5.3.8 Single wall vent pipe shall not be used outdoors, shall not originate in any unoccupied attic or concealed space and shall not pass through any attic, inside wall, concealed space, or floor.
- 5.3.9 A Category 4 appliance vent shall have a dedicated vent and shall not share a vent with a Category 1 appliance.
- 5.3.10 Gas dryers shall be exhausted (ducted) to the outdoors.
 - 1. Dryer exhaust shall **not** be connected into any gas vent, chimney wall, ceiling, attic, crawl space, or a concealed space of a building.
 - 2. Exhaust ducts shall be a rigid or UL listed flexible metal vent material. **Do not** use plastic or foil type vent material.
 - 2 a. Rigid metal duct material is required when vent passes through walls, ceiling or floors. The space around the duct shall be sealed with a non-combustible material.
 - 2 b. Flexible metal vent can be used as a transition from the dryer to the rigid metal duct.
 - 2 c. Flexible metal ducts are acceptable only if they are accessible for cleaning.
 - 2 d. Flexible metal vents must be fully extended and supported in the final dryer location. Remove excess to avoid sagging and kinking that could reduce airflow and poor performance.
 - 2 e. Flexible metal vents are not to be installed in or through enclosed walls, ceilings or floors.

UNCONTROLLED IF PRINTED

3. Exhaust ducts shall **not** be assembled with screws or other fastening means that extend into the duct. External clamps or tape, such as duct tape, shall be used to make connections.
4. Exhausting duct shall be dedicated for the dryer only.

5.4 Recall of High Temperature Plastic Vent (HTPV) Pipe

5.4.1 HTPV (high temperature plastic vent) pipe used in certain installations has been recalled because the HTPV pipe could crack or separate at the joints and leak flue products, including carbon monoxide, into the home.

5.4.2 This recall includes certain furnace and boiler vents installed after September 1987. Use the following information to identify a recalled plastic vent pipe system and refer to [Figure 2](#).

1. The vent pipes are colored gray or black.
 2. The vent pipes have the names "Plexvent", "Plexvent II", or "Ultravent" stamped on vent pipe or printed on stickers placed on pieces used to connect the vent pipes together.
 3. For furnaces, only HTPV systems that have vent pipes that go through the sidewalls of structures (horizontal systems) are subject to this program.
 4. For boilers, all HTPV systems are subject to this program.
- 5.4.3 If you discover this type of vent pipe, have the customer call the special toll-free number (800) 758-3688, available between 7 A.M. and 6 P.M. CST Monday - Friday, to verify that their HTPV pipe systems are subject to this recall program. Customers with eligible systems will receive a rebate towards a replacement or a new system.

Figure 2: Examples of Recalled Plastic Vent Pipe Systems

Revision Notes

Location of Changes	Summary of Changes
Paragraph 5.3.1 – Venting Code	"minimum of 1/4" rise per foot
Paragraph 5.3.4 NOTE:	Revised – A vent connector shall not be connected to a chimney flue serving a fireplace unless the fireplace flue opening is permanently sealed.
Paragraph 5.3.5	"gas flue" replaces "gas vent"

TURN 2.6 Corrugated Stainless Steel Tubing - CSST

1.0 Purpose

This document specifies requirements for installation of corrugated stainless steel tubing (CSST) for use in residential, commercial, and industrial services.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Inside Installation](#)

[6.0 Outside Installation](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Meter Changers
- Meter Specialists

4.0 General

- 4.1 CSST is **not** intended to be used for mechanical support. It should **not** be connected to the outlet of the gas meter bar.
- 4.2 All fittings and accessories used in the installation of CSST piping systems shall be approved by the manufacturer for use with their system.
- 4.3 The polyethylene jacket should be left on the CSST for the length of penetration through metal, masonry or concrete to provide a sleeve to protect the integrity of the pipe.

5.0 Inside Installation

- 5.1 The tubing should terminate either inside or outside of the foundation wall with a termination fitting. The meter shall be rigidly connected to the termination fitting with 1-inch IPS schedule 40 black iron pipe.
- 5.2 Gas piping shall **not** be used as a grounding conductor or electrode.
- 5.3 For 2 psig systems, CSST regulators must be installed horizontally in the upright position for proper operations of the vent limiter. Regulator without a vent limiter must be vented to the outdoors.
- 5.4 CSST may be directly connected to a fixed appliance such as a water heater or furnace when it terminates with a proper fitting, gas valve, and sediment trap.
 - 5.4.1 CSST shall **not** be used as a flexible appliance connector to a movable appliance such as a stove or dryer. Do not confuse CSST with flexible connectors (Figure 1).

Figure 1: CSST and Flexible Gas Appliance Connector

5.5 CSST shall terminate with a termination fitting at the entrance to the masonry fire box.

6.0 Outside Installation

- 6.1 CSST shall not be installed underground in contact with the earth or concrete unless the CSST is pre-sleeved (typically with black integral polyethylene) and specifically manufactured to be in contact with the earth or concrete.
- 6.1.1 If using CSST underground that is not pre-sleeved, it shall be installed within an external protective sleeve designed to withstand superimposed loads.
- 6.1.2 All sleeve ends shall be sealed liquid tight.
- 6.1.3 The minimum depth for buried gas piping as described in this procedure is 12 inches from the top of grade.
- 6.1.4 The minimum size of the CSST to be buried is $\frac{3}{4}$ inch.
- 6.2 When CSST is installed outdoors, the exposed stainless CSST tubing (where the jacket has been removed) shall be recovered with UV resistant tape as specified by the CSST manufacturer.

End of Instructions.

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

1.0 Purpose

This document specifies the required actions to be taken when encountering code violations or hazardous conditions on customer gas appliances and house piping.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Inspecting Customer Piping and Appliances](#)

[6.0 Manufactured Housing](#)

[7.0 Isolating an Appliance](#)

[8.0 Code Violations](#)

[9.0 Hazardous Conditions](#)

[10.0 Customer Mailing](#)

[11.0 Records](#)

Appendices:

[Appendix A - Warning Tag \(Stock Code 16-01-263\)](#)

[Appendix B - CSS-Generated Customer Letter](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Meter Changers
- Meter Specialists

4.0 General

- 4.1 This section describes the actions to be taken when encountering code violations or hazardous conditions on customer gas appliances and house piping.
- 4.2 An inspection of customer gas appliances and house piping is required when the customer chooses to have Ameren Illinois (AIC) re-light the appliances.
- 4.3 A copy of the Warning Tag is in [Appendix A](#).

5.0 Inspecting Customer Piping and Appliances

- 5.1 Gas field personnel or qualified individuals shall look for code violations and/or hazardous conditions in accordance with NFPA 54, HUD Title 24 Code Part 3280 Manufactured Home Construction and Safety Standards, or applicable local codes.
- 5.2 Where such conditions exist and the correction of the condition exceeds the normal scope of repair work performed by AIC gas field personnel, a **"Warning"** tag shall be completed and documented on the order.

- 5.3 Gas field personnel or qualified individuals may encounter situations that require the issuing of a **"Warning"** tag. However, there may be question whether the situation is a Code Violation or Hazardous Condition.
- 5.4 When in doubt about a situation, refer to the examples listed in this part or contact the Gas Supervisor.

6.0 Manufactured Housing

- 6.1 Gas appliances initially installed in a HUD approved manufactured home comply with the HUD Title 24 Code and are not required to comply with NFPA 54 Code.
- 6.2 Any gas appliance installed in manufactured housing, following the initial consumer sale, shall be labeled "Approved for Manufactured Housing" and installed in accordance with NFPA 54 Code.
- 6.3 Gas appliances installed in the living area of the manufactured home will obtain all combustion and dilution air from outdoors.

7.0 Isolating an Appliance

- 7.1 Gas field personnel may isolate a hazardous condition at the:
 - 7.1.1 Appliance control valve, or
 - 7.1.2 Appliance shut off valve, or
 - 7.1.3 Customer convenience valve, or
 - 7.1.4 Meter valve.
- 7.2 If the hazard is isolated at the meter valve, lock, Red Pin the valve, complete the order, and issue a Warning Tag.

8.0 Code Violations

A code violation is an improper installation that may become hazardous if the customer does not take corrective action.

- 8.1 When a code violation is identified, gas field personnel or qualified person shall do the following:
 - 8.1.1 Issue a **"Warning"** tag as a code violation.
 - 8.1.2 Describe the situation to the customer and explain the potential danger.
 - 8.1.3 Advise the customer to contact a qualified HVAC/plumbing contractor to have the code violation corrected.
 - 8.1.4 Complete and sign the **"Warning"** tag.
 - 1. Request that the customer sign the tag. If the customer refuses or is not available to sign the tag, turn the tag into the Gas Supervisor.
 - 8.1.5 Install the **"Warning"** tag on the piping or appliance, or give to the customer (or their representative). The original is retained by Ameren Illinois and filed for future reference.
- 8.2 Examples of Code Violations

- 8.2.1 Deteriorated or damaged fuel line that does not adversely affect appliance operation.
- 8.2.2 No shut off valve ahead of the appliance.
- 8.2.3 No sediment trap or improperly installed sediment trap on a furnace or water heater.
- 8.2.4 Appliance connector passing through any walls, partitions, ceilings or floors.
- 8.2.5 Two or more appliance connectors connected in series.
- 8.2.6 Horizontal vent pipe that is not sloped uphill at least 1/4" per foot.
- 8.2.7 Horizontal vent pipe that is not supported.
- 8.2.8 Single wall vent pipe not securely fastened together at joints with screws.
- 8.2.9 Single wall vent pipe installed outdoors.
- 8.2.10 Single wall vent pipe installed through protected combustible floor, interior wall, exterior wall or attic.
- 8.2.11 Water heater T&P valve without discharge pipe.
- 8.2.12 Water heater T&P valve discharge pipe with threads on end of pipe.
- 8.2.13 Appliance operating properly but is located in an insufficiently sized confined space.
- 8.2.14 When a furnace and/or water heater is located in a bedroom/bathroom, or an appliance has insufficient combustion/ventilation air, an operational inspection shall be performed with all appliances operating, the door closed and any exhaust fans on.
 - 1. If the appliance operates properly, a code violation shall be issued.
 - 2. If the appliance does **not** operate properly, a hazardous condition shall be issued and the appliance turned off.
- 8.2.15 Corrugated Stainless Steel Tubing (CSST) installation issues:
 - 1. CSST passing through furnace cabinet without protection from chafing.
 - 2. CSST passing through masonry wall/foundation without sleeve.
 - 3. CSST connected directly to outlet of meter set.
 - 4. An exposed metal section of tubing outside.
 - 5. Non pre-sleeved CSST installed underground without conduit.
 - 6. Conduit vented inside.
 - 7. Conduit **not** vented outside.
 - 8. CSST connected directly to moveable gas appliance.

9.0 Hazardous Conditions

A hazardous condition is an improper installation or operation of equipment that requires immediate action when encoun-

tered. **All hazardous conditions shall be corrected before the appliance is operated.**

- 9.1 When a hazardous condition is identified, gas field personnel shall do the following:
- 9.1.1 Isolate any hazardous condition found.
 - 9.1.2 Issue a "**Warning**" tag.
 - 9.1.3 Advise the customer that defective piping or appliances which create a hazardous condition shall not be used until the necessary repairs are completed.
 - 9.1.4 Advise the customer to contact a qualified HVAC/plumbing contractor to correct the condition as soon as possible.
 - 9.1.5 Complete and sign the "**Warning**" tag.
 - 1. Request that the customer sign the tag. If the customer refuses or is not available to sign the tag, turn the tag into the Gas Supervisor.
 - 9.1.6 Install the "Warning" tag on the piping or appliance, or give to the customer (or their representative). The original is retained by Ameren Illinois and filed for future reference.
- 9.2 Examples of Hazardous Conditions
- 9.2.1 Gas leak.
 - 9.2.2 A gas line/valve that is not capped or plugged.
 - 9.2.3 Yellow flames that cannot be corrected by adjustment.
 - 9.2.4 Distorted burner flames.
 - 9.2.5 Appliance safety that does not work properly.
 - 9.2.6 An appliance that is too dirty to operate safely.
 - 9.2.7 Gas piping installed through air duct, gas vent, or chimney.
 - 9.2.8 Gas appliance in a garage or in adjacent space that opens to the garage where the burners and ignition devices are less than 18" above the floor.

Exception: Water heater is listed as Flammable Vapor Ignition Resistant. See [TURN 2.4 Section 5.0](#).

- 9.2.9 Missing combustion door (one or more) or broken combustion chamber sight glass.
- 9.2.10 Glass missing from space heater.
- 9.2.11 Cold air return not ducted to the furnace where the circulating air is ducted to another room.
- 9.2.12 Thermostat that does not shut off the appliance.
- 9.2.13 Grills/louvers installed in the cold air return to the furnace in a confined space.

Must be operable so it can be closed during the heating season.

- 9.2.14 Insufficient combustion or ventilation air where the appliance does not operate properly.
- 9.2.15 Deteriorated or damaged fuel line that prevents proper appliance operation.
- 9.2.16 Missing T&P valve on a water heater.
- 9.2.17 Water heater T&P valve discharge capped or plugged.
- 9.2.18 Water heater with a reduced T&P valve or reduced discharge pipe.
- 9.2.19 Flammable liquids stored near gas appliances.
- 9.2.20 Gas dryer not ducted outdoors or vent assembled with screws.
- 9.2.21 Flexible plastic or thin foil vent tubing used to vent gas dryer.
- 9.2.22 Water heater or furnace that does not vent properly.
- 9.2.23 Water heater or furnace control valves that have been under water due to flooding.
- 9.2.24 Vent pipe is smaller than the appliance draft hood outlet or flue collar and does not meet the Vent Downsizing requirement listed in the NFPA 54 Code 13.1.2.
- 9.2.25 Category 1, natural draft vent appliances sharing a common vent with Category 3 or Category 4 appliance.
- 9.2.26 Natural vent system that does not terminate above an overhang.
- 9.2.27 No termination cap on vent.
- 9.2.28 Single wall vent pipe installed through unprotected combustible material, such as floor, wall, ceiling, etc.
- 9.2.29 Vent-free room heater used as the sole source of heat.
- 9.2.30 Plastic gas pipe used inside a structure or outdoors above ground.
- 9.2.31 An appliance installed in but not approved for mobile home or manufactured housing.
- 9.2.32 Furnace or water heater installed in a bedroom or bathroom that is not a direct vent type.
- 9.2.33 Vent-free appliance larger than 10,000 BTU in bedroom or 6,000 BTU in bathroom.
- 9.2.34 When a furnace and/or water heater is located in a bedroom/bathroom, or an appliance has insufficient combustion/ventilation air, an operational inspection shall be performed with all appliances operating, the door closed and any exhaust fans on.
 - 1. If the appliance operates properly, a code violation shall be issued.
 - 2. If the appliance does not operate properly, a hazardous condition shall be issued and the appliance turned off.
- 9.2.35 Commercial range must have a listed connector and restraint if on casters.

9.2.36 Inside regulator not vented properly. If designed with a vent limiter, the limiter must be facing upward.

10.0 Customer Mailing

10.1 If the customer refuses or is not available to sign the "**Warning**" tag, the Gas Supervisor or Ameren Illinois designee will send a letter with a copy of the original "**Warning**" tag to the customer of record addressing the code violation(s) or hazardous condition(s) encountered.

10.2 In these cases, when the hazardous condition is entered on the customer's account, the official letter can be printed from the Ameren Illinois CSS system. The letter is not signed by anyone at the generating location since the letter contains Ameren Illinois Customer Services contact information.

10.3 See [Appendix B](#) for a sample of the CSS-generated customer letter.

11.0 Records

11.1 All "**Warning**" tag originals should be maintained by each Region for a period of 3 years.

11.2 Customer mailings should be filed with the original Warning tag(s) for future reference.

Warning

There is a code violation or hazardous condition that could pose a potential danger.

Contact a reputable HVAC dealer or repair person to correct the condition(s) as soon as possible.

Do not operate equipment if hazardous condition is not corrected.

Remove tag after repairs have been made.

<input type="checkbox"/> Ameren Illinois	1.800.755.5000

Appendix B - CSS-Generated Customer Letter

August 15, 2014

CUSTOMER
Address

HAZARDOUS CONDITION: ACTION REQUIRED

Service Address

Account Number

Dear Customer,

Ameren Illinois has identified a code violation or hazardous condition at the service address noted above. Enclosed is a copy of the Notice of Code Violation or Hazardous Condition, which provides more details.

This condition may result in personal injury or death if corrective action is not taken. For your safety, the required repairs should be made immediately. We recommend that you contact a qualified heating and air conditioning contractor or a qualified plumbing contractor to perform this repair work.

If you have any questions concerning this situation, please refer to the enclosed Notice or call us Monday through Friday, 7 a.m. to 7 p.m.

Sincerely,

Customer Service
1.800.755.5000

TURN 2.8 Changing Meter Valves

1.0 Purpose

This procedure specifies approved methods for changing meter valves while the service line is under pressure.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Method 1: NO-BLO Changer](#)

[6.0 Method 2: Operating Property Line Valve](#)

[7.0 Method 3: Activating an EFV](#)

[8.0 Method 4: Excavating and Squeezing PE Pipe](#)

[9.0 Method 5: Excavating the Service Tee](#)

[10.0 Method 6: Installing Control Fitting](#)

[11.0 Method 7: "On-The-Fly"](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors

4.0 General

- 4.1 This procedure identifies seven approved methods for changing meter valves while the service line is under pressure.
- 4.2 The approved methods are:
- 4.2.1 [Method 1](#): Using NO-BLO meter valve changer.
 - 4.2.2 [Method 2](#): Operating property line valve.
 - 4.2.3 [Method 3](#): Activating an excess flow valve (EFV).
 - 4.2.4 [Method 4](#): Excavating and squeeze polyethylene pipe.
 - 4.2.5 [Method 5](#): Excavating the service tee and closing the punch.
 - 4.2.6 [Method 6](#): Installing a control fitting.
 - 4.2.7 [Method 7](#): Changing a meter valve "on-the-fly" under specified pressure conditions.

5.0 Method 1: NO-BLO Changer

- 5.1 The Dresser and Mueller NO-BLO valve changers are limited to a maximum pressure of 60 psig and may be used for ½", ¾", 1", 1 ¼", 1 ½", and 2" meter valves where the port opening is sufficiently sized to allow passage of the plugging unit.

- 5.2 Follow the manufacturer's instructions when using a NO-BLO changer. See [TAPS 2.2](#) Mueller No-Blow Valve Changer or [TAPS 2.1](#) Dresser Meter Valve Changer.

6.0 Method 2: Operating Property Line Valve

- 6.1 Access and turn off the valve.
- 6.1.1 Inspect the job site and eliminate possible sources of ignition.
 - 6.1.2 Make sure doors and windows of the structure near the job site are closed to prevent gas from entering the structure.
 - 6.1.3 Slightly opening the meter valve to allow the gas to bleed out.
 - 6.1.4 Verify the gas has been shut-off.

7.0 Method 3: Activating an EFV

- 7.1 Changing of meter valves where an excess flow valve (EFV) is installed may be performed as outlined:
- 7.1.1 Inspect the job site and eliminate possible sources of ignition.
 - 7.1.2 Make sure doors and windows of the structure near the job site are closed to prevent gas from entering the structure.
 - 7.1.3 Ensure that a fire extinguisher is present where the work is being performed.
 - 7.1.4 Shut off the old valve and remove piping from the outlet of the meter valve.
 - 7.1.5 Install vent piping to point the flow of gas away from the structure.
 - 7.1.6 Open the old valve, for approximately 2 seconds, which should activate the EFV.
 - 7.1.7 Remove the old valve and install the new meter valve.
 - 7.1.8 Close the new valve and install the outlet piping.
- 7.2 Once the EFV has reset, re-establish service in accordance with [TURN 2.1](#) Residential/ Small Commercial Customer.
- 7.3 If the EFV fails to trip, notify Gas Supervisor for follow up investigation and corrective action if required. Use one of the other procedures to shut-off gas.

8.0 Method 4: Excavating and Squeezing PE Pipe

- 8.1 The service head adapter installed with some PE services may prevent the use of a meter valve changer.
- 8.2 In this situation or where this option is desired, the PE service line may be excavated and squeezed off. See [POLY 2.2](#) Squeeze Off.

9.0 Method 5: Excavating the Service Tee

- 9.1 Changing a meter valve may be performed by excavating the service tee and closing the punch on the service tee.
- 9.2 The closed punch should shut off or significantly restrict the flow of gas to allow the meter valve to be changed.

10.0 Method 6: Installing Control Fitting

- 10.1 Install fitting in accordance with procedures in [TAPS 1](#).
- 10.2 Tap and stop fitting in accordance with manufacturer's instructions.

10.3 Verify the gas has been shut-off by slightly opening the meter valve.

11.0 Method 7: "On-The-Fly"

11.1 Changing a meter valve "on-the-fly" may be performed if conditions do not permit other methods (i.e., use of a NO-BLO meter valve changer, use of an EFV, squeezing a polyethylene pipe, operating service tee or installing a control fitting.)

11.2 Changing a meter valve "on-the-fly" is approved only within the pressure limits specified in Table 1 and shall be performed by two gas field personnel.

Table 1: Pressure Limitations

Service Pipe Size	Maximum Pressure (psig)
½"	100
¾"	100
1"	60
1 ¼"	30
1 ½"	20
2"	10

11.3 "On-The-Fly" Changing Procedure

11.3.1 Before changing the meter valve:

1. All safety equipment shall be in place prior to any additional steps being performed.
2. Gas field personnel at the job site shall wear Level 1 PPE as a precaution due to the exposure to gas associated with changing a valve "on the fly". See [WIGE 2.2](#) Personal Protective Equipment.
3. Verify the operating pressure range of the service to ensure the maximum pressure ([Table 1](#)) is not exceeded. Contact Gas Supervisor if there is a question on the operating pressure.
4. Inspect the job site and eliminate possible sources of ignition.
5. A fire extinguisher shall be at the location where work is being performed and, manned by one individual, while another individual changes the meter valve.
6. Make sure doors and windows of the structure near the job site are closed to prevent gas from entering the structure.
7. Have an x-pander plug available where the work is being performed in case the "on-the-fly" change cannot be completed.

11.3.2 Shut off the old valve. Remove piping from the outlet of the meter valve.

11.3.3 Open the old valve for approximately 2 seconds then shut off the valve to determine the volume of blowing gas that will be present and escaping.

11.3.4 Prepare the new meter valve by placing it in the open position with an approximate 3-foot section of pipe attached to the outlet, to ensure the gas is released above the head of the individual performing the work.

11.3.5 Coat the inlet threads on the new meter valve with thread compound.

11.3.6 Remove the old valve. Install the new meter valve.

11.3.7 Close the new valve, remove the section of pipe, and install the outlet piping.

11.3.8 Re-establish service in accordance with [TURN 2.1](#).

End of Instructions.

Operator Qualification (OQ) Required?

YES

TURN 2.9 Brass Appliance Connectors

1.0 Purpose

This document addresses safety issues and public awareness regarding uncoated brass appliance connectors, and specifies actions to take if the connectors are found in service.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Uncoated Brass Connectors Found in Service](#)

Appendices:

[Appendix A - CPSC Safety Alert](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Meter Changers
- Meter Specialists

4.0 General

- 4.1 Uncoated brass appliance connectors manufactured before 1980 (approximately) have a serious design flaw.
- 4.2 Experience has shown that the end pieces of these connectors may separate from the tubing causing a serious gas leak.
- 4.3 Numerous deaths, injuries and serious fires have resulted from the failure of uncoated brass connectors. It is expected that the failure rate of uncoated brass connectors will accelerate as they become older and subject to additional flexing.
- 4.4 At least annually, the Gas Communication committee will arrange for a customer bill insert explaining the hazards of uncoated brass connectors.

5.0 Uncoated Brass Connectors Found in Service

- 5.1 Gas field personnel shall inspect customer appliances for the presence of uncoated brass connectors each time they enter a customer home or business in the normal course of their work.
- 5.2 Uncoated brass connectors found should be replaced by the gas field personnel with a stainless steel connector supplied by AIC Ameren Illinois (AIC). Gas field personnel should will explain to the customer why the replacement is necessary.
- 5.3 An approved appliance valve should also be supplied and installed with the stainless steel connector if such a valve is not already in place.
- 5.4 If the workload is such that replacement of the uncoated brass connector cannot be accomplished when initially found:

- 5.4.1 Gas field personnel shall note the location and report it to the Gas Supervisor for later follow-up.
- 5.4.2 Gas Supervisor shall schedule the replacement of the uncoated brass connector as soon as possible but no longer than two months after being notified.
- 5.5 If the customer refuses to have the uncoated brass connector replaced, a **"Warning"** tag shall be issued informing the customer the uncoated brass connector may be dangerous and that they refused to have the connector replaced free of charge.
- 5.6 If the existing uncoated brass connector is improperly installed (e.g., passing through a floor, two or more appliance connectors connected in series) then the improper installation must be corrected by the customer.
 - 5.6.1 In such instances, the installation shall be marked as a code violation. A **"Warning"** tag shall be completed, informing the customer that the violation must be corrected and the uncoated brass connector replaced.
- 5.7 Gas field personnel shall properly discard the uncoated brass connector at their local headquarters or other AIC facility.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

Appendix A - CPSC Safety Alert

[\(View online.\)](#)

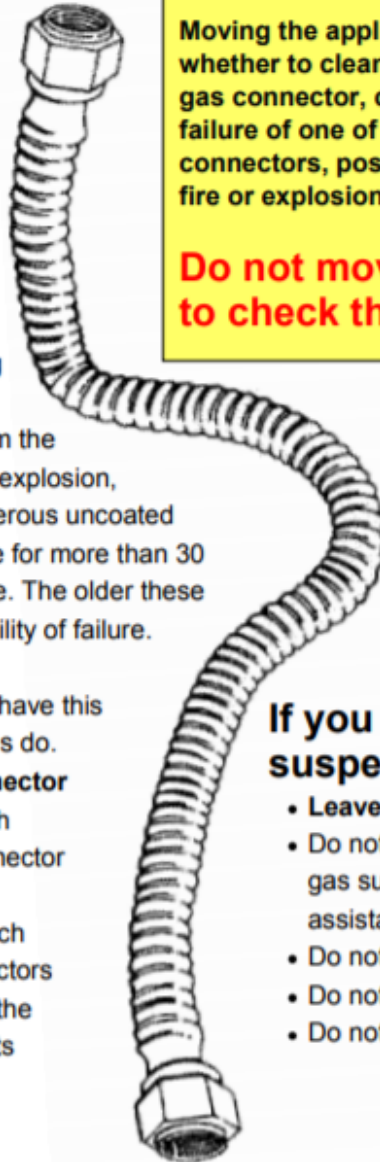

CPSC Safety Alert

Certain Older Gas Connectors May Be Dangerous

Gas connectors are corrugated metal tubes used to connect gas appliances in your home to fuel gas supply pipes. Some older brass connectors have come apart, causing fires and explosions resulting in deaths and injuries.

These older brass connectors have a serious flaw in how their tubing was joined to their end pieces. Over time, the end pieces can separate from the tubing, and cause a serious gas leak, explosion, or fire. To our knowledge, these dangerous uncoated brass connectors have not been made for more than 30 years, but many of them are still in use. The older these connectors get, the greater the possibility of failure.

Although not all uncoated connectors have this flaw, it is very difficult to tell which ones do. Therefore, **any uncoated brass connector should be replaced immediately** with either a new plastic-coated brass connector or a new stainless steel connector. Connectors can wear out from too much moving, bending, or corrosion. Connectors should always be replaced whenever the appliance is replaced or moved from its location.

⚠ WARNING

Only a qualified professional should check your connector and replace it if needed. Do not try to do this yourself!

Moving the appliance, even slightly, whether to clean behind it or to inspect its gas connector, can cause the complete failure of one of these older weakened connectors, possibly resulting in a deadly fire or explosion.

Do not move your appliance to check the connector!

If you smell gas and suspect a gas leak:

- Leave the house immediately
- Do not use your phone. Call your gas supplier or dial 911 for assistance from a neighbor's house.
- Do not light a match.
- Do not turn on a light.
- Do not switch on anything electrical.

TURN 2.10 Carbon Monoxide Investigation

1.0 Purpose

This document specifies actions to be performed when assisting the police or fire department with a carbon monoxide (CO) investigation.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Upon Arrival at the Site](#)

[6.0 CO Investigation](#)

[7.0 CO Checks at Appliances](#)

[8.0 Determining a CO Hazard](#)

[9.0 Potential Effects of Carbon Monoxide Exposure](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors

4.0 General

- 4.1 AIC gas field personnel may be asked to assist the police or fire department with a CO investigation.
- 4.2 The following outlines actions that should be performed whenever assisting the police or fire department with a CO call.

5.0 Upon Arrival at the Site

- 5.1 Turn on the CGI/CO instrument. Purge in a gas-free environment.
- 5.2 Check for the presence of natural gas on the LEL scale at the entrance of the structure.
- 5.3 Once determined that natural gas is not present, check for the presence of CO at the entrance of the structure.
 - 5.3.1 A CO reading of 100 PPM or higher is considered hazardous. Gas field personnel should not enter the structure until ventilated.
- 5.4 Check for the presence of CO throughout the structure, sampling 6 feet above the floor.
 - 5.4.1 Check all levels of the structure and any attached garage.
 - 5.4.2 CO can enter a structure from a vehicle operating in a garage.
- 5.5 When a CO reading above 15 PPM has been detected by the police, fire department, or AIC gas field personnel, then a CO investigation shall be performed.

Electronic CGI/CO instruments will react to the presence of hydrogen gas which is produced whenever lead acid batteries are being charged. Home owners may use lead acid batteries as a back-up power source for sump pumps.

6.0 CO Investigation

- 6.1 Determine what fuel burning equipment has been operating.
- 6.2 Close all windows and doors. Exhaust fans that may have been operating should be turned on and fuel burning equipment placed into operation.
- 6.3 Check for the presence of CO at heat registers, draft diverters, appliance fire doors, above direct vent and non-vented heaters, above gas fireplace logs, kerosene heaters and near gas stoves.
- 6.4 Check the flame characteristics of each appliance.
- 6.5 Check for adequate combustion and ventilation air.
- 6.6 Conduct a match test at each Category 1 vented appliance.

Appliances should be operating for a minimum of 5 minutes to ensure that the vent system has had ample time to warm up.

- 6.7 Visually check the vents for downward slopes, conflicts such as Category 4 appliance sharing a vent with Category 1 appliance, vent downsizing, outside vent termination height and caps. See Table 1.

Table 1: Category 1 and Category 4 Vent Types and Descriptions

Vent Type	Description
Category 1	Natural draft vent found on conventional appliances
Category 4	Power vent found on high efficiency appliances

7.0 CO Checks at Appliances

- 7.1 If a CO reading is above the maximum allowable CO level, the appliance shall be shut off and a "**Warning Tag**" issued. See [Table 2](#) for maximum allowable CO readings.
 - 7.1.1 *Stove*: CO readings should be taken 12" above each stove top burner and the oven exhaust after the unit has operated through a heating cycle.
 - 7.1.2 *Unvented Space Heater/Gas Log*: CO readings should be taken 24" above the space heater after the burner has operated at the highest setting for 5 minutes.
 - 7.1.3 *Water Heater/Furnace*: A CO reading should be taken above the fire door and above the draft diverter after the unit has operated for 5 minutes to warm the vent system.
 - 7.1.4 *Vented Fireplace*: A CO reading should be taken above the fire box after the unit has operated for 5 minutes to warm the vent/flue system.

7.1.5 **Vent Systems:** The hot combustion gases will damage an electronic CGI/CO instrument. The metallic vent probe and CO filter are required to cool combustion gases and remove impurities.

Table 2: Maximum Allowable CO Reading at a Gas Appliance

Appliance	Maximum CO
Range	45 PPM
Unvented Space Heater/Gas Log	15 PPM
Water Heater/Furnace	0 PPM
Vented Fireplace	0 PPM
Combustion Gases in the Flue	400 PPM

8.0 Determining a CO Hazard

8.1 Always advise the occupant to call a qualified heating and ventilation service (HVAC) contractor to complete a thorough inspection of their system for possible problems.

8.2 Advise the occupants to seek medical attention if they are feeling ill.

Table 3: CO Readings, Exposure and Action Required

CO Reading	Exposure	Action Required
0 to 15 PPM	This is the National Indoor Air Quality Standard for a residential structure.	No action required
16 to 35 PPM	This is an expected level of CO in a residential structure where an unvented appliance such as a stove has been operating for an extended period of time. 15 to 20 PPM may be encountered where occupants have been smoking.	Identify source
36 to 99 PPM	This is a high level of CO in a residential structure.	Conduct a CO
50 PPM	This is the OSHA maximum acceptable level that an average person may be exposed to in the workplace during an 8-hour day.	Identify source Corrective action
100 to 200 PPM	This is a hazardous level of CO in a residential structure. <i>Evacuation of the structure is recommended</i> and the structure must be ventilated by opening doors and windows before a CO Investigation is performed	Ventilate the structure CO Investigation
Greater than 200 PPM	This is an <i>extremely hazardous and life-threatening level of CO and requires an immediate evacuation</i> of the residential structure or areas in a work place where persons are exposed to the danger. Persons feeling ill should contact the Poison Control Center and seek medical attention. Emergency service personnel should be notified to assist with the evacuation and medical treatment.	Evacuate the structure services if occupants are below 100

9.0 Potential Effects of Carbon Monoxide Exposure

9.1 Table 4 shows potential effects and symptoms of CO exposure over time.

Table 4: Potential Effects of CO exposure

PPM	EFFECTS & SYMPTOMS	TIME
-----	--------------------	------

UNCONTROLLED IF PRINTED

200	Slight headache	3 hours
400-600	Headache, discomfort	1-2 hours
1000-2000	Headache, confusion, nausea; may stagger	1.5 hours
2000-2500	Heart palpitation	30 minutes
2500-3500	Unconsciousness	30 minutes
4000	Fatal	30 minutes

9.2 Effects will vary from person to person.

9.3 The health effects of CO depend on the level of CO and length of exposure, as well as each individual's health condition.

9.3.1 Health effects from exposure to CO levels of approximately 1 to 70 PPM are uncertain, but most people will not experience any symptoms. Some heart patients might experience an increase in chest pain.

9.3.2 As CO levels increase and remain above 70 PPM, symptoms may become more noticeable (headache, fatigue, nausea).

9.3.3 As CO levels increase above 150 to 200 PPM, disorientation, unconsciousness, and death are possible.

End of Instructions.

Revision Notes

Location of Changes	Summary of Changes
UPRT 1 Section 5.0 & 6.0	Updated to 125 psig

1.0 Purpose

This document outlines the requirements for raising the maximum allowable operating pressure (MAOP) of gas system while meeting the minimum requirements of 49 CFR 192 Subpart K.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Increasing MAOP Up to 125 PSIG](#)

[6.0 Increasing MAOP Above 125 PSIG](#)

[7.0 Records](#)

Attachments

[Attachment 1 - MAOP Uprating Plan Form](#) (PDF file)

3.0 Target Audience

- Gas Control
- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Tech Engineering (GTE)
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel

4.0 General

- 4.1 Develop project specific uprating procedures to raise the MAOP of a gas system and document them on the MAOP Uprating Plan form. See [Attachment 1](#) MAOP Uprating Plan form.
- 4.2 If remote monitoring capability exists for the affected (uprate) system and adjacent system, then Gas Control shall be involved in the planning, scheduling, and monitoring.
- 4.3 GTS shall:
 - 4.3.1 Establish or verify alarm points for the system being uprated and the adjacent system.
 - 4.3.2 Determine when Gas Control should issue an alarm notice.
 - 4.3.3 After the uprate is complete, verify with Gas Control that operating parameters on the system being monitored have returned to normal or planned operation.
 - 4.3.4 Provide Gas Control with new set points and alarm settings.

5.0 Increasing MAOP Up to **125 PSIG**

- 5.1 Prior to Uprating
 - 5.1.1 Prepare a preliminary map that shows:

UNCONTROLLED IF PRINTED

1. Limits of the proposed area to be updated.
 2. Type, size, age, and location of the facilities to be updated.
 3. Service line locations.
 4. Regulator stations feeding the proposed area.
 5. Isolation valves.
 6. Indication if uprate area and/or adjacent area is remotely monitored by Gas Control.
- 5.1.2 Complete a study to determine that the uprating will not adversely affect the distribution system and include:
1. Verification that all materials for the distribution main and related services are designed for the new MAOP.
 2. Review of leak history and repair records.
 3. Identify the use of compression couplings.
 4. Review service record cards on a low-pressure system to ensure that all low-pressure services have been identified.
 5. Check the service regulator orifice size and capacities.
 6. Verify internal relief capacities and allowable build up.
- 5.1.3 Prepare a written plan for each uprating project and document the plan on the MAOP Uprating Plan form (See [Attachment 1](#)). The plan shall outline:
1. The specific area and services affected.
 2. Steps to be taken to increasing the system pressure.
 3. Maximum allowable operating pressure for the area.
 4. Adequate overpressure protection.
 5. Required communications with Gas Control if area is remotely monitored.
- 5.1.4 A leak survey shall have been conducted on the mains and services within one year prior to the uprating and all potential hazardous leaks shall be repaired before raising the pressure.
- 5.1.5 All steel mains and services shall be under effective cathodic protection. Refer to [CORR 1](#).
- 5.1.6 If the system contains polyethylene (PE) pipe, the PE pipe shall have records demonstrating that it was tested at 1.5 times the proposed MAOP.
1. If there are no test records that substantiate the proposed MAOP, the PE pipe must be tested to 1.5 times the proposed MAOP prior to increasing the operating pressure. See [PTST 1](#).
- 5.1.7 The specifications of the connected equipment shall be reviewed, and any equipment not rated for the new MAOP shall be replaced.
- 5.1.8 Reinforce or anchor all offsets, bends, and dead ends in pipe joined by compression couplings and mechanical joints. Refer to [MAIN 2.3](#) and [REPR 2.1](#).
- 5.1.9 Each service shall have an outside shutoff valve, a regulator, and adequate overpressure protection.

5.2 Polyethylene (PE) Systems

5.2.1 PE systems can be uprated to a new MAOP that does not exceed the MAOP shown in **POLY 2.1 Section 6.0** MAOP Limitations for PE Pipe if:

The review steps as outlined in Paragraph 5.1.1 through 5.1.6 have been successfully completed. AND

The existing PE system has records that demonstrate the system had been tested at 1.5 times the proposed MAOP, at a minimum. OR

If there are no test records that substantiate the proposed Design MAOP, the PE pipe system can be uprated after being retested if:

1. The system is taken out of service and tested to 1.5 times the proposed MAOP, at a minimum, in accordance with **PTST 1**.
2. The system operating pressure shall be established at, or below, the new MAOP before the PE system is placed back in-service.

5.3 Upgrading

5.3.1 A pre-job meeting with all parties shall be held to discuss and approve the procedures in the plan and the various responsibilities. At a minimum the following shall be represented at this meeting:

1. Engineering (Region/GTE);
2. Operations (Region/GTS);
3. Gas Compliance.

5.3.2 The pressure shall be increased gradually at a rate that can be controlled:

1. In equal steps of 10 psig or 25% of the total pressure increase, whichever produces the fewest steps with a minimum of 2 steps.
2. Where the current operating pressure is 12" w.c. or less the same as above in **5.3.2 item 1** with a minimum of two incremental steps and the first step at 2 psig.

5.3.3 A leak survey shall be conducted immediately after each pressure increase step and shall continue until the entire affected area has been surveyed.

5.3.4 All leaks found during the leak survey, shall be classified in accordance with **LEAK 1** and documented within ClickMobile.

1. All hazardous leaks shall be repaired immediately.
2. All non-hazardous leaks shall be reevaluated and documented in ClickMobile after each survey.

6.0 Increasing MAOP Above **125 PSIG**

6.1 Upgrading procedures shall be developed for the upgrade of any gas facilities to or above **125 PSIG** on a case-by-case basis in consultation with:

- 6.1.1 Gas Engineering
- 6.1.2 Gas Tech Engineering
- 6.1.3 Gas Technical Services

- 6.2 Gas Control shall be involved in planning, scheduling, and uprating operation if the affected system or adjacent system is remotely monitored.
- 6.3 These procedures shall be in accordance with 49 CFR Part 192, Subpart K.
- 6.4 A pre-job meeting with all parties shall be held to discuss and approve the procedures in the plan and the various responsibilities. At a minimum the following shall be represented at this meeting:
 - 6.4.1 Engineering (Region/GTE)
 - 6.4.2 Operations (Region/GTS)
 - 6.4.3 Gas Compliance

7.0 Records

- 7.1 The following records associated with the uprating shall be attached to the completed [MAOP Uprating Plan form](#) and retained for the life of the facility:
 - 7.1.1 Leak surveys
 - 7.1.2 Cathodic protection surveys
 - 7.1.3 Regulator orifice changes
 - 7.1.4 Other work performed on the system

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0061: Inspect or Test Cathodic Protection Bonds
- 0071: Inspect or Test Cathodic Protection Electrical Insulation Devices
- 0301: Manually Opening and Closing Valves
- 0561: Pressure Test - Nonliquid Medium - MAOP Less than 100 psi
- 0571: Pressure Test - Nonliquid Medium - MAOP Greater than or Equal to 100 psi
- 0581: Pressure Test - Liquid Medium
- 0591: Leak Test at Operating Pressure
- 1241: Outside Gas Leak Investigation
- 1261: Walking Gas Leakage Survey
- 1271: Mobile Gas Leakage Survey - Flame Ionization
- 1281: Mobile Gas Leakage Survey - Optical Methane
- 1311: Inspect Pipeline Surface Conditions - Patrol Right of Way or Easement
- 1371: Operate Gas Pipeline - System Control Center Operations
- 1381: Operate Gas Pipeline - Local Facility Remote - Control Operations
- A003: Emergency Response

VAULT AND PIT INSPECTION

October 1, 2020

VALT 1 Requirements

1.0 Purpose

This document describes Ameren Illinois (AIC) requirements for inspection and maintenance of vaults/pits per 49 CFR §192.749.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Inspection \(§192.749\)](#)**3.0 Target Audience**

- Gas Field Personnel
- Gas Supervisors.
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors

4.0 General

4.1 A vault is defined as the following:

4.1.1 Subsurface structure housing piping and piping components.

4.1.2 Volumetric internal content of 200 cubic feet or more.

4.1.3 Constructed to be:

1. Sealed in such a manner that would allow gas to accumulate
OR
2. Vented.

4.2 A pit is defined as the following:

4.2.1 Subsurface structure housing piping and piping components.

4.2.2 Volumetric internal content of less than 200 cubic feet.

4.2.3 Constructed to be:

1. Sealed in such a manner that would allow gas to accumulate
OR
2. Vented.

5.0 Inspection (§192.749)

5.1 Vaults housing pressure regulating and pressure limiting equipment shall be inspected at least *once each calendar year* at intervals not exceeding 15 months.

5.1.1 Determine that vault:

1. Is in good physical condition.

- 2. Adequately ventilated.
- 5.1.2 If gas is found in the vault, the equipment in the vault shall be inspected for leaks, and any leaks found must be repaired.
- 5.1.3 The ventilating equipment shall be inspected to determine it is functioning properly.
- 5.1.4 Vault covers shall be inspected to ensure they do not present a hazard to public safety.

End of Instructions.

Operator Qualification (OQ) Required?

YES.

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

VAULT AND PIT INSPECTION

October 1, 2021

VALT 2.1 Inspecting Vaults and Pits

1.0 Purpose

This document describes Ameren Illinois (AIC) procedures for inspection and maintenance of vaults/pits per 29 CFR §1910.146 and 49 CFR §192.749.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Vault/Pit Hazard Assessment](#)[6.0 Working in Gaseous Environment](#)[7.0 Vault/Pit Inspection](#)**3.0 Target Audience**

- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors

4.0 General

4.1 Gas field personnel shall:

- 4.1.1 Park on the street or in a safe location. Avoid parking over main valves if they are required for make safe action.
- 4.1.2 Protect themselves from traffic and other hazards while working in or around vaults/pits.
- 4.1.3 Visually inspect all vaults/pits prior to entering, to identify hazards and verify safe for entry.
- 4.1.4 Use a ladder or built-in steps for ingress/egress in vault/pit with depth of 4 feet or more. Do not climb on pipes or regulators.
- 4.1.5 When gas-in-air concentration is equal to or greater than 30% LEL in a vault/pit:
 1. Use only intrinsically safe equipment or tools.
 2. Make all electrical connections and disconnections outside vault/pit.
 3. See [ACIG 2](#) Work Area Protection.
- 4.1.6 Have at least 1 fire extinguisher on the jobsite and upwind from the work area.

4.2 Compressed gas cylinders shall *not* be taken into or stored in a vault/pit.

5.0 Vault/Pit Hazard Assessment

5.1. Environment Testing

- 5.1.1 Test the environment of each vault/pit with gas detection equipment for oxygen deficiency and combustible gas concentration in the following manner:

UNCONTROLLED IF PRINTED

1. Insert a test probe into a hole in the lid, or by lifting the edge of the lid slightly.
 - 1 a. If gas concentration level is equal to or greater than 30% LEL, ventilate the vault/pit.
 2. Continue to check the environment at all levels of the vault/pit:
 - 2 a. Use an extension hose connected to the gas detection equipment.
 - 2 b. Allow instrument readings to stabilize at each level before lowering the probe further.
 - 2 c. Ventilate as needed.
- 5.1.2 If there is a possible source or indication of toxic gasses, such as carbon monoxide or hydrogen sulfide, the environment shall be tested for the specific gas prior to personnel entering the vault/pit.
- 5.1.3 Acceptable environment concentrations for entry without additional Personal Protective Equipment (PPE) required are:
1. Oxygen content between 19.5% and 23.5%.
 2. Gas-in-air concentration is less than 30% LEL.
 3. Carbon monoxide concentration is less than 30 ppm.
 4. For other toxic gas concentrations, contact Safety Specialist for threshold levels if necessary.
- 5.1.4 If acceptable entry conditions are not met, the space shall be ventilated.

Forced air ventilation is generally preferred over exhaust ventilation.

- 5.1.5 Re-test the vault/pit environment to determine if ventilation was adequate to bring concentrations within acceptable entry conditions.

5.2. Space Classification

- 5.2.1 Based upon visual inspection and air testing results, classify each vault/pit as follows:
1. Permit-Required Confined Space (PRCS)
OR
 2. Non-PRCS.
- 5.2.2 A vault/pit shall be considered a PRCS if:
1. Serious safety or health risks *other than natural gas* are present in the space, such as:
 - 1 a. Engulfment.
 - 1 b. Entrapment.
 - 1 c. Unsafe environment.
 - 1 d. Unsafe mechanical items.
 - 1 e. Unsafe electrical items.

UNCONTROLLED IF PRINTED

2. Such risks cannot be eliminated through ventilation or other means.

5.2.3 Entry to PRCS shall comply with 29 CFR §1910.146 including:

1. PPE.
2. Standby personnel.
3. Retrieval/rescue procedures.
4. Signage and barricaded entrance.
5. Training, especially on rescue procedures.

5.2.4 If the vault/pit is classified as PRCS, notify a Safety Supervisor.

5.3. Entry Requirements Based on Air Testing

5.3.1 After ventilation, if air quality is not within the acceptable limits listed below, entry into a vault/pit shall *not be performed* until further measures are taken to improve air quality:

1. Oxygen concentration is not between 19.5% to 23.5%
OR
2. Carbon monoxide concentration is greater than 30 ppm
OR
3. Toxic gas concentrations are above established threshold concentrations.

5.3.2 After ventilation, if the only environment hazard in the vault/pit is natural gas that is less than 30% LEL, then entry procedures shall be per [Paragraph 5.1.3](#).

5.3.3 After ventilation, if the only environment hazard in the vault/pit is natural gas that is equal to or greater than 30% LEL, then entry procedures shall be per [Section 6.0](#).

5.3.4 Continuously monitor the vault/pit environment while personnel are in vault/pit.

6.0 Working in Gaseous Environment

6.1. The following procedures apply where *natural gas is the only environment hazard* in vault/pit.

6.1.1 If gas-in-air concentration is equal to or greater than 30% LEL *but* less than or equal to 60% LEL, entry shall be made with Level 1 PPE (see [WIGE 2.2](#) Personal Protective Equipment) including:

1. Level 1 suit.
2. Goggles.
3. Work gloves.
4. Balaclava.

6.1.2 If gas-in-air concentration is greater than 60% LEL *and* the facility cannot be taken out of service, entry shall be made only with Level 2 PPE (see [WIGE 2.2](#) Personal Protective Equipment) including:

1. Level 2 hood suit.
2. Insulated gloves.
3. Supplied-air respiratory protection.

UNCONTROLLED IF PRINTED

4. Full-body harness and mechanical retrieval device.

7.0 Vault/Pit Inspection

- 7.1 In preparation for inspection, gas field personnel shall:

- 7.1.1 Upon finding gas in vault/pit through monitoring with a CGI, check piping and equipment for leakage.

1. Any leaks found should be classified and repaired per [LEAK 1](#).

- 7.1.2 Inspect piping and equipment for atmospheric corrosion.

- 7.1.3 If the vault/pit is sealed, ensure each opening has a tight-fitting cover without holes through which an explosive mixture might be ignited.

- 7.1.4 Inspect the vault/pit cover and verify that it does not present a hazard to the public.

- 7.1.5 Check the vault/pit structure, concrete, fiber, metal, etc. for deterioration.

- 7.1.6 Report all deficiencies found on the Regulator Station or Valve Inspection forms within ClickMobile.

- 7.2 During inspection:

- 7.2.1 Gas field personnel shall check:

1. Vault/pit has 2 ventilation ducts, each having at least the ventilating effect of a pipe 4 inches in diameter.

2. Ventilation ducts to ensure they are clear.

3. Outside ends of ventilation ducts for suitable weatherproof fitting or vent-head to ensure foreign matter cannot enter and cause an obstruction.

4. Outside ends of ventilation ducts are high enough above grade to disperse any gas-air mixtures that might be discharged.

5. Vault/pit has sufficient ventilation to minimize the formation of combustible environment inside.

6. Vault/pit with depth of 4 feet or more has ladder or steps in good working order for ingress/egress.

- 7.2.2 While personnel are in the vault/pit, the interior environment shall be retested for combustible gas concentration and oxygen deficiency at intervals not exceeding 1 hour *unless* interior environment is being continuously monitored.

- 7.2.3 All deficiencies found shall be reported on the appropriate Regulator Station or Valve Inspection forms within ClickMobile.

- 7.3 Inspection schedule

- 7.3.1 Per §192.749, vaults housing pressure regulating and pressure limiting equipment shall be inspected at least once each calendar year at intervals not exceeding 15 months.

- 7.3.2 Vaults not covered by Paragraph 7.3.1 shall be inspected once each calendar year at an interval not exceeding 15 months.

- 7.4 Inspection records

- 7.4.1 Inspections and deficiencies shall be recorded on the appropriate Regulator Station or Valve Inspection forms within ClickMobile.

UNCONTROLLED IF PRINTED

7.4.2 Inspections of vaults shall be maintained in Maximo.

7.4.3 All information shall be retained for life of the vault.

End of Instructions.

Revision Notes

Location of Changes	Summary of Changes
VALV 3	Section 6.0 – Spelling correction – Kerotest Gate Valves Section 7.0 - Valve Box Accessories Stock Code Table (Removed the – between Stock and Code)

VALV 1 Requirements

1.0 Purpose

This document specifies requirements for the placement and inspection of emergency valves and the installation of all valves within the Ameren Illinois (AIC) gas systems. This document complies with 49 CFR §§ 192.167, 192.179 and 192.181, 192.745 and 192.747.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Design Considerations](#)

[5.0 Emergency Valves - Location](#)

[6.0 Emergency Valve Inspection](#)

Appendices:

[Appendix A - System map showing Valve ID #](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Distribution Design Supervisors
- Distribution Design Specialists
- Gas Tech Services (GTS) Supervisor
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Storage Supervisors

4.0 Design Considerations

4.1 Valve placement should consider the following:

4.1.1 MAOP of the operating system.

4.1.2 Intended function:

1. Emergency
2. Non-emergency
3. Isolation
4. Blow down

4.1.3 Accessibility

1. Avoid excessive depth. Efforts should be made to install valves no deeper than 40 to 48 inches, to avoid the need for protective excavation systems (i.e. shoring) when valve must be exposed for maintenance.
2. Not in bottom of ditch if possible.

4.1.4 Zones of Isolation (Outage Zones) such that re-lights can be restored within a 24 hours period.

4.1.5 Prevention of back-feed situations on multi-fed systems.

4.1.6 Other operational or potential emergency situation as designated by GTE, Gas Supervisor or Gas Engineering.

5.0 Emergency Valves - Location

5.1 Transmission Pipelines (49 CFR §192.179)

5.1.1 Each transmission line shall have sectionalizing block valves spaced such that each point on the pipeline is within a specified distance from a valve as required by. See Table 1.

Table 1 Maximum Distance from Sectionalizing Valve

Pipeline Location	Maximum distance from sectionalizing valve
Class 1	10 miles
Class 2	7-1/2 miles
Class 3	4 miles
Class 4	2-1/2 miles

5.1.2 Each section of transmission main between sectionalizing block valves shall have an emergency blow-down valve with enough capacity to blow down the line as rapidly as practicable.

1. Locate blowdown valves such that gas can be released safely, without creating a hazardous situation.

5.2 Each staffed compressor station with greater than 1,000 horsepower shall have emergency valves and emergency blow-down valves that shuts off flow into the station.

5.3 High Pressure Distribution and Distribution Lines

5.3.1 Space valves for high pressure distribution and distribution lines to effectively control gas in an emergency. Consideration should be given to:

1. Size of the area to be isolated.
2. Rivers, major highways, and railroads.
3. Number of valves necessary to isolate the area.

5.4 Regulator Station or Flow Control Station

5.4.1 Install valves used to control a regulator station or flow control station at a safe distance from the station. See [VALV 2.1](#)

A safe distance is generally accepted as 25 feet or more from the pressure control or flow control station.

5.5 Records

5.5.1 Enter details for all emergency valves, including blow-down valves, as follows:

1. AIC electronic mapping system.

System maps will distinguish these valves as Emergency Valves along with their respective Valve ID #. See [Appendix A](#).

2. Maximo

2 a. Enter the same Valve ID # as shown in the electronic mapping system.

6.0 Emergency Valve Inspection (49 CFR §192.745, §192.747)

6.1 Inspect all emergency valves once each calendar year not to exceed 15 months.

6.2 Record inspections in ClickMobile and maintain in Maximo for the life of the valve.

6.3 Include a lid marked "GAS" on any new valve box installation.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

VALVES

October 1, 2021

VALV 2.1 Valve Installation**1.0 Purpose**

This document provides requirements for the installation of emergency and non-emergency valves in accordance with 49 CFR §§ 192.145, 192.150, 192.179, 192.181, 192.193 and 192.205 which include:

- Pipeline valves
- Storage field master and wing valves

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 General](#)****[5.0 Valve Identification](#)****[6.0 Emergency Line Valves](#)****[7.0 Emergency Station Valves](#)****[8.0 Non-Emergency Valves](#)****[9.0 Valve Installation Operations](#)****[10.0 Valve Box Installations](#)****3.0 Target Audience**

- Gas Engineering
- Gas Field Personnel
- Gas Supervisor
- Distribution Design Supervisors
- Distribution Design Specialist
- Gas Tech Services (GTS) Supervisor
- Gas Tech Services (GTS) Personnel
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 General

4.1 For procedures on installation of service line valves refer to [SERV 1](#).

4.2 GTE will provide the designation and location of emergency valves on:

- 4.2.1 Transmission pipelines
- 4.2.2 High pressure distribution pipelines
- 4.2.3 Pressure control or flow control stations.

4.3 Gas Engineering or Distribution Design Center (DDC/PDC) shall provide the designation and location, within the distribution system (< 100 psig), of :

- 4.3.1 Emergency valves.
- 4.3.2 Non-emergency valves.

UNCONTROLLED IF PRINTED

4.4 GSE will provide the designation and location, within gas storage field areas, of:

4.4.1 Emergency valves.

4.4.2 Non-emergency valves.

5.0 Valve Identification

5.1 Emergency valves shall be identified by identification number on distribution and transmission electronic mapping system which permits the issuing of individual valve operating instructions. See [VALV 1 Appendix A](#).

5.2 Valve numbering shall be maintained and recorded in Maximo.

5.3 All emergency valves or valve boxes shall be tagged with the valve number for easy identification in the field.

6.0 Emergency Line Valves

6.1 Transmission Pipelines (§192.150, §192.179)

6.1.1 Each point on a transmission line shall have a sectionalizing block valve spaced as specified in [VALV 1](#).

6.1.2 Each section of a transmission line installed after March 12, 1971 shall have provisions to blow down gas between sectionalizing block valves.

6.1.3 The discharge shall be located so the gas can be blown to the atmosphere without hazard. If the pipeline is adjacent to an overhead electric line, the discharge must be directed away from electric conductors.

6.1.4 Line valves installed within new or replaced transmission lines shall be capable of accommodating the passage of internal inspection devices.

6.1.5 Relief valves or regulator stations fed from a transmission line may be used as blow down devices, provided they have the capacity to blow down the transmission line as rapidly as possible.

6.2 High Pressure Distribution and Distribution Pipelines (§192.181)

6.2.1 Distribution valves that are necessary to facilitate control of gas shall be designated as emergency valves by the Gas Supervisor, Gas Engineering, DDC/PDC or GTE.

6.2.2 Valves must be spaced to effectively control gas in an emergency.

6.2.3 Zones of Isolation (Outage Zones) shall be established to support effective re-lights and emergency management.

1. The size of the zone shall be such that the majority of affected customers can have service restored within 24 hours. Refer to [VALV 1 Section 4.1.4](#).

7.0 Emergency Station Valves (§192.181)

7.1 New Pressure Control or Flow Control Stations

7.1.1 Designated stations are those subject to annual Operational and Primary Inspections. See [REGS 2.1](#).

7.1.2 Newly installed or newly designated pressure control or flow control stations shall have an emergency/fire valve installed on the inlet piping a safe distance from the station.

A safe distance is generally accepted as 25 feet or more from the pressure control or flow control station.

7.1.3 If pressure control or flow control station is on a system that has more than one source, a valve should be installed a safe distance from the station on the outlet side to eliminate back-feeding.

1. The maximum allowable distance shall be such that it allows for the effective management of a gas emergency.

7.2 Rebuilt Station Defined

7.2.1 A station rebuild is defined as:

1. Any non-maintenance type work intended to increase or decrease station capacity.
2. Any work or equipment change that increases or decreases station capacity.

7.2.2 Examples include:

1. Installation of operating standby regulator.
2. Physically relocating the regulator station.
3. Adding or removing additional pressure cuts.
4. Any work on station inlet piping that requires an interruption in the flow of gas.

7.2.3 Examples of maintenance items not considered as a "rebuild" include:

1. Replacing relief valve.
2. Replacing existing valves.
3. Replacing regulator with same or equivalent, if the purpose of the change is not to increase or decrease station capacity.
4. Installing a normally closed bypass (for inspections).
5. Adding a cathodic protection insulator.
6. Adding a valve ahead of relief valve.
7. Adding gauge taps.
8. Changing control line configuration.
9. Changing springs, orifices, liners, or ports, if the purpose of the change is not to increase or decrease station capacity.

7.3 Rebuilt Pressure Control or Flow Control Stations

7.3.1 Station Installed prior to March 31, 1971

1. Is not required to have an emergency valve on the inlet a safe distance from the station unless that station has or is going to be rebuilt as defined in [Section 7.2](#).
2. If is to be rebuilt it must have an emergency valve installed on the inlet piping in the same manner as a new station.

7.3.2 If an emergency valve exists, but does not meet the safe distance criteria, an on-site engineering evaluation shall be made to determine the availability of the valve during an emergency.

1. If the evaluation determines the emergency valve inaccessible, a new valve shall be installed at an acceptable safe distance from the station.

8.0 Non-Emergency Valves

8.1 Non-emergency valves are other valves installed through-out the gas system that improve the operation and maintenance of the system.

8.2 A non-emergency valve can be used to aid in sectionalizing or isolating areas of the system in situations requiring the shut-down of gas. These situations may include:

8.2.1 Damage to a gas main.

8.2.2 Gas main replacement or relocation project.

8.2.3 Uprating a section of the system.

8.2.4 Isolation of gas storage field wells.

8.3 Valve locations will be determined by:

8.3.1 Gas Engineering,

8.3.2 Gas Supervisor,

8.3.3 DDC/PDC,

8.3.4 GTE,

8.3.5 GSE, or

8.3.6 Gas Storage Field Supervisor.

8.4 The following locations are preferred for placement of non-emergency valves:

8.4.1 An entrance to a subdivision where a distribution main is being installed.

8.4.2 An entrance to a dead-end street with a cul-de-sac that is not part of a subdivision.

8.4.3 An entrance to a subdivision ending with a cul-de-sac that has more than 30 houses.

8.4.4 Within a main segment, such that a maximum of approximately 300 customers would be isolated by a set of valves.

8.4.5 Gas storage field wells.

8.5 Valves can have an assigned identification number and be entered on the gas electronic mapping system.

8.6 Valve can be entered in Maximo and designated as Non-Emergency Valve.

8.6.1 Maximo will maintain a listing, location, and attributes of Non-Emergency valves.

Be careful to enter the correct valve designation in Maximo so that an Emergency Valve is not inaccurately entered as Non-Emergency.

Some areas initially enter a valve as Non-Emergency until the valve is inspected. The valve designation is changed to "Emergency" when the inspection is entered to be scheduled for annual inspection.

8.6.2 Non-emergency valves do not require annual inspection.

8.6.3 Maximo will maintain a listing, location, and attributes of Non-Emergency valves.

8.7 If a below grade non-emergency valve is used to isolate or sectionalize gas main segments of a gas distribution system or transmission system during an emergency situation, the valve will be designated as an Emergency Valve after the emergency situation has been resolved.

8.7.1 An Emergency Valve ID shall be assigned.

8.7.2 The valve shall be entered into Maximo and on the electronic gas system map.

8.7.3 In the comments section of the ClickMobile valve inspection form, enter "valve was used during an emergency situation".

8.7.4 This does not apply to a below grade service line valve used to shut down a service line.

9.0 Valve Installation Operations

9.1 Steel Valves (§192.145)

9.1.1 The valve must have at least the minimum design rating for the Design MAOP of the system in which it is being installed.

9.1.2 The valve body must be compatible with the pipeline and/or gas storage field wells to which it is being connected.

9.1.3 Welded valves must be installed by a qualified welder using an approved welding procedure. See [WELD 2.3](#) and [WELD 4](#) for welding procedure specifications (WPS).

Generally, the valve should be in the closed position during welding to prevent damage to the valve seats.

1. Consult the valve manufacturer's instructions for the position of the valve during welding operations.

9.1.4 Flanged end valve shall have the appropriate gasket installed.

1. Bolting procedures for the flange shall be in accordance with [STLP 3.3](#).

9.1.5 Screwed end valves shall have a suitable threading compound (e.g. Real-Tuff, Megaloc, Slic-tite) applied sparingly to the threads of the pipe to which the valve is being installed. See [STLP 1 Table 2](#).

1. Apply the wrench to the valve end adjacent to pipe being attached.

9.1.6 Above ground valves shall be properly coated/painted as protection against atmospheric corrosion. See [CORR 2.3](#).

9.1.7 Prior to installation the Gas Supervisor or Gas Engineering should consult with Corrosion Control personnel to determine if an insulator kit should be installed in the proposed valve. See [CORR 2.1](#).

9.2 Polyethylene (PE) Ball Valves (§192.193)

9.2.1 The valve shall be pressure rated to meet the Design MAOP of the system in which it is being installed.

9.2.2 PE valves can be attached to the pipe by either butt fusion or electrofusion couplings. See [POLY 2.4](#) Butt Fusion or [POLY 2.5](#) Electrofusion for fusion information and requirements.

9.2.3 If a PE valve is being installed close to the transition fitting between steel and PE section of main, a test wire from the steel pipe and the tracer wire should be brought up inside the valve box.

Test wire and tracer wire shall be separate and not connected.

9.2.4 A PE valve shall be installed and backfilled adequately to prevent undue stress or strain on the PE main when the valve is operated.

9.3 All Valves

9.3.1 Valve should be located in a readily accessible location that is protected from damage due to:

1. Tampering.
2. Excessive outside forces.
3. Traffic loads.

9.3.2 Backfill around valves shall be adequately compacted to provide support to minimize stress and strain on the pipe when the valve is operated.

9.3.3 Efforts should be made to install valves no deeper than 40 to 48 inches, to avoid the need for protective excavation systems (i.e. shoring) when valve must be exposed for maintenance.

9.3.4 Valves located in rural areas should have a pipeline marker installed near the valve box.

10.0 Valve Box Installations

10.1 Any new valve installation, either steel or PE, must include the appropriate valve box and lid marked "GAS".

10.2 Any new valve installation, either steel or PE, may include a concrete pad around the valve box lid for future locating.

10.3 Install the correct valve box for the size and type of valve installed

10.4 The valve box must be independent of (i.e. not structurally supported by) the pipeline.

10.5 Backfill around the valve box should be compacted in approximately 12-inch layers to minimize settlement. When backfilling, take care not to knock or move the valve box out of alignment with the valve.

VALV 2.2 Valve Inspection, Maintenance, and Repair

1.0 Purpose

This procedure describes the inspection and maintenance procedures for all transmission, distribution emergency valves and gas storage field emergency and non-emergency valves in accordance with 49 CFR §§ 192.745 and 192.747.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Valve Inspections](#)

[6.0 Valve Maintenance](#)

[7.0 Follow-up Maintenance](#)

[8.0 Records](#)

Appendices:

[Appendix A - Plug Valve Maintenance](#)

[Appendix B - Kerotest Gate Valve Maintenance](#)

[Appendix C - Balon Flanges Ball Valve Repair](#)

3.0 Target Audience

- Gas Engineering
- Gas Field Personnel
- Gas Supervisor
- Gas Tech Services (GTS) Supervisor
- Gas Tech Services (GTS) Personnel
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Control

4.0 General

- 4.1 Communicate with Gas Control, before and after, when any inspection and/or maintenance work is scheduled to be performed on any valve that is monitored through the SCADA system and/or operated remotely by Gas Control.

5.0 Valve Inspections

- 5.1 The following valves shall be inspected and partially operated each calendar year, at intervals not exceeding 15 months:
- 5.1.1 Transmission, distribution, and station emergency valves.
 - 5.1.2 Gas storage field emergency valves.
 - 5.1.3 Gas storage field master and wing valves.
- 5.2 Check and verify for the presence of the valve identification tag/label.

UNCONTROLLED IF PRINTED

- 5.2.1 Verify valve id on tag/label is correct and is readable.
- 5.2.2 Replace or schedule for replacement if necessary.
- 5.3 Review, verify, correct or furnish missing data on the ClickMobile map and valve inspection form.
- 5.4 The valve box shall be inspected for alignment and obstructions that might preclude access to the valve adapter.
- 5.5 Ensure valve wrench fits properly on the valve adapter head.
- 5.6 When partially operating a Quarter Turn valve, take care to ensure valve is returned to its normal operating position.
 - 5.6.1 If necessary remove dirt or debris and perform visual check.
- 5.7 Partially operate manual valve or motor valve. Return valve to normal operating position.

VERY IMPORTANT: Make sure those normally closed valves which separate two systems that operate at different pressures are left in the **CLOSED** position.

- 5.8 Below ground valve shall be checked for leakage with an approved gas detection instrument that reads percent of gas-in-air on the LEL and Gas scale.
 - 5.8.1 Perform a final leakage check at the conclusion of the inspection.
- 5.9 Above ground valves shall be checked for leakage with either a leak detection instrument or leak detection fluid at the conclusion of the valve inspection.
- 5.10 Check for atmospheric corrosion on valves and piping installed above ground or in a vault/pit. See [CORR 1](#).
- 5.11 Unknown or inaccurate valve description and installation data that can be accessed without excavation or disruption of service shall be verified and entered onto the Click-Mobile inspection form.
- 5.12 Pressure control station emergency valves may be inspected and maintained during the annual pressure control station inspection.
- 5.13 If valve is in a vault, a vault inspection shall also be completed as per [VALT 2.1](#).

6.0 Valve Maintenance

- 6.1 Before operating the plug valve, lubricate to lift the plug and shear the grease.
- 6.2 After operating the plug valve, lubricate to replace grease loss due to operating.
- 6.3 Maintenance information for plug valves is provided in [Appendix A](#) which includes:
 - 6.3.1 Safety practices.
 - 6.3.2 Valve cleaner stock codes.
 - 6.3.3 Troubleshooting seized or difficult to turn valve.
 - 6.3.4 Lubricating procedures.
 - 6.3.5 Valve flush procedures.

UNCONTROLLED IF PRINTED

- 6.3.6 Lubricant stock codes.
- 6.3.7 Plug valve lubrication extension assembly.

Regulator station inlet plug valves should only be lubricated when difficult to turn to prevent accumulation of excess grease in downstream regulators.

- 6.4 Maintenance information for Kerotest gate valves is included in [Appendix B](#).
 - 6.4.1 Troubleshooting a valve that will not shut off.
 - 6.4.2 Troubleshooting repacking a valve.
 - 6.4.3 Repacking procedures:
 - 1. Zero pressure repacking.
 - 2. Primary repacking.
 - 3. Secondary repacking.
 - 6.4.4 Bonnet leak repair.
- 6.5 Maintenance and repair information for the Balon Ball Valves is provided in [Appendix C](#), which includes:
 - 6.5.1 Parts that are contained in the repair kit for various ball valve series.
 - 6.5.2 Balon parts listing for Series F and S lever operated valves.
 - 6.5.3 Repair procedures for the Series F and S lever operated valves.
- 6.6 Complete the following maintenance items at the time of the scheduled valve inspection:
 - 6.6.1 Paint valve box lid if needed.
 - 6.6.2 Straighten or adjust valve box if needed.
 - 6.6.3 Clean-out valve box if needed.
 - 6.6.4 Replace missing valve identification tag/label.
 - 6.6.5 Repair leaks.
 - 6.6.6 All below ground leaks, and aboveground leaks not repaired at the time of the inspection, must be classified and recorded in accordance with [LEAK 1 Section 5.0](#) Leak Detection and Classification.
- 6.7 Verify that the valves are properly shown on the reference maps to allow easy location.
 - 6.7.1 Measurements associated with the sketch in ClickMobile shall be checked to ensure they are reasonably correct.
- 6.8 Following maintenance of a valve, notify Gas Control that valve operation has returned to normal, if Gas Control is monitoring the valve.

7.0 Follow-up Maintenance

- 7.1 If gas field personnel determine an emergency valve is inoperable or is removed from service, the Gas Supervisor shall be notified immediately.

UNCONTROLLED IF PRINTED

- 7.1.1 An alternate valve shall be identified and designated for the purpose of controlling the flow of gas in an emergency OR
- 7.1.2 Maintenance shall be performed on the emergency valve to make it operable within the designated compliance date of that valve's annual inspection.
- 7.2 Gas Supervisor should review the inspection sheets and other maintenance work listed in Maximo.
 - 7.2.1 Maintenance work that can be reported during valve inspection includes:
 - 1. Replacement of valve number tags
 - 2. Miscellaneous work
 - 3. Mechanical maintenance
 - 4. Lubricate valve
 - 5. New insulator needed
 - 6. New gasket needed
 - 7. Data correction
 - 8. Clear vegetation
 - 9. Clear valve box
 - 10. Clean internal (flush)
 - 11. Clean external
 - 12. Bond wire
 - 13. Align valve box.

8.0 Records

- 8.1 Record on the ClickMobile inspection form the results of all emergency valve and gas storage field non-emergency valve inspections by those performing the inspection:
 - 8.1.1 Qualified gas field personnel,
 - 8.1.2 GTS personnel, or
 - 8.1.3 Gas storage field personnel.
- 8.2 Any data correction or update should be reported on the ClickMobile inspection form.
 - 8.2.1 Gas Supervisor, Gas Engineering, GTS Supervisor, GTE, Gas Storage Field Supervisor or GSE is responsible for ensuring data corrections are made within Maximo.
- 8.3 The results of the emergency valve inspection shall be entered into ClickMobile and maintained within Maximo.
- 8.4 The results of the inspection shall be maintained for life of the facility.

End of Instructions.

Revision Notes

Location of Changes	Summary of Changes
Appendix A-3 – Valve Cleaners	A-3.1 - Revise – Valve cleaners should be used on hard to turn or seized valves, see A-4, prior to lubrication.
Appendix A-7 – Lubrication gun	A-7.4 – Added – injection – Try to keep the injection pressure above 1500 psi.
Appendix B-1 – Kerotest Gate Valve Maintenance	B-1.2 – New – Kerotest recommends installing packing shims as a first attempt to stop a stem packing leak. The procedure can be found in <u>VALV 4 Kerotest Model -1 Gate Valve Operations Manual</u>

UNCONTROLLED IF PRINTED

Appendix A - Plug Valve Maintenance

A-1. General

- A-1.1 Routine maintenance with the proper lube sealant is the best assurance for trouble free valves.
- A-1.2 Plug valve lubrication makes the plug and valve body surface slippery to ease turning and reduce friction and galling.
- A-1.3 It also acts as a sealant.
- A-1.4 The tapered plug acts as a scraper.
- A-1.5 Each time a plug valve is operated, the plug scrapes a small amount of lubricant from the sides of the valve body.
- A-1.6 This reduces the lubricant film and allows the tapered plug to sink further into the body.

A-2. Safety Practices

- A-2.1 Install a gauge and a relief fitting on the outlet of the lubricating grease gun so that the pressure on the valve does not exceed the maximum pressure.
- A-2.2 Lubricating grease guns can create pressures in excess of 6,000 psig. Follow maintenance procedures when flushing or greasing.
- A-2.3 The maximum pressure used on the lubricant, when greasing a cast iron or semi-steel valve, is 4,000 psi.
 - A-2.3.1 If this pressure does not free the valve, consult a factory-trained valve maintenance technician.
- A-2.4 Do not exceed 4,000 psi on valves 4 inch and smaller and 6,000 psi on valves 6 inch and larger.
 - A-2.4.1 Consult manufacturer's catalog or assess the general condition of the valve to determine a safe injection pressure.

1. Never remove the coupler before opening the bleeder valve on the gun.
2. Keep hand away from the coupler and wiggle the hose to release trapped pressure.

A-3. Valve Cleaners

- A-3.1 Valve cleaners should be used on hard to turn or seized valves, see [A-4](#), prior to lubrication
- A-3.2 Valve cleaner, which softens old hardened grease, can be injected using a high-pressure valve lubricant gun.
- A-3.3 A nonflammable valve cleaner shall be of sufficient strength to clean the valve within 10-30 minutes. The cleaner should also contain lubricant that allows the valve to operate before the injection of the regular lubricant.

If the cleaner does not have lubricating qualities, the valve may seize.

A-3.4 Consider removing the grease extension rather than flushing all the grease in the extension through the valve.

A-3.5 [Table A1](#) provides list of available stock coded valve cleaners.

A-3.5.1 Equivalent valve cleaner can be purchased from appropriate vendors.

A-3.5.2 Valve cleaners have a short shelf life; order only as needed.

Table A1 Valve Cleaners

Product Name	Packaging	Stock Code
Sealweld Valve Cleaner	12 Ounce Cartridges, 16 per Case	31 56 361
Val-Tex Valve Flush	1 Quart Bottles, 4 per Case	15 52 738

A-4. Seized or Difficult to Turn Valves

A-4.1 Eventually, the valve will leak or stick.

A-4.2 If plug valve is hard to turn, flush it with valve cleaner and re-grease it. Never force a hard turning valve.

A-4.3 If possible, lubricate and clean plug valves in the open position so that the body and plug lubrication channels are in alignment (see [Figure A1](#)).

When the valve is lubricated in a closed position, the lubricant cannot spread over the entire surfaces of the plug and body.

Figure A1 - Typical Plug Valve Lubrication Channels and Typical Grease Gun

A-4.4 See [A-5](#) for lubrication procedure.

A-4.5 To align the lubrication channels, fully open or fully close the valve.

A-4.6 Inject valve cleaner into the valve slowly to allow simultaneous and equal distribution of the cleaner.

A-4.7 If the pressure gauge indicates the material is not moving, allow the cleaner to sit under pressure.

A-4.8 After 10-30 minutes, pump additional cleaner into the valve.

A-4.9 If the valve still shows signs of being restricted, try to operate the valve a few degrees (being careful not to open or close valve) while continuing to pump cleaner into the valve to dislodge some of the deposits.

A-4.10 Re-grease the valve after the hardened deposits have been removed.

A-4.10.1 Inject valve grease into the valve by hand pumping the grease gun slowly.

A-4.10.2 The pressure gauge should climb steadily.

A-4.10.3 Continue pumping grease as long as the valve takes pressure and volume.

A-4.10.4 At some point, the gauge needle should drop off.

a. Drop in pressure generally means the plug has unseated, indicating a fully lubricated valve.

b. This point can also be felt when the pumping effort declines.

A-4.11 Operate the valve a few degrees to check ease of operation.

A-5. Lubrication Procedure

A-5.1 Make sure the valve is in the full open position.

A-5.2 Load the gun with the proper amount of lube sealant called for in [Table A2](#) or valve manufacturer's instructions.

A-5.2.1 Return the piston in the hydraulic gun to the desired depth using the markings on the gun handle.

A-5.2.2 Do not force the stick into the barrel.

A-5.2.3 If the stick is out of round, before unwrapping, roll it in your hands and reduce the diameter.

A-5.2.4 Rewrap any unused portion.

A-5.3 Pump the lube sealant into the valve.

It takes approximately 44 strokes of a hydraulic gun to pump one ounce of material, or approximately 350 strokes for 8 ounces (one "J" size stick)

A-5.4 If the valve continues to leak. The sealing surfaces may be severely worn or damaged. Consider the following options:

A-5.4.1 If you have been using bulk lube sealant, try injecting stick grade which has a higher viscosity.

A-5.4.2 Remove the stops and rotate the plug 180 degrees. This will reposition the damaged surfaces.

A-5.5 As a last resort, TFE filled lube sealant may be used. Repeat use of this lube sealant is not recommended. Consult VAL-TEX for further information.

A-5.6 Solid fillers in lubricants or sealants are a major cause of plug valve malfunctions.

Table A2 Valve Lube Sealant Capacity in Ounces

Size (inches)	Cameron Ball Valve	Grove Ball Valve	Nordstrom-Audco-Walworth Plug Valve	Size (inches)	Cameron Ball Valve	Grove Ball Valve	Nordstrom-Audco-Walworth Plug Valve
1/2			1/2	20	43	11	72
3/4			1/2	22		11	80
1			1	24	51	13	88
1-1/2			1	26		14	96
2	5		3	28	60	14	
3	7		4	30	64	15	112
4	9		5	32		17	
6	13	3	9	34		17	
8	17	3	11	36	76	18	
10	21	4	14	38		19	
12	26	5	17	40		20	
14	30	5	32	42	89	21	
16	34	7	40	48	102	24	
18	38	9	56				

Note: When using Valve Flush it may be necessary to perform flushing procedure twice.

A-6. Valve Flush

UNCONTROLLED IF PRINTED

A-6.1 Before using Valve Flush, try to turn the valve.

A-6.1.1 This could loosen some of the particles that are binding the plug.

A-6.2 Ensure valve is in the full open position.

A-6.3 Tighten the bonnet bolts snugly with a box or open-end wrench.

Use a crisscross method to ensure even tightening of bonnet bolts..

A-6.4 Add Valve Flush equal to the sealant capacity listed for the valve in [Table A2](#) or valve manufacturer's instructions.

A-6.5 Load the required amount of Valve Flush into the gun and pump it into the valve.

Do not exceed 4,000 psi on valves 4" and smaller and 6,000 psi on valves 6" and larger. Consult manufacturer's catalog or assess the general condition of the valve to determine a safe injection pressure.

A-6.6 Use the markings on the gun handle to determine how far to push the piston down.

A-6.6.1 Each mark is 1-1/8" and is equal to approximately 1 ounce.

A-6.7 After injecting Valve Flush, let it soak for 30 minutes or long as possible to allow time to soften the hardened deposits.

Open the by-pass valve on the gun before removing the coupler from the fitting.

A-6.7.1 Keep your hand away from the coupler and wiggle the hose to release any trapped pressure.

A-6.8 Flex the valve approximately 10 times by turning it from an open to a closed position.

A-6.8.1 Any valve that cannot be closed completely should be closed as much as possible.

A-6.9 Attempt to tighten the bonnet bolts again.

A-6.10 If required, repeat the procedure from step [A-6.5](#).

A-7. Lubrication Gun will not build pressure

A-7.1 Check for seepage around the fitting.

A-7.2 Inspect the coupler washer and the fitting for defects or trash.

A-7.3 Check for leakage around the bonnet. Tighten the bonnet bolts again.

A-7.4 Try to keep the injection pressure above 1500 psi.

UNCONTROLLED IF PRINTED

A-7.5 If the pressure drops rapidly or never builds, after checking for leakage, you are probably relieving in one or two veins only.

A-7.5.1 You can try to build a false blockage by injecting a small amount of lube sealant (approximately 10%-20% of its capacity) to temporarily plug the open veins and allow the Valve Flush to build pressure against the veins that are still clogged.

A-7.5.2 Then try the flush procedure again until full amount of Valve Flush has been injected.

A-8. Lubricants

A-8.1 The solids content of stick type lubricants is much greater than that of greases packaged in pails or cartridges.

A-8.2 While stick form lubricant is easier to handle, the lubricating qualities are greatly reduced.

A-8.3 Grease cartridges can be loaded into a grease gun with an ez-loader assembly, making it easier to handle.

A-8.4 See Table 3 for a list of available lubricants that are stock coded. Equivalent lubricants can be purchased from appropriate vendors.

Table A3 Valve Lubricants

Lubricants		
Product Name	Packaging	Stock Code
Val-Tex #80	Box of Size B, 3/8" Diameter, Sticks, 24 per Box	31 56 325
Val-Tex #80 or Rockwell #555	Box of Standard Size K, 1-1/2" Diameter, Sticks, 12 per Box	31 55 237
Sealweld #911	Case of 12 Ounce Cartridges, 16 per Case	31 56 324

A-8.4.1 Sealweld #911 is a last resort lubricant. #911 contains PTFE and requires a separate device that attaches to grease gun to load grease into gun. #911 is designed for valves that are leaking by and will fill voids up to 0.010 inches.

A-8.4.2 Size B, C, D, sticks are for use in the Mini-Mite. Size of Mini-Mite and sticks used depends on the size of the meter valve being lubricated. In addition to these, Sizes A and G sticks are for use in the Mini-Mite. The Size A stick is 1/4" diameter and the G stick is 5/8" diameter.

A-8.4.3 Size K stick is for use in the 10,000 psi and the 15,000 psi High Pressure Screw Prime Valve Lubricant Gun.
Size J stick is for use in the 10,000 psi High Pressure Hydraulic Valve Lubricant Gun.

A-9. Plug Valve Lubrication Extension

A-9.1 Plug valve lubrication extensions can be used with stem lubricated plug valves, 2 inch and over.

A-9.2 Lubricate valves each year, more often if operated frequently.

A-9.3 Fill rod with lubricant before installing. Extension requires hollow-handle rod for valve operation.

A-9.4 Figure A2 illustrates a typical below ground plug valve with a lubrication extension.

Figure A2 - Typical Plug Valve Lubrication Extension Installation

(See [Table A4](#) for stock codes)

- A-9.5 Use standard giant button head fitting furnished with valve, or order separately for valves having manual type screw.
- A-9.6 Size extension rod and fittings to tap in valve up to a maximum of 3/8" diameter.
- A-9.7 Use reducing fittings for larger size taps.
- A-9.8 Protect rod and all exposed threads with a cold applied tape (i.e. cold applied wax tape).
- A-9.9 Extension can also be made with 3/8 inch stainless steel tubing and Swagelok fittings.
- A-9.10 Plug valves without 2 inch square operating nut require a 2 inch square adapter fitting.
- A-9.11 Table A4 lists stock code for items shown in [Figure A2](#):

Table A4 Stock codes for Valve Lubrication Fittings

Stock Code	Description
19 23 824	Steel Coupling, 1/4" 6,000 lb
19 23 826	Steel Coupling, 3/8" 6,000 lb
19 22 466	Button Head Fitting, 1/4" 10,000 lb
19 22 467	Button Head Fitting, 3/8" 10,000 lb
32 23 087	Extension Rod, 1/4"Sch 80, Black Pipe
32 23 091	Extension Rod, 3/8"Sch 80, Black Pipe

Appendix B - Kerotest Gate Valve Maintenance

B-1. General

UNCONTROLLED IF PRINTED

- B-1.1 This section provides a procedure for performing maintenance on Kerotest gate valves.
- B-1.2 Kerotest recommends installing packing shims as a first attempt to stop a stem packing leak. The procedure can be found in [VALV 4 Kerotest Model M-1 Gate Valve Operations Manual](#)
- B-1.3 The repacking procedures are categorized as follows:
 - B-1.3.1 Primary - Condition 1: Valve under pressure
 - B-1.3.2 Secondary - Condition 2: Valve under pressure and Primary procedure was unsuccessful
 - B-1.3.3 Zero - Condition 3: Valve under zero pressure
- B-1.4 Manufacturer or vendor can be consulted for any updates to maintenance or repair procedures.
- B-1.5 For components of Kerotest Gate Valve see Figure B1.

Figure B1 Kerotest Gate Valve Diagram

B-2. Troubleshooting

B-2.1 Valve will not shut off

- B-2.1.1 When pipeline valves remain in an open position for a period of time, sediment or dirt may collect inside the valve.
 1. Slowly close these valves, throttling them for a short time so the turbulence flushes away any sediment or dirt that might have settled in the valve.
 2. In the event of an emergency close the valve without throttling.
- B-2.1.2 When complete shutoff is not obtained, the valve can be reseated as follows:

UNCONTROLLED IF PRINTED

1. Drive wedge into seats with moderate effort.
2. Turn back 1 to 2 complete turns and again drive into seats with moderate effort.
3. Continue this procedure until shutoff is obtained.

B-2.2 Repacking Valve

B-2.2.1 Malfunction of the packing seal may be caused by worn packing.

B-2.2.2 Repack valve as outlined in sections B-3, B-4, and B-5.

B-3. Zero (Condition 3) Pressure Repacking Procedure

B-3.1 Refer to drawing [Figure B2](#) for steps B-3.2 through B-3.10.

B-3.2 Close valve tightly with wrench.

B-3.3 Remove nut (1), lock washer (2), and operating square (3).

B-3.4 Remove all cap screws (4) and gland (5).

B-3.4.1 Upper thrust washer (7) may remain in gland (5) or on stem square (11).

B-3.5 Rotate stem square (11) in same direction as when closing the valve until it is free from the wedge.

B-3.5.1 Withdraw stem from valve.

B-3.5.2 Lower thrust washer (13) may remain in the cover or on the stem square (11).

B-3.6 Remove:

B-3.6.1 Top packing adapter (8).

B-3.6.2 V-rings (9).

B-3.6.3 Lower packing adapter (10).

B-3.7 Replace lower thrust washer (13) in cover if removed.

B-3.8 Lubricate new parts with light oil and insert in packing chamber as follows:

B-3.8.1 Lower packing adapter (10).

B-3.8.2 V-rings (9).

B-3.8.3 Top packing adapter (8).

B-3.9 Insert stem square (11) in cover and rotate slowly by hand in the direction for opening valve. Continue rotation until stem shoulder (12) contacts lower thrust washer (13).

B-3.10 Check if upper thrust washer (7) is in place. Position gasket (6) and gland (5) on cover. Insert cap screws (4) fully and tighten. Place operating square (3) and lock washer (2) on stem and then secure with nut (1).

Figure B2 Kerotest Packing Diagram

B-4. Primary (Condition 1) Repacking Procedure

- B-4.1 Not recommended for pressures greater than 90 psig.
- B-4.2 Refer to drawing [Figure B2](#) for steps B-4.3 through B-4.13.
- B-4.3 Open valve fully. Backseat to form a seal between lower thrust washer (13) and stem shoulder (12).
- B-4.4 Remove nut (1), lock washer (2), and operating square stem (3).
- B-4.5 Remove **only** two of the cap screws (4).
- B-4.6 Replace with two all thread studs (size and length recommended in [Table B1](#)).
- B-4.7 Thread all thread studs into cover until they bottom. Install a nut on each stud and tighten.
- B-4.8 Remove all remaining cap screws (4).
- B-4.9 Slowly and evenly loosen the two nuts on the all thread studs, watching that the studs do not unthread from cover as the nuts are turned.
 - B-4.9.1 If gland rises as the nuts are loosened, backseat seal has not been obtained.
 - B-4.9.2 Retighten nuts, replace and retighten missing bolts, and then reattempt backseat seal.
 - B-4.9.3 Continue to loosen nuts until the top of the nuts are flush with the top of the safety studs.
- B-4.10 Rotate stem slowly with open end wrench on stem square (11) until pressure pops packing. Backseat immediately.

Grip end of wrench and keep fingers clear. Pressure may slam gland against wrench when packing pops.

- B-4.10.1 If packing does not pop out, replace gland. Retighten nuts on all thread studs, and replace and tighten remaining cap screws (4).
- B-4.10.2 Close valve tightly and refer to [B-5](#) Secondary Repacking Procedure. Continue with step [B-5.6](#).
- B-4.11 Remove nuts and gland (5).
 - B-4.11.1 Upper thrust washer (7) may remain in gland (5) or on stem square (11).
- B-4.12 Remove top packing adapter (8), V-rings (9), and lower packing adapter (10).
- B-4.13 Lubricate new parts with light oil and insert in packing chamber as follows:
 - B-4.13.1 Lower packing adapter (10).
 - B-4.13.2 V-rings (9).
 - B-4.13.3 Top packing adapter (8).

A slight leak in the backseat seal can cause difficulty in replacing the V-rings; a straightened paper clip or smooth wire can be used on the side of the V-rings to allow pressure to vent until the adapter can be quickly inserted and the gland bolted down.

- B-4.14 Place upper thrust washer (7) on stem square (11) if removed.
- B-4.15 Position gasket (6) and gland (5) on cover.
- B-4.16 Insert cap screws (4) fully and tighten.
- B-4.17 Place operating square (3) and lock washer (2) on stem square and then secure with nut (1).

Table B1 All Thread Stud Sizes

Valve Size	Stud & Nut Size	Stud Length
1-1/4"	5/16" - 18 UNC	2"
2" & 3"	3/8" - 16 UNC	2-1/2"
4", 6", 8"	3/8" - 16 UNC	3"
10" & 12"	1/2" - 13 UNC	4-1/4"
16"	3/4" - 10 UNC	6-1/4"

B-5. Secondary (Condition 3) Repacking Procedure

- B-5.1 Not recommended for pressures in excess of 90 psig.
- B-5.2 Refer to drawing [Figure B2](#).
- B-5.3 Close valve tightly with wrench.
- B-5.4 Remove nut (1), lock washer (2) and operating square (3).

UNCONTROLLED IF PRINTED

Before proceeding, remember: If the valve was closed under pressure, the pressure is trapped in the body cavity. When the stem or packing is removed, this pressure will bleed from the body. Therefore, this procedure is not recommended for pressures in excess of 90 psig.

- B-5.5 Remove only two of the cap screws (4).
- B-5.6 Replace with two all thread studs (size and length recommended in table below).
- B-5.7 Thread all thread studs into cover until they bottom. Install a nut on each stud and tighten.
- B-5.8 Remove all remaining cap screws (4).
- B-5.9 Slowly and evenly loosen the two nuts on the all thread studs, watching that the studs do not unthread from cover as the nuts are turned.
 - B-5.9.1 If gland and packing rise as nuts are loosened, continue to slowly loosen nuts until the trapped pressure begins to bleed.
 - B-5.9.2 If the bleeding pressure does not diminish, successful seat shutoff has not been obtained.
 - B-5.9.3 Using the nuts on the studs, replace the packing and the gland. Reinstall the remaining cap screws (4) and reattempt seat shut-off.
- B-5.10 When trapped pressure has been reduced to zero remove:
 - B-5.10.1 The two nuts and the gland (5).
 - B-5.10.2 Upper thrust washer (7) may remain in gland (5) or on stem square (11), top packing adapter (8), V-rings (9), and lower packing adapter (10).
- B-5.11 Lubricate new parts with light oil and insert in packing chamber as follows: Lower packing adapter (10), V-rings (9), and top packing adapter (8).
- B-5.12 Place upper thrust washer (7) on stem square (11) if removed.
- B-5.13 Position gasket (6) and gland (5) on cover. Insert cap screws (4) fully and tighten.
- B-5.14 Place operating square (3) and lock washer (2) on stem, secure with nut (1).
- B-5.15 If gland and packing do not rise as nuts are loosened, continue to loosen nuts until the top of the nuts are flush with the top of the all thread studs.
 - B-5.15.1 Slowly rotate the stem square (11) in the same direction as closing the valve until the trapped pressure begins to bleed.
 - B-5.15.2 If the bleeding pressure does not diminish, successful seat shut-off has not been obtained. Rotate stem in the direction for opening valve until it contacts lower thrust washer.

Take care not to break gate seal as packing will be subject to full pressure and gas flow.

UNCONTROLLED IF PRINTED

- B-5.16 Retighten nuts on all thread studs and reinstall cap screws (4) in gland.
- B-5.17 Reattempt seat shut off.
- B-5.18 When trapped pressure has been reduced to zero, remove the two nuts and then gland (5).
- B-5.19 Rotate stem square (11) in the same direction as closing the valve until it is free from the wedge.
- B-5.20 Withdraw stem from valve.
 - B-5.20.1 Lower thrust washer (13) may remain in the cover or on the stem square (11).
- B-5.21 Remove top packing adapter (8), V-rings (9), and lower packing adapter (10).
- B-5.22 Replace lower thrust washer (13) in cover (if removed).
- B-5.23 Lubricate new parts with light oil and insert in packing chamber as follows:
 - B-5.23.1 Lower packing adapter (10).
 - B-5.23.2 V-rings (9).
 - B-5.23.3 Top packing adapter (8).
- B-5.24 Insert stem square (11) in cover and rotate slowly by hand in the direction for opening the valve.
- B-5.25 Continue rotation until stem shoulder (12) contacts lower thrust washer (13).

Additional stem rotation will unseat the wedge resulting in full gas pressure and flow.

- B-5.26 Check if upper thrust washer (7) is in place.
 - B-5.27 Position gasket (6) and gland (5) on cover.
 - B-5.28 Insert cap screws (4) fully and tighten.
 - B-5.29 Place operating square (3) and lock washer (2) on stem and then secure with nut (1).
- B-6. Bonnet Leak Repair
- B-6.1 When a bonnet leak is detected, do not attempt to retighten the existing bonnet bolts, and do not attempt to operate the valve, since loads applied could cause damaged bolts to break.
 - B-6.2 Refer to [VALV 4](#) Forms and Reference Materials, for Kerotest Model -1 Gate Valve Bonnet Leak Repair Procedure document.
 - B-6.3 If the valve can be depressurized, remove bonnet and replace gasket and existing bonnet bolts after depressurization with only Kerotest authorized parts.
 - B-6.3.1 Coat the new bonnet gasket with Slic-Tite TFE paste or equivalent.
 - B-6.3.2 During the bolt replacement, tighten bolts in proper sequence and to the torque listed in manufacturer's instructions.

UNCONTROLLED IF PRINTED

B-6.4 If the valve cannot be depressurized, remove and replace the bolts one at a time.

B-6.4.1 For 1-1/4" valve, a special Kerotest bolt replacement fixture and procedure must be used. Refer to VALV 4 for Kerotest manufacturer repair manual.

B-6.4.2 For 2" thru 6" valve, Kerotest strongly recommends that support clamps be used during bolt replacement. See [Figure B3](#).

1. Part number for Support Clamps for 2" and 3" valves is 72544794.
2. Part number for Support Clamps for 4" and 6" valves is 72544802.

Figure B3 Kerotest Valve Support Clamp

B-6.4.3 Support clamps are not required on 8" and larger valves.

B-6.5 If leakage continues on valves 2 inch and larger after bolts have been replaced, contact Kerotest or a Kerotest vendor. A Kerotest Factory Trained person is the only one qualified to perform the necessary repair procedures.

Appendix C - Balon Flanged Ball Valve Repair

C-1. General

C-1.1 This section provides information extracted from Balon installation and repair manual for the repair of Balon flanged body Series F steel ball valves.

C-2. Repair Kit

C-2.1 Balon valves require no regular maintenance to maintain proper operation and sealing. Balon stems require no adjustment or greasing for proper sealing and operation.

**SERIES "F" AND "S" FLANGED END AND SCREWED END
(LEVER OPERATED AND GEAR OPERATED) SERIES "LM"
AND "LS" SCREWED END**

SEAL KIT CONTENTS: SERIES "F" AND "S" LEVER OPERATED

1. Seal kits are available for Balon Series "F" and "S" ball valves. Each kit contains the following parts:
 - A. 2 - Ball Seats
 - B. 1 - Body O-Ring
 - C. 1 - Stem TFE Thrust Washer
 - D. 1 - Stem O-Ring
 - E. 1 - Stem Stop Plate Retainer Ring
 - F. 1 - Stem Weather Guard
 - G. 1 - Dust Cover
 - H. 1 - Stop Plate Retainer
 - I. 1 - Stop Plate

SEAL KIT CONTENTS: SERIES "F" GEAR OPERATED

1. Seal kits are available for Balon Series "F" Flanged End Gear Operated ball valves. Each kit contains the following parts:
 - A. 2 - Ball Seats
 - B. 1 - Body O-Ring
 - C. 1 - Stem TFE Thrust Washer
 - D. 1 - Stem O-Ring
 - E. 1 - Stem Stop Plate Retainer Ring
 - G. 1 - Stem Key

SEAL KIT CONTENTS: SERIES "LM" AND "LS"

1. Seal kits are available for Balon Series "LM" and "LS" ball valves. Each kit contains the following parts:
 - A. 2 - Ball Seats
 - B. 1 - Weather Guard
 - C. 1 - Stem Washer
 - D. 1 - Stem Seal
 - E. 1 - Body Seal

Seal kits are sold by valve ball bore size and will fit any Balon ball valve with that bore size, regardless of valve material, end style, or working pressure. (Must specify NACE seal kit if valve has NACE trim. The valve will have letter N in valve part number tag, such as 2R-F63N-RF.) Otherwise, order standard seal kit. If letters TFE appear on valve tag, order Teflon seats.

C-3. Parts List

**BALON BALL VALVE PARTS LIST
SERIES "F" AND "S"
(LEVER OPERATED)**

ITEM	PART NAME
1	Handle
2	Handle Bolt
3	Weather Guard
4	Lock Plate Retainer
5	Lock Plate
6	Dust Cover
7	Stop Plate Retainer
8	Stop Plate
9	Stem O-Ring
10	Stem Seal
11	Stem
12	Ball
13	Ball Seat
14	Body O-Ring
15	End Adapter
16	Body
17	Body Stud Nuts
18	Body Stud Bolts
19	Body Bolts

BALON BALL VALVES HAVE A BODY SECTION WHICH CONTAINS THE BALL AND STEM AND THE ADAPTER SECTION THAT BOLTS OR SCREWS TO THE BODY.

WITH SAFETY LOCK DEVICE
FIGURE 1

WITHOUT SAFETY LOCK DEVICE
FIGURE 1

WARNING: BEFORE ATTEMPTING TO REPAIR A VALVE THAT HAS BEEN IN SERVICE BE SURE TO BLOCK THE ENDS AND SLOWLY OPEN AND CLOSE THE VALVE TO VENT ANY INTERNAL PRESSURE

C-4. Repair Procedures

**BALON BALL VALVE REPAIR
SERIES "F" AND "S" (LEVER
OPERATED)**

1. **WARNING: BEFORE ATTEMPTING TO REPAIR A VALVE THAT HAS BEEN IN SERVICE BE SURE TO BLOCK THE ENDS AND SLOWLY OPEN AND CLOSE THE VALVE TO VENT ANY INTERNAL PRESSURE.**
2. Disassemble valve body and adapter.
3. With valve in closed position remove ball seat (13), body O-Ring (14), and ball (12).
4. Remove stem top works. (Note position of all components.)
5. Before removing stem, carefully file all edges of stem wrench flats and stop plate area to remove any burrs or permanent damage may occur to the stem bore. (FIG. 1)
6. Remove stem (11), stem O-Ring (9), and stem washer (10).
7. Clean all valve components thoroughly.
8. Install new stem seals (9) and (10) and grease.
9. Install stem (11) in valve. Install stop plate (8) and stop plate retainer (7) and fill cavity around stem with grease. **(IF VALVE IS NOT EQUIPPED WITH STANDARD SAFETY LOCK DEVICE (FIG. 2) SKIP TO STEP 10.)** Install dust cover (6). Install lock plate (5). Check for proper alignment, one hole and one slot on lock plate should line up with one hole and one slot on stop plate when fully open or closed. Install lock plate retainer (4). Grease snap ring area and install weather guard (3).
10. Install new ball seats (13) and body O-Ring (14), and grease.
11. Install ball (12).
12. Assemble valve. When installing body to end adapter, be careful not to pinch or damage O-Ring.
13. After valve is assembled, cycle to assure free and easy operation.

**SYNTHETIC GREASE THAT IS MOISTURE RESISTANT SHOULD BE USED.
IF ANY PROBLEMS ARE ENCOUNTERED, CONTACT BALON CORPORATION AT 405-677-3321.**

VALVES

October 1, 2022

VALV 3 Approved Valves and Valve Box Accessories**1.0 Purpose**

The procedure provides lists of Ameren Illinois (AIC) approved valves and accessories.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Plastic \(PE\) Ball Valves](#)[5.0 Steel Ball Valves](#)[6.0 Kerotest Gate Valves](#)[7.0 Valve Box Accessories Valve Box Accessories Stock Code Table](#)**3.0 Target Audience**

- Gas Engineer
- Gas Supervisors
- Gas Field Personnel
- Gas Tech Engineering (GTE)
- Gas Tech Services (GTS) Supervisors
- Gas Tech Service (GTS) Personnel
- Gas Storage Engineering (GSE)
- Gas Storage Supervisors
- Gas Storage Field Operators

4.0 Plastic (PE) Ball Valves**4.1 General**

- 4.1.1 This section provides AIC stock codes along with manufacturer's specifications for plastic ball valves installed on plastic high pressure distribution, plastic distribution and plastic service lines.
- 4.1.2 Kerotest, Lyall - Polytec, and Broen are approved manufacturers for all polyethylene ball valves.
- 4.1.3 Refer to the valve manufacturer's website for product specifications on valve dimensions.
- 4.1.4 PE2406/PE2708 Ball Valve Stock Codes – Table 1

STOCK #	SIZE	MATERIAL	TYPE	CONNECTION	RATING	Valve Box
39 22 116	1/2"	PE2406 PE2708	Full Port Ball	Butt Fusion	60 PSIG	19 72 128

5.0 Steel Ball Valves

5.1 General

- 5.1.1 This section provides AIC stock codes along with manufacturer's specifications for steel ball valves being installed within AIC's transmission, steel distribution systems and steel service lines.
- 5.1.2 Balon (Utili Seal), Kerotest (Weldball), and Broen (Ballomax) are approved manufacturers for floating ball valves.
- 5.1.3 Cameron and Balon are approved manufacturers for bolted trunnion mounted ball valves.
- 5.1.4 Used as an alternate for a Kerotest Model 1 Gate Valve
- 5.1.5 Buried or above ground applications
- 5.1.6 Refer to the valve manufacturer's website for product specifications on valve dimensions.

1. Valves manufactured prior to July 2006 have the following ANSI rating: Class 150 - 275 psig and Class 300 - 720 psig.
2. Valve manufactured after July 2006 have the following ANSI rating: Class 150 - 285 psig and Class 300 - 740 psig.
3. If in question, check the pressure rating on the valve body.

5.2 Class 150 Steel Ball Valves and associated valve box - Table 3

6.0 Kerotest Gate Valves

6.1 General

6.1.1 This section provides AIC stock codes for steel gate valves being installed on transmission, high pressure distribution, steel distribution, and steel service lines.

UNCONTROLLED IF PRINTED

1. Valves manufactured prior to July 2006 have the following ANSI rating: Class 150 – 275 psig and Class 300 – 720 psig.
2. Valve manufactured after July 2006 have the following ANSI rating: Class 150 – 285 psig and Class 300 – 740 psig.
3. If in question, check the pressure rating on the valve body.

6.1.2 Refer to the valve manufacturer's website for product specifications on valve dimensions.

VALV 3.3 Valves: Approved Valves and Valve Box Accessories, May 15, 2022

Revision Notes

Location of Changes	Summary of Changes
Throughout this document	All of the valve dimension tables have been removed. Manufacturers change some dimension with each update making it difficult to ensure our tables had accurate information. Best solution is to uti-

UNCONTROLLED IF PRINTED

	lize manufacturer's website for the latest information and dimensions.
Paragraph 4.1.1 – PE Ball Valves	Removed reference to dimensions.
Paragraph 4.1.3 -	Retitled - PE2406/PE2708 Ball Valve Stock Code – Table 1
Paragraph 4.1.3 – Table 1	Added 1-1/4" Reduced Port Ball Valve
Paragraph 4.1.4	Retitled – PE3408/PE4710 Ball Valve Stock Code – Table 2
Paragraph 4.1.4 – Table 2	Added – 1/2", 8" and 12" Full Port Ball Valves
Paragraph 5.1.1 – Steel Ball Valves	Removed reference to dimensions
Paragraph 5.1.2	Balon, Kerotest, and Broen are approved manufacturers for floating ball valves.
Paragraph 5.1.3	Cameron and Balon are approved manufacturers for bolted trunnion mounted ball valves.
Subsection 5.2 – Class 150 Steel Ball Valves	Added several new Class 150 valves in Table 3.
Subsection 5.3 – Class 300 Steel Ball Valves	Added several new Class 300 valves in Table 4.
Subsection 5.4 – Class 150 Trunnion Mounted Ball Valves	Table 5 – Class 150 Cameron and Balon Trunnion Mounted Ball Valves have been added.
Subsection 5.5 - Class 300 Trunnion Mounted Ball Valves	Table 6 - Class 300 Cameron and Balon Trunnion Mounted Ball Valves have been added
Paragraph 6.1.1 – Kerotest Gate Valve	Removed reference to dimensions
Subsection 6.2 - Class 150 Kerotest Gate Valve	Several new valves have been added to Table 7. Table 7 now contains all of the connection configurations that were previously in separate tables,
Subsection 6.3 - Class 300 Kerotest Gate Valve	Several new valves have been added to Table 8. Table 8 now contains all of the connection configurations that were previously in separate tables,

WELDING

December 1, 2020

WELD 1 Requirements**1.0 Purpose**

This document includes the welding specifications and procedures to be used for construction, fabrication, and maintenance of all Ameren Illinois (AIC) gas piping systems. Coverage shall be fully in accordance with 49 CFR Part 192 Subpart E - Welding of Steel in Pipelines.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 General](#)****[5.0 Welding Procedures](#)****[6.0 Qualification of Welders](#)****[7.0 Limitations on Welders](#)****[8.0 Preparation for Welding](#)****[9.0 Inspection and Test of Welds](#)****[10.0 Nondestructive Testing](#)****[11.0 Repair or Removal of Defects](#)****[12.0 Production Weld Quality Issues](#)**

Appendices

[Appendix A - Flow Chart for Production Weld Quality Issues](#)**3.0 Target Audience**

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Superintendents
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 General

4.1 All AIC and contractor personnel performing work for AIC or on its facilities shall follow the specifications, procedures, regulations, and codes presented or referenced (directly or indirectly) herein.

4.1.1 This means to follow the latest edition of regulations and codes that have been adopted by reference in the current 49 CFR Part 192 Regulations.

4.1.2 All welding must be performed using a qualified procedure and by a qualified welder in accordance with respective requirements addressed below.

UNCONTROLLED IF PRINTED

- 4.2 See [Subsection 10.3](#) for listed specifications for approved nondestructive testing procedures.

5.0 Welding Procedures (§192.225)

- 5.1 The AIC qualified welding procedures (WPS) shall comply with 49 CFR Part 192, Subpart E of the Federal PHMSA-OPS Regulations and the latest incorporated by reference (IBR) edition of API Std 1104 under §192.7.
- 5.2 Welding to establish procedures must be performed by a qualified welder in accordance with the welding requirements outlined herein.
- 5.3 Each test weld used to qualify the WPS shall have the integrity verified by destructive testing in accordance with applicable industry welding standards, namely API Std 1104.
- 5.4 Each separate procedure must be qualified, and the test documented on a Welding Procedure Qualification Report (WPQR) form.
- 5.4.1 The qualifying tests shall be recorded in detail, to include the results.
- 5.4.2 The WPQRs will be maintained by the AIC Training Section.
- 5.5 The WPSs are listed as reference material in [WELD 4](#). New or updated procedures approved by the Gas Standards and Procedures personnel can be used prior to being published in the O&M. These new or updated procedures will be published in the next O&M update.
- 5.6 Contractors or fabrication shops may have their welding procedures reviewed and approved by the Supervisor Technical Training - Welding and Gas Standards and Procedures personnel. For construction of pipelines and piping systems, see [WELD 2.3](#).

6.0 Qualification of Welders (§192.227)

- 6.1 Each AIC or contract welder must be qualified in accordance with 49 CFR Part 192, Subpart E, §192.227 and latest IBR edition of API Std 1104 per §192.7.
- 6.2 An AIC or contract welder who is to make a welded service line connection to a main must first perform an acceptable test weld under Section II of Appendix C to Part 192.
- 6.3 For more specific welder qualifications, see [WELD 2.2](#).

7.0 Limitations on Welders (§192.229)

- 7.1 No welder whose qualification is based on nondestructive testing may weld on compressor station pipe and components.
- 7.2 No welder may weld with a particular welding process unless, within the *preceding 6 calendar months*, they have been engaged in welding with that process.
- 7.3 A welder may not weld on pipe to be operated at a pressure that produces a hoop stress of 20% or more of SMYS unless:
- 7.3.1 The welder has had one weld tested within the *preceding 6 calendar months*,
AND
- 7.3.2 Weld was found acceptable under API Std 1104, Section 6, Qualification of Welders and/or Section 9, Acceptance Standards for Nondestructive Testing.
- 7.4 Welders may maintain an ongoing qualification status by performing welds that are tested and found acceptable (see 7.3.2) at least *twice each calendar year*, (but not at intervals exceeding 7-1/2 months).

8.0 Preparation for Welding (§192.235)

- 8.1 Before beginning any welding, the welding surface must be clean and free of any material that may be detrimental to the welding process.
- 8.2 Pipe or component must be aligned to provide the most favorable condition for depositing root bead. The alignment must be preserved while root bead is being deposited.
- 8.3 Welding operations must be protected from weather conditions that would impair quality of the completed weld. (Reference §192.231.)

9.0 Inspection and Test of Welds (§192.241)

- 9.1 Visual inspection of welding must be conducted by an individual qualified by appropriate training and experience to ensure the weld is acceptable and in accordance with the approved and appropriate welding procedure.
- 9.2 Welds on a pipeline to be operated at a pressure that produces a hoop stress of 20% or more of SMYS must be nondestructively tested, except:
 - 9.2.1 Welds that are visually inspected and approved by a qualified welding inspector need not be nondestructively tested if:
 - 1. The pipe's nominal diameter is less than 6 inches, OR
 - 2. The pipeline is to be operated at a pressure that produces a hoop stress of less than 40% of SMYS and the welds are so limited in number that nondestructive testing is impractical.
- 9.3 The acceptability of a weld that is nondestructively tested or visually inspected is determined according to the standards in API Std 1104, Section 9, "Acceptance Standards for Nondestructive Testing".

Should a girth weld be found unacceptable under those standards for a reason other than a crack, and if Appendix A to API Std 1104 applies to the weld, the acceptability may be further determined under that appendix. Contact AIC Gas Training Center if assistance is needed to determine the weld acceptance.

10.0 Nondestructive Testing (§192.243)

- 10.1 Nondestructive testing of welds must be performed as follows:
 - 10.1.1 By any process, other than trepanning, that will clearly indicate defects that may affect the weld integrity.

"Trepanning" is destructive intervention in which a hole is drilled or scraped into the pipe or other material surface (or possibly cutting a test strap) to address or evaluate a problem. That method of testing shall not be used.

- 10.1.2 In accordance with written procedures and by persons trained and qualified in the established procedures using equipment employed in their testing.

- 10.2 API Std 1104, Section 9, "Acceptance Standard for Nondestructive Testing" will be used for proper interpretation of each nondestructive test to ensure the acceptability of the weld.
- 10.3 Welds on pipelines requiring nondestructive inspection will be tested in accordance with one of approved methods included in the following sections:
 - 10.3.1 Radiographic Testing: see [WELD 2.6](#).
 - 10.3.2 Magnetic Particle Testing: see [WELD 2.7](#).
 - 10.3.3 Liquid Penetrant Testing: see [WELD 2.8](#).
- 10.4 When nondestructive testing is required, see Table 1 for the percentage of each day's field butt welds, selected at random by the operator, that must be nondestructively tested over their entire circumference:

Table 1: Inspection Percentage

Location	Daily Percentage Required
Class 1, except offshore	At least 10%
Class 2	At least 15%
Class 3 and Class 4	100% *
At crossing of major navigable rivers	100% *
Within railroad and public highway ROW	100% *
In tunnels, on bridges, overhead road crossings	100% *
At pipeline tie-ins, including tie-ins for replacement sections	100%
* Note: If impractical, then a minimum of 90% required.	

- 10.5 Where a welder is isolated from the principal welding activity, a *sample of each welder's work for each day* must be nondestructively tested when testing is required as determined for Inspection and Test of Welds ([Section 9.0](#)).
- 10.6 Complete nondestructive testing and associated repairs before a pipeline segment is subjected to leak and/or strength testing. As required, nondestructively test the final tie-in welds prior to pressurizing the pipeline segment.
- 10.7 When nondestructive testing is required, a record must be retained for life of the pipeline as follows:
 - 10.7.1 Record showing inspections by milepost, engineering station, or by geographical features,
 - 10.7.2 Number of girth welds made,
 - 10.7.3 Number of welds nondestructively tested,
 - 10.7.4 Number of welds rejected, AND
 - 10.7.5 Disposition of the rejects.
- 10.8 If AIC requests the actual radiographic film be retained, it shall be processed, handled, and stored in a manner such that the images can be interpreted for at least 3 years. Gas Tech Engineering will file/store the film. See [WELD 2.6](#).

11.0 Repair or Removal of Defects (§192.245)

- 11.1 Each weld that is unacceptable through nondestructive testing or visual inspection must be removed or repaired.

- 11.2 Each weld that is repaired must have the defect removed down to sound metal and the repair segment must be preheated if conditions exist that would adversely affect quality of the weld repair.
- 11.3 The repaired segment must be inspected in the same manner that the defect was found to ensure acceptability.
- 11.4 Weld repair by removal on pipe that is in a fixed position, where the pipe ends cannot be brought back together, shall be cut-out as a pipe segment per Table 2:

Table 2: Required Pipe Segments for Fixed Pipe

Nominal Pipe Size (In.)	Minimum Length
Up thru 8	12"
Greater than 8	At least 1-1/2 times the diameter

- 11.5 Weld repair on pipe that is not fixed in position (i.e., on skids or jack stands) is allowed by cutting out 1 inch on each side of the weld and reposition pipe back together. Then re-weld using the original weld procedure.
- 11.6 In order to avoid overlapping Heat Affected Zones (HAZ), there should be a *minimum 1 inch between welds*.
- 11.7 Repair of a crack, or of any defect in a previously repaired area must be in accordance with appropriate procedures that have been qualified under 49 Part 192, Subpart E and API Std 1104.
 - 11.7.1 Repair procedures must provide that the minimum mechanical properties specified for the welding procedure used to make the original weld are equally met upon completion of the final weld repair.
 - 11.7.2 Welds shall be repaired with the original AIC welding procedure or an approved AIC repair procedure.

12.0 Production Weld Quality Issues

- 12.1 Whenever a production weld quality issue is identified through visual inspection or non-destructive testing, it shall be fully investigated, and a corrective action plan developed / implemented according to the procedure outlined below and shown in the flow chart (see [Appendix A](#)).
- 12.2 Report all weld quality issues identified to the Training Superintendent Gas Construction & Operations and Welding Training Supervisor, who will provide notification to Region Operations and/or Construction Services.
- 12.3 Establish an investigation team to review the weld quality issue and develop a corrective action plan.
- 12.4 In event that the investigation team does not gain consensus on the issue or the corrective action plan, the team shall report their findings to the Training Superintendent, Region Gas Superintendent, and Gas Compliance who shall do the following:
 - 12.4.1 Review the investigation team findings,
 - 12.4.2 Develop a recommendation for corrective action, AND
 - 12.4.3 Forward the results to AIC Senior Leadership for review and approval.
- 12.5 Implement the adopted corrective action plan.
- 12.6 Quality Assurance shall monitor the effectiveness of the corrective action plan and report results back to the investigation team.

End of Instructions.

Operator Qualification (OQ) Required?

Yes

Appendix A - Production Weld Quality Issues Flow Chart

UNCONTROLLED IF PRINTED

WELDING

October 1, 2021

WELD 2.1 Safe Welding Practices**1.0 Purpose**

This document addresses various safety considerations for welding activity throughout Ameren Illinois (AIC) gas operations. As such, the area shall be inspected by the AIC representative responsible for authorizing such operations before cutting or welding is permitted.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Activity Areas](#)[5.0 Fire Guard](#)[6.0 Supervisor Role](#)[7.0 Welder Responsibilities](#)[8.0 Welding or Cutting on Containers](#)[9.0 Protection of Personnel](#)[10.0 Ventilation](#)[11.0 Equipment](#)**3.0 Target Audience**

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Superintendents
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 Activity Areas

4.1 Cutting or welding shall not be permitted in the following situations:

4.1.1 In areas not authorized by the AIC representative.

4.1.2 In buildings with sprinklers while such protection is impaired.

4.1.3 In areas near the storage of large quantities of exposed, readily ignitable materials.

4.1.4 In areas monitored by fire detection systems, until such time that the detection system has been appropriately disabled and alternate means of fire protection provided.

4.2 Cutting or welding shall be permitted only in areas that are, or have been made, free of flammable vapors (i.e., below 30% of LEL) and fire safe.

UNCONTROLLED IF PRINTED

- 4.3 When work cannot be moved practically, as in some construction or repair work, the area shall be made safe by removing combustibles or protecting combustibles from ignition sources.
- 4.4 Where practicable, all combustibles shall be relocated at least 35 feet from the work site.
 - 4.4.1 Where relocation is impracticable, combustibles shall be protected with flame-proofed covers or otherwise shielded with metal guards or curtains.

5.0 Fire Guard

- 5.1 A fire guard is required whenever welding is performed in locations where combustibles exist that might be ignited by sparks from the welding operation, or any of the following conditions exist:
 - 5.1.1 Combustible material, which is less than 35 feet from the operation.
 - 5.1.2 Measurable quantity of combustibles that are more than 35 feet away from the operation but are easily ignited by sparks.
 - 5.1.3 Wall or floor openings within 35 feet that expose combustible material in adjacent areas, including concealed spaces in walls or floors.
 - 5.1.4 Combustible materials that are adjacent to the opposite side of metal partitions, walls, ceilings, or roofs and are likely to be ignited by conduction or radiation.
- 5.2 The fire guard shall have the proper fire extinguisher at the location where the welding is being performed and be trained in its use.
- 5.3 The fire guard shall be familiar with facilities for sounding an alarm in event of a fire.
- 5.4 The fire guard shall be alert for fires in all exposed areas, try to extinguish them only when obviously within the capacity of equipment available, or otherwise sound the alarm.
- 5.5 A fire watch shall be maintained until such time that the area has been completely inspected to preclude the possibility of smoldering fires.

6.0 Supervisor Role

- 6.1 Supervisors shall recognize their responsibility for safe usage of cutting and welding equipment and consider the following:
 - 6.1.1 Based on fire potential for the facility, establish areas for routine cutting and welding, and, if needed, establish additional procedures for cutting and welding in other areas.
 - 6.1.2 May designate a qualified individual to be responsible for authorizing cutting and welding operations in areas not specifically designated for such processes.
 - 6.1.3 Insist that cutters or welders are suitably trained in the safe operation of their equipment and safe use of the process.
 - 6.1.4 Advise all contractors about flammable materials or hazardous conditions should they not be aware.
 - 6.1.5 Determine whether the work will be conducted in a confined space in accordance with AIC procedures. See [CONF 1](#).

7.0 Welder Responsibilities

- 7.1 The welder shall be responsible for the following:

- 7.1.1 Safe handling of the cutting or welding equipment and safe application of the cutting or welding process.
- 7.1.2 Determining the flammable and combustible materials and hazardous areas present, or likely to be present, in the work location, to include using a portable gas detector if appropriate.
- 7.1.3 Protecting flammable and combustible materials from ignition by the following:
 - 1. Move work to a location free from dangerous materials.
 - 2. If work cannot be moved, have the material moved a safe distance from the work area or have the materials properly shielded against ignition.
 - 3. See that cutting and welding are scheduled so that operations that might expose flammable and combustible materials to ignition are not started during cutting or welding.
- 7.1.4 Note on the Job Briefing and /or secure authorization such as a "Hot Work" permit for the cutting or welding operations from appropriate supervision.
- 7.1.5 Determining that conditions are safe before beginning welding operations.
- 7.1.6 Determining that fire protection and extinguishing equipment are properly located at the site before beginning welding.
- 7.1.7 Where a fire watch is required, verify that fire guard is available at site before beginning the welding operation.

8.0 Welding or Cutting on Containers

8.1 Used Portable Containers:

- 8.1.1 Perform no cutting, welding, or other hot work on used drums, barrels, portable tanks, or other containers unless specifically approved by AIC Engineering and Safety Representatives.

8.2 Venting and Purging:

- 8.2.1 Prior to cutting or welding, all hollow spaces, cavities, or containers shall be vented to permit the escape of air or gases.
- 8.2.2 Where any question, recommend purging the container with inert gas.
- 8.2.3 Testing shall be conducted to ensure the oxygen content is safe for welding.

9.0 Protection of Personnel

9.1 General

- 9.1.1 *Railing:* When working on scaffolds, or runways more than 4 feet above ground, protect the welder or helper against falling. This may be accomplished by:
 - 1. Railings (primary means),
 - 2. Body harnesses, OR
 - 3. Some other equally effective safeguards.

The area below such work area shall be considered a hard hat area.

- 9.1.2 **Welding Cable:** Welders shall place welding cable and other equipment so that it is clear of passageways, ladders, and stairways.
- 9.1.3 **Welding in Excavations:** When welding in an excavation/trench, follow all requirements in the Excavation Safety section (see [EXCV](#)) to protect workers from excavation related hazards, including cave-ins. Protect welders working in excavations from accumulation of welding fumes as specified in the ventilation section below.

9.2 Eye/Ear/Face Protection

9.2.1 Selection

- 1. Use welding helmets/hoods during all arc welding operations. Provide helpers or attendants with proper eye protection. Safety glasses should be worn under a welding hood or face shield.
- 2. Use goggles or other suitable eye protection during all gas welding or oxygen cutting operations.
- 3. Helmets and hand shields shall be designed and positioned to protect the face, neck, and ears from direct radiant energy from the arc.
- 4. Welding helmets shall be provided with filter plates and cover plates designed for easy removal.
- 5. See Table 1 for the selection of proper shade numbers. These recommendations may be varied to suit the individual's needs.

Table 1: Welding Shade Numbers

Welding Operations	Shade No.
Shielded Metal Arc Welding (SMAW)	9 - 10
Gas Metal Arc Welding (GMAW)	10 - 11
Submerged Arc Welding	Shaded glasses (3 - 4) to guard against occasional arc flash

- 6. All filter lenses and plates shall meet the test for transmission of radiant energy prescribed in ANSI 287. "American National Q Standard Practice for Occupational and Educational Eye and Face Protection."

9.2.2 Where the work permits, the welder should be enclosed in:

- 1. An individual booth, painted with a finish that is low reflection, such as zinc oxide (an important factor for absorbing ultra-violet rays), or
- 2. Enclosed with noncombustible screens that are similarly painted.
- 3. Booths and screens shall be situated as to comply with Welding Screens and Booths (see [Subsection 9.5](#)).

9.2.3 Ear Plugs are recommended to keep sparks out of the ear canal.

9.3 Protective Clothing

- 9.3.1 **General Requirements:** Protect personnel exposed to the hazards created by welding or cutting operations by personal protective equipment. Appropriate protective clothing required for any welding operation will vary with the individual's size, nature, and location of the work to be performed.

9.3.2 **Clothing Selection:**

1. Clothing should provide enough coverage and be made of suitable materials to prevent skin burns caused by sparks, spatter, or radiation.
2. Synthetic or plastic materials that can melt and cause severe burns are not recommended for use as clothing near welding arcs.
3. All outside clothing such as jumpers or overalls should be reasonably free from oil or grease.
4. Sparks may lodge in rolled-up sleeves, clothing pockets, or overalls/ trouser cuffs. Therefore, recommend:
 - 4 a. Sleeves and collars be kept buttoned and pockets be eliminated from the front of clothing. When pockets are present, they should be emptied of flammable or readily combustible materials.
 - 4 b. Trousers or overalls should not have cuffs and should not be turned up on the outside.

9.3.3 *Caps & Gloves*: All welders and cutters shall wear protective flame-resistant caps & gloves. Recommend using gloves made of leather or other suitable material for the "spark environment."

9.3.4 *Capes & Sleeves*: Cape sleeves or shoulder covers with bibs made of leather or other flame-resistant material should be worn during overhead welding or cutting operations.

9.4 Noise Control

9.4.1 The most direct way to control excessive noise is to reduce the intensity at the source. When control methods fail to bring noise exposure within allowable limits, then employ personal protective devices (i.e., earmuffs or earplugs).

9.5 Welding Screens and Booths

9.5.1 Where welding is required in or around populated areas, welding screens or booths shall be established to avoid the possibility of "arc burn" or other injury to the general public or fellow employees.

1. To minimize ventilation restriction, it is desirable to have screens / booths mounted approximately 1 to 2 feet above the floor.
2. Screens must be secured to avoid being knocked over or displaced by windy conditions.

9.6 See [WELD 1, Subsection 8.3](#) regarding weather protection.

10.0 Ventilation

10.1 Adequate ventilation (natural or mechanical) must be provided for all welding and cutting related operations.

10.1.1 This means enough ventilation that exposure to hazardous concentrations of airborne contaminants is maintained below allowable levels for personnel.

10.2 The area environment where welding or cutting is performed should be checked with a gas detection instrument, as necessary, to ensure environment is non-hazardous and is not oxygen deficient. The check must always be conducted when performing these operations in confined spaces.

10.3 Natural ventilation (i.e., natural air currents or wind) is acceptable only for performing welding, cutting, and related processes outdoor.

10.4 Mechanical Ventilation

- 10.4.1 AIC Safety Specialist should be contacted with any question regarding requirements for mechanical ventilation.
- 10.4.2 To maintain adequate air quality, mechanical ventilation must be used when welding and cutting:
1. Indoors,
 2. In confined spaces, AND
 3. In excavations, as necessary.
- 10.4.3 Mechanical ventilation consists of general room ventilation or local exhaust ventilation.
- 10.4.4 Local exhaust ventilation is preferred, with the following precautions taken:
1. The system shall be of enough capacity and arranged to remove fumes and smoke at the source and ensure any concentration in the breathing zone is within safe limits.
 2. Local exhaust ventilation shall consist of freely movable hoods to be placed by the welder as close as practical to the work area.
 3. The system exhaust must be situated to ensure that welding fumes and smoke are not dispersed to other work areas or re-entrained into the building make-up air.
- 10.4.5 If general mechanical (room) ventilation is used, the following conditions must be met:
1. Space at more than 10,000 cubic feet per welder in an enclosed area (i.e., a building).
 2. Ceiling height is more than 16 feet.
 3. Welding is not done in confined space, such as tanks, etc.
 4. Welding space does not contain partitions, balconies, or other structural barriers that significantly obstruct cross ventilation.
 5. The welding area is maintained generally clear of visible welding fumes. Welding area is sufficiently separated from adjoining building areas to prevent welding fumes from moving into those areas.

11.0 Equipment

11.1 Gas Bottles

- 11.1.1 Handle and transport oxygen and acetylene cylinders with extreme care to avoid damage to cylinders. Always maintain valve protection caps on cylinders when they are in transit or storage.
- 11.1.2 Acetylene cylinders shall only be transported and used in the vertical (upright) position. This will ensure that the liquid acetone within the cylinder will not get into the regulator and/or hose, thus creating a potential for a fire or explosion.
- 11.1.3 Secure all gas bottles with chains or other adequate supports when being used to prevent them from being pulled or knocked over.

11.2 Regulators

11.2.1 Turn off all regulators and gas bottle valves (oxygen and acetylene) when not in use.

11.2.2 Relieve the (regulator) pressure by opening the torch valves after the bottle valves are closed.

11.3 Hoses

11.3.1 Maintain oxygen and acetylene hoses in good condition and check all fittings for tightness.

11.3.2 Ensure oxygen hoses are green color and acetylene hoses are red.

11.3.3 Replace hose if any question about its condition.

11.3.4 Never use any oil or grease on any hose fittings or regulators.

11.3.5 Cutting and welding torches should be fitted with an anti-flashback check valve.

11.4 Welding Machines and Cables

11.4.1 All welding machines shall be operated in accordance with the manufacturer's safety practices.

11.4.2 Ensure ground connections and welding cables are the proper size for amperage being used.

11.4.3 Promptly repair or replace damaged cables, worn spots, and loose cable connectors.

11.4.4 Any connector or welding cable that is "more than warm to the hand during welding" is an indication of excessive resistance and the problem should be corrected.

11.5 Electrode Holders

11.5.1 Electrode holders shall be rated for the amperage being used for the specific procedure.

11.5.2 Insulated electrode holders are preferred for all AIC welding.

11.5.3 The AIC welding inspector may require the use of insulated electrode holders for specific applications.

WELDING

October 1, 2021

WELD 2.2 Welder Qualifications**1.0 Purpose**

This document establishes the requirements for the qualification and certification of welders for construction, fabrication, and pipeline maintenance welding of pressure piping systems for Ameren Illinois (AIC). It is in accordance with 49 CFR Part 192, §192.227 Qualification of welders and welding operators, and §192.229 Limitation on welders and welding operators.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Welding Inspector](#)[6.0 Qualification Categories - Initial Test](#)[7.0 Service Line Connection Welding \(Service Tee\)](#)[8.0 Workmanship](#)[9.0 Welder Requalification](#)[10.0 Destructive Testing](#)[11.0 ASME Piping](#)[12.0 Records and Retention \(§192.227\)](#)

Appendices

[Appendix A - Welder Positions](#)**3.0 Target Audience**

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Superintendents
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 General

- 4.1 Welder Qualification testing is to determine the ability of the welder (AIC personnel or contractor) to make sound welds.
- 4.2 Upon completion of an initial qualification test, the welder is limited to the process and can weld within the essential variables (see API 1104, Section 6 and/or API 1104, Appendix B) for which qualification was made.
- 4.3 Re-qualification (6-month and annual) allows a welder to keep welding in that process.

UNCONTROLLED IF PRINTED

- 4.4 No welder whose qualification is based on nondestructive testing may weld compressor station pipe and components.
- 4.5 Welder qualification shall be conducted at locations approved by the Training Supervisor - Welding or an AIC approved welding inspector.

5.0 Welding Inspector

- 5.1 Welder qualification shall be conducted under the supervision of an AIC approved welding inspector/observer.
- 5.2 An independent testing agency may be used to provide "destructive testing" and to document the qualification testing of welders.
- 5.3 The welding inspector shall have been trained in using the AIC Gas O&M Plan and applicable codes/standards, plus have previous experience in testing welders.
- 5.4 Supervisor Technical Training - Operations [Welding] shall ensure that all welding is conducted in accordance with the approved welding procedures (WPS), standards, and codes.
- 5.5 The Training Supervisor - Welding shall be responsible to ensure all welder qualification records are processed and distributed in accordance with the AIC Gas O&M Plan.

6.0 Qualification Categories - Initial Test

6.1 General

- 6.1.1 All AIC and contract welders working on AIC pressure piping systems shall be qualified in one or more of the categories defined below.
- 6.1.2 Qualification in a single category qualifies a welder to weld only in that specific category with the welding process as used for test.
- 6.1.3 All testing will be on material Grade B or greater, but not to exceed SMYS 60,000 psi (X60).
- 6.1.4 It is preferred that all welders using "Gas Metal Arc Weld (GMAW)" be qualified first in "Shielded Metal Arc Weld (SMAW)".
- 6.1.5 All welders shall test using the same welding techniques, travel speed, and machine settings as for "field" welding.
- 6.1.6 All field welding shall follow the AIC approved Welding Procedures (WPS).
- 6.1.7 The welder will be given time to establish appropriate machine settings prior to actual testing.
- 6.1.8 Welds will be tested in accordance with the latest edition incorporated by reference (IBR) of API 1104, Section 6, Qualification of Welders.

6.2 AIC Welder Qualification Categories

- 6.2.1 For welder qualification categories, see Table 1.

Table 1: Welder Qualification Categories

Category	Description	Reference
Pipeline - SINGLE (Ref API 1104, Section 6.2)	Pipelines governed by & inspected to PHMSA Part 192 and API 1104 requirements.	Section 6.3

Pipeline - MULTIPLE (Ref API 1104, Section 6.3)	Pipelines & related fabrications governed by & inspected to PHMSA Part 192 & API 1104 requirements	Section 6.4
IN-SERVICE (Ref API 1104, Appendix B)	Welding on pressurized gas pipelines in accordance with API 1104, Appendix B "In-Service Welding."	Section 6.5
ASME PIPING (Used as needed) (Ref BPVC, Section IX)	Piping systems constructed/inspected in accordance with ASME B31.3.	Section 11.0

6.3 Pipeline - Single Qualification (Butt/Branch welds on nominal pipe diameters)

- 6.3.1 Welders qualifying for a specific pipe diameter may qualify in accordance with API 1104, "Qualification of Welders - Single Qualification," and the requirements of this section.
- 6.3.2 A welder may qualify on multiple diameters and wall thickness singularly as outlined in Table 2.

Table 2: Welder Qualification - Single Type

Test ID.	Type Weld	Size Pipe (Inches)	Wall Thickness (inch)	No. of Tests
1	Butt	1-1/4	< 0.188	2
2	Butt	2	< 0.188	2
3	Butt	4	≥ 0.188	1

Note: Tests 1 thru 3 singularly qualify welder to make a Butt & LAP welds ≤ 12.75" OD / ≤ 0.750" WT.

- 6.3.3 Welders qualifying under these requirements shall make a complete groove weld on pipe with the axis of the pipe 45° inclined, fixed plane (6G) position. See [Appendix A](#) for the different welder positions.
- 6.3.4 Welding shall be done in accordance with the applicable AIC welding procedure.
- 6.3.5 The pipe diameter and wall thickness shall be in accordance with the project requirements.
- 6.3.6 A welder making a single-qualification test for branch connections, fillet welds, or other similar configurations shall follow the specific Welding Procedure Specifications for branch connections. See Table 3.

Table 3: Welder Qualification - Branch Connection

Test ID.	Type Weld	Size (Inches)	Wall Thickness (inch)	No. of Welds
1	"Branch-on" fillet	1-1/4 on 2	≥ 0.188	1
2	"Branch-on" fillet	2 on 4	≥ 0.188	1

Notes:

1. These initial tests (singular application) will be in the 5F position (branch out the side) as full-penetration welds. See [Appendix A](#).

2. These tests qualify the welder to make all position branch type welds on pipe 12.75" OD and ≤ 0.750 " thickness.

6.3.7 Successful completion of these tests, in accordance with API 1104, "Qualification of Welders," qualifies the welder for the group diameter and wall thickness range which was used for qualification, subject to the essential variables listed in "Single Qualification" of API 1104.

6.4 Pipeline/Fabrication -- Multiple Qualification

6.4.1 Welders qualifying under pipeline/fabrication requirements shall make 2 welds described herein in accordance with "Multiple Qualification" of API 1104.

6.4.2 The 1st test shall be a groove weld (open butt weld).

1. The test pipe to have a minimum outside diameter of 12.75" and wall thickness ≥ 0.250 ".
2. Test pipe will be placed and welded in *either* the horizontal-fixed (5G) or the 45°-fixed (6G) position. For positions, see [Appendix A](#).

6.4.3 The 2nd test will be a "branch on" full-penetration groove fillet-weld test in the horizontal fixed position.

1. This test will use ≥ 12.75 " OD pipe with a wall thickness ≥ 0.250 ".
2. Welder shall layout, cut, fit, and weld a full-size branch-on-pipe connection.
3. A full-size hole shall be cut in the main run pipe.

6.4.4 Completing both tests successfully in accordance with "Multiple Qualification" of API 1104, qualifies the welder for the following, subject to the essential variables listed in "Multiple Qualification" of API 1104:

1. All positions,
2. All diameters,
3. All wall thicknesses, and
4. All joint designs and fittings.

6.5 In-Service Welding Test

6.5.1 All welders working on pressurized gas piping systems above 100 psig that require an in-service procedure shall be qualified in accordance API 1104, Appendix B, "In-Service Welding", using an approved AIC welding procedure.

6.5.2 Qualification will be done on 12.75" OD pipe branch-on test (no hole in run pipe).

6.5.3 The qualification grouping for pipe diameters and wall-thicknesses shall be in accordance with API 1104.

6.5.4 Branch-on fitting (full penetration groove weld with fillet reinforcement):

1. Pipe at 12" nominal diameter.
2. Pipe thickness at minimum 0.250".
3. Run pipe in horizontal position with branch out the side (5F position). See [Appendix A](#).

6.5.5 The weld should be tested and considered acceptable if it meets the requirements of API 1104, Appendix B, "In-Service Welding" and "Visual Examination and Destructive Testing".

- 6.5.6 Only Low-Hydrogen welding electrodes will be used for welding on AIC High-Flow Pressurized piping systems operating above 100 psig in accordance with the approved AIC in-service welding procedures (WPS) and [WELD 2.4](#).
- 6.5.7 In-Service Reference Codes and Standards:
1. PHMSA 49 CFR Part 192:
 - 1 a. Subpart E, Welding of Steel in Pipelines,
 - 1 b. Subpart M - Maintenance,
 - 1 c. Appendix B, Section II.B., Weldability, and
 - 1 d. Appendix C to Part 192 - Qualification of Welders for Low Stress Level Pipe
 2. API Std 1104 - Welding of Pipelines and Related Facilities, Appendix B - In-Service Welding
 3. ASME B31.8 - Gas Transmission and Distribution Piping Systems
 4. PRCI L51660 - Development of Simplified Weld Cooling Rate Models for In-Service Gas Pipelines
 5. PRCI L52047 - Updated Pipeline Repair Manual, Revision 6.

7.0 Service Line Connection Welding (Service Tee)

- 7.1 All welders doing service line welding on 2" or less pipe shall weld two ¾" service line connection fittings in the 2F position. See [Appendix A](#).
- 7.2 These welds must be in accordance with, and found acceptable to, Appendix C to Part 192 - Qualification of Welders for Low Stress Level Pipe. There is additional test for welders of service connections to mains.

8.0 Workmanship

- 8.1 All welder qualification and re-qualification test welds shall pass visual inspection to *demonstrate good workmanship* and uniform weld profiles around the entire pipe circumference.
- 8.1.1 Arc burns on the pipe surface are not permitted.
 - 8.1.2 Undercut must fall within tolerance as set forth in API 1104, Table 4, "Maximum Dimensions of Undercutting."
 - 8.1.3 Filler wires are to be kept to a minimum.
 - 8.1.4 Complete fusion is required on both the root and cap pass.
 - 8.1.5 Weld must be free from:
 1. Cracks.
 2. Burn through.
- 8.2 AIC (approved testing personnel) shall have the right to terminate welder test at any time if candidate does not possess the skills required to make the quality of weld required by this specification.
- 8.3 Any welder who makes a weld that fails to comply with requirements of this section may be disqualified from further work at discretion of the AIC Supervisor Technical Training - Operations [Welding] or Welding Inspector Supervisor.

8.4 Any AIC Supervisor may ask for review of a welder whose welding skill is in question (e.g., excessive leaks, poor workmanship, untimely job completion). See [WELD 1, Section 12.0](#), Production Weld Quality Issues.

9.0 Welder Requalification

9.1 Requalification - General

9.1.1 Welders that have not welded in their qualified process within 6 months shall be deemed inactive and forfeit the 6-week grace period.

9.1.2 Sample test welds to be completed by the welder while in the presence of a qualified observer or by remote observation (such as FaceTime). The welds will be tested by a qualified welding inspector for compliance with acceptance criteria per API 1104 (IBR).

9.1.3 An annual written, oral, or LMS CBT Operator Qualification (OQ) test will be given with the annual welder test.

9.2 *Annual requalification* -- Active qualified welders must complete a requalification test twice each calendar year, not to exceed 7-½ months from their initial qualification or previous requalification test.

9.2.1 The 1st test of the year is the annual qualification and the 2nd test is the 6-month test.

9.2.2 Each year the Welding Department will select the pipe sizes for the annual requalification testing.

9.2.3 *Single Qualified Welder Annual Requalification* - See Table 4A for the sample welds to be completed by the welder for annual requalification as single qualified.

Table 4A: Requalification Welding Tests - Annual Single-Qualified

Weld Type	Pipe Size (Inches)	Wall Thickness (Inch))	Position	No. of Welds
Butt Weld	Welding Dept. Choice	> 0.188	5G	1
Branch Fillet Weld (1)	2" on 4"	≥ 0.188	2F	1
Service Line	3/4 on 2 or 4	---	2F	2
Note: (1) Not required for the 6-month test.				

9.2.4 *Multi-Qualified Welder Annual Requalification* -- See Table 4B for the sample welds to be completed by the welder for annual requalification as multi-qualified.

Table 4B: Requalification Welding Tests - Annual Multi-Qualified

Weld Type	Pipe Size (Inches)	Wall Thickness (Inch)	Position	No. of Welds
Butt Weld	Welding Dept. Choice	> 0.250	5G	1
Branch Fillet Weld (1)	Welding Dept. Choice	> 0.250	4F	1
Service line	3/4 on 2 or 4	---	2F	2
Note: (1) Not required for the 6-month test.				

9.2.5 The 6-month requalification test may be taken from a production weld; however, if this is not possible, see Table 4A or 4B for welds to be made for the specified process.

9.3 In-Service Welders -- Annual and 6-Month Requalification

- 9.3.1 The annual and 6-month requalification test requirements will be the discretion of the AIC Supervisor Technical Training - Operations [Welding].
- 9.3.2 All testing and acceptance criteria will meet the essential variables of API 1104, Appendix B.

10.0 Destructive Testing

10.1 All initial weld tests shall be destructively tested. Annual and 6-month requalification may be either destructive or radiographically examined.

10.1.1 Any test weld failing to meet destructive test or alternative radiographic test acceptance criteria as set forth in API 1104 or Appendix C to Part 192 or API 1104, Section 9, Radiograph shall result in immediate test failure and that welder shall not weld on any AIC gas facilities until further testing is conducted.

- 1. AIC will implement radiographic testing of a current weld as prescribed in 49 CFR §192.229(c)(1) using API 1104, Section 9 criteria.
- 2. Attach the Level II or Level III reader's sheet to the welder's requalification report.

10.1.2 Failure to submit a weld sample test upon request, or failing to test by the scheduled date, is considered an automatic failure.

10.1.3 If a welder fails to pass a weld test because of unavoidable conditions or conditions beyond their control, the welder may be given a second opportunity to qualify.

10.1.4 If a welder fails to requalify and a qualified welding inspector / instructor is present at the time AND the cause of the failure can be determined; then options are:

- 1. Following on the spot training and procedure review, the welder will be given 1 more opportunity to submit at least 2 additional sample tests. If both tests are successful, there will be no need to perform a full test.
- 2. After at least 5 days, the welder may be re-evaluated by participating in additional training / procedure review and producing a full initial test under the supervision of a qualified welding inspector.

11.0 ASME Piping

11.1 Where needed, all welders working on ASME B31.3 piping systems shall be qualified in accordance with the requirements of ASME Section IX, "Boiler & Pressure Code".

11.2 The qualification test will be made using the pipe wall thickness and diameter that the welder will be expected to weld in production.

11.3 The pipe will be in the 6G position using an approved AIC welding procedure qualified in accordance with ASME Section IX. For welder position, see [Appendix A](#).

11.4 Qualification on pipe diameters of 2-7/8" or greater allows the welder to make groove and fillet welds in all positions and on pipe diameters from 2-7/8" and greater.

11.5 The maximum thicknesses qualified will be 2 times the actual wall thickness of the test pipe.

11.6 There is no minimum wall thickness limit for welder qualification per ASME Section IX.

12.0 Records and Retention (§192.227)

UNCONTROLLED IF PRINTED

- 12.1 The Supervisor Tech Training - Welding shall ensure all welder qualification records are processed, distributed, and filed at the Welding Training facility and/or in the Operator Qualification Department records.
- 12.2 The welder is responsible for having their "Weld Qualification Report" available for review when welding.
- 12.3 For transmission pipe installed after July 1, 2021, all welder qualification records must be retained for at least 5 years following the date of construction. To ensure proper coverage of records related to various AIC construction, other than service lines, retain all welder qualification records for a minimum of 8 years.
- 12.3.1 All welder records are retained at Pawnee Gas Training Center (paper copy) and electronic copy on the Pawnee G drive.

End of Instructions.

WELD 2.3 Construction of Pipelines

1.0 Purpose

This document establishes the welding and inspection requirements for the construction and fabrication of all pipelines and piping systems for Ameren Illinois (AIC). It is in accordance with 49 CFR Part 192.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Material Requirements](#)

[5.0 Welding Procedures](#)

[6.0 Welder Qualification](#)

[7.0 Welding Process](#)

[8.0 Pre-alignment Inspection](#)

[9.0 Welding Requirements](#)

[10.0 Weld Repairs](#)

[11.0 Weld Inspection](#)

[12.0 Records](#)

Appendices

[Appendix A - Joining Unequal Steel Wall Pipe and Fittings](#)

3.0 Target Audience

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Superintendents
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 Material Requirements

4.1 In addition to AIC material specifications and purchase order requirements, all material, steel pipe flanges, fittings, and valves used in the construction of AIC pipelines and related piping systems shall meet the material requirements listed in Table 1.

Table 1: Material Standards & Specifications

COMPONENT	SPECIFICATION
-----------	---------------

UNCONTROLLED IF PRINTED

Pipe	API 5L, "Specification for Line Pipe" ASTM A105, "Standard Specification for Carbon Steel Pipe for High-Temperature Service" ASTM A106, "Standard Specification for Seamless Carbon Steel Pipe for High-Temperature Service" Specification for Electric-Fusion-Welded Steel Pipe for High-Pressure Service at
Fittings	ANSI B16.5, "Specification for Steel Pipe Flanges and Flanged Fittings" ASME B16.5, "Specification for Flanges and Flanged Fittings" MSS SP-75, "High-Strength, Wrought, Butt-Welding Fittings"
Valves	API 6 D, "Specification for Pipeline and Piping Valves"
Flanges	MSS- SP44, "Steel Pipeline Flanges" ASME B16.5, "Pipe Flanges and Flanged Fittings"

- 4.1.1 Steel pipe shall be legibly marked and readable with the specification or standard to which it was manufactured and the heat number so that proper welding procedure can be used.
- 4.1.2 When welding pipe that is stenciled "multi-grade," the procedure for the project design grade of pipe shall be used.
- 4.1.3 When using materials of different grades, the procedure for the highest grade of pipe shall be used.

4.2 Fitting Requirements

- 4.2.1 Fittings should be beveled to a standard 30 to 37.5 degrees.
- 4.2.2 The mating wall thicknesses of fittings and flanges should be equal to the pipe to which it is joined, or not exceeding the acceptable variations permitted for joining pipe of unequal wall. See [Appendix A](#)
- 4.2.3 Butt weld valves (by approved manufacturer) shall be of forged steel construction and should have the same mating wall thickness as the pipe to which joined, or not exceeding the acceptable variations permitted for joining pipe of unequal wall.
 - 1. The project plans or valve manufacturer shall specify whether the butt weld valve is to be in the open or closed position when welded.

5.0 Welding Procedures

- 5.1 In accordance with DOT regulations, detailed welding procedure specifications (WPS) must be established and qualified to demonstrate that welds having suitable mechanical properties and soundness are workable prior to production welding.
- 5.2 The quality of the welding procedure welds shall be determined by destructive testing in accordance with API 1104. ASME projects will follow ASME BPVC, Section IX procedures.
- 5.3 Qualification of WPS shall be in accordance with:
 - 5.3.1 API 1104, Section 5, "Qualification of Welding Procedures for Welds Containing Filler-Metal Additives" for the construction of new pipelines,
 - 5.3.2 API 1104, Appendix B for maintenance welding on existing pipelines, or
 - 5.3.3 ASME BPVC, Section IX where applicable.
- 5.4 A welding procedure shall NOT be used for pipeline construction or for repair welding prior to its approval by AIC Gas Standards and Procedures personnel.
- 5.5 All welding will follow the WPS that has been documented by a Welding Procedure Qualification Report (WPQR). The AIC procedures that are currently approved are in-

cluded in [WELD 4](#). However, new or updated WPS may be approved in advance of publishing in the next O&M update (see [WELD 1, Section 5.0](#), Welding Procedures).

- 5.6 A contractor or fabrication shop may submit their own procedure for review by AIC welding instructor and approval by Gas Standards and Procedures. The approved WPS shall always be followed while performing welding for AIC. A copy of that procedure will be maintained by AIC welding instructor and Gas Standards and Procedures.
- 5.7 The ambient temperature at which the welding procedure qualification was conducted shall be included in the WPS. The approved procedure may be used for construction at temperatures above and below the test temperature provided preheat temperatures as specified in the WPS are followed.

6.0 Welder Qualification

- 6.1 Prior to performing any welding for AIC, all welders (AIC personnel, contractor, or fabrication shop) shall be qualified in accordance with [WELD 2.2](#). All welder qualification testing shall be under the direct supervision of an approved AIC qualified welding inspector.
- 6.2 Once qualified, the welder is permitted to weld within the essential variables of their qualification test. These variables are detailed in API 1104, Section 6, "Qualification of Welders" for new construction and API 1104, Appendix B for "In-Service Welding".
 - 6.2.1 Welders shall follow an approved Welding Procedure (WPS) within the scope of those variables.

7.0 Welding Process

- 7.1 The approved field welding processes to be used for construction and fabrication are:
 - 7.1.1 Shielded Metal Arc Weld (SMAW)
 - 7.1.2 Gas Metal Arc Weld (GMAW)
- 7.2 All welding will be "Direct Current Electrode Positive" (DCEP).
- 7.3 Welding electrodes and grounding requirements include the following:
 - 7.3.1 Cellulose coated electrodes (E6010, E7010, and E8010) shall not be stored in ovens, but maintained in a dry area at a temperature above freezing and below 100 °F.
 - 7.3.2 Low-hydrogen electrodes (E7018) used for in-service welding shall be in a factory sealed container until opened. After opening sealed container, the rods shall be stored in holding ovens at 250 °F minimum to 350 °F maximum temperature.
 - 1. Rods must be returned to oven after being in ambient air for *8 hours*.
 - 2. The rods will then need a re-heat period of *48 hours* to recondition the electrode before re-use.

Discard low-hydrogen electrodes after reheating twice.

- 7.3.3 Discard all electrodes (GMAW and SMAW) that have been exposed to an atmosphere that may affect their operating characteristics or weld quality.
- 7.3.4 Electrode holders shall be the fully insulated type when used for welding on the inside of pipe.

7.3.5 The ground connection shall be constructed of steel, of similar chemical composition, with respect to the pipe and be of sufficient size to prevent overheating. It shall be fully insulated except for the one point of contact. See [Subsection 9.10](#) regarding using ground.

7.3.6 Shielding gas for GMAW is welding Grade CO₂ (Carbon Dioxide).

8.0 Pre-alignment Inspection

8.1 General

8.1.1 Prior to alignment, all pipe and/or fittings shall be inspected for defects that might impair the pipeline service life.

8.1.2 Pipe wall and bevel defects shall be repaired or removed as described herein.

8.2 Pipe Wall Defects

Defects shall be handled as specified:

8.2.1 Laminations and Cracks

1. Laminations found in the pipe wall require that the pipe be inspected by an approved ultra-sonic thickness gauge and the portion of pipe, which contains lamination, shall be cut out as a cylinder. See [REPR 1](#) for segment cutout procedure.
2. Cracks found in the pipe wall require that the portion of pipe containing a crack be cut-out as a cylinder. See [REPR 1](#) for segment cutout procedure.

8.2.2 Dents

1. All dents exceeding the specifications in API 5L (Section 9.10.5.2, 45th edition - shall be cut-out as a cylinder. See [REPR 1](#) for segment cutout procedure.

8.2.3 Gouges, Grooves, Scratches, and Notches

1. All gouges, grooves, scratches, and notches that exceed the specifications of API 5L shall be eliminated by grinding, providing the wall thickness is not reduced to below the minimum requirement. For API 5L wall thickness tolerances, see [Table 9](#) and [Table 11](#) in WELD 2.10, Arc Burn Removal.
2. Should grinding reduce the wall thickness below the minimum requirement, the area shall be cut out as a pipe cylinder. See [REPR 1](#) for segment cutout procedure.

8.3 Pipe Bevel Defects

8.3.1 Laminations

1. Laminations, or other visual defects, in the pipe bevel that exceed ¼" shall be removed by cutting out the applicable pipe as a cylinder.

8.3.2 Bevel Damage

1. Bevel damage, such as dents, gouges, or depressions, shall be repaired if their depth exceeds 1/16". Repair by grinding or filing to smooth the defect into existing bevel.
2. Damage that requires grinding to the point where the bevel may be modified from the tolerances on the welding procedures shall be rejected and the end shall be re-beveled.

8.3.3 Root Face Damage

1. The root face (land), if damaged, may be restored to its original dimension by filing or grinding.
2. Should restoration not be practicable, the end shall be completely re-beveled.

8.3.4 Bevel Dents

1. Denting restricted to top edge of the bevel shall be ground smooth and not be cause for rejection, unless, in the opinion of the welding inspector, the denting extends beyond the area where the cap pass will tie-in to the bevel edge.

9.0 Welding Requirements

9.1 Electrodes

- 9.1.1 The specific classification and type of welding electrodes used during construction and fabrication shall be as described in the approved welding procedure.
 1. Electrodes shall be ordered by their AWS classification number (e.g., E6010, E7010-G, E8010-G) based on their designation in the applicable procedure.
 2. Any change in AWS classification requires approval by the AIC Code Compliance Group.
 3. Electrode E8010-8P+ should not be used due to delayed cracking issues.
 4. See other electrode discussion under [Subsection 7.3](#).
- 9.1.2 All electrodes used by contractors should be opened in the presence of AIC inspector and dated.
 1. AIC inspector has the right to disallow the use of any electrodes that might be of questionable condition or moisture content. This applies to any welding, including welder qualification.
- 9.1.3 Welding electrodes shall be stored and handled in accordance with the manufacturers recommended practice.
 1. Electrodes should be stored in sealed original metal containers until ready for use.
 2. Those in opened containers should be protected from deterioration and excessive moisture changes.
 3. Visual inspection of the electrodes should be done prior to and during welding.
 4. Electrodes that show surface oxidation, fractured coatings, or eccentricity of the coating with respect to the electrode core wire should be discarded.
 5. See other electrode discussion under [Subsection 7.3](#).

9.2 Line-Up and Fit-Up of Butt Welds

- 9.2.1 External line-up or internal clamps should be used to ensure proper alignment for butt welds greater than 2" nominal diameter, unless it is impractical due to dimensional differences (e.g., flange or fittings to pipe, fitting to flange). Then, the pipe will be firmly supported to prevent movement.

9.2.2 External line-up clamps (for butt welds) may be removed before the complete root bead is applied, provided the line pipe is not unduly stressed and it is securely supported, and tack welded.

1. Root bead segments shall be approximately equal length and spaced around the circumference of the joint.
2. When conditions make it difficult to prevent movement of the line pipe, or if the line pipe weld will be unduly stressed, then approximately 50% of root bead should be uniformly spaced around the circumference of pipe before line-up clamp is released or removed.

9.2.3 The clamps shall remove out-of-roundness and shall provide a uniform joint fit-up. High-low conditions on equal-wall thickness pipe should not exceed 3/32".

9.2.4 When an internal alignment clamp is used for achieving alignment, it shall be held firmly in position until the root pass is approximately 90% completed and line pipe has been properly supported.

9.2.5 Root opening shall have uniform spacing throughout circumference of the joint. The spacing shall be in accordance with the approved welding procedure.

1. Minor root opening adjustments are permitted after installation of a root-bead segment to maintain root-opening tolerances.
2. Adjustments to the root gap greater than 1/8" on weld assemblies is not allowed unless the root-bead segment is replaced.

9.3 Longitudinal Seam Offset

9.3.1 Longitudinal seams in adjacent lengths of longitudinal welded pipe shall be offset by a minimum of 2".

9.4 Miter Joints

9.4.1 A miter joint on steel pipe to be operated at pressure that produces a hoop stress of 30% or more of SMYS may not deflect the pipe more than 3 degrees.

9.4.2 A miter joint on steel pipe to be operated at pressure that produces a hoop stress less than 30% SMYS may not deflect the pipe more than 12-1/2 degrees. Further, it must be a distance equal to one pipe diameter or more away from any other miter joint, as measured from the crotch of each joint.

9.4.3 Wrought-steel welding elbows and transverse segments of these elbows may not be used for changes in direction on steel pipe that is 2" or more in diameter unless the arc length, as measured along the crotch, is at least 1".

1. Segment-able fittings should be used for dissecting fittings.

9.5 Weld Joint Bevels

9.5.1 Unless otherwise specified, AIC will supply pipe with beveled ends conforming to API 5L.

9.5.2 When re-beveling is necessary, it may be accomplished using a mechanized oxyacetylene beveling machine or an approved facing tool.

9.5.3 If approved by the AIC welder, a rust preventative such as deoxaluminat may be applied to the pipe bevels to prevent rust and corrosion during long-term storage.

9.6 Transition Joints

UNCONTROLLED IF PRINTED

- 9.6.1 The transition between pipe ends of unequal thickness shall be by mechanical tapering, or by welding in accordance with ASME B31.8 or by means of a fabricated weld transition fitting not less than 12" minimum or 1-1/2 pipe diameters in length. For weld transition fittings, see [STLP 3.1 Section 5.0](#).
- 9.6.2 See [Appendix A](#) for acceptable preparations for joining pipe ends by butt welding for materials having unequal wall thickness and/or SMYS, all in accordance with ASME B31.8, "Gas Transmission and Distribution Piping Systems."

9.7 Socket Weld Joining

- 9.7.1 Socket weld fitting shall initially be fully seated on the clean pipe end.
- 9.7.2 The end of the fitting shall be marked on the pipe.
- 9.7.3 The fitting shall be moved 1/16" to 1/8" away from the mark or an approved spacer ring installed between the mark and the fitting.
- 9.7.4 Socket weld fitting shall not be bottomed out when welding.

This space is needed for thermal expansion as the fitting is welded.

9.8 Weld Joint Cleaning

- 9.8.1 Clean the beveled weld joint and the inside and outside surfaces at the end of each pipe to be field welded for a minimum distance of 1" immediately prior to welding.
- 9.8.2 All traces of foreign material shall be removed by hand or using power tools. Scale and slag shall be removed after completing each pass.
- 9.8.3 The pipe ends shall be completely dry prior to and during field welding. This may be accomplished by using propane or oxy-acetylene torches with a "rosebud" tip regardless of ambient temperature.
- 9.8.4 The pipe and/or fittings must be free of moisture (outside or inside) prior to and during welding operation.

9.9 Welding Equipment

- 9.9.1 Welding equipment used for field welding shall be maintained in good working condition and have the same performance capabilities as used to qualify the welding procedure.
- 9.9.2 Any machine that is not performing satisfactorily shall be removed from service and replaced or repaired.
- 9.9.3 Machines used for certified welding will be inspected periodically for voltage, amperage, gas flow, and general integrity. Annual inspection can be performed by AIC personnel, inspectors, or welders.

9.10 Weld Ground Placement

- 9.10.1 Commercially available grounding clamps may be used for fabrication work and/or field construction as applicable.

The use of magnetic ground clamps or copper ground shoes is prohibited.

9.10.2 The ground shall be located in a manner (preferably on the cap of a completed weld) that prevents arc burns on the pipe.

1. DO NOT tack weld ground clamps to pipe or fittings.
2. During production welding (ref pipe gang), place the welding ground on the last finished or unfinished weld.
3. Grounds used for final line welding should be placed on the finished weld.

9.10.3 Arc burn damage on the pipe is not acceptable.

9.10.4 Arc burns on pipe or on completed welds shall be eliminated in accordance with [WELD 2.10](#), or cut-out as a cylinder if directed by the welding inspector.

9.11 Weld Joint Clearance

9.11.1 When the pipe is welded aboveground, a minimum clearance of 16" is recommended.

9.11.2 When the pipe is welded in the ditch, the bell hole shall be of sufficient size to provide the welding personnel with ready access to the joint for all welding operations.

9.12 Root Bead Segments

9.12.1 Root bead segments, which are to be incorporated into the final weld, shall be thoroughly cleaned of scale, and suitably prepared at each end by means of grinding to ensure complete stringer bead continuity.

9.12.2 Root bead segments shall be free of cracks.

9.13 Weld joint Protection

9.13.1 Welding shall not be performed when weather conditions exist that would be detrimental to the quality of the finished weld. Rain, snow, winds above 15 MPH (for SMAW), and moisture from any source, are known to contribute to unfavorable weld quality.

GMAW process cannot tolerate any wind (0 MPH).

9.13.2 Welding may continue during inclement weather only after adequate shelters and precautions are implemented to ensure proper weld protection.

9.13.3 The AIC weld inspector shall determine if the protective measures are adequate prior to welding.

9.14 Weld Pass Requirements

9.14.1 A minimum of 2 complete weld passes shall be made prior to leaving weld in the unfinished condition. This requirement is to ensure weld cracking will not occur.

- 9.14.2 Depending on the pipe wall thickness and/or weld stress level, the AIC welder may require additional passes be made prior to leaving the weld temporarily unfinished.
- 9.14.3 Unfinished welds that have cooled should be preheated to between 200 °F and 500 °F prior to completion.
- 9.14.4 Maximum time for unfinished welds should be as soon as possible, not to exceed 72 hours.

9.15 Preheating Welds

- 9.15.1 Preheating of welds shall be in accordance with the approved welding procedures. A minimum 200 °F (maximum 500 °F) preheat is required when the ambient temperature is below 50 °F.
- 9.15.2 Heating might be required to remove moisture from the welding region, a minimum of approximately 2" on each side around the joint, prior to welding.
- 9.15.3 Temperature readings shall be taken using temperature indicating crayons or pyrometers (direct reading or infrared). Measurements shall be made at 4 locations 90 degrees apart on each side of the weld joint. The location shall be 2" from the weld centerline.

9.16 Inter-pass Cleaning and Removal of Visual Defects

- 9.16.1 Each pass of the weld metal shall be cleaned of slag or remaining flux using hand or power tools with wire wheels before a further pass is applied.
- 9.16.2 Visible defects, such as slag cavities, cold laps, and other deposition faults, shall be removed by grinding.
- 9.16.3 Clusters of surface porosity and high points shall be removed by grinding prior to deposition of the next pass.

9.17 Filler and Finished Beads

- 9.17.1 The completed weld shall have a uniform cross-section around the entire circumference.
- 9.17.2 At no point shall the weld crown (cap pass) surface be below the outside surface of the pipe, nor should it be above the parent metal by more than 1/16". However, the height of a weld crown may exceed 1/16" if the contour provides a uniform transition into the pipe material on both sides of the weld. Maximum height is 1/8" with a smooth contour.
- 9.17.3 Two beads shall not be started at the same location, and the face of the completed weld should be approximately 1/8" greater than the width of the original groove.
- 9.17.4 The completed weld shall be thoroughly brushed, cleaned, and inspected.

9.18 Weld Stripper Passes

- 9.18.1 A stripper pass may be used to eliminate external conditions such as external undercut or incomplete fill of a cap pass.
- 9.18.2 Stripper passes, when used, shall be minimum 2" in length, and a minimum of an electrode diameter in width.
- 9.18.3 Prior to welding a stripper pass on a weld that has cooled to ambient temperature, the area to be welded shall be preheated from a minimum of 200 °F to a maximum of 500 °F for a distance of 3" on each side of the weld.

UNCONTROLLED IF PRINTED

9.19 Back-Welding

9.19.1 When pipe and/or a fitting size permits access to the inside surface, back-welding may be used to eliminate unacceptable internal conditions or to complete the weld on transitions or fittings to pipe.

9.19.2 Prior to back-welding, the area shall be preheated from the outside to achieve a preheat temperature on the inside surface from a minimum of 200 °F to maximum of 500 °F. This preheat applies to all areas of back-welding.

9.20 Arc Burns (49 CFR 192.309(c))

9.20.1 Arc burns shall be eliminated in accordance with the approved arc burn removal procedure. See [WELD 2.10](#), Arc Burn Removal.

9.21 Pipe Coating Protection

9.21.1 The pipe coating, if applicable, on pipe 8" nominal diameter and larger should be protected from weld spatter and mechanical abrasion during welding.

9.21.2 If weld spatter is observed on smaller than 8" pipe, the pipe coating should be covered for protection before proceeding.

9.22 Tie-In Welds

9.22.1 Once started, tie-in welds shall be completed without interruption.

9.23 Identification of Welders

9.23.1 Each welder should mark the weld or section of weld for which he has been responsible. AIC welders may use their employee number. Contract welders may use their initials, last 4 digit of SSN, or welder qualification employee number.

9.23.2 The ID marking will be done with a weatherproof contrasting color permanent ink or paint marker.

10.0 Weld Repairs

10.1 Depending on extent of defective weld areas found during visual or nondestructive examination, the weld may be repaired or cut-out as a cylinder of pipe in accordance with the following limits:

10.1.1 Repairs shall use the original welding procedure or an approved AIC repair procedure.

10.1.2 Cracks, regardless of their location, shall be cut-out as a cylinder unless a repair is performed following the appropriate WPS and is approved by the AIC welder supervisor or in a manner acceptable to the welding inspector.

10.1.3 Defects, except cracks, found by visual examination, magnetic particle, or liquid penetrant that are externally exposed in the cover pass may be repaired.

10.1.4 Defects found by visual or nondestructive examination (e.g., slag inclusions, porosity, gas pockets) may be repaired in compliance with API 1104 provided the defects can be removed without grinding completely through the weld.

10.1.5 Defects, which require removal of the root pass, require approval of the AIC welding inspector.

10.2 Before the above repairs are made, the defective area shall be entirely removed to clean metal by grinding.

10.2.1 All slag and scale shall be removed by wire brushing.

10.3 All repair cavities shall be at least 2" in length and repaired with a minimum of 2 passes.

10.3.1 The start and stop points of repair passes shall not be superimposed over the start and stop of the preceding pass.

10.3.2 The start and stop of each repair pass shall be ground smooth.

10.4 Prior to repair welding, a minimum of 2" on each side of the repair area shall be pre-heated to a temperature from a minimum of 200 °F. to a maximum of 500 °F and maintained during welding. Temperature shall be checked by temperature indicating crayons or pyrometers (direct reading or infrared).

10.5 All repairs shall first meet visual acceptance and then meet the Acceptance Standards for Nondestructive Testing in API 1104.

10.6 The qualified welder assigned to perform the specific task is responsible for identifying the correct welding procedure for the pipe grade, outside diameter, and wall thickness.

10.7 When welding on pipe diameters of 16" or greater, 2 welders should be used to complete the root bead and hot pass. Then, 1 welder can complete the filler and cap passes.

10.7.1 On pipe diameters less than 16", one welder may be used.

11.0 Weld Inspection

11.1 Recommended Non-Destructive Testing (NDT) Methods

11.1.1 AIC recognizes there are several NDT methods available for field inspection of fillet and groove welds for new construction.

11.1.2 Table 2 shows the current NDT recommendations by AIC for each type of weld. (As NDT methods and technology change or improve, the table will be revised accordingly.)

Table 2: Recommended NDT Methods

Weld Type / Joint Design	NDT METHODS		
	Radiographic	PT or LPT	MT or MPT
Groove Butt Welds	R		
Fillet Welds		A	R
Legend: PT or LPT = Liquid Penetrant Testing MT or MPT = Magnetic Particle Testing R = Recommended A = Alternate Method			

11.2 Visual Weld Inspection

11.2.1 Visual inspection of welds will be conducted to ensure that welding is performed in accordance with WPS and that welding meets the requirements of this specification and the Acceptance Standards for Nondestructive Testing in API 1104. See [WELD 2.5](#).

11.3 Radiographic Inspection

11.3.1 When conducting radiographic examination of butt welds, it shall meet the requirements in 49 CFR Part 192. At the option of AIC, the extent of radiographic examination may exceed these requirements to assure quality welding is being achieved throughout the project. See [WELD 2.6](#).

11.3.2 Unless specified otherwise, the standard of acceptability for interpretation of radiographic film or digital image for all regulated pipeline or piping system welds shall be the Acceptance Standards for Nondestructive Testing in API 1104.

11.4 Production Weld Qualification

11.4.1 At the discretion of the qualified AIC representative, production welds may be cut-out and tested to confirm the adequacy of the welding procedure under construction conditions. Financial accountability will be:

1. Welds meeting the requirements of API 1104 will be charged to AIC.
2. Those welds not meeting the requirements of API 1104 will be charged to the pipeline contractor.

11.5 Disqualification of Welders

11.5.1 A welder who makes a weld that fails to comply with these requirements may be disqualified from further welding at discretion of the qualified AIC representative.

12.0 Records

12.1 For records required and retention, see [WELD 2.6. Section 10.0](#).

End of Instructions.

WELD 2.3 Welding: Construction of Pipelines, October 1, 2020

Revision Notes

Location of Changes	Summary of Changes
Paragraph 9.16, Item 3	Remove the requirement to grind starts and stops in the inter-passes. Inter-passes starts and stops can be cleaned with hand or power tools with wire wheels.
Revision Notes	Updated – WELD 2.3 Welding: Construction of Pipelines.

Appendix A - Joining Unequal Steel Wall Pipe and Fittings

A-1. This appendix is to illustrate acceptable preparations for joining pipe ends by butt welding materials having unequal wall thickness and/or SMYS, all in accordance with ASME B31.8, "Gas Transmission and Distribution Piping Systems."

A-1.1 When the SMYS of the material sections to be joined are unequal, the deposited weld metal shall have mechanical properties at least equal to those of the section having the higher strength.

A-1.2 The transition between ends of unequal thickness may be accomplished by taper or welding as illustrated below or by means of a prefabricated transition fitting.

A-1.3 Sharp notches or grooves at the edge of the weld where it joins a slanted surface shall be avoided.

A-1.4 Where joining sections of unequal thickness but equal SMYS, there is no minimum angle limit to the taper.

A-1.5 The maximum thickness (tD) for design purposes (i.e., MAOP calculations), shall not be greater than 1.5 times the wall of the thinner pipe (t).

A-1.6 Unequal Internal Diameters (Internal Offset)

A-1.6.1 If the nominal wall thickness of the adjoining pipe ends does not vary more than $3/32$ " , no special treatment is necessary. Full root penetration and bond is required in welding.

$3/32$ " maximum

A-1.6.2 Where the nominal internal offset is greater than $3/32$ " , the transition must be made by a taper cut on the inside of the thicker section. The taper angle shall not be greater than 30 degrees nor less than 14 degrees.

* Note: No minimum angle when the pipes have equal yield strengths.

A-1.7 Unequal External Diameters (External Offset)

A-1.7.1 Where the external offset does not exceed $1/2$ the thinner section, the transition may be made by welding provided the angle of rise of the weld surface does not exceed 30 degrees and both bevel edges are properly fused.

A-1.7.2 Where the external offset exceeds $1/2$ the thinner section, that portion of the offset over $0.5t$ shall be tapered not less than 14 degrees and not more than 30 degrees.

* Note: No minimum angle when the pipes have equal yield strengths.

A-1.8 Unequal Internal and External Diameters (External and Internal Offset)

A-1.8.1 Where there is both an internal and an external offset, the joint design shall be such that both the external portion of the offset over $0.5t$ and the internal offset of more than $3/32$ " is tapered not less than 14 degrees and not more than 30 degrees.

* Note: No minimum angle when the pipes have equal yield strengths.

End of Appendix.

WELDING

WELD 2.4 In-Service Welding

1.0 Purpose

This document establishes the requirements for in-service welding and inspection of pressure piping systems for Ameren Illinois (AIC). It is in accordance with 49 CFR Part 192.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Material Requirements](#)

[6.0 Acceptable Repair Methods](#)

[7.0 Welder Qualification](#)

[8.0 Welding Procedures](#)

3.0 Target Audience

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Superintendents
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 General

- 4.1 *In-service welding* is any welding performed on a pipeline or pressure piping system that contains gas (or any liquid) under static or flowing conditions.
- 4.2 Burn-through and hydrogen-induced cracking are major concerns when performing in-service welding.
- 4.3 AIC accepts the methods discussed herein for the repair of piping systems. Further, all repairs on gas piping systems shall be done in accordance with the Repairs section of the O&M Plan. See [REPR 1](#).
- 4.4 Welding on lines that are under internal pressure shall be done in strict conformance with the AIC O&M Plan and the approved AIC welding procedures.

5.0 Material Requirements

- 5.1 All materials used for in-service welding, such as sleeves and fittings, shall meet the minimum design requirements for wall thickness plus yield and tensile strength as specified by the welding procedure.
- 5.2 Backing strips should be a low-carbon material (e.g., 1010, 1020 carbon mild steel).

6.0 Acceptable Repair Methods

6.1 Pipe Replacement

- 6.1.1 If practicable due to available downtime, the preferred option is to replace the defect area by cutting out a cylindrical piece of pipe and replacing it with new pipe.
- 6.1.2 For repair purposes, a "cut-out cylinder" should be the minimum length as outlined below. See [REPR 1, Subsection 6.1](#).
 1. Size 2" through 8" nominal diameter: minimum 12".
 2. Greater than 8" nominal diameter: minimum of 1.5 times the nominal pipe diameter.

6.2 Full Encirclement Sleeves

- 6.2.1 Complete encirclement using split sleeves can be used for the repair of leaking welds, unacceptable welds, dents, corrosion, or pipe leaks. See [REPR 1, Subsection 6.3](#), Welded Full-Encirclement Split Sleeve.
- 6.2.2 The sleeve material shall provide the same pressure capability (or greater) as the carrier pipe.
- 6.2.3 All full-encirclement sleeves applied to repair leaks shall be fully welded both longitudinally and circumferentially in accordance with the Welding Sequence procedures. See [Subsection 8.4](#).
- 6.2.4 Full-encirclement sleeves that require "In-Service" welding procedures should be fitted with a low-carbon backing strip (e.g., 1010 /1020 carbon (18 gauge), 0.043 inch thick mild steel (approx. 1 inch wide)) under the longitudinal seams that contact the carrier pipe.

This is to prevent arcing or welding to the carrier pipe in the hoop stress direction.

1. Steel banding/strapping shall not be used for backing strips.

6.3 Hot Tap Fittings

- 6.3.1 When installing full-encirclement fitting, use backing strips whenever possible. A root opening of 1/16" to 3/16" shall be maintained on both longitudinal seams of the split fitting.
 1. The backing strip shall be of the same or comparable chemical composition to the material being welded.

Exercise *extreme caution* when welding the longitudinal weld to prevent burning through the backing strip and welding or arcing to the carrier pipe.

- 6.3.2 The hot tap fitting shall **not** be located within 2' of a pipe anchor, girth weld, flanged connection, or threaded connection unless approved by the Welding Supervisor.

- 6.3.3 The carrier pipe and the fitting shall be sand blasted or mechanically cleaned of all coating, scale, paint, or other foreign material. Cleaning shall be at least 3" on either side of the welding area.
- 6.3.4 Tapping in a girth weld is not permitted.
- 6.3.5 If the tap is through an area containing a longitudinal seam on pipe listed below, the area shall be ultrasonically analyzed for 10" beyond the fillet weld at the ends of the fitting. The weld shall meet the acceptance standards of API Std 1104.
 - 1. All transmission pipe, AND
 - 2. High pressure distribution pipe 4" and larger with MAOP of 100 psig or greater.

Gas Tech Engineering or Integrity Management may request an alternative method for analyzing the seam.

- 6.3.6 All hot tap fittings and other pressure containing fittings shall be leak tested in accordance with [PTST 1, Section 10](#), Testing after:
 - 1. Completing the welding, but before cutting the hot tap, and
 - 2. After tapping, soap test the weld at line pressure.

7.0 Welder Qualification

- 7.1 All in-service welding personnel using In-Service welding procedures shall be qualified in accordance with [WELD 2.2](#), which includes the requirements of, API Std 1104, Appendix B, "In Service Welding".

8.0 Welding Procedures

8.1 General

- 8.1.1 All in-service welding with operating pressures greater than 100 psig shall comply with the requirements of this specification or API 1104, Appendix B.
- 8.1.2 The in-service welding procedure specification (WPS) to be used will be those contained in [WELD 4](#) and designated with the "IS" prefix, unless specified otherwise.

8.2 Wall Thickness Survey

- 8.2.1 Prior to any in-service welding or installation of a fitting to be used to tap the lines listed below, the area to be welded shall be ultrasonic tested (UT) for laminations, internal corrosion, and inclusions. See [WELD 2.9](#).
 - 1. All transmission lines.
 - 2. High pressure steel distribution mains of 4 inch and larger with MAOP of 100 psig or greater.
- 8.2.2 The minimum wall thickness for 4" and larger carrier pipe that may be welded is 0.188", unless otherwise approved by the AIC Welding Supervisor.
- 8.2.3 The UT survey, shown in [Figure 1](#), shall be made around the entire circumference of the pipe, 3" either side of where circumferential fillet welds will be made.

- 8.2.4 For hot taps or side tap shaped nipples, the UT survey shown in [Figure 2](#) shall include the area to be tapped and 3" around the outside area of the branch connection.
- 8.2.5 Recommended UT approach is to perform inspection with one person moving probe and a second person reading and recording the data.
- 8.2.6 Any area that appears to indicate wall thickness defects are present shall be further evaluated by AIC personnel.

Figure 1: UT Survey - Full Encirclement

Figure 2: UT Survey - Full Encirclement with Hot Tap

8.3 In-Service Welding Electrode Requirements

- 8.3.1 The welding procedures approved for pipeline maintenance on the following AIC piping systems shall require a check for HIGH-flow (indicating rapid cooling, thus quenching the base metal):
 1. Pipe 4" nominal diameter and larger,
 2. Operating above 100 psig, AND

3. Older than 1975 (being high-carbon equivalence).

- 8.3.2 Preheat the pipe weld region between 400 °F to 500 °F for 3" both sides of the weld area. If this area cools below 200 °F within 4 minutes, this would indicate HIGH flow and the weld must be made with an AIC In-Service Welding Procedure IS01.
- 8.3.3 In-service welding requires using low hydrogen welding electrodes (specifically E 7018 H4R) and an additional Welder Qualification test specific to the Welding Procedure.
- 8.3.4 E7018-H4R are the preferred electrodes but if the pipe weld area remains hot without additional heating, then the welder may use Cellulose or "Gas Metal Arc Weld (GMAW)" procedures appropriate to the base material.
- 8.3.5 Pipelines that have been depressurized or purged to 0% gas may be welded using cellulosic and GMAW electrodes.
- 8.3.6 Storage and handling of low hydrogen electrodes shall be as described by the manufacturer. As a minimum requirement, all low hydrogen electrodes for use with in-service pipe welding shall be stored in rod ovens at temperature between 250 °F and 350 °F after they have been removed from their sealed container.
- 8.3.7 Low hydrogen welding electrodes found in "under-temperature" ovens (below 250 °F) will be painted yellow and discarded. Open new electrodes and store in a properly heated electrode oven.
- 8.3.8 Any electrodes which have been exposed to moisture or which are of a questionable condition shall not be used for pipeline in-service welding applications.
- 8.3.9 Welding full encirclement fittings (i.e., Style 110, 220 and Mueller full-encirclement control fitting) should utilize backing strips when using an "In-Service" welding procedure. See [Subsection 6.2](#).

8.4 Welding Sequence

All welding of full encirclement sleeves or fittings shall be done following the requirements of the applicable AIC welding procedure. The sequence follows:

- 8.4.1 Complete the UT survey at the areas to be fillet welded, if necessary. If survey indicates the pipe does not meet minimum wall thickness tolerances of API 5L, locate another area that conforms to the thickness tolerance prior to welding. As stated in UT Survey (see [Paragraph 8.2.2](#)), 0.188" is the minimum wall thickness to be welded without approval from the AIC welding supervisor.
- 8.4.2 Vent holes (typically 1/4") may be utilized for venting leaking gas.
1. An appropriate weld fitting, such as nipple or weld-o-let, could be welded over the vent hole to which a vent stack can be attached.
 2. The weld fitting and vent stack shall be constructed with pressure rated materials compatible with the maximum operating pressure of the pipe being repaired.
 3. Following completion of the repair, insert and weld a steel plug/cap in the fitting to prevent removal.
 4. The top vent hole should be welded last to vent superheated welding fumes.
- 8.4.3 Place the top and bottom sleeves or fittings with the backing strips tacked in the weld region of the bottom sleeve/fitting over the carrier pipe area.

- 8.4.4 Clamp or hold the sleeves/fittings in place, maintaining the proper weld root spacing for the longitudinal welds. Tack weld sleeves and backing strips together at the ends and center in the longitudinal grooves.
- 8.4.5 **DO NOT** tack weld sleeves to the carrier pipe (prohibited).

Note that welding the longitudinal groove welds results in weld shrinkage of the sleeve or fitting around the carrier pipe.

- 8.4.6 Give allowance during fit-up for shrinkage of 1/16" to 3/32" across the diameter of the sleeve during welding of the longitudinal groove welds. Recommend using a feeler gauge to measure.
- 8.4.7 After tacking the sleeves/fittings, complete the longitudinal welds on both sides (weld the longitudinal welds equally or use 2 welders simultaneously if available).
 - 1. Exercise care to ensure the longitudinal welds do not fuse to pipe at the ends of sleeve. The backing strip ensures that the longitudinal welds does not penetrate the carrier pipe.
 - 2. Refer to the procedure for proper sequence of the weld passes.
 - 3. See WPS IS 01 for special heating requirements for fittings that are wall thickness of 1.25 inch or greater.
- 8.4.8 With the longitudinal (side) welds completed, allow for cooling (shrinkage), then complete the lap-fillet weld on 1 end of the sleeve/fitting This allows the sleeve/fitting to move or shrink toward the welded end. Refer to the procedure for proper sequence of weld passes.
- 8.4.9 When the first end has been completely welded and cooled to ambient and/or line temperature, weld the last end to completion. Refer to the procedure for proper fillet weld size and proper sequence of weld passes.
- 8.4.10 Visually examine the longitudinal groove welds and circumferential fillet welds. When code requires or engineer requests, non-destructive inspection should be done in accordance with [WELD 2.7](#) - Magnetic Particle Testing (MPT) or [WELD 2.8](#) - Liquid Penetrant Testing (LPT).
- 8.4.11 If the fitting is being exposed to operating pressure, check the fitting with leak detection fluid or leak detection instrument as required before coating.
- 8.4.12 Protectively coat the sleeve/fitting with an approved coating. See [CORR 2.3](#).

8.5 Arc Burns

- 8.5.1 Arc burns on pipelines operating at or above 40% SMYS shall be cut-out as a cylinder, or at the discretion of the welding inspector may be eliminated in accordance with [WELD 2.10](#).
- 8.5.2 For removal of arc burns on other pipelines, see [WELD 2.10](#). The manner and extent of removing metal can be critical (i.e., must maintain minimum wall thickness).

8.6 Inspection Requirements

8.6.1 Fillet Welds

1. *Visual inspection* (mandatory requirement for all welds) in accordance with [WELD 2.5](#).
2. *Magnetic Particle Testing (MPT)* is the preferred NDT process. See [WELD 2.7](#).
3. *Liquid Penetrant Testing (LPT)* is an alternate to MPT. See [WELD 2.8](#).
4. Any crack or defect that has the appearance of a crack-like indication may be cause for rejection.

8.6.2 Longitudinal Groove Welds

1. During fit-up of the sleeves/fittings to the carrier pipe, conduct visual inspection to ensure the proper placement of the backing strips behind the groove weld.
2. In addition to visual inspection of welds, the inspection of longitudinal groove welds on full encirclement sleeves/fittings may be done using the preferred MPT process. If necessary, the LPT process is an acceptable alternative to MPT.
3. Any crack or defect that has a crack-like appearance shall be rejected.

8.6.3 Test Time Period

1. After completing the in-service weld, allow time for the weld to cool to ambient and/or line temperature prior to conducting any non-destructive test. The longer the time after completing weld, the greater the chance of detecting a crack in the weld if one might exist. When possible, 24 hours is desired.

WELD 2.5 Visual Inspection

1.0 Purpose

This document establishes the visual inspection requirements for gas pipeline welding and welded gas systems for Ameren Illinois (AIC). It is in accordance with 49 CFR Part 192.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Inspection Requirements](#)

[5.0 Records/Reports](#)

[6.0 Inspection Equipment and References](#)

3.0 Target Audience

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Superintendents
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 Inspection Requirements

4.1 General

- 4.1.1 Prior to conducting welding inspection on pipelines or piping systems, the welding inspector must have the knowledge of, and be familiar with, the industry codes, standards, and the AIC specifications that govern the respective construction activity.
- 4.1.2 The inspector should have access to the applicable codes and AIC welding procedures (WPS) in his possession for reference.
- 4.1.3 Welding inspector must have the appropriate inspection equipment on hand for determining compliance to the welding procedures and construction specifications. For inspection equipment, see [Section 6.0](#).
- 4.1.4 For compliance with AIC standard construction practices, **below are the primary areas that the welding inspector shall inspect and document.**

4.2 Welder and Procedure Qualification

- 4.2.1 The Welding Supervisor is required to check the qualification records for each welder working on AIC construction projects to ensure that current and proper qualification data is on file for the pipe diameters and wall thicknesses being welded. See [WELD 2.2](#) and [WELD 2.3, Section 6.0](#).

UNCONTROLLED IF PRINTED

4.2.2 Welding inspector shall examine the Welding Procedure Specification applicable to the project.

1. The Training Supervisor - Welding is required to ensure that the records of procedure test results are complete and accurate.

4.2.3 Any questions about the validity of AIC or contractor procedures for a particular application should be brought to immediate attention of the Training Superintendent-Gas Constructions & Operations.

4.3 Pipe/Component Surface Condition

4.3.1 The welding inspector shall examine the surface of all pipe and components for defects that might affect serviceability.

4.3.2 Any gouge, groove, dent, or other defect that exceeds the allowable depth in accordance with the applicable material standards must be removed by grinding or replacing the entire section as a cylinder.

4.3.3 After grinding to eliminate gouges or grooves, the wall thickness must be measured to ensure adequate wall thickness remains.

4.4 Alignment and Fit-up

4.4.1 Periodically ensure that the alignment and root space are in accordance with the approved AIC welding procedure (WPS).

4.4.2 Ensure the weld joint is clean and free of all foreign material, such as dirt, oil, and coating material.

4.4.3 Inspect end bevels for manufacturing defects, such as laminations, improper bevel angle, and improperly machined root face.

4.4.4 Check for handling defects, such as dent and root face damage.

4.4.5 Ensure the process / method of aligning pipe and components is done in a manner that does not result in abnormal residual stress on the completed weld.

4.4.6 For fillet welds, consider weld shrinkage that occurs. Require proper welding space with components being joined prior to welding.

4.5 Pipe Butt Welds

4.5.1 For diagram of the various butt weld passes, see Figure 1.

Figure 1: Various Welding Passes

4.5.2 Root Pass

1. When the welding procedure requires preheating, the temperature shall be measured by TempilStiks (see Figure 2 and [Paragraph 6.2.6](#)) or pyrometers

(direct reading or infrared). Preheating temperatures shall be maintained until completion of the root pass.

Figure 2: TempilStik -- Holder and Crayon

2. Check condition of the root pass electrodes and determine that the proper AWS classification and diameter are being used.
3. Examine the cable connections at the welding machine to verify that the correct polarity is being used.
4. During root pass welding, periodically verify that amperage, voltage, and travel speed comply with the approved welding procedure.

Recognize that root pass travel speed and amperage are closely related. Excessive travel speed usually indicates excessive amperage is being used and vice-versa. These being outside the procedure parameters increase potential for a thinner root bead possibly leading to cracking.

4.5.3 Hot Pass

1. Preheat when required.
2. Check condition of the hot pass electrodes and determine that the proper AWS classification and diameter are being used.
3. Ensure that the time period (major importance) is not exceeded between the root pass and the hot pass as specified in the approved welding procedure.
4. Periodically verify that amperage and voltage measurements are appropriate during deposition of the hot pass.
5. Require that the completed hot pass be cleaned of all slag by power brushing.
6. Ensure inter-pass temperature is not exceeded.

4.5.4 Fill Passes

1. Preheat if required.
2. Check condition of the fill pass electrodes and determine that the proper AWS classification and diameter are being used.
3. Confirm that the welding procedure is being followed regarding the number of fill passes for the respective wall thickness.
4. Periodically measured amperage and voltage to determine compliance with the approved AIC welding procedure. When checking voltage at the machine terminals, allow for a 2-3 volt drop at the arc depending on the length of the welding cable.

UNCONTROLLED IF PRINTED

5. Ensure that inter-pass cleaning is enough to eliminate slag-entrapment between passes.
6. Ensure inter-pass temperature is not exceeded.

4.5.5 Cap Pass

1. Preheat if required.
2. Check condition of the cap pass electrodes and determine that the proper AWS classification and diameter are being used.
3. Measure amperage, voltage, and travel speed on a periodic basis to determine compliance to the approved AIC welding procedure.
4. Ensure that the cap pass is properly cleaned, including the edges of the cap pass, so that a complete and thorough inspection can be performed.
5. Visual acceptance criteria for the finished weld, unless otherwise stated, shall be as follows:
 - 5 a. The weld crown (cap pass) surface shall not be below the pipe surface at any point, nor should it be above the parent metal by more than 1/16".
 - 5 b. Cap passes which are above the parent metal by more than 1/16" and which (per welding inspector opinion) may be suspect for having excessive re-enforcement may be ground down to 1/16" above the pipe surface. However, the height of a weld crown may exceed 1/16" if the contour provides a uniform transition into the pipe material on both sides of the weld. Maximum height is 1/8" with a smooth contour.
 - 5 c. Undercut at depth greater than allowed in Table 1 shall be repaired.

Table 1: Undercutting

Maximum Dimensions of Undercutting	
Depth	Length
> 0.032" or > 12.5% of wall thickness (WT), whichever is smaller.	Not acceptable
> 0.016" but ≤ 0.031" or > 6% WT OR ≤ 12.5% of pipe WT, whichever is smaller.	2" in a continuous 12" weld length OR 1/6th the weld length, whichever is smaller.
≤ 0.016" or ≤ 6% of pipe WT, whichever is smaller.	Acceptable, regardless of length

- 5 d. Two beads shall not be started at the same location, and the face of the completed weld should be approximately 1/8" greater than the width of the original groove.
- 5 e. Visibly porosity (pinholes) is not allowed. Porosity shall be removed by grinding. If the grinding reduces the cap below the pipe surface, the weld will be repaired following weld repair requirements.
 - 200 - 500°F preheat.
 - Weld length at minimum 2 inches.

- Steel Punches or peening the hole shut is not permitted.

5 f. Cracks of any length are not allowed and must be cut-out as a cylinder of pipe.

5 g. Arc burns on the weld or pipe are not allowed. For arc burns removal, see [WELD 2.10](#).

4.5.6 Pipe Fillet Welds

1. Inspect all fillet welds to ensure compliance with approved AIC welding procedure.
2. All fillet welds should have a minimum of 3 weld passes. (This requirement is to eliminate any potential leak path.) However, 3/4" punch tees can be with a 2-pass weld.
3. Unless otherwise specified, inspect fillet welds using the acceptance criteria listed below.
 - 3 a. Leg size shall be in conformance with approved procedure.
 - 3 b. Pinholes or porosity are not allowed.
 - 3 c. Undercut greater than 1/64" in depth is not allowed, regardless of length.
 - 3 d. Cracks of any length are not allowed. (See [Weld 2.3, Paragraph 10.1.2](#).)

5.0 Records/Reports

- 5.1 Develop and retain all visual inspection records and reports as appropriate for AIC compliance with this specification on a respective project basis.

6.0 Inspection Equipment and References

- 6.1 Visual inspection of pipe welding involves the use of certain instruments and inspection tools to measure pipe and components for conformance to AIC purchase specifications, welding parameters, and material defects. codes and standards.
- 6.2 Recommended equipment for the welding inspector includes the following (*plus additional optional equipment as needed*).
 - 6.2.1 Personal corrective glasses as needed.
 - 6.2.2 DC amperage meter (analog or digital) for measuring welding amperage (Tong meter, 0-200 amps).
 - 6.2.3 DC voltmeter for measuring arc welding voltage (DC Voltmeter, 100VDC).
 - 6.2.4 Dial or digital caliper (6") for accurate measurement of root face, pipe wall thickness at the ends, tensile specimens, etc.
 - 6.2.5 Pit measuring gage or dial indicator depth gage.
 - 6.2.6 Temperature indicating sticks (i.e., TempilStiks available at 150°, 200°, 250°, 300°, 350°, 400°, 450 °F.) or suitable pyrometer.
 - 6.2.7 Tape measure (6') for measuring length of weld deposit to assist in determining welding travel speed.

- 6.2.8 Stopwatch (or watch with a second hand) for measuring arc time of welding electrodes to determine travel speed during welding.
- 6.2.9 Ultrasonic Thickness Gage available onsite for measuring remaining wall thicknesses after a gouge or arc burn is removed.
- 6.2.10 Optional:
 - 1. "Pi" or diameter tape for measuring pipe ends to ensure conformance to API 5L or other pipe specifications.
 - 2. Gauss- meter with longitudinal probe available should a question arise regarding pipe possibly being magnetized. (Pipe could have magnetized by electromagnetic inspection methods or the pipe lifted with electromagnetics.) Knowing if pipe might be magnetized can help explain certain welding problems.
- 6.2.11 Fillet weld gauges.
- 6.2.12 Quality flashlight.
- 6.3 In addition to the above equipment, the welder and/or welding inspector is expected to have the applicable welding procedure specifications (WPS) on-site for immediate reference.
- 6.4 Added resources that should be readily accessible are the applicable codes and industry standards for reference.

WELD 2.6 Radiographic Testing

1.0 Purpose

This document establishes the requirements for performing radiographic inspection of circumferential groove (butt) welds on all gas pipelines and gas piping systems made during construction or fabrication for Ameren Illinois (AIC). It is in accordance with 49 CFR Part 192.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Radiographic Testing Personnel](#)[6.0 Radiation Safety](#)[7.0 Radiographic Testing Procedures](#)[8.0 Radiographic Quality](#)[9.0 Production Radiography](#)[10.0 Reports](#)**3.0 Target Audience**

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Superintendents
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 General

- 4.1 This procedure applies equally to maintenance/repair projects where the nature or involvement of welding work is like primary pipeline construction or related fabrication.
- 4.2 This specification does not apply to longitudinal groove (butt) welds and fillet welds made during in-service welding of full encirclement sleeves or patches.

5.0 Radiographic Testing Personnel

- 5.1 All Level I, Level II, or Level III radiographic testing (RT) personnel engaged in production and evaluation of radiographs for AIC shall provide AIC Gas Compliance with the following written documentation prior to production radiography:
 - 5.1.1 Certification or recertification by their employer in the Radiographic Testing method for the following:
 1. Previous 3 years as either a Level I or Level II, and

UNCONTROLLED IF PRINTED

2. Previous 5 years for Level III

NOTE:	A 5 years recertification interval for Level I, and Level II may be acceptable, if approved by AIC, for those NDT companies which conduct the additional required certification testing.
--------------	--

5.1.2 Documentation shall include the following minimum information:

1. Name of certified individual.
2. Level of certification (e.g., Level I, Level II, Level III).
3. Educational background and experience of certified individual.
4. Statement indicating satisfactory completion of training in accordance with employer's written practice.
5. Results of certification examination (grades).
6. Date of certification and/or recertification.
7. Certification expiration date.
8. Signature of employer's certifying person.

5.1.3 Certifications shall be in accordance with American Society for Nondestructive Testing, Recommended Practice No. SNT-TC-1A.

5.2 All other RT personnel (e.g., assistant radiographer/trainee) assigned to and engaged in assisting the Level II or Level III radiographer in the production of radiographs shall have a State of Illinois' Industrial Radiographer Certification Card

5.3 Vision Acuity Record

5.3.1 Current record of individual's near-vision acuity results administered by an approved medical professional to ensure natural or corrected near-distance acuity in at least one eye. This is to verify that individual can read a minimum of Jaeger Number 1 or equivalent type and size letter at a distance not less than 12".

5.3.2 Documentation of successful results from an administered color-contrast differentiation examination within the past 5 years.

5.4 All RT personnel engaged in the production and evaluation of radiographs for AIC shall maintain a copy of their certifications on the job site.

5.5 All requested information shall become part of the final job packet.

5.6 The AIC Project Engineer and/or Construction Inspector shall verify that RT personnel do have their current certifications.

5.7 Only Level II or Level III RT personnel shall:

5.7.1 Interpret radiographic images of production welds.

5.7.2 Report all defects observed in the images.

5.7.3 Indicate whether the weld meets the standard of acceptability as specified in the referencing code standard (i.e., API Std. 1104, Section 9).

5.8 RT personnel may be required to:

5.8.1 Demonstrate their ability to produce acceptable radiographs with each radiographic procedure they use prior to performing production radiographs.

5.8.2 Be recertified at the option of AIC or if any question arises about their ability. Level II or III RT personnel and film interpreter's work will be subject to review by AIC representative and any pattern of inconsistency will be cause for additional training, testing, or dismissal.

5.9 AIC shall have the right to remove any RT personnel who, in the opinion of the AIC representative, is incompetent, careless, unsafe, or otherwise not qualified to perform the work assigned, or who is found to be insubordinate or guilty of improper conduct.

6.0 Radiation Safety

6.1 All RT personnel engaged in the production of radiographs for AIC shall possess a current "Radiation Safety ID Card" issued by an authorized radiation safety regulatory jurisdiction.

6.2 When production requires a 3-man crew, the crew shall consist of a Level II/III, Level I, and a trainee as a minimum.

6.3 The lead radiographer (RT Level II or Level III) assigned to the job site shall be responsible for protection and monitoring of every person working with or near sources of radiation. This protection and monitoring must comply with applicable federal, state, and local regulations that apply to radiation safety.

6.3.1 No radiographer or their assistants may perform radiography without a film badge, pocket dosimeter, and properly calibrated and operable radiation survey instrument and rate alarm meter. This monitoring equipment must be acceptable to the AIC Welding Inspector.

6.4 Appropriate radiation warning signs shall be posted whenever radiographic examinations are taking place. In addition to visual surveillance by the RT personnel, radiation safety barriers, cones, ropes, or tape may be used to keep unauthorized individuals away from radiation areas.

7.0 Radiographic Testing Procedures

7.1 General

7.1.1 This section prescribes the minimum requirements for establishing and qualifying the radiographic procedures to be used for examination of welds covered by this section

7.1.2 Procedures should be qualified and approved whenever there is a change in an essential variable.

7.1.3 The required radiographic testing of welds shall be performed on pipe that is uncovered, accessible, and not coated with any material that would interfere with radiographic testing.

7.1.4 Weld shall meet the visual inspection criteria prior to being radiographed.

7.2 Procedure Qualification

7.2.1 Procedures to be used on the work assignment should be qualified/approved by AIC prior to the performance of any radiographic examination.

7.2.2 An approved radiographic shot (to prove qualified/detailed procedure) should be documented and attached to the radiographic report

1. The procedure shot can be the first production shot and should be documented by placing "P" after the weld number on the film or other imaging media.

2. Any changes in details contained in API Std 1104, Section 11.1.2.2 Film Radiography (20th Edition), require a new procedure shot. Details may include:
 - 2 a. Radiation source.
 - 2 b. Intensifying screens.
 - 2 c. Film.
 - 2 d. Exposure geometry.
 - 2 e. Exposure conditions.
 - 2 f. Processing method.
 - 2 g. Material being tested.
 - 2 h. Image quality indicators (IQI).
 - 2 i. Heat shields.
- 7.2.3 An AIC representative may be allowed to witness the test and determine acceptance of the procedure.
 1. Advanced notice must be given to AIC to schedule personnel for witnessing the procedure qualification.
- 7.2.4 The radiographer performing the radiographic test will be simultaneously qualified in the procedure.
- 7.2.5 Qualified procedures may be used by other radiographers from the same contractor provided they have a copy of the procedure record and they qualify their ability to produce an acceptable radiograph using the procedure details.

8.0 Radiographic Quality

- 8.1 The radiographic images produced by gamma ray or x-ray using the qualified procedure(s) shall have appropriate radiographic density, clarity, and contrast as required by the referencing code standard (i.e., API Std. 1104).
 - 8.1.1 Gamma ray shall use Class 1 film as follows:
 1. For pipe 6" nominal diameter and larger: D2 thru D5 film.
 2. On pipe less than 6" nominal diameter: D2 thru D4 film.
- Since most radiographic examinations performed at AIC are gamma ray, Class I film will be predominately used. Alternative film may be used with written approval by AIC approved third-party Level III technician.
- 8.1.2 X-Ray shall use Class 1 film or better or other imaging media. Alternative film may be used with written approval by an AIC approved third-party Level III technician.
- 8.2 The following criteria shall be used to evaluate radiographic images:
 - 8.2.1 An acceptable image quality that is free from fog and from processing irregularities that could mask the image of actual imperfections.
 - 8.2.2 The prescribed image quality indicator (IQI) and the essential wire diameter.

- 8.2.3 A satisfactory identification system.
- 8.2.4 An acceptable technique and setup.
- 8.2.5 Compatibility with referenced code acceptance standards.
- 8.3 The lead radiographer (RT Level II or Level III) assigned to the job site shall be equipped with a densitometer based on the H&D density measuring system and an enclosed high intensity viewing light.
- 8.4 The viewing light and the densitometer must meet the requirements as specified in Paragraphs [9.4.5](#) and [9.4.6](#), respectively, and shall be acceptable to the Welding Inspector.
- 8.5 All radiographic film images shall be examined with the aid of high intensity light and compliance with film density requirements as specified in the referenced code standard (i.e., API Std. 1104) and confirmed using the densitometer.
- 8.6 Exposure and processing of production radiographs shall be such that:
 - 8.6.1 The H&D density through the weld metal for transparent-based film shall be:
 - 1. Not less than 1.8, and
 - 2. Not more than 4.0.
 - 8.6.2 The images of the image quality indicator's (IQI) identifying style number, ASTM set letter, and essential wire diameter shall all appear clearly on the radiograph.

9.0 Production Radiography

- 9.1 Only RT procedures approved by AIC shall be used. A single-wall exposure/single wall viewing (SWE/SWV) radiographic technique should be used when practical and safe to do so. When not practical to use a single-wall exposure technique, a double-wall exposure technique shall be used.
 - 9.1.1 However, when a double-wall exposure/single wall viewing (DWE/SWV) radiographic technique is used, there shall be a minimum of 3 exposures for each weld examined.
- 9.2 When more than 1 radiographic film is used to examine a weld, the following requirements shall be met:
 - 9.2.1 Complete weld identification shall appear on each film image.
 - 9.2.2 Adjacent film images shall overlap by a minimum of 2"; and
 - 9.2.3 At the ends of adjacent film, the same circumferential location marker shall appear on both films, as evidence of complete coverage.
- 9.3 Use only lead foil intensifying screens and having minimum thickness front and back at 0.005".
- 9.4 The weld identification (ID) numbering system will be established by AIC and furnished to the radiographic contractor prior to construction role.
 - 9.4.1 All film shall be clearly identified using lead letters/numbers or with a film ID flasher as follows:
 - 1. ID numbers/letters to be 1/4" - 3/8" height.
 - 2. Minimum ID to include contractor name, date, job number, weld number, Ameren-IL.

3. When using a film ID flasher, then flash information on the overlap end of each film.
- 9.4.2 Unless otherwise approved as location markers, a numbering belt shall be used during production radiographic examination. It shall be of enough length to cover the entire circumference of the weld.
1. Place numbering belt adjacent to the weld with lead numbers representing specific increments in "inches", as designated by AIC. Start the numbers with "0" and proceed in a clockwise direction. Practice maximum 4" increments on pipe 6" and larger.
 2. Place the number "0" in the number belt in line with the "top button" of the weld. Using the specified marking material, mark the pipe at this location along with an arrow showing the direction of location marker numbering.
 3. The direction of location marker numbering shall be the same throughout the project and will be conveyed to the radiographic contractor by AIC prior to production radiography.
- 9.4.3 The radiographic contractor shall visibly mark any weld that is to be repaired or cut-out.
1. The marking medium shall be such that the markings on the pipe will be identifiable until the location of the weld and final disposition have been recorded
- 9.4.4 The use of permanent markers (e.g., felt pen, "sharpies") are prohibited and shall not be used to make marks on the radiographic film.
- 9.4.5 Facilities and Equipment for Viewing Radiographs
1. The following facilities and equipment shall be used for radiographic film interpretation on AIC projects:
 - 1 a. Viewing facilities shall provide subdued background lighting of an intensity that will not cause reflections, shadows, or glare on the radiograph that interfere with the interpretation process.
 - 1 b. Viewing unit shall be high intensity type light equipped with a dimmer control as part of the equipment to provide proper illumination for the range of densities being viewed.
 - 1 c. The equipment shall produce enough illumination to view a maximum density of H&D 4.0.
 - 1 d. The viewing screen shall be provided with masks to reduce the lighted area to the film size and control light coming through low-density portions of the radiograph that could interfere with interpretations.
 - 1 e. The screen shall be free of scratches, dirt or other debris that could lead to misinterpretations.
- 9.4.6 Film Densitometer
1. A film densitometer (for checking film density) shall be provided on each radiographic testing unit (e.g., darkroom) and shall be used by the RT personnel to ensure the specification densities are met.
 2. Each film densitometer shall have an attached calibration sticker and be kept in good working condition.

3. Use a density calibration strip to calibrate the unit daily prior to production use. The calibration shall be documented, and record maintained.

9.4.7 Radiographic Equipment Requirements - General

1. The radiographic contractor shall provide radiographic inspection units equipped with all equipment and supplies necessary to produce, process, and interpret radiographs at the job site.
2. All equipment shall always be maintained in a good repair state .
3. Enough spare equipment should be readily available to eliminate downtime of radiographic operations.
4. Only equipment approved by AIC should be used for production radiography.

9.4.8 Darkroom Facilities - General

1. Darkrooms should be equipped for use as film processing and film viewing facilities.
2. The radiographic contractor may elect to use separate facilities for each function providing the requirements of this specification are met.
3. In addition to having processing capability for all film, the darkroom should meet the following minimum conditions:
 - 3 a. Darkrooms or viewing facilities should be large enough to comfortably accommodate at least 2 people viewing radiographs.
 - 3 b. Each darkroom or viewing facility shall have at least 1 film viewer that meets the Film Viewers requirements listed in [Paragraph 9.4.5](#).
 - 3 c. Each darkroom shall be equipped with a film densitometer for checking the film density.
 - 3 d. Each darkroom shall have electric power plants of sufficient size to independently operate all equipment.
 - 3 e. Recommend heating and air conditioning of darkroom.

9.4.9 Production Quality

1. The radiographic contractor shall perform all work under this specification in an orderly and expeditious manner while always maintaining required quality.
2. Reasonable time will be provided for the performance of the girth weld radiography and documentation, but at no time shall unnecessary delays be allowed due to equipment, supply, or personnel problems.

9.4.10 Standards of Acceptability

1. The standard of acceptability for radiographic film interpretation shall be API Std 1104, latest PHMSA approved edition.
2. The radiographic contractor's interpreter shall be responsible for assuring all radiographs are interpreted in accordance with API Std 1104.
3. Imperfections identified in the radiograph shall be measured, using a ruler and/or optical comparator.
 - 3 a. Ruler: A clear, thin plastic ruler graduated in at least 1/16" increments shall be used for measuring weld imperfections.

- 3 b. Optical Comparator: If it is necessary to use a comparator, it is recommended that the maximum of 7X power be used, and it should have a positive focusing adjustment.
4. In the case of broken or elongated slag lines that appear in the same plane or line, each indication shall be measured, and the total length of all indications used to determine the acceptance of this discontinuity

9.4.11 Film Review

1. AIC representative shall have the right to review radiographs at any time during the project.
2. The welding contractor shall have the right to review radiographs only when accompanied by AIC representative.
3. Radiographs may be reviewed on the pipe right-of-way provided it does not interfere with radiographic inspection operations.

9.4.12 Film Storage

1. Radiographic film of all acceptable welds and/or repairs shall be carefully prepared and filed in compartmentalized boxes or placed in envelopes in numerical order.
2. Radiographic film of unacceptable welds shall be stored with the repair radiographs.
3. Radiographic film of cut-out welds shall be stored separately.
4. The RT contractor will process, handle, and store the images in a manner that they are interpretable for at least 3 years after they are produced.
5. When boxes are used, each box shall contain a grid sheet identifying the radiographic film in each compartment and a copy of the applicable inspection reports.
6. The following information shall be placed on the front edge of the radiographic film boxes or envelopes:

Ameren Illinois
Film Container Number _____
Date _____
X-ray Numbers _____ to _____
Radiographic Contractor's Name _____
Line Section _____
P.O. No. _____

- 9.4.13 Film Retention: Upon completion of the review of the weld radiographs, and at discretion of the AIC Representative, the film may be properly discarded (even though RT contractor has requirement under [Paragraph 9.4.12, Item 4](#)). Otherwise, see [Paragraph 10.2.3](#).

9.4.14 If other imaging media is recorded on discs, the discs should become part of the final job packet.

10.0 Reports

10.1 Daily Radiographic Examination Reports

10.1.1 The radiographic contractor shall be responsible for furnishing the field AIC representative and construction contractor's representative with a detailed report of each previous day's radiography results.

10.1.2 The daily radiographic report supplied to AIC should include the following:

1. Weld ID number.
2. Status of weld (acceptable/unacceptable).
3. Defect type.
4. Location of defect on pipe circumference.
5. Location of defect in reference to cross-section (based on judgment).
6. Date radiography performed.
7. Pipe diameter & wall thickness.
8. Well Location.
9. Number of welds radiographed.
10. Type of exposure: Single Wall Exposure/Single Wall Viewing (SWE/SWV) or Double Wall Exposure/Single Wall Viewing (DWE/SWV), etc.
11. Crew size and Unit No.
12. Radiographer's signature.
13. Defect code per API Std 1104, Section 9. (20th Edition as current)
14. AIC representative's signature.

10.2 Report Retention

10.2.1 A copy of the daily radiographic reports showing the location and disposition of each weld shall be maintained in AIC's permanent job file for life of the pipeline.

10.2.2 In addition to retaining daily radiographic reports, establish and retain a project summary for life of the pipeline that includes the following:

1. Total welds made,
2. Total welds repaired,
3. Total welds cut-out, AND
4. Certification by the Project Engineer or Chief Welding Inspector that all work and radiographic inspection was performed in accordance with 49 CFR 192 requirements and API Std 1104.

10.2.3 With the certified project summary, the radiographic film can be disposed after waiting 1 year for any possible audit of the construction files (including film) or for some other specific issue. This recognizes that the film has served its purpose and can rapidly deteriorate and become unmeaningful and contentious. Film disposal shall be in an environmentally safe manner.

WELD 2.7 Magnetic Particle Testing

1.0 Purpose

This document is to outline the requirements to be followed by Ameren Illinois (AIC) when Magnetic Particle Testing is performed for examination of pipelines and related facilities.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Magnetic Particle Testing Personnel](#)[6.0 Magnetic Particle Testing Procedures](#)[7.0 Method and Equipment](#)[8.0 Dry Magnetic Particle Application](#)[9.0 Wet Magnetic Particle Application](#)[10.0 Interpretation and Acceptance](#)[11.0 Reports](#)[12.0 Report Retention](#)**3.0 Target Audience**

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Superintendents
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 General

- 4.1 This establishes magnetic particle examination/testing criteria that is to be used for examination of welds on new construction as well as being used during maintenance activities.
- 4.2 The magnetic particle examination method is applied to detect cracks and other imperfections on the surface of ferromagnetic materials.
- 4.3 In principle, this method involves magnetizing an area to be examined, and applying ferromagnetic particles to the surface. Particle patterns form on the surface where the magnetic field is forced out of the part and over imperfections to cause a leakage field that attracts the particles. Particle patterns are usually characteristic of the type imperfection that is detected.

UNCONTROLLED IF PRINTED

- 4.4 Whichever technique (Dry or Wet) is used to produce the magnetic flux in the part being examined, maximum sensitivity will be to linear imperfections oriented perpendicular to the lines of flux. For optimum effectiveness in detecting all types of imperfections, each area is to be *examined at least twice*, with the flux lines during one examination being approximately perpendicular to the flux lines during the other examination.
 - 4.4.1 *Dry Magnetic Particle* testing shall be used when the temperature of the surface being tested is between 100 °F and 600 °F. However, dry magnetic particle testing can be done on surfaces under 100 °F.
 - 4.4.2 *Wet Magnetic Particle* testing is acceptable with contrast only and only when the temperature of the surface being tested is below 100 °F.
- 4.5 AIC does not allow magnetic particle examination on surface areas that are coated or painted. Contrast coating used for wet magnetic testing is not considered a paint or coating.

5.0 Magnetic Particle Testing Personnel

- 5.1 All Level I, Level II, and Level III magnetic particle testing (MT) personnel for AIC assignment to perform examinations and evaluate results shall provide AIC Gas Compliance with the following written documentation prior to work activity:
 - 5.1.1 Certification or recertification by their employer in the Magnetic Particle Testing method for the following:
 1. Previous 3 years as either a Level I or Level II, and
 2. Previous 5 years for Level III.

NOTE:	A 5 years recertification interval for Level I, and Level II may be acceptable, if approved by AIC, for those NDT companies which conduct the additional required certification testing.
--------------	--

- 5.1.2 Documentation shall include the following minimum information:
 1. Name of certified individual.
 2. Level of certification (e.g., Level II, Level III).
 3. Educational background and experience of certified individual.
 4. Statement indicating satisfactory completion of training in accordance with employer's written practice.
 5. Results of certification examination (grades).
 6. Date of certification and/or recertification.
 7. Certification expiration date.
 8. Signature of employer's certifying person.
- 5.1.3 Certifications shall be in accordance with American Society for Nondestructive Testing, Recommended Practice No. SNT-TC-1A.
- 5.2 Vision Acuity Record
 - 5.2.1 Current record of individual's near-vision acuity results administered by an approved medical professional to ensure natural or corrected near-distance acuity in at least one eye. This is to verify that individual can read a minimum of Jaeger Number 1 or equivalent type and size letter at a distance not less than 12".

- 5.2.2 Documentation of successful results from an administered color-contrast differentiation examination within the past 5 years.
- 5.3 AIC Project Engineer or Construction Inspector shall request the above information when the magnetic particle testing contractor is contacted and prior to a work assignment.
- 5.4 All MT testing personnel engaged in the examination and evaluation of magnetic particle results performed for AIC shall maintain a copy of their certifications credentials on the job site.
- 5.5 Only Level II or Level III MT testing personnel shall:
 - 5.5.1 Interpret magnetic particle testing results.
 - 5.5.2 Report all defects observed.
 - 5.5.3 Indicate whether the weld meets standard of acceptability as specified in the referencing code standard (i.e., API Std. 1104, Section 9.4).
- 5.6 MT personnel may be required to:
 - 5.6.1 Demonstrate their ability to produce acceptable magnetic particle examination results using approved procedures prior to performing production magnetic particle testing.
 - 5.6.2 Be recertified at the option of AIC or if any question arises about their ability. Level II or III MT personnel's work will be subject to review by AIC representative and any pattern of inconsistency will be cause for additional training, testing, or dismissal.
- 5.7 AIC shall have the right to remove any MT personnel who, in the opinion of the AIC representative, is incompetent, careless, unsafe, or otherwise not qualified to perform the work assigned, or who is found to be insubordinate or guilty of improper conduct.

6.0 Magnetic Particle Testing Procedures

- 6.1 General
 - 6.1.1 This section prescribes the minimum requirements for establishing and qualifying the magnetic particle testing procedures to be used for examination of welds.
 - 6.1.2 The NDE contractor shall provide a detailed procedure to produce acceptable magnetic particle examination results.
- 6.2 Procedure Qualification
 - 6.2.1 All procedures to be used on the work assignment shall be qualified prior to performing any magnetic particle examination of a production nature.
 - 1. Advanced notice must be given to AIC to schedule personnel for witnessing the procedure qualification.
 - 2. AIC representative shall determine the acceptance of procedure.
 - 3. Procedure shall be qualified by performing an acceptable magnetic particle examination of a weld following approval of the procedure.
 - 4. A completed Qualification Form shall be provided by the NDE contractor for acceptance by AIC.
 - 6.2.2 AIC representative may further review all procedure details and the test results prior to beginning testing.

UNCONTROLLED IF PRINTED

- 6.2.3 The MT testing Level II or III technician performing the magnetic particle test will be simultaneously qualified in the procedure.
- 6.2.4 Qualified procedures may be used by other MT Level II or III technicians from the same contractor provided they have a copy of the procedure record and they qualify their ability to produce an acceptable magnetic particle examination using the procedure details.
- 6.2.5 The approved qualified procedure(s) used for inspecting welds should be filed in the job packet.

7.0 Method and Equipment

7.1 General

- 7.1.1 Reference Table 2, Recommended NDT Methods under [WELD 2.3, Paragraph 11.1.2](#).
- 7.1.2 Welds shall meet visual acceptance criteria prior to MPT.
- 7.1.3 All magnetic particle examinations shall be performed utilizing the continuous magnetization method (i.e., current flow is energized while ferromagnetic particles are being applied) with either wet or dry ferromagnetic particles.

Under no circumstances shall the "Prod Technique" be used for examination of pipeline girth welds due to potential of arcing the pipe during examination.

- 7.1.4 Permanent magnets are banned from use.
- 7.1.5 All examinations shall be conducted with enough field overlap to ensure 100% coverage.

7.2 Yoke Technique

- 7.2.1 Either an alternating current (AC) or direct current (DC) electromagnetic yoke may be used.
- 7.2.2 Each weight shall be weighed with a properly calibrated scale and stenciled with the applicable nominal weight prior to first use.
- 7.2.3 Verify the magnetizing power of yokes prior to use each day the yoke is used. Record the power on the NDE Contractor's daily inspection report.
 - 1. The lifting power of each yoke shall be confirmed by its ability to lift the specified test weight in a vertical direction at the maximum pole spacing that will be used.
 - 1 a. AC electromagnetic yoke at 10 lbs.
 - 1 b. DC electromagnetic yoke at 40 lbs.
- 7.2.4 Electromagnetic yoke shall be used to examine groove and fillet welds, and should be conducted in the following manner:
 - 1. Poles of the magnetic yoke shall be adjusted to ensure:
 - 1 a. Good contact with the surface to be examined, and
 - 1 b. Distance between poles does not exceed 6".

UNCONTROLLED IF PRINTED

2. When area to be examined is 4" or less, the yoke shall be placed on the part being examined as shown in [Figure 1](#).
3. Apply the magnetic powder by lightly dusting the area between the poles.
4. Use the squeeze air bulb to lightly remove excess powder. Attention must be given to not remove any magnetic particle indications that have formed.
5. Remove the yoke and evaluate the magnetic particle indications.
6. Clean the surface with a paper towel or dry rag and repeat the examination with the yoke pole positions as shown in [Figure 2](#). Repeat the action steps 3 thru 5 above.
7. When the area to be examined is greater than 4", repeat steps 3 thru 5 for Figures 1 and 2 with pole positions overlapping as shown in [Figure 3](#) for each 4" of area examined.

Figure 1: Magnetic Particle Inspection Sequence

Figure 2: Magnetic Particle Inspection Sequence

Figure 3: Magnetic Particle Inspection Sequence

7.3 Examination Medium

7.3.1 General: Magnetic particle properties and concentrations shall meet the minimum requirements as identified in ASTM E709.

7.3.2 Visible Dry Color Magnetic Particles

1. The visible dry method may utilize magnetic particles which contrast with the examination surface.
2. Color of the magnetic particles shall be different than color of the examination surface.

7.3.3 Visible Wet Color Contrast Magnetic Particles:

1. The visible wet method may utilize black oxide (ink) magnetic particles that are applied over a white background paint to provide contrast with the examination surface.

8.0 Dry Magnetic Particle Application

- 8.1 Preparation: Prior to performing magnetic particle examinations, all areas to be examined shall be free of slag, spatter, scale, dirt, paint, grease, and any other foreign matter that could mask or interfere with interpretation of imperfections.
- 8.2 Dry Continuous Magnetization Technique
 - 8.2.1 Dry particles lose most of their mobility when they contact the surface of a part. Therefore, it is imperative that the area under examination be under the influence of the applied magnetic field while the particles are still airborne and free to be attracted to leakage fields.
 - 8.2.2 Before applying dry magnetic particles, start the flow of magnetizing current. Stop the current flow after completing powder application and blowing off excess powder.
- 8.3 Dry Magnetic Powder Application
 - 8.3.1 Do NOT apply dry magnetic particles to damp surfaces
 - 8.3.2 Use a bulb-type applicator to apply dry magnetic powder such that a light uniform, dust-like coating settles upon the surface of the part while it is being magnetized.
- 8.4 Dry Magnetic Powder Removal
 - 8.4.1 Removal of excess dry magnetic powder is generally done while the magnetizing current is present.
 - 8.4.2 Use a squeeze air bulb which permits removal of excess dry magnetic particles without affecting the relevant magnetic particle indications.

Exercise care to prevent removing particles attracted by leakage field, which may prove to be a relevant indication.

9.0 Wet Magnetic Particle Application

- 9.1 Preparation: Prior to performing magnetic particle examinations all areas to be examined shall be free of slag, spatter, scale, dirt, paint, grease, and any other foreign matter that could mask or interfere with the interpretation of imperfections.
- 9.2 Technique: The wet continuous magnetization technique involves bathing the part with the examination medium to provide an abundant source of suspended particles on the surface of the part. Then, terminating the bath application immediately prior to the termination of the magnetizing current.
- 9.3 Wet Magnetic Particle Application
 - 9.3.1 Wet magnetic particles suspended in a container/vehicle at a recommended concentration may be applied either by spraying or flowing over the areas to be examined during the application of the magnetizing field current (continuous technique).
 - 9.3.2 The wet medium may be applied using either aerosol spray can or spray pump to evenly apply the wet particles over the examination surface.
- 9.4 Visible Wet Color Contrast Magnetic Particles:
 - 9.4.1 The visible wet method uses contrasting color magnetic particles over the background coating on the test area.

UNCONTROLLED IF PRINTED

10.0 Interpretation and Acceptance

- 10.1 Interpretation shall be carried out to identify the location and character of the indication.
- 10.2 The interpretation shall identify if an indication is false, nonrelevant, or relevant. False and nonrelevant indications shall be proven as false or nonrelevant.
- 10.3 All relevant indications shall be evaluated in accordance with API Std 1104 (latest PHMSA approved edition), Acceptance Standards for Nondestructive Testing, Section 9.4, Magnetic Particle Testing.

11.0 Reports

11.1 Daily Magnetic Particle Examination Reports

- 11.1.1 The NDE contractor shall be responsible for furnishing the field AIC representative and construction contractor's representative with a detailed report of each previous day's magnetic particle testing results.
- 11.1.2 The daily magnetic particle testing report supplied to AIC for the inspection of welds shall include the following:
 - 1. Weld ID number.
 - 2. Status of weld (acceptable/unacceptable).
 - 3. Defect type.
 - 4. Location of defect on pipe circumference.
 - 5. Location of defect in reference to cross-section (based on judgment).
 - 6. Date inspection was performed.
 - 7. Pipe diameter & wall thickness.
 - 8. Weld location.
 - 9. Number of welds tested.
 - 10. Technique used.
 - 11. Testing equipment identification and calibration date.
 - 12. Magnetic particle type.
 - 13. MT technician's signature.
 - 14. AIC Representative's signature.
- 11.1.3 The NDE contractor shall keep a copy of all daily reports for the duration of their project assignment.

12.0 Report Retention

- 12.1 A copy of the daily MT report showing the location and disposition of each weld inspected shall be maintained in AIC's permanent job file for life of the pipeline.

End of Instructions.

WELDING

October 1, 2022

WELD 2.8 Liquid Penetrant Testing

1.0 Purpose

This document outlines the requirements and specifications to be followed by Ameren Illinois (AIC) when Liquid Penetrant Examination is used for examination of welds on new pipeline construction and during maintenance activities on pipelines and related facilities.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Liquid Penetrant Testing Personnel](#)[6.0 Liquid Penetrant Testing Procedures](#)[7.0 Method and Equipment](#)[8.0 Procedure](#)[9.0 Interpretation and Acceptance](#)[10.0 Reports](#)[11.0 Report Retention](#)**3.0 Target Audience**

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Superintendents
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 General

- 4.1 The liquid penetrant examination method is applied to detect cracks and other imperfections that are open to the surface of materials under examination.
- 4.2 The liquid penetrant is applied evenly over the surface being examined and allowed to enter open imperfections. After a suitable dwell time, the excess surface penetrant is removed. A developer is applied to draw entrapped penetrant out of the imperfection and stain the developer. The test surface is then examined to determine the presence or absence of indications.
- 4.3 This specification is limited to using only visible, solvent removable liquid penetrant materials.
- 4.4 AIC does not allow liquid penetrant examination on surface areas that are coated or painted.

UNCONTROLLED IF PRINTED

5.0 Liquid Penetrant Testing Personnel

5.1 All Level I, Level II, and Level III liquid penetrant testing (PT) personnel for AIC assignment to perform examinations and evaluate results shall provide AIC Gas Compliance with the following written documentation prior to work activity:

5.1.1 Certification or recertification by their employer in the Liquid Penetrant Testing method for the following:

1. Previous 3 years as either a Level I or Level II, and
2. Previous 5 years for Level III.

NOTE:	A 5 years recertification interval for Level I, and Level II may be acceptable, if approved by AIC, for those NDT co
--------------	--

5.1.2 Documentation shall include the following minimum information:

1. Name of certified individual.
2. Level of certification (e.g., Level II, Level III).
3. Educational background and experience of certified individual.
4. Statement indicating satisfactory completion of training in accordance with employer's written practice.
5. Results of certification examination (grades).
6. Date of certification and/or recertification.
7. Certification expiration date.
8. Signature of employer's certifying person.

5.1.3 Certifications shall be in accordance with American Society for Nondestructive Testing, Recommended Practice No. SNT-TC-1A.

5.2 Vision Acuity Record

5.2.1 Current record of individual's near-vision acuity results administered by an approved medical professional to ensure natural or corrected near-distance acuity in at least one eye such that individual can read a minimum of Jaeger Number 1 or equivalent type and size letter at a distance not less than 12".

5.2.2 Documentation of successful results from an administered color-contrast differentiation examination within past 5 years.

5.3 AIC Project Engineer or Construction Inspector shall request the above information when the liquid penetrant testing contractor is contacted for and prior to a work assignment.

5.4 All PT personnel engaged in the examination and evaluation of liquid penetrant testing results performed for AIC shall maintain a copy of their certifications credentials on the job site.

5.5 Only Level II or Level III PT testing personnel shall:

5.5.1 Interpret liquid penetrant testing results.

5.5.2 Report all defects observed.

5.5.3 Indicate whether the weld meets standard of acceptability as specified in the referencing code standard (i.e., API Std. 1104, Section 9.5).

UNCONTROLLED IF PRINTED

5.6 PT personnel may be required to:

- 5.6.1 Demonstrate their ability to produce acceptable liquid penetrant examination results using approved procedures prior to performing production liquid penetrant testing.
- 5.6.2 Be recertified at the option of AIC or if any question arises about their ability. Level II or III PT personnel's work will be subject to review by AIC representative and any pattern of inconsistency will be cause for additional training, testing, or dismissal.

5.7 AIC shall have the right to remove any PT personnel who, in the opinion of the AIC representative, is incompetent, careless, unsafe, or otherwise not qualified to perform the work assigned, or who is found to be insubordinate or guilty of improper conduct.

6.0 Liquid Penetrant Testing Procedures

6.1 General

- 6.1.1 This section prescribes the minimum requirements for establishing and qualifying the liquid penetrant testing procedures to be used for examination of welds.
- 6.1.2 The NDE contractor shall provide a detailed procedure to produce acceptable liquid penetrant examination results.

6.2 Procedure Qualification

- 6.2.1 All procedures to be used on the work assignment shall be qualified prior to performing any liquid penetrant examination of a production nature.
 - 1. Advanced notice must be given to AIC to schedule personnel for witnessing the procedure qualification.
 - 2. AIC representative shall determine the acceptance of procedure.
 - 3. Procedure shall be qualified by performing an acceptable liquid penetrant examination of a weld following approval of the procedure.
 - 4. A completed Qualification Form shall be provided by the NDE Contractor for acceptance by AIC.
- 6.2.2 AIC representative may further review all procedure details and the test results prior to beginning testing.
- 6.2.3 The PT testing Level II or III technician performing the liquid penetrant test will be simultaneously qualified in the procedure.
- 6.2.4 Qualified procedures may be used by other PT Level II or III technicians from the same contractor provided they have a copy of the procedure record and they qualify their ability to produce an acceptable liquid penetrant examination using the procedure details.

7.0 Method and Equipment

7.1 General

- 7.1.1 Reference Table 2, Recommended NDT Methods under [WELD 2.3, Paragraph 11.1.2](#).
- 7.1.2 Welds shall meet visual acceptance criteria prior to LPT.
- 7.1.3 All liquid penetrant examinations shall be performed only by utilizing the visible, solvent removable liquid penetrant materials with nonaqueous wet developers.

7.1.4 All examinations shall be conducted with enough field overlap to ensure 100% coverage.

7.2 Visible Penetrant

7.2.1 Visible penetrant testing uses a penetrant that can be seen in visible light.

7.2.2 The penetrant is usually red, so that resultant indications produce a definite contrast with the white developer background.

7.2.3 Visible penetrant indications shall be viewed under adequate white light.

7.3 Other Materials

7.3.1 Solvent Removable Penetrants

1. Solvent removable penetrants are formulated so that excess surface penetrant can be removed by wiping until most of the penetrant has been removed.
2. The remaining traces of surface penetrant shall be removed with solvent remover.

To prevent removal of penetrant from imperfections, care shall be taken to avoid using excess solvent.

3. Do NOT flush the surface with solvent to remove excess penetrant as the penetrant indications could easily be washed away.

7.3.2 *Solvent Removers*: Such removers function by dissolving the penetrant, making it possible to wipe the surface clean and free of excess penetrant.

7.3.3 *Developers*: Developers form a translucent or white absorptive coating that aids in bringing the penetrant out of surface imperfections through a blotting action, thus increasing visibility of the indications.

1. Nonaqueous Wet Developers

- 1 a. Nonaqueous wet developers are suspensions of developer particles in a nonaqueous solvent carrier ready for use as supplied.
- 1 b. Nonaqueous wet developers are sprayed on to form a thin coating on the part's surface when dried. This thin coating serves as the developing medium.

8.0 Procedure

8.1 The following processing parameters apply to the visible penetrant testing method.

8.1.1 *Temperature Limits*: The temperature of penetrant materials and the material surface under examination shall be between 40 °F and 125 °F.

Specific qualified PT procedures for testing welds outside of the above temperatures shall be approved by AIC.

- 8.1.2 *Examination Sequence*: Final penetrant examination shall be performed after completing all operations that could cause surface connected imperfections or operations that could expose imperfections not previously open to the surface.

8.2 Pre-cleaning

Specific qualified PT procedures for testing welds outside of the above temperatures shall be approved by AIC.

- 8.2.1 The success of any penetrant examination procedure is greatly dependent upon the surrounding surface and imperfection being free of any contaminants that might interfere with the penetrant entering imperfections.
- 8.2.2 Ensure all surfaces to be examined are clean and dry before applying penetrant.
1. "*Clean*" means that the surface must be free of rust, scale, welding flux, weld spatter, grease, paint, oily films, dirt, and any foreign material that might interfere with the penetrant process.
 2. If only a section of a part is involved, such as a weld, include the heat affected zone for examination. Thus, remove all contaminants from the total area subject to examination.
- 8.2.3 If necessary, grinding is permitted to eliminate surface irregularities that could mask indications of unacceptable imperfections.
- 8.2.4 It is essential that the examination surface be thoroughly dry after cleaning. Any liquid residue will hinder the entrance of the penetrant.

8.3 Penetrant Application:

- 8.3.1 After the part has been cleaned, dried, and is within the specified temperature range, penetrant may be applied to the surface to be examined. Ensure the entire part or area under examination is completely covered with penetrant.
- 8.3.2 Application methods may include dipping, brushing, flooding, or spraying.

8.4 Penetrant Dwell Time

- 8.4.1 After application, allow excess penetrant to drain from the part while allowing for proper penetrant dwell time. Ensure that no pooling of penetrant forms on the part.
- 8.4.2 The dwell time for penetrant to remain on part (for proper penetration) shall be as recommended by penetrant manufacturer and not be exceeded.

8.5 Penetrant Removal

- 8.5.1 After the required penetrant dwell time, remove excess penetrant by wiping with a dry, clean, lint-free cloth/towel.
- 8.5.2 Follow-up by using a clean, lint-free cloth/towel lightly moistened with solvent remover to remove the remaining traces of surface penetrant.

Use gentle wiping to avoid removing penetrant from any imperfections.

8.5.3 Fully dry the surface for examination prior to applying nonaqueous wet developers. Drying time is only that necessary to adequately dry the part.

8.6 Developer Application

8.6.1 After excess penetrant has been removed and surface dried, apply nonaqueous wet developer in a manner to ensure complete part coverage with a thin, even film. However, apply thick enough to provide a contrasting background.

8.6.2 Do NOT dip or flood parts with nonaqueous wet developer, because the solvent action of these type developers can flush or dissolve the penetrant from within the imperfections.

8.7 Developing Time

8.7.1 Developing time begins immediately after the coating of wet developer is dry.

8.7.2 Developer is to remain on the part prior to examination not less than 10 minutes.

8.7.3 Maximum developing times shall be 1 hour.

8.8 Inspection

8.8.1 After the applicable developing time, perform examination of part under visible light as appropriate.

8.8.2 It is advisable to observe the "bleed out" during developing time as an aid in interpreting indications.

9.0 Interpretation and Acceptance

9.1 Interpretation shall be carried out to identify the location and character of the indication.

9.2 The interpretation shall identify if an indication is false, nonrelevant, or relevant. Further, the false and nonrelevant indications shall be proven as to which (i.e., false or nonrelevant).

9.3 All relevant indications shall be evaluated in accordance with API Std 1104 (latest PHM-SA approved edition), Acceptance Standards for Nondestructive Testing, Section 9.5, Liquid Penetrant Testing.

10.0 Reports

10.1 Daily Liquid Penetrant Examination Reports

10.1.1 The NDE contractor shall be responsible for furnishing the field AIC representative and construction contractor's representative with a detailed report of each previous day's liquid penetrant testing results.

10.1.2 The daily liquid penetrant testing report supplied to AIC for inspection of welds shall include the following:

1. Weld ID number.
2. Status of weld (acceptable/unacceptable).
3. Defect type.
4. Location of defect on pipe circumference.
5. Location of defect in reference to cross-section (based on judgment).
6. Date inspection was performed.
7. Pipe diameter & wall thickness.

8. Weld location.
 9. Number of welds tested.
 10. Technique used.
 11. Testing equipment identification and calibration date.
 12. Liquid penetrant used and batch number.
 13. Lighting utilized and intensity.
 14. Dwell times applied.
 15. PT technician's signature.
 16. AIC Representative's Signature.
- 10.1.3 When appropriate for documentation purposes, photographs of defect indication may be attached to report by any suitable means.
- 10.1.4 The NDE contractor shall keep a copy of all daily reports for the duration of their project assignment.

11.0 Report Retention

- 11.1 A copy of the daily PT report showing the disposition and location of each weld inspected shall be maintained in AICs' permanent job file for life of the pipeline.

WELD 2.9 Ultrasonic Thickness Examination

1.0 Purpose

This document defines the minimum requirements for determining pipe or plate thickness for Ameren Illinois (AIC) using an ultrasonic thickness gauge. This is a means for checking pipe thickness in accordance with 49 CFR Part 192 requirements.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Equipment and Materials](#)

[5.0 Personnel Requirements](#)

[6.0 Instrument Calibration](#)

[7.0 Technique](#)

[8.0 Final Cleaning](#)

[9.0 Records](#)

3.0 Target Audience

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Superintendents
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 Equipment and Materials

- 4.1 Use an approved digital thickness gauge when needing to perform various material thickness measurements.
 - 4.1.1 Reference requirement for using ultrasonic thickness measurements as part of Internal Corrosion Direct Assessment (ICDA) per 49 CFR Section 192.927(c)(3).
- 4.2 AIC uses a DeFelsko PosiTector UTG. See [WELD 4](#) for the DeFelsko Full Guide manual.
- 4.3 Couplant is a liquid that facilitates transmission of ultrasonic energy to the specimen being tested. It can be a variety of liquids, such as oil, lubricants, water, glycerin.

5.0 Personnel Requirements

- 5.1 Personnel operating the thickness gauge shall be thoroughly familiar with the manufacturer's instructions for the operation, application, calibration, and maintenance of the test instrument.

UNCONTROLLED IF PRINTED

- 5.2 Technician shall be familiar with API Std 1104 (latest PHMSA approved edition), Acceptance Standards for Nondestructive Testing, Section 9.6, Ultrasonic Testing.

6.0 Technique

- 6.1 Calibration of the digital thickness instrument shall be performed according to the manufacturer's instructions.
- 6.2 Instrument calibration shall be confirmed on the same material and product form (e.g., round pipe, flat plate) as the material to be measured.
- 6.3 For calibration confirmation, each instrument shall be supplied with a calibration step block machined with steps (size applicable) to the instrument used. The instrument calibration shall be re-checked approximately midway through the inspection process.
- 6.4 If the instrument is not in calibration, the previous thickness check shall be retaken.
- 6.5 The operator shall be alert to the need of using consistent transducer pressure, couplant type, and amount of couplant.

7.0 Technique

- 7.1 Remove excess dirt, loose scale, paint, epoxy, or other foreign material (from the surface to be examined) that could prevent accurate thickness measurements
- 7.2 Prepare the area to be examined such that a good contact between the transducer and the surface is obtained.
- 7.3 Apply the appropriate type couplant in a consistent manner (i.e., thin, uniform film) on the material to be examined. Use enough to get a clear imagine. See [Subsection 4.3](#) regarding couplants.
- 7.4 The transducer contact face must be held parallel to the pipe inside diameter surface.
- 7.5 Scan the complete area and record the minimum and maximum thickness readings.

8.0 Final Cleaning

- 8.1 After the readings have been recorded and instrument calibration re-checked, evaluate the resulting data for satisfaction/acceptance.
- 8.2 Remove the couplant completely from the examination surface to extent necessary for restoring coating where applicable.

9.0 Records

- 9.1 When AIC requires documenting the examination results the following information shall be recorded on the AIC Ultrasonic Thickness Record form. See [WELD 4](#).
- 9.1.1 Instrument model and serial number.
- 9.1.2 Transducer frequency.
- 9.1.3 Calibration standard.
- 9.1.4 Type couplant.
- 9.1.5 Date of examination.
- 9.1.6 Name of technician performing examination.
- 9.1.7 Examination result (minimum and maximum thickness obtained).

End of Instructions.

WELD 2.10 Arc Burn Removal

1.0 Purpose

This document addresses the problem of arc burns as encountered during the welding process and the removal considerations/requirements by Ameren Illinois (AIC). It is in accordance with 49 CFR §192.309(c) requirements.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Removal Sequence](#)

[6.0 API Wall Thickness Tolerances](#)

Appendices

[Appendix A - API Table 9, 43rd Edition](#)

[Appendix B - API Table 11, 45th Edition](#)

3.0 Target Audience

- Gas Tech Engineering (GTE)
- Gas Integrity Management Personnel
- Gas Engineers
- Gas Supervisors
- Gas Field Personnel - Welders
- Gas Construction Services Supervisors
- Gas Contract Welding Inspectors
- Contract Gas Construction Company Supervisors
- Contract Gas Construction Company Welders
- Contract NDT Personnel

4.0 General

- 4.1 Technically, an arc burn or arc strike is the result of momentarily touching the electrode holder, electrode, or ground clamp to the pipe surface.
 - 4.1.1 These arc burns are usually of short duration and the depth of heating is superficial; however, the area will contain a much harder metallurgical structure called "martensite" from which small cracks may initiate.
 - 4.1.2 In addition to the hard structure and rapid cooling, the thin fused area of the arc burn is not properly protected from the environment since gas generated ingredients and slag formers in the electrode covering have not been heated and brought into use.
- 4.2 The PHMSA regulation 49 CFR §192.309(c) requires that any arc burn on pipe operating at or over 40% SMYS must be repaired or removed.
- 4.3 For the listed reasons, arc burns:
 - 4.3.1 Shall be removed on a transmission pipeline,
 - 4.3.2 Should be removed on a high-pressure distribution pipeline, or

UNCONTROLLED IF PRINTED

- 4.3.3 At the welding inspector's review option, cut out of the pipeline.

Consult with Gas Tech Engineering before grinding to repair any defect on transmission piping or high-pressure distribution piping operating above 100 psig. See [REPR 1](#).

- 4.4 A welder who repeatedly makes arc burns may be subject to disqualification or other disciplinary action, all at the discretion of AIC.
- 4.5 For related discussion, see the following:
- 4.5.1 [WELD 2.2, Section 8.0](#), Workmanship.
- 4.5.2 [WELD 2.3, Subsection 9.10](#), Weld Ground Placement, and
- 4.5.3 [WELD 2.3, Subsection 9.20](#), Arc Burns.

5.0 Removal Sequence

Arc Burns shall be removed as follows:

- 5.1 Determine the minimum wall thickness required for the pipe containing an arc burn. Refer to the following references for wall thickness tolerances based on manufactured date of the pipe:
- 5.1.1 Before 2009: See [Appendix A](#) for API 5L, 43rd Edition, Table 9, OR
- 5.1.2 During 2009 or later: See [Appendix B](#) for API 5L, 45th Edition, Table 11.
- 5.2 Measure the existing wall thickness surrounding the arc burn.
- 5.3 Compare the existing wall thickness with the minimum required wall thickness.
- 5.4 Providing there is adequate thickness remaining, grinding of the arc burn area may be performed.
- 5.5 Remove all evidence of the arc burn by grinding and/or filing.
- 5.6 Upon removal of all burn evidence, swab the "ground-out" area using a "Q-tip or cotton ball with an appropriate American Welding Society (AWS) approved etching solution.
- 5.6.1 This can be a 10 to 20% solution of ammonium persulfate (i.e., mix 20% ammonium persulfate crystals and 80% water).
- 5.6.2 If a blackened spot appears, the metallurgical notch (arc burn) has not been completely removed.
- 5.6.3 If necessary, perform additional grinding/filing, followed by repeating the application of approved etching solution.
- 5.7 When the arc burn has been completely removed, measure the area using an ultrasonic thickness gauge to determine remaining thickness of the pipe wall.
- 5.8 If the remaining wall thickness is equal to or greater than that required, the arc burn has been successfully removed.
- 5.9 If the resulting wall thickness is less than required, the portion of pipe that contained the arc burn shall be removed as a cylinder or repaired with an approved procedure listed in [REPR 1](#).

6.0 API Wall Thickness Tolerances

6.1 For pipe manufactured before 2009: API Reference Table 9

6.1.1 See [Appendix A](#) for Table 9 from API 5L, "Specifications for Line Pipe," 43rd Edition -- Used for pipe manufactured before 2009.

6.1.2 *Calculation Example:* ARC BURN on 6" OD PIPE: 0.375" W.T.

- Allowable wall thickness tolerance for API 5L Grade B pipe, 18" diameter and smaller is: +15% and --12.5%.
- Based on API requirement, for complete arc burn removal in this example, maximum material thickness that can be removed is calculated as follows
 - 3/8" wall thickness = 0.375"
 - 12.5% of 0.375 = 0.046"
- Therefore, maximum thickness that can be removed = 0.046"
- Hence, considering nominal wall thickness = 0.375"
 - Less the 12.5% of 0.375 = (0.046)
 - **Minimum wall thickness = 0.329**

6.2 For pipe manufactured in 2009 and later: API Reference Table 11

6.2.1 See [Appendix B](#) for Table 11 from API 5L, "Specifications for Line Pipe," 45th Edition - Used for pipe manufactured in 2009 and later.

Revision Notes

Location of Changes	Summary of Changes
Paragraph 4.1.2	environment replaces atmosphere

Appendix A - API Wall Thickness Tolerances

A-1. Table 9 from API 5L, "Specifications for Line Pipe," 43rd Edition. **Reference Table for pipe manufactured before 2009.**

Table 9 - Tolerances for Wall Thickness

Table 9 - Tolerances for Wall Thickness			
Pipe Size (Inches)	Type of Pipe	Tolerance ¹ (Percent of Specified Wall Thickness)	
		Grade B or Lower	Grade X42 or Higher
≤ 2-7/8	All	+20.0% to -2.5%	+15.0% to -12.5%
> 2-7/8 and < 20	All	+15.0% to -12.5%	+15.0% to -12.5%
≥ 20	Welded	+17.5% to -12.5%	+19.5% to -8.0%
≥ 20	Seamless	+15.0% to -12.5%	+17.5% to -10.0%

1 Where negative tolerances smaller than those listed are specified by the purchaser, the positive tolerance shall be increased to the applicable total tolerance range in percent less the wall thickness negative tolerance.

Appendix B - API Wall Thickness Tolerances

B-1. Table 11 from API 5L, "Specifications for Line Pipe," 45th Edition (*measurement units flipped however*). **Reference Table for pipe manufactured in 2009 and later.**

Table 11 - Tolerances for Wall Thickness

Table 11 - Tolerances for Wall Thickness	
Wall Thickness <i>t</i> in. (mm)	Tolerances ^a in. (mm)
SMLS pipe^b	
≤ 0.157 in. (4.0 mm)	+ 0.024 in. (0.6 mm) - 0.020 in. (0.5 mm)
> 0.157 in. (4.0 mm) to < 0.984 in. (25.0 mm)	+ 0.150 <i>t</i> - 0.125 <i>t</i>
≥ 0.984 in. (25.0 mm)	+ 0.146 in (3.7 mm) or + 0.1 <i>t</i> , whichever is the greater - 0.120 in. (3.0 mm) or - 0.1 <i>t</i> , whichever is the greater
Welded pipe^{c, d}	
≤ 0.197 in. (5.0 mm)	± 0.020 in. (0.5 mm)
> 0.197 in. (5.0 mm) to < 0.591 in. (15.0 mm)	± 0.1 <i>t</i>
≥ 0.591 in. (15.0 mm)	± 0.060 in. (1.5 mm)

a If the purchase order specifies a minus tolerance for wall thickness smaller than the applicable value given in this table, the plus tolerance for wall thickness shall be increased by an amount sufficient to maintain the applicable tolerance range.

- b For pipe with $D \geq 14.000$ in. (355.6 mm) and $t \geq 20.984$ in. (25.0 mm), the wall thickness tolerance locally may exceed the plus tolerance for wall thickness by an additional $0.05 t$, provided that the plus tolerance for mass (see 9.14 in API 5L 44th edition) is not exceeded.
- c The plus tolerance for wall thickness does not apply to the weld area.
- d See 9.13.2 for additional restrictions.

4.0 Electrode Properties

4.1 Strength Properties:

AWS Classification	Tensile Strength (PSI-Minimum)	Yield Strength (PSI-Minimum)	Elongation (%-Minimum)
E 6010	60,000	48,000	22
E 7010-G	70,000	60,000	22
E 8010-G	80,000	67,000	19
E 9010-G	90,000	77,000	17

Note: Values are for weld deposits in the as-welded condition.

4.2 SMAW Electrodes - Typical Amperage/Voltage Ranges:

LOW-HYDROGEN ELECTRODES (E7018, E8018, E9018)		
Diameter	Amperage	Voltage

UNCONTROLLED IF PRINTED

3/32"	80 - 100	20 - 23
1/8"	115 - 135	20 - 23
5/32"	140 - 190	20 - 23
CELLULOSE-COATED ELECTRODES (E6010, E7010-G, E8010-G, E91010-G)		
3/32"	50 - 70	22 - 25 (20-23 for Root Pass)
1/8"	85 - 120	22 - 25 (20-23 for Root Pass)
5/32"	115 - 160	22 - 28 (20-23 for Root Pass)
3/16"	140 - 190	25 - 28

Notes:

1. Voltage numbers presented herein are typical of measured values across the arc.
2. When measuring at machine terminals, voltage may be 2-3 volts higher due to circuit resistance.

4.3 GMAW Electrodes - Typical Voltage (short circuit transfer)

ER 70 S- 6	0.035 Solid Wire	Carbon Dioxide Shielding Gas
17 - 22 volts	18.5 volts at approximately 150 IPM is a good starting point	

5.0 Pipe Properties

5.1 Yield and Tensile Strength

API PIPE GRADE	YIELD STRENGTH (PSI - MINIMUM)	TENSILE STRENGTH (PSI - MINIMUM)
B	35,000	60,000
X42	42,000	60,000
X46	46,000	63,000
X52	52,000	66,000
X56	56,000	71,000
X60	60,000	75,000
X65	65,000	77,000
X70	70,000	82,000
X801	80,000	90,000

Notes:

1. Pipe Grade X80 has a maximum tensile strength of 120,000 PSI.
2. There is no maximum value for the other pipe grades unless specified by purchase order.

5.2 Pipe Sizes and Wall Thickness -- Schedule 5S thru Schedule 80:

COMMERCIAL PIPE SIZES and WALL THICKNESSES ASME B36.10 and B36.19 (inches)											
Nominal Pipe Size (NPS)	Outside Diameter (inches)	SCH 5S	SCH 10S	SCH 10	SCH 20	SCH 30	STD	SCH 40	SCH 60	XS	SCH 80

6.0 Useful Formulas

6.1 Design Formula for Steel Pipe (49 CFR §192.105):

$$P = (2 St/D) \times F \times E \times T$$

Where,

P = Design pressure in psig.

S = Yield strength in psi determined in accordance with §192.107.

t = Nominal wall thickness of pipe in inches.

D = Nominal outside diameter of pipe in inches.

F = Design factor determined in accordance with §192.111.

(Assume F=1 here)

E = Longitudinal joint factor determined in accordance with §192.113.

(Assume E=1 here)

T = Temperature derating factor determined in accordance with §192.115.

(Assume T=1 here)

6.1.1 Hoop Stress:

$$\text{Hoop Stress } S \text{ [psi]} = \frac{P \times D}{2 \times t}$$

Where,

P = operating pressure, D = nominal outside diameter, and t = wall thickness.

6.1.2 Determine if Pipeline is Operating at 20% or More of SMYS:

For the specific pipeline system, calculate 20% of the pipe SMYS to compare with pipeline operation:

$$X = 20\% \text{ SMYS} = \frac{(0.20) \times (2) \times (\text{Yield Strength}) \times t}{D}$$

Where,

Yield Strength is the SMYS for the pipe grade (e.g., Gr X42 pipe has Yield Strength = 42,000 psi), t = wall thickness, and D = outside diameter.

If the actual pipeline operating pressure is equal to or greater than X, then the pipeline system is operating at or above 20% of SMYS and the line is classified as a transmission facility (49 CFR §192.3).

6.1.3 **Actual % SMYS** (for a given pressure, in psi):

$$\% \text{ SMYS} = \frac{P \times (D/2t)}{\text{Yield Strength}}$$

Where,

P is operating pressure, D = outside diameter, t = wall thickness of pipe, and Yield Strength is the SMYS for the pipe grade (e.g., Gr X42 pipe has Yield Strength = 42,000 psi).

6.1.4 **Diameter to Wall Thickness Ratio:**

$$\text{Diameter to Wall Thickness Ratio} = D/t$$

Where,

D = outside diameter and t = wall thickness of pipe.

6.2 Welding Related Formulas

6.2.1 **Power Loss Formula:**

$$\text{Power Loss PL [Watts]} = (V_1 - V_2) \times I$$

Where,

V1 = Voltage at terminals, V2 = Voltage at electrode holder (across arc), and I = Current (Amperage).

Note: Select weld cable and ground (work) connections so that the voltage drop in the welding circuit *does not exceed 4 volts*.

6.2.2 **Travel Speed:**

$$\text{Travel Speed (inches per minute)} = \frac{\text{Length of Weld} \times (60 \text{ sec/min})}{\text{Weld Time}}$$

Where,

Length of Weld is inches, and Weld Time is seconds.

6.2.3 **Heat Input of Each Weld Pass:**

$$\text{Heat Input [Joules per inch]} = \frac{A \times V \times (60 \text{ sec/min})}{\text{Travel Speed}}$$

Where,

A = amps, V = volts, 60 is a constant (sec/min), and Travel Speed is inches per minute.

6.2.4 **Ultimate Tensile Strength of Weld:**

$$\text{Ultimate Tensile Strength } S \text{ [psi]} = \frac{P}{A}$$

Where,

P = load (lbs) and A = cross-sectional area of the coupon before testing (width x thickness) in square inches.

6.2.5 Percent Elongation of Specimen:

$$\% \text{ Elongation} = \frac{\text{Final Length} - \text{Original Length}}{\text{Original Length}} \times 100\%$$

Notes:

1. Before bending or tensile testing, lightly center punch two gauge marks 2" apart, at approximately the center of the sample, with the weld in the center of the 2" gauge length.
2. After testing, put pieces together and measure the distance between gauge marks.
3. Calculate percent elongation using above formula.

6.2.6 Percent Reduction of Tensile Specimen:

$$\% \text{ Reduction} = \frac{\text{Original Area} - \text{Final Area}}{\text{Original Area}} \times 100\%$$

Notes:

1. Measure and record original cross-section of specimen.
2. After testing, put pieces together and measure the cross-sectional area of the necked-down portion of broken sample.
3. Calculate percent reduction using above formula.

6.3 Figure Fitting "Take Off" Measurement:

6.3.1 90° Standard Radius "takeoff" is 1.5 x pipe diameter (Example: 4" 90° has a 6" takeoff).

6.3.2 45° Standard Radius "takeoff" is pipe diameter x .625 (Example: 4" 45° has a 2.5" takeoff).

WORKING IN GASEOUS ENVIRONMENT

April 1, 2021

WIGE 1 Requirements

1.0 Purpose

This document describes Ameren Illinois (AIC) requirements per 29 CFR §1910.132 for working in or near blowing gas in an outdoor environment that is considered hazardous due to gas-in-air.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

3.0 Target Audience

- Emergency Responders
- Gas Field Personnel
- Gas Storage Field Personnel
- Gas Storage Supervisors
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Safety Department Manager

4.0 General

4.1 Basic properties of natural gas:

4.1.1 Flammable.

1. Natural gas ignition temperature range: 1000 - 1200 degrees Fahrenheit (°F).
2. Natural gas burns with a flame temperature of 2200 °F.

Even an ignition of short duration (flash) will cause severe burns to exposed flesh.

4.1.2 Lighter than Air.

4.1.3 Colorless.

Blowing natural gas may be visible under certain atmospheric and gas pressure conditions.

4.1.4 Odorless and tasteless.

- Unodorized natural gas may retain odors accumulated from its production or storage formation.
- Odorized natural gas has a distinctive foul odor often described as rotten eggs, onions, or hydrogen sulfide.

4.1.5 Non-toxic.

- Natural gas will displace oxygen in the atmosphere leading to possible suffocation.
- Personnel not properly protected may inhale a potentially flammable concentration of natural gas.
- If an ignition occurs, the flame may follow the airway passages into the lungs resulting in potentially fatal respiratory system injury.

4.2 A hazardous outdoor environment is a gas-in-air concentration equal to or greater than 30% LEL (1.5% natural gas).

4.3 Gas field personnel shall monitor gas-in-air readings with a gas detection instrument when gas-in-air is capable of causing harm to life and/or property by ignition or suffocation.

End of Instructions.

Operator Qualification (OQ) Required?

UNCONTROLLED IF PRINTED

Location of Changes	Summary of Changes
Section Title	Working In Gaseous Environment: Requirements
1.0 Purpose	Modified to working in an outdoor environment that is considered hazardous due to gas-in-air.
Subsection 4.2	Defined hazardous environment – gas-in-air concentration equal to or greater than 30% LEL. Defined hazardous environment – gas-in-air concentration equal to or greater than 30% LEL.
Subsection 4.3	Gas field personnel shall monitor gas-in-air readings with a gas detection instrument when gas-in-air is capable of causing harm to life and/or property by ignition or suffocation.

WORKING IN GASEOUS ENVIRONMENT

April 1, 2023

WIGE 2.1 Hazardous Environment

1.0 Purpose

This document describes Ameren Illinois (AIC) requirements per 29 CFR §1910.132 for gas field personnel to avoid potential injury when working in or near blowing gas in an outdoor environment that is considered hazardous due to gas-in-air. For indoor situations, see [LEAK 2.1](#).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Identifying a Hazardous Outdoor Environment Due to Gas-In-Air](#)[6.0 Safe Zone](#)[7.0 Working in a Hazardous Outdoor Environment Due to Gas-In-Air](#)[8.0 Shut Down Options When Working in a Hazardous Outdoor Environment Due to Gas-In-Air](#)**3.0 Target Audience**

- Gas Field Personnel
- Gas Storage Field Personnel
- Gas Storage Supervisors
- Gas Supervisors
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Safety Department Manager

4.0 General

4.1 Gas-in-air readings are taken with a **CGI** within the breathing zone (approximately 10 inches from the mouth and nose) of person closest to a gaseous environment.

4.1.1 An approved hands-free air monitor can be used in-lieu of a CGI for monitoring the work area environment. See [WIGE 3](#) for manufacturer's instructions.

4.1.2 Follow the manufacturer's instructions for operating, calibrating, and maintaining.

4.2 Parking and approach considerations:

4.2.1 Gas field personnel (personnel that are Operator Qualified in the required covered tasks to investigate a gas leak and/or repair a gas leak.) See appropriate sub-part of Emergency Plan under [EMER 2.4](#).

4.2.2 Non-gas field personnel including Emergency Responders (personnel that are not Operator Qualified in the required covered tasks to investigate a gas leak and/or repair of a gas leak.) See [EMER 2.3](#).

4.3 Gas field personnel shall:

4.3.1 Protect themselves from traffic and other hazards while working in or around hazardous environment.

UNCONTROLLED IF PRINTED

1. See [WIGE 2.2](#) for details of Level 1 and Level 2 Personal Protective Equipment (PPE).
- 4.3.2 Ensure that a dry chemical (A, B, C) fire extinguisher is present near the worksite while working in a gaseous environment.
 1. A minimum 20 pound fire extinguisher is required when workers are in Level 2 PPE. The fire extinguisher shall be discharge tested upwind of the work-site.
 2. A 10 pound fire extinguisher is acceptable when workers are in standard work clothes or Level 1 PPE.

5.0 Identifying a Hazardous Outdoor Environment Due to Gas-In-Air

- 5.1 The outdoor environment is considered hazardous at any work location where there is a gas-in-air reading equal to or greater than 30% LEL (1.5% natural gas):
- 5.2 Locations where the environment may be considered hazardous due to gas-in-air include:
 - 5.2.1 Damage to a gas facility such as:
 1. Main
 2. Service line without an EFV activation
 3. Regulator station.
 2. Farm tap.
 3. Meter set.
 4. Riser.
 - 5.2.2 Changing a meter valve "on the fly".
 - 5.2.3 Working adjacent to a blowing relief valve.
- 5.3 Locations where the environment *would not* be considered hazardous due to gas-in-air include:
 - 5.3.1 Purging a service or main through a valve or grounded squeeze tool that is vented to the environment through a metallic stack that is grounded. See [PURG 2](#).
 - 5.3.2 Purging gas from a stopper.
 - 5.3.3 Igniting and burning small volumes of gas purposely released as steel welding operations are performed.
- 5.4 Consider the following options to minimize exposure to working in a hazardous environment:
 - 5.4.1 Use valves which are located in a non-hazardous environment.
 - 5.4.2 Excavate and squeeze pipe in a non-hazardous environment.
 - 5.4.3 Excavate and use control fittings in a non-hazardous environment.
 - 5.4.4 Work above grade and utilize above grade tools when possible.
 - 5.4.5 Work upwind of gas-in-air when possible.

5.4.6 Vent gas-in-air or create an engineering approved barrier between blowing gas and gas field personnel to minimize gas-in-air readings where work is to be performed.

5.5 Proper positioning of gas field personnel while working in a hazardous environment due to gas-in-air can greatly reduce the potential for severe burns and injuries in the event of an ignition.

6.0 Safe Zone

6.1 Gas Field Personnel shall:

6.1.1 Define the limits of the hazardous environment by using a gas detection instrument.

6.1.2 After the extent of the gas migration is determined or additional gas personnel have arrived to assist, establish a safe zone perimeter if there is hazardous environment due to gas-in-air.

6.1.3 In establishing the safe zone perimeter, check the area for gas-in-air concentrations less than 30% LEL to ensure the outer limits of the safe zone perimeter have a non-hazardous environment.

6.1.4 Consider the amount and pressure of gas being released plus wind speed and direction when establishing the outer limits of the safe zone perimeter.

6.1.5 If there is a hazardous environment due to gas-in-air, monitor the perimeter of the safe zone to ensure the environment outside the safe zone remains non-hazardous.

1. Adjust the safe zone perimeter to remain non-hazardous.

Perimeter adjustment is particularly needed if there is a change in wind direction or wind speed.

6.1.6 Visually mark the perimeter of the safe zone using barricades, signs, cones, fencing, marking paint, and/or warning tape.

6.1.7 Monitor the atmosphere inside and around the safe zone.

1. If the gas detection instrument reading within the safe zone indicates a gas-in-air reading equal to or greater than 60% LEL (3% natural gas),

1 a. Wear Level 2 PPE in that area.

6.2 Any personnel inside the safe zone shall wear at a minimum Level 1 PPE until there is no longer a hazardous environment.

6.3 Emergency Responders and non-gas field personnel dispatched to make an affected area safe shall maintain a safe zone perimeter with minimum 20-foot radius from location of suspected cause of gas-in-air. See [EMER 2.3](#).

Emergency Responders and non-gas field personnel usually do not have access to a gas detection instrument or Level 1 PPE.

7.0 Working in a Hazardous Outdoor Environment Due to Gas in Air

7.1 Gas field personnel shall:

- 7.1.1 If working in an excavation is required, review [EXCV 2.9](#) and use it in conjunction with WIGE procedures.
- 7.1.2 Refer to [WIGE 2.2](#) for listing of required Level 1 and Level 2 PPE.
- 7.1.3 Have the option to define the limits of the non-hazardous environment when the gas-in-air readings are less than 30% LEL without the Level 1 PPE.
- 7.1.4 Suit-up in Level 1 PPE if a gas detection instrument gas-in-air reading of 30% LEL (1.5% natural gas) to 60% LEL (3.0% natural gas) is measured in the breathing zone where the work is to be performed.
- 7.1.5 Suit-up in Level 2 PPE if a gas detection instrument gas-in-air reading equal to or greater than 60% LEL (3.0% natural gas) is measured in the breathing zone where the work is to be performed.
- 7.1.6 Evaluate the proposed work area for the ability to retrieve personnel in the event a rescue is necessary.
 - 1. If personnel cannot be effectively removed from the area using a lifeline, personnel shall not enter the area.

7.2 When gas field personnel are suited up in Level 2 PPE, additional gas field personnel suited up in proper level of PPE as described in [Subsection 7.1](#) shall perform support functions such as:

- 7.2.1 Manning fire extinguishers and discharge testing them prior to work being performed.
- 7.2.2 Manning safety harness lifelines: minimum 2 people per worker.
- 7.2.3 Manning the supplied air equipment.
- 7.2.4 Monitoring environment of the work area and safe zone with a gas detection instrument.
- 7.2.5 Supplying tools, material, and equipment to workers.
- 7.2.6 Being the designated back-up person suited-up in Level 2 PPE.

8.0 Shut Down Options When Working in a Hazardous Outdoor Environment Due to Gas-In-Air

- 8.1 If determined that gas field personnel are to work in a hazardous outdoor environment, options are listed below to shut down the source of gas-in-air. Due to hazardous variables of natural gas, other options can be considered.

Accidental ignition is a risk associated with gas-in-air mixtures. Be aware of potential ignition sources including mechanical sparking/arcing, static arcing, lightning, and non-intrinsically safe devices. See [ACIG](#).

8.1.1 Above grade:

1. Turning an inline valve on service/main to the off position
 2. Turning an above grade meter valve or valve at farm tap to the off position.
 3. Utilizing steel squeeze off tool. See [STLP 2.3 Steel Pipe Squeeze-Off](#).
 4. Utilizing above grade mustang squeeze off tool. See [POLY 2.2 Section 6.0](#)
 5. Installing an expander plug if operating pressure is 60 psig or less.
 6. Installing a stainless steel band clamp. See [REPR 1 Subsection 6.8](#).
 7. Tightening fittings and/or bolts. For flanges, see [STLP 3.3, Section 6.0](#).
- 8.1.2 Below grade:
1. Turning an inline valve on the service/main to the off position.
 2. Turning an above grade meter valve or valve at farm tap to the off position.
 3. Utilizing steel squeeze off tool. See [STLP 2.3 Steel Pipe Squeeze-Off](#).
 4. Utilizing above grade mustang squeeze off tool. See [POLY 2.2 Section 6.0](#)
 5. Utilizing a grounded hand held squeeze off tool. See [POLY 2.2](#).
 6. Installing a stainless steel band clamp. See [REPR 1 Subsection 6.8](#).
 7. Tightening fittings and/or bolts. For flanges, see [STLP 3.3, Section 6.0](#).
 8. Installing a Plidco Split+Sleeve. See [REPR 2.2](#)
 9. Install a tapered screw plug. See [REPR 1 Paragraph 8.2.3](#).

4.0 General

4.1 AIC continually evaluates and approves Personal Protective Equipment (PPE) products.

4.1.1 Gas Standards and Procedures group in conjunction with Safety Department evaluate and approve PPE products.

4.1.2 Once approved, PPE products are added to the Tools & Equipment on the Gas Standards and Procedures SharePoint Site: <https://ameren.sharepoint.com/sites/GasIL/Materials/>.

This edition of WIGE 2.2 may not list all approved PPE products due to time lag between adding approved PPE products to Gas Standards and Procedures SharePoint Site and the next edition of WIGE 2.2. See [Section 5.0](#).

4.1.3 To ensure gas field personnel are supplied with correct PPE, specifications and manufacturer information are included in Table1 and on the Gas Standards and Procedures SharePoint site (see [Paragraph 5.1.1](#)).

UNCONTROLLED IF PRINTED

Table 1: Currently Approved Personal Protective Equipment

PPE Re-quired	Level/Gas Concentration	
	Level 1 ≥30 % and ≤ 60% LEL (1.5 and 3% gas)	Level 2 >60% LEL(>3% gas)
Single Layer FR Coveralls	Bulwark: CMD8 OR Silver Needle: 3017J1-A US HIVIS YEL	Bulwark: CMD8 OR Silver Needle: 3017J1-A US HIVIS YEL
Head Sock/ Hood	Chicago Protective Apparel – KCF-51	Chicago Protective Apparel – KCF-51
Insulated FR Hood		Silver Needle – #279L-4
Goggles	Paulson A-TAC Firefighters Goggle, 510-SLN OR Paulson A-TAC Firefighters Goggle, 510-SL	
Lens Cover	OPTIONAL: Paulson A-TAC Firefighters Goggle Clear Cover Lens, A-GLCC	
Work Gloves	Leather or Kevlar	
Insulated FR Coveralls		Silver Needle #3015Q – 3
Safety Har-ness		Built into Insulated Coveralls
Insulated Gloves		Silver Needle 372-16 Kevlar Glove
Lifeline		Technora Egress Personal Escape Rope
Supplied Air Respirator		MSA PremAire or Premaire Cadet Escape

5.0 Tools & Equipment SharePoint Site

5.1 Approved PPE products are maintained in Gas Standards and Procedures SharePoint Site.

5.1.1 PPE specification and vendor information for each item are shown on the Share-Point Site: <https://ameren.sharepoint.com/sites/GasIL/Materials/>.

5.2 PPE items that are currently in use, that meet the specifications in this section, and continue to function as designed may continue to be used until such time they are replaced.

UNCONTROLLED IF PRINTED

6.0 PPE Specifications

6.1 Level 1 PPE specifications

6.1.1 Level 1 Flash Suit (Single Layer, Flame Resistant (FR) Coveralls):

1. Designed and tested to protect wearer from the intense heat associated with a flash fire of very-short duration where the gas is consumed quickly.
2. FR material with minimum 5 calorie per square centimeter (cal/cm²) rating.
3. Velcro closure tabs at wrists and ankles.
4. FR reflective trim.
 - 4 a. For work on or near roads or in areas with moving equipment:
 - An AIC FR high-vis vest shall be worn over the older blue flash suits since they do not meet ANSI Class 2 high-visibility requirements.
 - The new yellow flash suits meet the ANSI Class 3 high visibility requirements so FR high-vis vest are not required.

The yellow flash suits can be worn for nighttime flagging since they meet the ANSI Class 3 high visibility requirement.

5. FR AIC logo/name.
 6. No modifications or alterations shall be made to the coveralls.
- #### 6.1.2 Level 1 Head Sock:
1. FR material with minimum 20 cal/cm² rating.
 2. Shall meet NFPA 1971 Standard for Structural Firefighting (NFPA 1971).

6.1.3 Goggles:

1. Shall meet both ANSI Z87.1 Eye Protection and NFPA 1971.

6.2 Level 2 PPE specifications

6.2.1 Level 2 insulated FR coveralls:

1. Insulated FR material with minimum 47 cal/cm² rating.
2. No FR reflective trim required.
3. No FR AIC logo/name required.

FR high-vis vests are not to be worn over Level 2 Insulated Coveralls.

6.2.2 Level 2 insulated FR hood:

1. Insulated FR material with minimum 47 cal/cm² rating.

6.2.3 Level 2 insulated gloves:

UNCONTROLLED IF PRINTED

1. Emergency Gas classification

OR

2. Structural Fire Fighting Glove meeting NFPA 1971.

6.2.4 Supplied air equipment:

1. All use of supplied air equipment shall comply with the Ameren Respirator Compliance Program which includes requirements for:

1 a. Medical qualification.

1 b. Respirator fit testing: shall be performed for the same brand, model, and size of face piece that will be worn in the field.

1 c. Training: field personnel shall be trained on the specific supplied air equipment provided by the company.

1 d. Care/cleaning.

1 e. Maintenance.

1 f. Inspections.

1 g. Breathing air quality: breathing air for supplied-air respirators shall meet OSHA Standard 29 CFR §1910.134, Grade D Compressed Breathing Air (Grade D) and shall be supplied from one of the following:

- Compressed air cylinders, certified by the vendor to be Grade D quality,
- Oil-free compressor designed specifically for breathing air use,

OR

- Work compressor:

- Breathing-air supply shall be connected before introduction of any anti-freeze or lubricating compounds.
- Compressor shall be equipped with a:
 - > Breathing-air filtration system to remove particulates, oils, water, and odor.
 - > Carbon monoxide alarm set to alarm at 10 ppm and shall be calibrated at least monthly.

2. The air supply shall be connected to the breathing air hoses via a regulator, gauge, and manifold system designed for breathing air

2 a. Gauges shall indicate both air supply and distribution pressures.

3. Breathing airline hoses (between the supply manifold and the user) shall be of the same manufacturer as the supplied-air unit and shall not exceed 300-feet in length.

3 a. An aluminized Zetex airline cover shall envelop the air supply line connected to the user as a means of protecting the airline hose from potential damage if a fire erupts.

4. Airline respirator units shall:

4 a. Be certified by National Institute for Occupational Safety and Health

UNCONTROLLED IF PRINTED

4 b. Include a minimum 5-minute escape bottle and a full facepiece.

6.2.5 Full body harness.

6.2.6 Lifeline:

1. Flame-resistant material with minimum 4,000-pound strength.

6.2.7 Airline cover:

1. Aluminized Zetex material, 2" inside diameter and minimum 15-foot length.

7.0 Level 1 PPE Availability, Care, and Storage

7.1 Availability

7.1.1 Single layer FR coveralls, head socks and goggles shall be assigned to all gas field personnel responding to gas emergencies.

7.2 Care and storage

7.2.1 PPE listed in [Paragraph 7.1.1](#) shall be carried on work trucks to be available when gas field personnel are working near or with escaping gas.

7.2.2 When not in use, PPE listed in [Paragraph 7.1.1](#) shall be protected and stored in bags such as Estex, Silver Needle, or equivalent to prevent soiling or damage.

Estex and Silver Needle bags are shown on the Tools & Equipment list on the Gas Standards and Procedures SharePoint site. See [Section 5.0](#).

7.2.3 FR coveralls shall be laundered in accordance with the manufacturer's instructions.

7.2.4 FR coveralls and head socks shall not be worn for everyday use.

8.0 Level 2 PPE Availability, Care, and Storage

8.1 Availability

8.1.1 The following PPE shall be assigned to Gas Supervisors:

1. Insulated FR coveralls.
2. Insulated FR hood.
3. Supplied air equipment.
4. Safety harness.
5. Lifeline.
6. Insulated gloves.

8.1.2 The Gas Supervisors shall ensure that the PPE listed in [Paragraph 8.1.1](#) is readily available and in good condition when needed.

8.2 Care and storage

8.2.1 When not in use, the PPE listed in [Paragraph 8.1.1](#) shall be protected and stored in a waterproof container or in an enclosed safety trailer.

- 8.2.2 Insulated FR coveralls and insulated FR hood shall not be compacted when stored.

Compaction greatly reduces the thermal protection of the material.

- 8.2.3 Supplied air equipment shall be stored in a manner that does not deform the face mask or kink the air lines.
- 8.2.4 Insulated FR coveralls and insulated FR hoods shall be laundered as necessary following the laundering instructions on the apparel label.

9.0 Inspection

- 9.1 All supplied-air equipment shall be inspected prior to use, at least monthly, and documented in Maximo. The equipment includes:
- 9.1.1 Air supply.
 - 9.1.2 Filtration system.
 - 9.1.3 Carbon monoxide alarm.
 - 9.1.4 Regulator/manifold system.
 - 9.1.5 Hoses.
 - 9.1.6 Airlines.
- 9.2 A qualified person shall inspect escape bottles annually and hydrostatically test them every 5 years.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

EMERGENCY SHUTDOWN SYSTEMS

SESD 1 - Requirements

1. Objective

- A. This section outlines the requirements for emergency shutdown systems for field compressor stations, except for unattended field compressor stations of 1,000 horsepower (746 kilowatts) or less.
- B. Required testing procedures, appropriate documentation of testing results and record keeping is discussed.

2. Specific Emergency System Requirements

An emergency shutdown system must include the following:

- A. It must be able to block gas out of the station and blow down the system piping.
- B. It must discharge gas from the blow down piping at a location where gas will not create a hazard.
- C. It must provide means for the shutdown of gas compressing equipment, gas fires and electrical facilities in the vicinity of gas headers and in the compressor building, EXCEPT that: electrical circuits supplying emergency lighting required to assist station personnel in evacuating the compressor building and the area in the vicinity of the gas headers MUST remain energized; electrical circuits needed to protect equipment from damage MAY remain energized
- D. It must be operable from at least two locations, EACH of which is outside the gas area of the station; near the exit gates, if the station is fenced, or near emergency exits, if not fenced; and, no more than five hundred (500) feet (153 meters) from the limits of the station
- E. If a compressor station supplies gas directly to a distribution system with no other source of gas available, the emergency shutdown system MUST be designed so that it will not function at the wrong time and cause an unintended outage on the distribution system.

3. Design Changes

Engineering design for revisions to existing or new gas compressor station emergency shutdown systems shall include, but not be limited to:

- A. Compressor suction and discharge valves shall include pneumatic or electric devices that, when activated by the ESD system, will eliminate any gas at the input/output to each compressor.
- B. Emergency shutdown system design shall include adequate relief capacity for cylinder and piping capacity to vent when activated.
- C. All engineering design proposals for gas compressor stations shall include an emergency shutdown system schematic for the station files.
- D. The Gas Storage Engineer - Facilities must review and approve engineering design for compressor station emergency shutdown systems.

Supersedes: January 1, 2013

UNCONTROLLED IF PRINTED

October 1, 2019

EMERGENCY SHUTDOWN SYSTEMS

SESD 2.01 - Testing and Recording

1. General

- A. The Emergency Shutdown (ESD) system at each compressor station shall be tested once each calendar year, at intervals not to exceed 15 months.
- B. The ESD system shall be tested by tripping one of the hard wired shut down systems or one of the hand pull stations that result in block-in isolation valves closing and ESD vent valves opening.
- C. Actual block-in valve operation and vent valve operation, to prove system capability, is required only once for each annual test.
- D. ESD vent valve operability shall be tested with normal operating pressure at the ESD vent valve(s). ESD vent valve downstream isolation valve(s) (if available) may be closed during the ESD testing to prevent station blow down as long as the ESD vent valve(s) are still subjected to normal operating pressure during testing.

2. Testing Procedures

- A. An Operator Qualified Storage Field employee shall test all alarm inputs that trigger the ESD system to ensure that they are functioning properly and are supplying the required outputs to initiate the block-in or block-in and vent actions.
- B. The manual pull/valve stations of the ESD system shall also be tested to verify that they are functioning properly.

3. Recording Procedures

- A. It shall be the Operator Qualified Storage Field employee's responsibility to ensure that the ESD system test is recorded in Maximo.

3. Storage of Combustible or Flammable Materials
4. Ventilation
5. Liquid Removal
6. Startup, Shutdown, Operating

COMPRESSOR STATIONS
SFCS 1 - Operating Requirements

May 15, 2022

1. Objective

- A. This section addresses the various operating requirements for a compressor station(s) located at the Ameren Illinois gas storage fields.
- B. The set-up, lay-out and equipment utilized at the storage fields vary by location and the legacy company that designed and developed the field.
- C. Procedures contained in this section will be general in nature with the more specific procedures located at the individual compressor stations.

2. Safety and Security

- A. Each compressor station has adequate fire protection facilities. If fire pumps are to be utilized the emergency shutdown system will not affect utilization of the pump(s).
- B. Each compressor station prime mover has an automatic device that shuts down the unit before the speed of either the prime mover or the driven unit exceeds a maximum safe speed. This does not include electrical induction or synchronous motors.
- C. Each compressor unit has a shutdown or alarm device that operates in the event of inadequate cooling or lubrication of the unit.
- D. Each compressor station gas engine that operates with pressure gas injection is equipped to automatically shut off the fuel supply and vent the distribution manifold.
- E. Muffler(s) of the gas engine in a compressor station will have slots or holes in the baffles of each compartment that prevents gas from being trapped in the muffler.
- F. Each compressor station has fire and gas detection and alarm systems. See [SFFD](#) and [SFGD](#).
- G. Each compressor station has an emergency shutdown system. See [SESD](#).
- H. Each compressor station is located within a fenced area must have at least 2 gates located so as to provide a convenient opportunity for escape to a place of safety or have other facilities affording a similarly convenient exit from the area. Each gate located within 200 feet of any compressor plant building must open outward and, when occupied, must be openable from the inside without a key.
- I. Electrical facilities installed in compressor stations, conforms to the National Electrical Code, ANSI/NFPA 70, where applicable.

3. Storage of Combustible or Flammable Materials

- A. Combustible or flammable materials in quantities beyond those required for everyday use, or other than those normally used in the compressor station buildings, are stored at least twenty five (25) feet or further away from the compressor building.
- B. Combustible or flammable material located at the storage fields normally consist of diesel fuel, gasoline, methanol and mercaptan. Quantities of these material stored at each field varies.
- C. Some of the storage fields have above grade storage tanks that are located twenty five (25) feet or more from the compressor station and more than ten (10) feet from the storage field property line.

UNCONTROLLED IF PRINTED

D. Combustible and flammable materials are in durable containers suitable for the material being stored

Storage and protection of combustible or flammable materials meet the requirements of NF-PA 30, Flammable and Combustible Liquids Code.

4. Ventilation

A. Each compressor station building must be ventilated to ensure that employees are not endangered by accumulation of gas in rooms. Sumps, attics, pits, or other enclosed places.

B. The compressor station building incorporates convection or electrical powered ventilation and/or a gas detection sensor system.

C. The convection or electric powered ventilation system design recommendation considers gas quality, floor to ceiling temperature differential and natural air ventilator size and installation location to ensure building environment remains below the lower explosive limit (LEL) of natural gas, 5.0% gas-in-air.

D. Gas detector systems shall be designed to remain energized with a power loss and may systematically open power ventilation, or automatically shut down compressors and/or signal an alarm. See [SFGD](#) for gas detection systems and testing.

E. Ventilation requirements are not applicable to compressor stations that are not enclosed within a building since there is free circulation of air around the station.

5. Liquid Removal

A. Where entrained vapors in gas may liquefy under the anticipated pressure and temperature conditions, the compressor must be protected against the introduction of those liquids in quantities that could cause damage.

B. Each liquid separator used to remove entrained liquids at a compressor station must have a manually operable means of removing these liquids.

C. Where slugs of liquid could be carried into the compressor, have either automatic liquid removal facilities, an automatic compressor shutdown device or a high liquid level alarm.

D. Separators will be manufactured in accordance with section VIII of the ASME Boiler and Pressure Vessel Code, except that liquid separator(s) constructed of pipe and fittings without internal welding must be fabricated with a design factor of 0.4 or less.

6. Startup, Shutdown, Operating

A. Since the compressor station equipment utilized in the Ameren Illinois Gas Storage Fields varies from field to field, each storage field has its own specific startup and shutdown procedures.

B. Operating procedures for each field also varies depending on the equipment and layout of the field. Specific operating procedures are located at each field.

FIRE DETECTION SYSTEMS

January 1, 2014

SFFD 1 - Requirements

1. Objective

This section outlines the requirements for testing the fire detection and alarm systems in compressor stations

2. Requirements

A. The fire detectors and other initiating devices in the fire system shall be tested twice per calendar year at intervals not to exceed seven and a half (7 1/2) months.

B. The Fire System Trouble alarm will be tested twice per calendar year at intervals not to exceed seven and a half (7 1/2) months

C. The fire detection gas control alarms and ESD actuation shall be tested once each calendar year at intervals not to exceed fifteen (15) months.

Supersedes: January 1, 2013

FIRE DETECTION SYSTEMS
SFFD 2.01 - Testing and Recording

October 1, 2019

1. Pre-Testing Cautions

A. On-site personnel should be notified prior to testing Fire Detection system to prevent unwarranted concern or reaction to alarms occurring during the test period.

B. **Caution:** The fire detection and alarm system is connected to the plant emergency shutdown system and sends a trouble alarm to Gas Control. Isolate equipment from the alarm circuit during the test. Isolated devices shall be reconnected at the completion of test activities.

2. Fire Detector and Initiating Device Testing Procedures

A. The following checks shall be completed two times per calendar year, maximum interval of 7-1/2 months and shall be recorded by an Operator Qualified Storage Field employee.

B. Verify proper operation of the Fire System Trouble alarm to Gas Control (if applicable).

C. Activate each detector and alarm initiating device. Check that the proper alarm and zone indications are given at the fire control panel.

3. Fire Detection Alarm and ESD Actuation Testing Procedures

A. The following checks shall be completed at least one time per calendar year, maximum interval of 15 months and shall be reported by an Operator Qualified Storage Field employee.

(1) Verify proper operation of the Fire Alarm signal(s) to Gas Control

(2) Verify proper operation of the Fire Alarm inputs to the ESD system

4. Reporting and Verification and Record Retention Instructions

A. It shall be the Operator Qualified Storage Field employee responsibility to ensure that the Fire Detection Alarm Inspection is recorded in Maximo.

GAS DETECTION SYSTEMS
SFGD 1 - Requirements

January 1, 2014

1. Objective

This section outlines the requirements for the installation of fixed gas detection and alarm systems in compressor stations, the level of monitoring necessary and the maintenance and performance testing requirements.

2. Requirements

A. Not later than September 16, 1996, each compressor building in a compressor station must have a fixed gas detection and alarm system installed, unless the building is constructed so that at least fifty (50) percent of its upright side area is permanently open, or it is located in an unattended field compressor station of 1,000 horsepower (746kW) or less.

B. Except when shutdown of the system is necessary for maintenance, the system must be able to continuously monitor the compressor building for a concentration of gas-in-air of not more than 25% LEL and warn persons about to enter the building and people in the building of the danger should this condition be exceeded.

C. Each gas detection and alarm system must be maintained to function properly. Any maintenance required must include performance tests.

Supersedes: January 1, 2013

GAS DETECTION SYSTEMS
SFGD 2.01 - Testing and Recording

October 1, 2019

1. Pre-Testing Cautions

A. On-site personnel should be notified prior to testing the Gas Detection systems to prevent unwarranted concern or reaction to alarms occurring during the test period.

B. **Caution: The gas detection and alarm system is connected to the plant emergency shut-down system and sends a trouble alarm to Gas Control. Isolate equipment from the alarm circuit during the test. Isolated devices shall be reconnected at the completion of test activities.**

2. Gas Detector Calibration Quarterly Testing Procedure

A. Routine performance tests (calibration checks) of the gas sensors and control modules shall be completed four times each calendar year, not to exceed each calendar quarter by more than forty five (45) days and shall be recorded by an Operator Qualified Storage Field employee .

B. Verify proper operation of the Gas Trouble alarm signal to Gas Control (if applicable).

C. Perform a calibration check of each gas sensor. Calibrate each Gas Sensor and/or Control Module that does not provide indication with test gas applied.

3. Gas Detection System Alarm Testing Procedure

A. The following checks shall be completed at least one time per calendar year, maximum interval of 15 months and shall be recorded by an Operator Qualified Storage Field employee.

(1) Check mounting positions of all gas sensor assemblies and verify that modifications to plant layout did not impact their effectiveness.

(2) Verify proper operation of the Gas Alarm signal(s) to Gas Control.

(3) Verify proper operation of all ESD inputs and other activated devices from the Gas Detection System.

4. Reporting and Verification and Record Retention Instructions

A. It shall be the Operator Qualified Storage Field employee responsibility to ensure that the Gas Detection Alarm Inspection is recorded in Maximo

GAS STORAGE INTERNAL CORROSION MONITORING
GSIC 1.01 Internal Corrosion Monitoring Plan

April 1, 2023

1. Objective

- A. This section describes the guidelines for monitoring metallic piping systems and related appurtenances, such as vessels, for the precursors to and effects of internal corrosion.
- B. The processes and procedures contained in this section are applicable only to storage field gathering system piping carrying dry gas, wet gas or both.
- C. Internal corrosion control for pipelines outside of the storage fields is covered in [CORR 1](#). Ameren Illinois' (AIC) Operation and Maintenance (O&M) Plan.
- D. Potential corrosivity may be estimated by knowing the chemical composition of the gas transported, liquids removed, or sludge and solids found in the pipeline. Samples of these constituents are taken periodically from sampling points and at other times whenever the opportunity exists.
- E. Internal surfaces of pipe exposed for any reason are inspected for internal corrosion damage and tested when conditions for internal corrosion are observed. See [CORR 1 Appendix A](#) - Buried Pipe Examination Form. Samples can be tested in the field as described in the following subsections and/or submitted for laboratory analysis at the discretion of the Corrosion Control personnel.
- F. Test result interpretations must include knowledge of the history of the segment, the limitations of sampling and testing techniques, and the basic principles governing the process of internal corrosion. When necessary, additional investigation, testing, and results evaluation are performed to determine if an environment is more or less corrosive than indicated by the available data.

4. Operating Data and Physical Data

To form a complete picture of the potential for internal corrosion, certain operational data should be gathered and analyzed in conjunction with hands on examinations and test result data all of which are applied in the context of the physical make-up of the system.

5. Operational Data

The following data should be available from general records of field operation on a daily, weekly, or other interval basis. Individual data points may not be as useful as trends of the operating parameters. The information should be recorded at the time of sample collection from a measurement point as close as possible to the sample taking location. As with any good logging, the date and time of the readings should be recorded in order to correlate its value with the collection of samples for testing.

A. Pressure

(1) The operating pressure at the time of sampling is necessary for calculating the partial pressure of gas components accurately. It is also used for calculating the stress level in the pipe, which may be important if deteriorated pipe is discovered.

(2) Other pressures to be aware of include the maximum allowable operating pressure (MAOP) and design pressure of the portion of the system under review. These should be part of the permanent record of the system.

B. Temperature

This data point may provide information concerning corrosion rates. Increased temperature will generally result in increased corrosion growth rates, which in turn are used to determine remaining life calculations for the pipe.

C. Typical Flow Rates

This information can be used to determine surface velocities along the pipe wall which will describe the type of flow, especially in mixed phase systems. The type of corrosion suspected might then be predicted.

D. Liquid Volumes Removed

All volumes of liquid collected, whether or not tested either in field or laboratory, should be recorded for each location where liquid is drained. Just as important is noting when no liquid is present during a routine blow down activity. See [PCBH 3 Inspection Form](#).

E. Sludge or Solids Collected

All quantities of sludge or solids removed whether or not it is tested should be recorded and each location noted from where it is removed.

6. Physical Data

UNCONTROLLED IF PRINTED

Materials used, design and construction practices, history of the system or segment, etc. may have an effect on where internal corrosion occurs and what form it might take.

A. Age of pipe

Older pipe may have more inclusions that can serve as internal corrosion initiation sites. When new pipe is installed in older systems, more aggressive corrosion has occasionally been found to occur in the newer pipe.

B. Type of Seam versus Seamless

Certain ERW pipe seams are susceptible to selective seam corrosion at the fusion line and/or in the heat affected zone of the seam weld. The wall thickness of older seamless pipe may have a significant variance around its circumference that could affect presumptions made from wall thickness measurements.

C. Welding Procedures/Quality

For example, welds that exhibit poor workmanship may cause greater disruption to local flow or provide crevices at the inner diameter of the weld. These are places where internal corrosion can start.

D. Design and Construction

Low spots, unused bypasses, dead legs and similar locations are sites where liquids or contaminants will accumulate when present. Places where the flow drastically changes direction or velocity are susceptible. Couplings and flanges present both flow disruption and accumulation points.

E. Hydrostatic Test Records

(1) In addition to knowing when the pipeline was tested and to what pressure, such records may indicate how long the water was left in the pipeline before the dewatering process and the level of dryness achieved after dewatering.

(2) The source of the test water when available can be valuable. Surface water from lakes, ponds or rivers is more likely to contain organisms that could lead to the breeding of bacteria inside the pipeline.

F. Repairs and Replacements

(1) Repairs, especially due to internal corrosion, may lead to susceptible sections of the piping that require closer scrutiny.

(2) The location and dates will indicate where problems have historically been found and lead to determination of possible causes.

(3) Similar information about replacements, including the results of internal inspections at those locations, is equally valuable.

G. Original Water Composition

(1) If available, original water composition within the formation may be used to validate the amount of various constituents (i.e. iron, calcium, or sulfate) identified in a liquid/solid/sludge sample.

(2) For example, a solid sample was collected from a pig run identified a high concentration of iron. The original water composition shows a large amount of iron present suggesting that the majority of the iron is most likely from the ground water rather than corrosion from the pipe.

7. Gas Samples

A. Gas samples are taken during both the injection season and the withdrawal season. As gas chromatographs are installed and implemented, gas sampling may be supplemented or superseded by chromatograph data at the discretion of the Corrosion Control personnel.

B. In addition to samples, gas is tested on-site for Hydrogen Sulfide (H₂S) content.

C. Sample Locations & Methods

(1) Gas within the storage field is considered reasonably homogeneous however; some variation may be seen between wells. Therefore, additional testing at individual wells may be limited to specific gas components at the discretion of the Corrosion Control personnel and should be based upon historical gas analysis trends.

(2) During the injection season, station samples are collected at meter locations.

(3) During the withdrawal, station samples are collected at the station inlet of the gathering system.

(a) H₂S testing is performed on active injection/withdrawal wells in fields where the station H₂S is detected above 6 PPM.

(b) H₂S content is tested on-site at each active wellhead using stain tube gas detectors and/or a Sensit Gold CGI.

(4) Station gas samples first tested for H₂S and then collected in stainless steel cylinders for laboratory testing.

(a) Gas sampling and testing is performed in accordance with [GSIC 2.04](#) - Sampling Natural Gas For Laboratory Analysis, and documented on [Form GSIC-2.04-1, Field Gas Sampling](#).

(b) Alternatively, H₂S may be continuously monitored using electronic equipment.

(5) Field testing and/or sampling may not be required for components that are continuously monitored by gas chromatography. The need for additional testing will be determined by the Corrosion Control personnel.

D. Analysis for Internal Corrosion Indicators

For the purpose of monitoring for internal corrosion, the samples are analyzed for carbon dioxide (CO₂), hydrogen sulfide (H₂S), oxygen (O₂), and water vapor.

(1) CO₂ - Carbon Dioxide

(a) The percentage of CO₂ in the gas stream is determined through gas chromatography. Using the percentage CO₂ and gas pressure, the partial pressure of CO₂ can be determined. Refer to section [8- Gas Unit Conversions](#) below for unit conversions commonly used for gas analysis.

(b) For purposes of this test, the gas pressure at time of sampling as well as minimum and maximum pressure of the storage field is used. Figure 1 illustrates the concentration (%) at which the gas will exceed the CO₂ concern levels at either the minimum or maximum storage field pressure.

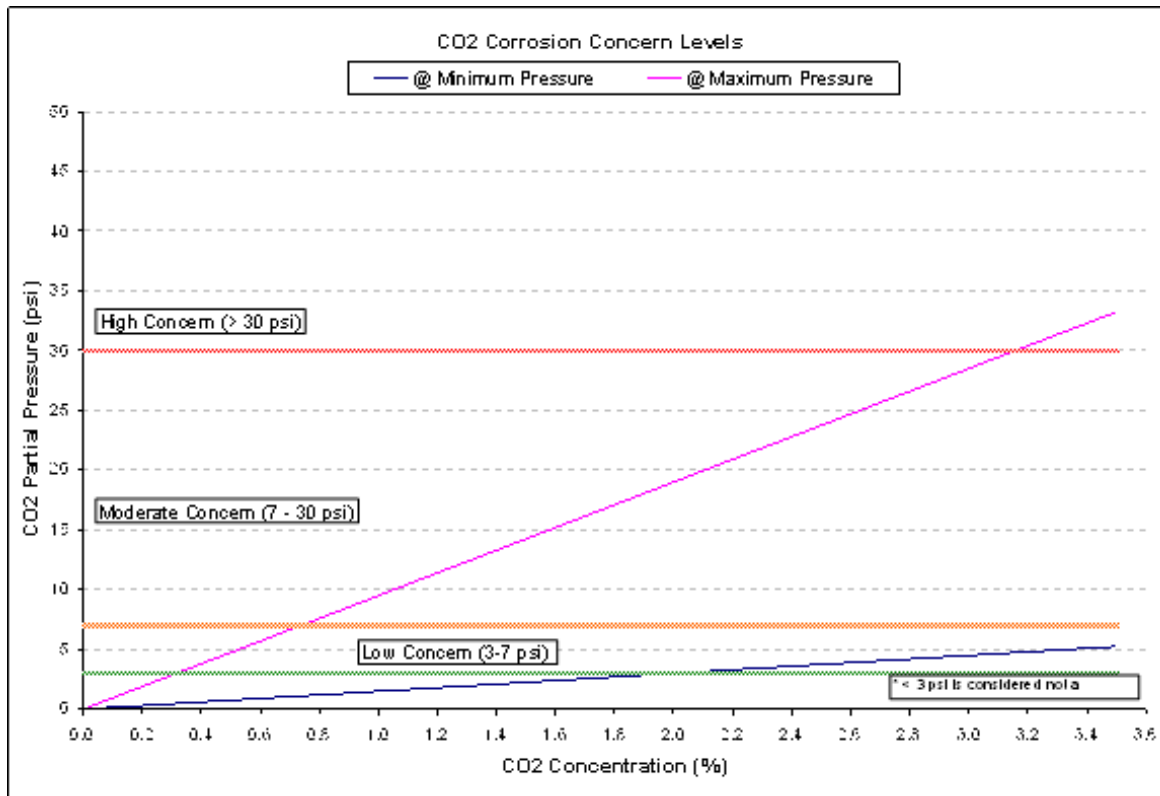

Figure 1. Example of CO₂ Corrosion Concern Levels

(c) As long as the partial pressure of CO₂ is below 3 psig, it is not a factor affecting internal corrosion of the piping.

(d) The table below identifies concern levels for CO₂ partial pressures stated in NACE RP0106-2006 "Control of Internal Corrosion in Steel Pipelines and Piping Systems." The partial pressure versus CO₂ concentration graph in Figure 1 can be used to identify when a carbon dioxide concern exists.

CO ₂ Partial Pressure (psig)	Level of Concern
< 3	Low Risk
3 - 30	Moderate Risk
> 30	High Risk

(2) H₂S - Hydrogen Sulfide

(a) The amount of H₂S in the gas stream is determined by using a stain tube or an electronic meter. The stain tube provides a read out in ppm. Electronic meters give a direct reading of the percent of H₂S in the gas.

(b) In terms of internal corrosion, H₂S is typically evaluated in ppm and / or partial pressure. Refer to section 8 - Gas Unit Conversions below for unit conversions commonly used for gas analysis.

(c) For purposes of this test, the gas pressure at time of sampling, as well as minimum and maximum pressure of the storage field, is used.

(d) Figure 2 illustrates at what concentration (ppm) the gas will exceed the H₂S concern level (0.05 psi) at a minimum or maximum pressure.

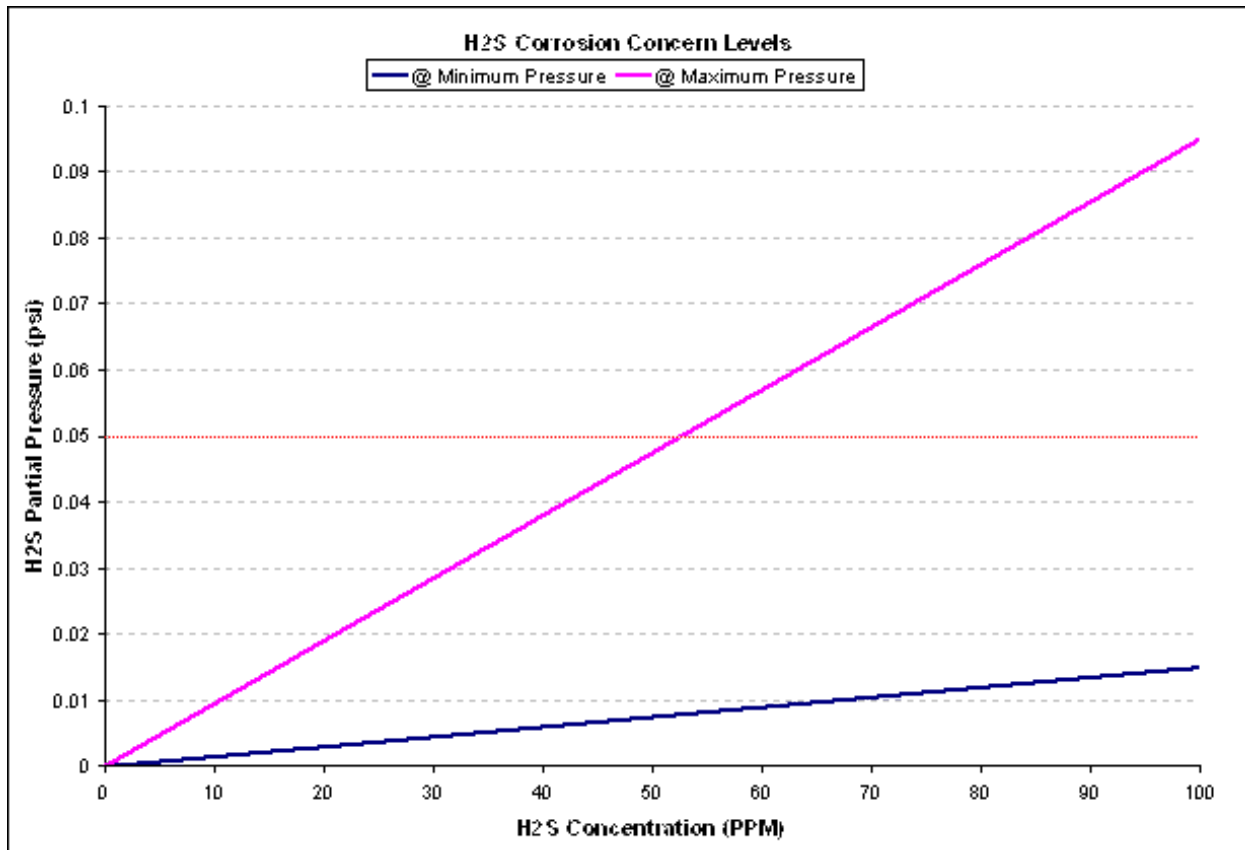

Figure 2. Example of H₂S Corrosion Concern Level using Total Pressure and H₂S Concentrations

(e) Shown in the table below are concern levels for internal corrosion due to elevated levels of H₂S. Gas maintained at tariff quality is considered a low concern for internal corrosion due to H₂S. Furthermore, partial pressures below 0.05 psia are considered a low concern for sulfide stress cracking^[1].

H ₂ S (ppmv)	Level of Concern
< 50	Low Risk
50 - 200	Moderate Risk
> 200	High Risk

(3) O₂ - Oxygen

(a) Oxygen within a gas stream containing water will accelerate corrosion pitting. O₂ is measured by an oxygen analyzer.

(b) It can also be evaluated as an additional component of gas chromatograph analysis.

(c) Alternatively, special stain tubes may be used to test for O₂ content.

(d) If O₂ is indicated, it is necessary to determine the dissolved O₂ concentration in water when it is present. A dissolved O₂ concentration above 10 to 50 ppm can be considered corrosive

(e) to steel pipelines. Refer to section [8 - Gas Unit Conversions](#) below for unit conversions commonly used for gas analysis.

(f) The restriction for transported gas from suppliers ranges from 20 to 50 ppmv.

(g) NACE standard practice states that companies shall make reasonable efforts to maintain the gas free from oxygen if the oxygen level exceeds 1000 ppmv (0.1 Vol.%).

(h) As a caveat in cases where oxygen is found in natural gas samples, there is always the possibility that air contamination might have occurred during the sampling process or at the laboratory during analysis. To obtain additional oxygen concentration information it is recommended to use an oxygen sensor instrument at the sampling site.

(4) Water Vapor

(a) Water content in the gas stream can be measured with either a stain tube or an electronic meter. Both of devices determine the amount of water in pounds per million cubic feet (lbs/MMSCF) of the gas.

(b) A value of less than 7 lbs/MMSCF is generally considered non-corrosive. At higher concentrations and certain pressure and temperature conditions, it is possible for free water to condense.

(c) Water content is continuously monitored downstream of the dehydration system.

(d) Upstream of the dehydration system (e.g. at the wellheads), the gas may be considered water saturated.

(e) Testing water vapor content at various wellheads can help quantify the level of water saturation within a given storage field. This additional testing may be performed at the discretion of the Corrosion Control personnel.

(5) Additional testing

(a) Heating value, relative density and hydrocarbons are typically obtained from laboratory samples.

(b) The heating value identifies the quality of the gas by measuring the amount of [heat](#) released during the combustion of a specified amount.

(c) Hydrocarbons are analyzed by the laboratory to identify the main components of the gas.

8. Gas Unit Conversions

A. The constituents analyzed in the gas stream may be reported in several different units. This section identifies the different equations used to perform unit conversions for the various constituents.

B. First equation uses the percentage, typically reported by a laboratory, and gas pressure to calculate the partial pressure.

$$\text{Partial Pressure} = \frac{\text{mole \%} \times \text{total pressure}}{100}$$

C. The percentage of the constituent may also be converted into parts per million (PPM), using the following equation:

$$\text{Parts Per Million (PPM)} = \frac{\text{mole \% O}_2 \times 10^6}{100}$$

D. The last equation uses typically reported by a stain tube or an electronic meter, to convert to the partial pressure of the constituent in the gas.

$$\text{Partial Pressure} = \frac{\text{PPM} \times \text{total pressure}}{10^6}$$

9. Liquid Samples

A. The composition of liquids removed from the piping and equipment is information useful in estimating corrosivity. Since corrosion requires an electrolyte, there will be no internal corrosion where no liquids are present.

B. Measurement and analysis of liquids from the piping along with knowledge of the original water composition within the formation can be used to predict changes in corrosivity or corrosion mechanism due to changes in process conditions.

C. Measurements of interest include temperature, pressure, alkalinity, pH, dissolved H₂S, dissolved CO₂ and metal/cations and anion analysis (lab).

D. Composition determined from analysis can improve corrosion monitoring efforts by identifying corrosion products. Refer to [GSIC 2.03](#) - Collecting and Testing of Fluids Samples, for additional information.

E. Sample Locations & Methods

(1) Sampling locations are chosen so that data represent the majority of liquids within the system being monitored. They should also represent locations where internal corrosion is expected to be most aggressive as may be determined by previous experience, inspections of the system piping and equipment or as predicted by integration of data collected through this monitoring program.

(2) Typical sampling locations to consider include the following:

(a) Drips (pipeline, meter station, compressors, etc.)

(b) Vessel/header drain lines

(c) Liquid recovery vessels (well head separators, slug catchers, scrubbers)

(d) Dead end sections of pipe with no flow

(e) Pig launchers and receivers

(f) Tanks

(g) Meter tubes

(h) Low areas (sags, river crossings, etc.)

(i) Side streams and sample loops

(3) Testing for corrosion information is performed in accordance with [GSIC 2.03](#) - Collecting and Testing of Fluid Samples. Field-testing should be completed within four (4) hours of collection and, if possible, samples should be analyzed within thirty six (36) hours.

(4) If a full sample size (i.e. 3 - 4 ounce bottles) is not available, the number of tests may be limited in order to optimize the type and quantity of results obtained. Priority should be given to pH, temperature, and bacteria tests.

(5) Analysis for Internal Corrosion Indicators

F. Field Tests

Although field analysis of withdrawn liquids tends to be less precise than laboratory testing, the lesser accuracy is offset by the fact that some parameters can change over time or after

UNCONTROLLED IF PRINTED

removal from the pipeline environment. Therefore, the following recommended tests should be performed immediately after a liquid sample is collected.

(1) pH

The pH of the liquid water is determined by a pH meter or pH (litmus) paper. This is an important field measurement because it will change following depressurization and when there are significant levels of dissolved iron in the liquid. Low pH levels, such as 5.0 or less, may result in increased corrosion.

(2) Temperature

Temperature is measured using a thermometer or electronic instrument that has an appropriate range. A "rule of thumb" is the corrosion reaction rate doubles for every 10°C (18°F) increase in temperature.

(3) Bacteria

(a) Bacteria testing should be started immediately upon sample collection because levels of viable bacteria may increase or decrease in a few hours.

(b) Bacteria cultures are injected into a dilution series and, depending on the reaction observed after the incubation period (APB 5 to 14 days, SRB greater than 28 days) the total number of bacteria colonies per liter are determined.

(c) When found in a liquid sample, bacteria are typically described as planktonic; sessile bacteria are typically found in solid or sludge samples. Planktonic bacteria of 1000 colonies per ml are considered a concern for corrosion (SRB or APB).

(d) In some cases, the liquid sample may be preserved in the field for laboratory analysis to determine the exact type of bacteria present. This additional testing would be done at the discretion of the Corrosion Control personnel.

10. Additional Tests (Optional)

A. Total alkalinity, dissolved H₂S, and dissolved CO₂ are typically obtained from laboratory samples. However, field test kits are available for situations when immediate results are desired.

B. For example, root cause investigations might warrant use of these tests rather than waiting for lab analysis to issue preliminary findings.

C. The relative complexity of performing these tests and/or the subjective nature of the results makes these impractical to run for every sample.

(1) Total Alkalinity

(a) Alkalinity is a pH dependent factor that will also change as the pH changes.

(b) This test is performed with a HACH Alkalinity test kit (or equivalent).

(c) Alkalinity is determined by counting the number of drops required to activate Phenolphthalein or Bromocrescol Green-Methyl Red indicators.

(d) If the pH test result is less than 4.5, the total alkalinity test is unnecessary and the value is assumed to be zero.

(2) Dissolved H₂S

(a) This test is performed in the field because H₂S leaves the sample after depressurization.

- (b) Two different field test methods are available and should be used depending on the volume and cleanliness of the water sample.
 - (c) If at least 100 mL of liquid is available to test, a HACH Hydrogen Sulfide test kit should be used. This test determines H₂S concentration by comparing exposed test papers to a color chart.
 - (d) If less than 100 mL of liquid is available to test, a test kit may be used. This test determines H₂S concentration by comparing an activated solution in an ampoule to a color chart.
 - (e) Refer to [GSIC 2.03](#) - Collecting and Testing of Fluid Samples for recommended test kits.
- (3) Dissolved CO₂

The test kit for measuring the amount of CO₂ in the sample solution should be used as soon as practical after sample collection since the CO₂ will be liberated from the sample due to the pressure reduction. Refer to [GSIC 2.03](#) - Collecting and Testing of Fluid Samples for recommended test kits

11. Laboratory Tests

The primary purpose of laboratory testing is to determine the composition of the liquid sample. Most results are reported as concentration in parts per million (ppm). Recommended tests performed are summarized below.

A. Metal/Cations Analysis

(1) This test determines the concentration of common cations, which are positively charged ions. Knowing the type and concentration of these ions present helps predict the formation of deposits, or when combined with other information, indicate corrosion is occurring. Common cations used for analysis are:

- (a) Calcium
- (b) Barium
- (c) Iron
- (d) Magnesium
- (e) Manganese
- (f) Potassium
- (g) Sodium
- (h) Strontium

(2) Iron and/or manganese can also be naturally occurring in the water produced therefore not all concentrations are indicative of internal corrosion. Once a typical composition for a given well formation is established, any concentrations outside of this "normal" range can be flagged as a concern.

(3) Generally speaking, the ratio between iron and manganese within a particular formation should hold relatively constant therefore a high Fe to Mn ratio could also be indicative of internal corrosion. A typical concern level for Fe/Mn ratio would be 0.017.

B. Anion Analysis

(1) The concentration of common anions (negatively charged particles) is the result of this test.

(2) The type and concentration of anions in the sample can be used to predict acceleration of corrosion pit initiation (such as when chloride ions are present) or inhibition of corrosion activity (such as when phosphate ions are in the liquid).

(3) Common anions used for analysis are:

(a) Chlorides

(b) Sulfates

(c) Sulfides

C. Alkalinity

(1) Carbonate, bicarbonate and hydroxide ions determine the alkalinity of the liquid. These can neutralize acids and act as a pH buffer.

(2) Bicarbonate and carbonate ions, together with cations such as calcium or iron, form commonly found scale. In general, corrosivity tends to decrease as alkalinity increases.

D. pH

The pH of a sample is the negative logarithm of the hydrogen ion concentration in an aqueous medium. The pH will indicate whether a sample is acidic (< 7), neutral (~7) or alkaline (>7).

E. Total Dissolved Solids (TDS)

(1) TDS are the sum of all dissolved ions (cations and anions) detected in the analysis of an aqueous liquid.

(2) This value can be used to verify the completeness of an analysis based on the sum of each of the individual constituents of the sample should approximate the total dissolved solids value.

F. Miscellaneous

Other tests may be specified at the discretion of the Corrosion Control personnel.

(1) Remaining inhibitor concentrations may help monitor the effectiveness of an inhibitor program.

(2) Specific gravity may be useful in determining the root cause of internal corrosion.

(3) Glycol scans can be performed to detect the total amount (as a percentage) of alcohol type compounds contained within a liquid sample such as methanol, various ethylene glycols, isopropanol and propylene glycol.

(4) The presence of glycol may indicate upsets or carryover from dehydration, which may also introduce water, chlorides and other corrosive contaminants into the system.

12. Analysis of Sludge or Solid Samples

A. Whenever sludge or solids are removed from a pipeline or equipment, collect a sample of the material according to [GSIC 2.01](#) - Internal Corrosion Examination.

B. Perform field tests for pH, sulfides and bacteria. Samples are sent to a laboratory for a complete compositional analysis including anions, cations, metals, organics, iron carbonate (FeCO₃), and iron sulfide (FeS) If there is liquid in the sample, determine if it is water, which supports corrosion, or hydrocarbons.

C. Field Tests

Field tests for pH, bacteria, and sulfides are performed immediately after sample collection. Once the line or vessel is opened and the sample exposed to the outside environment, conditions begin to change. Therefore, it is essential to take these readings as soon as possible:

(1) pH

(a) The pH of the solid or sludge is determined by a pH meter or pH (litmus) paper.

(b) This is an important field measurement because it will change following depressurization and when there are significant levels of dissolved iron in the liquid. Low pH levels, such as 5.0 or less, may result in increased corrosion.

(2) Bacteria

(a) Because levels of viable bacteria may increase or decrease in a few hours this test should begin immediately upon sample collection.

(b) Bacteria cultures are injected into a dilution series and, depending on the reaction observed after the incubation period (APB 5 to 14 days, SRB greater than 28 days) the total number of bacteria colonies per liter are determined.

(c) When found in a liquid sample, bacteria are typically described as planktonic; sessile bacteria are typically found in solid or sludge samples.

(3) Sulfides and Carbonates

(a) The presence of sulfides or carbonates in a solid sample can be detected by adding a small amount of hydrochloric acid (or other strong acid) Bubbling indicates a positive test for carbonates.

(b) Lead acetate test paper is then used to test for sulfides.

D. Laboratory Tests

(1) Compositional data may be useful in determining the corrosivity of the internal pipeline environment.

(2) If a sample of solids contains a large fraction of Iron Sulfide (FeS), also known as "black powder", it may smolder and/or ignite when exposed to air. Caution is required for shipping such a sample as well as handling it during clean out in the field.

(3) Analyze the sample for the following compositional data:

(a) Alkalinity

Alkalinity measures the amount of constituents (bicarbonates, etc.) in water that neutralize acids and act as pH buffers. When alkalinity increases, corrosivity tends to decrease.

(b) % Ash

Percent ash is the amount of non-[aqueous](#) residue that remains after a sample is [burned](#), which consists of mostly metal [oxides](#). (Non-volatile)

(c) Chloride, soluble

i. Chlorides tend to exacerbate localized corrosion (pitting-type) when in contact with steel for extended periods.

ii. Most are quite soluble in water, therefore they will only be found in samples where fluids high in chloride ion concentrations encounter dry conditions preventing them from deliquescing.

iii. Chlorides can interact with hydrogen ions to form HCl and lower the pH.

UNCONTROLLED IF PRINTED

(d) Metals (Calcium, Barium, Iron, Magnesium, Manganese)

i. Iron found in a solid sample that has accumulated in vessels, loosened during cleaning pig runs, or debris found when a cutout is made on the line typically represents corrosion product.

ii. When considering Iron, manganese should also be noted. A large manganese to iron ratio usually reflects corrosive conditions.

iii. Large amounts of calcium, barium and magnesium indicate scaling.

iv. Magnesium can form corrosive scales with chlorides and sulfates. Magnesium carbonate is a protective scale.

v. Calcium can form acidic or alkaline scales as well. Calcium carbonate is protective, while calcium sulfate and calcium chloride are corrosive.

vi. Barium sulfate is a problematic scale which deposits on steel and is extremely difficult to remove once formed. Once adhered to the pipe, corrosive conditions are likely to occur beneath the scale.

(e) pH, slurry

The pH of a sample is the negative logarithm of the hydrogen ion concentration in an aqueous medium. The pH will indicate whether a sample is acidic (< 7), neutral (~7) or alkaline (>7).

(f) Sulfate, soluble

Sulfate salts are acidic and can impact corrosion, especially causing localized under-deposit or crevice corrosion.

(g) Sulfide

i. The corrosion rate and formation of iron sulfide is relatively general when their amounts are nearly equal.

ii. When the amount of sulfide is considerably less than iron, iron sulfide formation is less likely; therefore, the impact of sulfide corrosion is deemed minimal.

iii. If the opposite is true, iron sulfide is readily formed and there has been significant sulfide influenced corrosion.

13. Corrosion Monitoring

A. Corrosion Coupons

(1) A corrosion coupon is a small, carefully weighed and measured specimen of metal inserted into the pipeline or vessel and exposed to the internal environment for a specified period of time.

(2) The difference in the weight of the coupon before and after exposure can be converted into a general corrosion rate at that point in the piping system.

(3) Instructions for coupon removal and installation are provided in [GSIC 2.02](#) - Monitoring Corrosion Weight Loss Coupons.

(4) In general, corrosion coupons are installed in representative locations and/or the most severe internal corrosion location anticipated or known from prior experience.

(5) At a minimum, AIC installs a single corrosion coupon, ER probe, or other corrosion monitoring device at each storage field. Storage fields having a higher known corrosivity will have multiple coupon or probe locations.

(6) The corrosion rate for each coupon is expressed in mils per year (mpy) and calculated from the difference between the starting and ending weights, the surface area of the coupon, its density and the time it was exposed to the internal environment of the pipeline.

$$\text{CorrosionRate (mpy)} = \frac{22.25}{DAT} \times \Delta W$$

Where,

ΔW = Change in Weight (mg)

D = Density of the coupon (g/cm³)

A = Area of the coupon (in²)

T = Exposure Time (days)

(7) Based on NACE RP0775-2005, a qualitative guideline for the interpretation of measured corrosion is given below.

Corrosion Rate (mpy)	Level of Concern
< 1	Low Risk
1 - 5	Moderate Risk
> 5	High Risk

(8) Coupons are to be evaluated twice per calendar year but with intervals not to exceed 7½ months. Coupons are not to be re-used after removal.

(9) One set is inserted at the end of the withdrawal season and removed and analyzed at the end of the injection cycle to monitor potential corrosion during injection.

(10) The coupons that replace this set are left in place through the injection/withdrawal period before removal for measurement.

B. Electronic Corrosion Probes

(1) Electronic probes can measure corrosivity in real time and without needing to be removed from the pipeline. Location on the pipeline is generally the same as for coupons.

(a) An electrical resistance (ER) probe determines metal loss by measuring the increase in the electrical resistance of an electrode as corrosion reduces its cross sectional area over time.

(b) Continuous electrolyte is not required for this type of probe to operate making it a good choice for placement in a gas stream.

(c) ER probes are not intended for monitoring pitting.

(d) Fouling of the probe by deposits (e.g., iron sulfide) may affect its accuracy.

(2) Linear polarization probes (LPR) instantly determine corrosion rate by measuring the degree of resistance to a small applied voltage.

(a) The LPR must be submerged in electrolyte in order to operate limiting its possible placement to locations that normally contain a liquid.

(b) These probes can be fouled by hydrocarbon liquids.

UNCONTROLLED IF PRINTED

(3) AIC currently utilizes ER probes at all storage fields. LPR probes are being used at one AIC storage field.

(4) Where both coupon and probe data is available, the relative corrosion rates are compared.

(5) The output from an ER probe is a signal proportional to the element's metal loss. The corrosion rate is then calculated using multipliers specific to the probe type. Corrosion Rate can then be expressed as the change in metal loss over time.

$$\text{CorrosionRate (mpy)} = \frac{P \times 365}{1000} \times \frac{\Delta S}{\Delta t}$$

Where,

P = Probe Multiplier (dimensionless)

ΔS = Change in Signal (dimensionless)

Δt = Time between Readings (days)

C. Ultrasonic Thickness (UT) Survey

(1) An UT survey is a useful method for determining corrosion rate information, remaining life and the extent of any internal corrosion damage of various pressure equipment and piping with the storage fields.

(2) Generally, the UT survey is performed at wellhead water knockout vessels, wellhead sweep piping, station piping and dead ends (where liquids may accumulate).

(3) The UT survey procedure would include:

(a) Ultrasonic - "A" Scan with remote data acquisition. All test point locations should be scanned by continuous coupling to the test item. The average scan incorporates a 2" minimum wide test band at the critical locations. The lowest reading should be recorded, localized and documented for assessment.

(b) Areas that reveal unusual metal loss should be addressed within the "comments" section of the report and summary.

(c) Calibration - All ultrasonic sets should be calibrated in accordance with standard Vertical and Horizontal Linearity specifications.

(d) Surface Preparation - All Oxides, scale, loose paint, etc. shall be removed by scraping.

(4) UT surveys typically utilize a third-party contractor and performed once per calendar year. At a minimum, the person performing the UT Survey should have ANST Level 2 and API 653 certifications. Personnel assisting under the direction of a qualified individual do not require ANST Level 2 or API 654 certifications.

(5) The surveys are performed per contractor's specifications unless otherwise directed by the Corrosion Control personnel.

Note: [GSIC 2.01, Section 5 - Ultrasonic Thickness Testing](#), does not cover annual UT survey requirements.

(6) If desired, a Fitness-For-Service (FFS) may be performed in addition to the standard UT survey. FFS requires more data points and more detailed examination when significant wall loss is found. Results are analyzed by a qualified individual per API 579-1/ASME FFS-1.

(7) Inspection intervals for each location are determined based upon the corrosion rate and remaining wall thickness data. After two or more data points are accumulated for each test location, a corrosion rate can be calculated to determine the frequency of future UT testing.

$$\text{Corrosion Rate (mpy)} = \frac{WT_2 - WT_1}{\Delta t} \times 1000$$

Where,

WT = Average Wall Thickness (inches)

Δt = Time between Measurements (years)

(8) The frequency of testing can be the lesser of either one-half the Remaining Life or at an interval specified by AIC personnel.

(9) The table below identifies the risk for the various corrosion rates established by the UT survey. These should be used to determine the frequency of testing.

Table 1. UT Survey

Corrosion Rate (mpy)	Total Wall Loss (%)	IC Risk
< 1.0		Low
1.0 ≤ Rate ≤ 5.0		Moderate
> 5.0	> 20%	High

(10) Ideally, a second UT survey would be performed one year after the initial baseline survey in order to determine a corrosion rate for each location. However, at the discretion of Corrosion Control personnel, if the baseline survey reveals the vessel or piping to be in good condition (i.e. at or above nominal wall thicknesses) the second survey may be postponed.

14. Corrosion Rate and Remaining Life

A. Corrosion Growth Rate

(1) When possible, the corrosion rate should be determined by directly comparing measured wall thickness measurements over a known time interval.

(2) The use of coupons is another relatively direct measurement technique.

(3) Both, however, are limited in that only averages are calculated and may present an inaccurate picture in changing or volatile conditions.

(4) If multiple corrosion rate data points are available for the same location, they should be used in the following order of precedence: UT survey, Corrosion Coupons, ER Probes.

(5) Since direct measurement is frequently not practical, a corrosion rate may be estimated by considering "like/similar" areas of the piping system where a rate is more likely to be known.

(a) "Like/similar" areas contain the same pipe material, transport the same product and experience virtually the same flow and operating conditions.

(b) Comparison of the results of sampling performed on specimens removed from the piping should aid in this analysis.

B. Remaining Life

(1) The remaining strength of a corroded pipe is determined by use of ASME B31G, Manual for Determining the Remaining Strength of Corroded Pipelines or the AGA Pipeline Research Committee, Project PR-3-805, A Modified Criterion for Evaluating the Remaining Strength of Corroded Pipe (with RESTRENG) Limitations are also specified in the procedures.

(2) In order to calculate the remaining life, the depth of the corroded areas (i.e. remaining wall thickness), length of the corroded areas, pipe diameter, grade and wall thickness need to be known.

(3) One of the outputs of the remaining strength methods is the maximum safe pressure (calculated failure pressure) of the pipe in its corroded condition. This value is needed to calculate the remaining life of the facility in accordance with the following equation per NACE SP0502-2008:

$$\text{Remaining Life (years)} = 0.85 \times \left(\frac{P_{fail}}{P_{yield}} - \frac{MAOP}{P_{yield}} \right) \times \frac{WT}{1000 \times GR}$$

Where,

P_{fail} = Failure Pressure (psi)

P_{yield} = Yield Pressure (psi), [2·SMYS·t/OD]

MAOP = Maximum Allowable Operating Pressure (psi)

WT = Wall Thickness (inches)

GR = Growth Rate (mpy), [Note: The equation as written above accounts for Growth Rate in mils per year instead of inches per year.]

15. Examination of Exposed Surfaces

A. Anytime the inside of a pipeline is exposed for any reason, the internal surfaces must be inspected for evidence of corrosion. This will include when pipe is cut out, spool pieces are removed, valves or other flanged equipment is taken out of the line and similar situations.

B. When pipe is tapped and the tapping coupon is retrieved, its inside surface should also be inspected.

C. Visual examination should be done as soon as possible after the internal surface is exposed. Changes to deposits and corrosion products, if present, occur when exposed to air, light and moisture.

D. The inspection involves more than a simple determination of pipe wall thinning or pitting due to internal corrosion.

E. Other evidence from inside the pipe needs to be collected and analyzed to establish the root cause and point toward a mitigation strategy.

F. Examination for internal corrosion should be performed in accordance with [GSIC 2.01](#) - Internal Corrosion Examination and documented on applicable form.

16. Root Cause Analysis

If it appears that internal corrosion has occurred at the location and a more detailed investigation is warranted, the following additional pieces of information above and beyond what is collected on [Form GSIC-2.01-1](#) may be required in order to perform a root cause investigation:

- A. Physical location information - The piping configuration upstream and downstream may also be useful
- B. Potential source liquids - sampled from upstream locations, when applicable, for laboratory analysis
- C. Operating history data - obtained from appropriate sources
- D. Pipe sample - preserved for laboratory analysis

17. Data Trending

- A. Internal corrosion is dependent upon a variety of factors including physical layout of the system and chemical composition of the gas transported.
- B. The following data sets provide the strongest correlation to internal corrosion risk and therefore are used to benchmark risk within each storage field as well as compare conditions between fields.
 - (1) History of Internal Corrosion - leaks, ruptures, or repairs required due to internal corrosion (if available)
 - (2) Corrosion Rate - high / moderate / low per UT survey, corrosion coupon, &/or ER probe data
 - (3) H₂S - high / moderate / low based on ppm concentration
 - (4) CO₂ - high / moderate / low based on partial pressure
 - (5) Bacteria - Acid Producing Bacteria (APB) or Sulfate Reducing Bacteria (SRB) colony count of 1,000/mL or more
- C. Each data component is a useful tool that when taken as a whole, the data can be used to focus additional corrosion monitoring, mitigation, maintenance or repair activities.

18. New or Revised Piping

- A. Construction of new piping or modifications to existing pipelines may affect the potential for internal corrosion at virtually any location within the storage field.
- B. Care should be taken to evaluate such changes in view of regulatory requirements for the design and construction of the components.
- C. In addition, at least initially, the internal corrosion monitoring program may need to be modified until the effect of the piping changes becomes clear.
- D. Each new transmission line or replacement of line pipe, valve, fitting, or other line component in a transmission line must
 - (1) Be configured to reduce the risk that liquids will collect in the line;
 - (2) Have effective liquid removal features whenever the configuration would allow liquids to collect; and

(3) Allow use of devices for monitoring internal corrosion at locations with significant potential for internal corrosion.

E. When changes to the configuration of a transmission line are made, the impact of the change on internal corrosion risk to the downstream portion of existing piping must be evaluated.

F. Provisions for removal of liquids and monitoring of internal corrosion as appropriate are required.

19. Documentation

A. Records relating to internal corrosion are filed and maintained as follows and should be maintained for the life of the pipeline.

(1) Routine / Regular Maintenance

(2) Facility (Storage Field)

(a) Well

(b) Pipeline Segment

20. Data for Audits and Reviews

A. Records should be kept in a central location and easily referenced in order to simplify audit preparation.

B. Current and historical test data for each storage field will be filed under facility, specific to wellhead name or pipeline segment.

C. Monitoring Records:

(1) Coupons - location and frequency of coupon monitoring

(2) Gas Samples - location and frequency of sampling, type of analysis performed (CO₂, H₂S, O₂, water vapor), CO₂ corrosivity ranges

(3) Water/Liquid Samples - frequency and location of sampling, constituents analyzed, threshold criteria used

(4) Solids Samples - location and frequency of sampling (at pig receivers), presence of iron oxide (Fe_xO_x), iron Sulfide (FeS), scale, or sand

(5) Instrumented Inspection Surveys - lines surveyed, frequency

D. Mitigation Records:

(1) Inhibitor Programs - program start date, treatment type, inhibitors used

(2) Maintenance Pigging - routine pigging program in place at various storage fields

(3) Gas Velocity Control

E. Operation Records:

(1) Pressure, Flow, and Temperature - maximum and minimum for both injection and withdrawal

(2) Water, CO₂ and O₂ Content - for both injection and withdrawal

(3) Leaks and Leak Surveys - 5 year history

UNCONTROLLED IF PRINTED

- (4) Failures and Ruptures - 5 year history
- (5) Upsets - 3 year history by type and cause

F. Basic Storage Information:

- (1) Compressors
- (2) Dehydration
- (3) Sweeting
- (4) Scrubbers / Separators
- (5) Draining/blowing frequency

G. Miscellaneous Information:

Any well treatments (e.g. fracturing or acidizing) must be summarized.

[1] NACE MR0175-2002. Sulfide Stress Cracking Resistant Metallic Materials for Oilfield Equipment.

GAS STORAGE INTERNAL CORROSION MONITORING
GSIC 1.02 Safety Considerations

April 1, 2023

1. Objective

A. This section describes Safety Considerations when performing monitoring tasks and inspection activities related to metallic piping systems and associated appurtenances such as vessels, for the precursors to and effects of internal corrosion.

B. The processes and procedures contained in this section are applicable only to storage field gathering system piping and related appurtenances carrying dry gas, wet gas or both. Internal corrosion control for pipelines outside of the storage fields is covered in [CORR 1. Ameren Illinois' \(AIC\) Operation and Maintenance \(O&M\) Plan](#).

2. Part 192 Reference

49 CFR §§ 192.475, 192.476, & 192.477

3. Safety Considerations

A. Follow all applicable Company safety procedures including those related to ACIG - accidental ignition, CONF - confined space entry, DAMG - damage prevention, and EXCV - excavation safety when excavating pipe and facilities.

B. Ensure appropriate Personal Protective Equipment (PPE) is used specific to the job being performed.

C. Always use latex (or similar) gloves and appropriate eye protection when collecting and testing liquid or corrosion (MIC) samples.

D. Storage field testing may involve controlling gas at elevated pressures. Use appropriate tools and equipment to prevent instruments and pipe plugs from uncontrolled movement which may cause injury during removal or installation.

E. Discontinue work when thunderstorms are in the area. Lightning strikes at remote distances can create hazardous voltage surges on the pipeline.

F. Do not allow natural gas to accumulate in confined areas or come in contact with potential ignition sources. Natural gas displaces oxygen in confined areas and is an ignition hazard when operating electronic devices which are not Intrinsically Safe or otherwise classified.

G. ER/LPR probe and trace oxygen data collection is performed using a probe specific electronic device which is Intrinsically Safe. Follow manufacturing instructions.

H. Review and understand the appropriate Safety Data Sheets (SDS) when applicable. Consult with a qualified Safety Compliance Engineer regarding interpretation.

I. Take appropriate safety precautions when performing direct examinations.

J. When near venting gas, be aware of the wind direction and park vehicle(s) accordingly. Turn off the vehicle(s) and/or any electronic device(s).

K. Ensure gas is vented away from personnel performing testing.

L. H₂S can be a health hazard even in low concentrations. Personnel should utilize an H₂S monitor when performing gas sampling and testing at storage facilities with a history of H₂S.

M. Contractors should notify responsible Company personnel prior to performing work including collecting samples.

UNCONTROLLED IF PRINTED

4. Documentation

Documentation relating to Damage Prevention (locate, JULIE), confined space entry (permit), excavation safety (dig record with excavation dimensions, soils checklist) and monitor calibration, concentration measurement should be retained.

GAS STORAGE INTERNAL CORROSION MONITORING
GSIC 2.01 Internal Corrosion Examination

April 1, 2023

1. General

A. This procedure provides a standard method of collecting and recording data during examination of pipe for internal corrosion whenever pipe is removed from the gas system.

B. The processes and procedures contained in this section are applicable only to storage field gathering system piping carrying dry gas, wet gas or both. Internal corrosion control for pipelines outside of the storage fields is covered in [CORR 1](#). Ameren Illinois' (AIC) Operation and Maintenance (O&M) Plan.

2. Part 192 Reference

49 CFR 192.475(b)

3. Safety Considerations

Please refer to [GSIC 1.02](#) - Safety Considerations.

4. Site Conditions

A. Consideration should be given to collecting information about site conditions before, during and after excavation.

B. Excavation activities may destroy some site condition evidence therefore consideration should be given to taking photographs and measurements prior to excavation.

C. Photographic considerations may include, but not be limited to:

- (1) The site prior to excavation / exposure
- (2) The site during excavation / exposure
- (3) The internal surface of the cut-out, if applicable
- (4) Any corrosion product that is present
- (5) The internal surface of the pipe on either side of the cut-out, if applicable
- (6) Pipe after replacement / repair
- (7) Site after backfill and restoration

D. Consideration may be given to documenting the general site conditions found prior to excavation on [Form GSIC-2.01-1 - Storage Internal Corrosion Examination](#):

- (1) Topography, drainage, and land use.
- (2) Footage measurement to the centerline of the excavation / exposure from a known reference point such as a road centerline, valve, meter station, etc.
- (3) GPS coordinates of the excavation site if equipment available.

E. If acquired, ensure the following information is documented on the applicable form during / after pipe exposure:

- (1) Length of excavation / exposure.

UNCONTROLLED IF PRINTED

- (2) Pipeline depth of cover. If depth of cover varies significantly within the exposure, additional depths or a sketch may be provided.
- (3) Whether the inspection is at or near a low spot.

*Note: Refer to **CORR 1 Appendix A** - Buried Pipe Examination procedures to document external conditions. This should be performed prior to removing the coating.*

F. If possible, determine the pipeline inclination angle and record on [Form GSIC-2.01-1, Storage - Internal Corrosion Examination](#).

- (1) Ensure the pipe surface is clean of dirt and debris for at least two (2) inches more than the length of level.
- (2) Use a factory-coated length if accessible to ensure the pipe wall is as smooth as possible when taking angle measurements.
- (3) Locate and mark an initial Top Center of Pipe location and its affiliated direction (north, south, east or west).
- (4) Locate and mark a second Top Center of Pipe location at a point that is at least two (2) inches longer in length than the level and indicate its affiliated direction (opposite direction as the initial location based).
- (5) If an electronic level is available, measure the inclination angle directly on the pipe with the level centered between the Downstream and Upstream marks.
- (6) If an electronic level is not available, use the following manual bubble level technique.
- (7) Place a bubble level centered between the downstream and upstream marks.
- (8) Place the level directly onto the pipe or set on a straight edge placed on the pipe.
- (9) Adjust the level or straight edge with an angle wedge so that it is leveled using the level bubble indicator.
- (10) Measure the elevation difference from the pipe surface to the level using calipers or other approved device.
- (11) Calculate the Pipeline Inclination Angle using the following equation.

$$P_{in} = \arctan (El_m / L_l)$$

where:

P_{in} = Pipeline Inclination Angle, degrees

El_m = Measured elevation difference

L_l = Length of level

- (12) If using an Excel spreadsheet, the result for P_{in} will be in radians. Multiply P_{in} by 180 divided by pi (π) to obtain degrees (cell * 180/pi()).

5. Ultrasonic Thickness Testing

A. Ultrasonic Thickness (UT) readings may be taken during examination of a pipeline or vessel to determine or verify the presence of internal corrosion.

B. This document provides a standard method of collecting and recording data during ultrasonic testing of pipe for internal corrosion.

C. To ensure good contact between the transducer and the surface, prepare the area to be examined.

(1) For UT instruments capable of deducting coating thickness, clean the coating using a cloth and water prior to examination.

(2) For Ultrasonic instruments not capable of deducting coating thickness, metal surface must be free of corrosion or mechanical deformities.

D. Clean away any contaminants present with a clean, dry, stiff brush.

(1) If not all the contaminants can be removed with this method, use a wire brush.

(2) The surface to be examined must be free of rust, scale, welding flux, weld spatter, grease, oily films and dirt.

E. Prepare the area so that the transducer contact face can be held parallel to the inside diameter surface.

F. Perform ultrasonic thickness measurements around the circumference of the pipe. Document readings on [Form GSIC-2.01-1](#).

(1) If a girth weld is exposed, perform ultrasonic thickness measurements on each side of the weld so that each joint of pipe is tested.

(2) Take readings at the 12, 3, 6 and 9 o'clock positions approximately one (1) foot apart for the length of the exposed pipe.

(3) If additional detail on wall loss is required, take readings using a one (1) inch grid from the 4 o'clock position to the 8 o'clock position on the pipeline at each of the circumferential locations.

(a) Internal corrosion is more likely in areas where liquid collects at the bottom of the pipe.

(b) Pipe to be removed from service or cut out does not require 1" gridding.

(4) If wall loss is found throughout the gridded area, extend the one (1) inch grid 360° around the pipe circumference. Corrosion can occur at any internal location in the presence of wet gas.

(5) If corrosion or wall loss greater than 10% of nominal wall thickness is found on pipe that is not intended for replacement, contact Supervising Engineer, Gas Storage to determine if repair or replacement is necessary.

(a) Request the Supervising Engineer, Gas Storage (or designee) perform ASME B31G, Modified B31G or RSTRENG remaining strength calculations as applicable.

(b) Data necessary to complete these calculations includes:

- i. Diameter
- ii. Nominal Wall thickness
- iii. MAOP
- iv. Class location

v. Pit depth measurements

vi. Pit length (including interactive pits if applicable)

(6) Pits are considered to be interacting based on the following:

(a) Pits less than one-inch apart in the axial direction are classified as interacting.

(b) Pits less than 6 times the wall thickness (6T) apart in the circumferential direction are classified as interacting.

(7) Clearly mark cut-out locations on the pipe. If possible, do not cut where internal corrosion is present (i.e. cut on either side of the identified corrosion area).

6. Visual Examination

A. Whenever the internal pipe surface is accessible, visually examine the surface for evidence of corrosion, black powder, scale, or liquid.

B. Oxygen exposure will affect any bacteria present as well as degrade other testing relevant to internal corrosion; therefore the testing must happen as soon as possible to capture the status of the internal system.

C. If possible, make the cuts at locations without internal corrosion or use two or four wheel pipe cutter to prevent heat from the cutting torch affecting the internal corrosion condition. If pipe is split longitudinally use a cutting torch to obtain necessary samples for analysis.

D. If hydrocarbons are present, immediately test the internal surface of the pipe for the presence of PCBs. See [PCBH](#) - PCB Handling.

(1) Pipe cut-out segments should be preserved (refer to [Section 9 - Sample Preservation](#)) and remain on-site until test results confirm the absence of PCBs if necessary.

(2) Step "E" below should be performed prior to preserving the sample.

(3) If test results indicate PCBs are present, proceed according to [PCBH](#) - PCB Handling.

E. Immediately test the internal surface for the presence of MIC per [GSIC 2.06](#) - Field Testing for Bacteria (MIC).

Note: If pipe is cut with a cutting torch, or similar method, and the pipe is dry, testing for bacteria may not be possible.

F. Examine the internal surface of the pipe and collect and test samples per Sections [7](#) and/or [8](#) of this procedure.

G. Remove any scale or corrosion product from inside the accessible areas of the pipe using a clean, sterilized spatula or knife.

(1) Take care to not scratch the metal.

(2) The spatula or knife may be sterilized by rinsing with alcohol.

H. Visually examine the internal pipe surface and document findings on the applicable form.

(1) Examine the pipe surface for evidence of liquid hold-up. Estimate the extent of area affected by liquid hold-up.

(2) Note the presence of hydrogen sulfide (H₂S) or odorant "rotten egg" smell if observed.

(3) Examine the internal pipe surface for evidence of corrosion or scale.

(4) Document corrosion extent including the following information:

- (a) Type of damage (e.g. etching, pitting, general corrosion)
- (b) Minimum wall thickness in areas of most severe corrosion
- (c) Circumferential and longitudinal extent of corrosion
- (d) O'clock position of the corrosion
- (e) Location of deposits and corrosion under deposits
- (5) Document the presence and amount of scale or black powder.

1. If corrosion pitting is present inside pipe that is not intended for replacement, contact Supervisor Gas Storage or Corrosion Control personnel to determine if additional piping needs to be removed.

7. Sampling and Testing - Liquids

If liquid is observed during examination, perform the following tests.

A. Obtain a sample(s) of any liquid present inside the pipe for qualitative analysis. Refer to [GSIC 2.03](#) - Collecting and Testing Fluid Samples.

B. Analyze any fluid present inside the pipe for MIC per [GSIC 2.06](#) - Field Testing for Bacteria (MIC).

8. Sampling and Testing - Solids

If solid scale or corrosion product is observed during examination, perform the following tests.

A. Obtain a sample(s) of any corrosion product or scale for qualitative analysis.

(1) Collect the sample with a clean, sterilized spatula, knife, or other tool.

(a) The spatula or knife may be sterilized by rinsing with alcohol.

(b) Alternatively, collect the sample using clean latex or rubber gloves.

(2) Avoid touching the sample with bare hands or tools other than those cleaned for gathering the sample to prevent contamination.

(3) Place sample in a plastic jar with a plastic lid.

(a) Jars are typically four (4) or eight (8) ounces in size.

(b) Pack the sample jar full of material to displace air, if sufficient quantity is available.

(c) Alternatively, collect the sample in a clean double bagged Ziploc-type bag and compress the bags to displace the air when sealing.

(d) If possible, collect two separate samples. One good sample is better than two bad samples so requirements 8. A. (3)(b) and 8. A. (3)(c) will supersede this requirement.

(4) Tightly close the jar and seal with plastic tape (or seal the plastic bags after labeling).

(5) Label the jar or bag with the following information:

(a) Location and/or Line name

(b) Sample number (including date)

Example of sample numbering format as follows:

XX-MMDDYY-ZZ

UNCONTROLLED IF PRINTED

where,

XX = 2-letter code for storage field

MMDDYY = month, date, year

ZZ = 2-digit sequential number

Example: The first sample taken on July 16, 2011 at Johnston City storage field would be labeled **JC-071611-01**.

(6) Analyze any corrosion product for MIC per Gas Storage Internal Corrosion Monitoring [GSIC 2.06](#) - Field Testing for Bacteria (MIC).

B. Sample field test kits may be used on-site in lieu of laboratory analysis at the discretion of the Corrosion Specialist.

(1) Field test kits may also be used on samples collected as described in 8. A. above.

(2) If directed by the Corrosion Control personnel, analyze the corrosion product using a qualitative Chemical Species kit.

(3) Examples of test kits include, but are not limited to:

(a) Carbonates and Sulfide - (MSES SKU 575)

(b) Bubbling indicates a positive test for carbonates when a small amount of hydrochloric acid (or other strong acid) is added to the sample. Lead acetate test paper (e.g. MSES SKU 5018) can then be used to test for sulfides.

(c) Bacteria - MSES SKU 510, 520 or 530; Dixie Test Kit Number 4

9. Sample Preservation

A. Pipe segments removed from the line may be further examined to verify the extent and cause of internal corrosion.

B. This examination may be performed at a later date or sent to a laboratory for analysis if the samples are properly preserved.

C. After fluid and / or product have been sampled per above, carefully remove the remaining corrosion product from inside the cut-out using a clean spatula or knife.

D. Take care to not scratch the metal.

E. The spatula or knife may be sterilized by rinsing with alcohol.

F. Label the cut out section with the 12 o'clock position and label the ends as to the north-south or east-west orientation.

G. Cap the ends of the pipe and wrap the segment entirely with plastic wrap. Plastic wrap will prevent additional oxygen from affecting the internal surface.

H. Ensure the pipe remains uncontaminated from outside sources in the event that additional testing is necessary.

10. Examination of Cut-Out Pipe Segment

- A. Destructive evaluation of the pipe segment may be performed to further verify the extent and cause of internal corrosion after removal.
- B. Cut the pipe lengthwise to allow for internal examination.
 - (1) Cut the pipe in the location of the smallest amount of internal corrosion per the ultrasonic thickness testing.
 - (2) Perform additional ultrasonic thickness testing as necessary.
- C. Clean any remaining material with a dry, stiff brush. A nylon brush is recommended.
 - (1) A metal brush can mar pit features.
 - (2) If all corrosion product is not removed with the stiff brush, use a brass bristle brush in the longitudinal direction only.
- D. Visually examine the area with the unaided eye.
- E. If possible, examine the detail of the corrosion pits using a magnifying lens at 5X to 50X.
 - (1) The following features may be indicative of MIC:
 - (a) Large crater 2-3 inches or more in diameter
 - (b) Cup-type hemispherical pits on the pipe surface or in the craters
 - (c) Striations or contour lines in the pits or craters running parallel to longitudinal pipe axis (around the pipe)
 - (d) This type of corrosion will be seen only under magnification
 - (e) Tunnels sometimes at the end of the craters, running parallel to longitudinal pipe axis (around the pipe)
- F. Identify, measure, and chart all corrosion defects on applicable form. If pitting is found, select the box(es) that most closely describe conditions found. More than one item may be selected. Use space for additional comments if necessary.

11. Documentation

- A. Personnel should complete, **within ClickMobile**, Buried Pipe Examination Form, **CORR 1 Appendix A** and the Corrosion and Steel Damage Evaluation Form, **CORR 1 Appendix B** prior to the [Form GSIC-2.01-1](#).
- B. [Form GSIC-2.01-1](#) is utilized to capture additional information pertinent to internal corrosion. This form is only applicable to storage field gathering system piping carrying dry gas, wet gas or both. This information may be used to update GIS or other databases, as applicable.
- C. The following documentation may also be necessary, depending on tests performed. If used, attach to applicable form:
 - (1) Buried Pipe Examination
 - (2) Corrosion and Steel Damage Evaluation Form
 - (3) [Form GSIC-2.06-1 - Field Analysis for MIC](#)
 - (4) Photographs
- D. Complete a separate form for each location examined.
- E. Print a copy of relevant pictures taken and attach to the form.

UNCONTROLLED IF PRINTED

- (1) For each picture, note what the photo is documenting.
 - (2) Note reference numbers relating to the Coating Defect Table or Corrosion Defect Table.
- F. Document the extent of any repairs or replacements on the applicable form. If repairs or replacements are noted, submit a copy to Supervising Gas Storage Engineer.
- (1) Pipe replacement information may be used to update As-Built drawings as well as the GIS system.
 - (2) Pipe repair information (e.g. sleeves) may be noted in the GIS system.
 - (3) Pipe removal, retirement, or abandonment information may be used to update the GIS system.
 - (4) Maintain documentation in the Project File.

GAS STORAGE INTERNAL CORROSION MONITORING
GSIC 2.02 Monitoring Corrosion Weight Loss Coupons

April 1, 2023

1. General

- A. This procedure describes a standardized method for field handling of corrosion metal coupons prior to and following exposure.
- B. The process of field coupon monitoring is applicable only to the storage field gathering system piping.
- C. Per 49 CFR § 192.477, weight loss coupons must be evaluated two (2) times each calendar year, with intervals not to exceed 7 ½ months. Ameren (AIC) typically installs and removes weight loss coupons at various locations within each storage field coinciding with the injection and withdrawal seasons. Shorter coupon exposures may also be used on a case-by-case basis.
- D. Corrosion monitoring devices should be placed in a location where corrosion is most likely to occur.
- E. Coupons are removed from the coupon holder with clean gloves and stored in envelopes provided by the coupon supplier to prevent contamination which preserves their accuracy.

2. Part 192 Reference

49 CFR §§ 192.475, 192.476, & 192.477

3. Safety Considerations

Refer to [GSIC 1.02](#) - Safety Considerations.

4. Coupon Preparation

- A. Ensure new coupon is the correct size and type.
- B. Always use a new coupon. Never reuse a coupon after exposure and analysis.
- C. Follow the recommended coupon removal dates provided unless otherwise directed by Corrosion Control personnel.
- D. Coupon removal / installation dates should coincide with the beginning and end of injection and withdrawal seasons if possible.

5. Vessel Preparation

- A. Depending on the type of coupon used, the vessel may require depressurization / pressurization for safety.
- B. AIC utilizes the following two types of coupon systems:
 - (1) Plug-type coupons - A plug type coupon is a coupon installed in a fixed pipe plug using a coupon holder
 - (2) Insertion-type coupons - uses a specially designed packing gland to insert or retract a coupon from a pressurized system without a process shutdown.

UNCONTROLLED IF PRINTED

CAUTION: System depressurization is required during insertion and removal when using fixed (pipe plug) coupon holders.

6. Coupon Removal

A. Remove the coupon / coupon holder from the vessel

B. Remove coupon from coupon holder.

(1) Coupons should only be handled on the edges.

(2) Clean, lint-free cotton gloves or cloths, disposable plastic gloves, coated tongs, or coated tweezers are recommended when handling coupons.

C. Inspect the coupon for deposits, damage, and evident corrosion.

D. Place coupon in the coupon's original envelope.

(1) Verify the coupon number is the same as the number on the envelope.

(2) If liquid is present on the coupon, use a clean lint-free paper towel to absorb the liquid before placing it into the envelope.

(3) Ensure coupons that are removed early are held in a clean and dry location until shipped to laboratory with other coupons.

(4) Alternatively, coupons may be removed from the oxygen environment and stored in a non-corrosive alcohol mixture until shipped to laboratory with other coupons.

E. Record the following information on [Form GSIC-2.02-1 - Weight-Loss Coupon Monitoring Report](#), for the appropriate location and coupon serial number:

(1) Storage Field

(2) Well Name/Number

(3) Removal Date

7. Coupon Installation

A. Remove the coupon holder from the vessel.

B. Inspect the coupon holder (plug) threads and vessel for corrosion. Clean and apply new sealant material on both threads.

C. Remove, inspect and clean the assembly. Repair / replace parts if they are damaged, worn or deformed.

D. Attach the new coupon to the coupon holder.

(1) Leave coupons in their protective envelopes or sealed plastic bags until they are being attached.

(2) Clean, lint-free cotton gloves or cloths, disposable plastic gloves, coated tongs, or coated tweezers are recommended when handling coupons.

(3) Ensure coupon(s) is securely held in place and is electrically isolated from contact with all other metals.

(4) Coupons should only be handled on the edges.

Note: If necessary, a notch can be made on the steel plug to ensure appropriate orientation of the coupon in the vessel / pipeline. When coupon is placed in the process flow, it should be parallel to the process flow to reflect similar conditions experienced by the pipeline.

(5) If installing multiple coupons in the same location, ensure coupons are in consistent orientation in order to make the different data sets comparable.

E. Ensure coupon installation location (coupon & coupon holder area) is free of debris prior to reinsertion.

F. Screw the fixed coupon holder back into the vessel. If a notch was made, verify the notch is in the position specified to ensure coupon is oriented correctly.

G. Pressurize the vessel, if necessary.

H. Record the following information on [Form GSIC-2.02-1 - Weight-Loss Coupon Monitoring Report](#):

(1) Storage Field

(2) Well Name/Number

(3) New Coupon Serial Number

(4) Initial Coupon (New) Weight

(5) Installation Date

I. Store empty coupon envelopes in a clean and dry place until coupons are removed.

8. Submit to Laboratory

A. Package coupons for shipment to laboratory.

(1) Ensure coupon envelopes are properly sealed.

(2) Sort and package coupons by storage field.

B. Fill out any laboratory request forms, if necessary

C. Request laboratory analysis for the following characteristics:

(1) Final Coupon Weight

(2) Weight Loss

(3) Corrosion rate (mils per year)

(4) Corrosion deposits

(5) Type of Corrosion (i.e. local, general, pitting)

D. The laboratory will need the following information in order to complete its analysis. This data should be available on [Form GSIC-2.02-1- Weight-Loss Coupon Monitoring Report](#):

(1) Initial Coupon Weight (pre-recorded based on coupon Serial Number)

(2) Exposure Time (Date installed / removed)

E. Mail or ship coupons to the laboratory using a traceable method.

9. Documentation

UNCONTROLLED IF PRINTED

- A. Includes [Form GSIC-2.02-1 - Weight-Loss Coupon Monitoring Report](#).
- B. Maintain documentation in the project file
- C. Coupon changeout dates will be entered into Maximo by qualified storage field personnel.

GAS STORAGE INTERNAL CORROSION MONITORING GSIC 2.03 Collecting and Testing of Fluid Samples

April 1, 2023

1. General

A. This process establishes a standardized method for the collection and/or analysis of interior pipeline or vessel fluid samples.

B. The process of field testing fluid samples is applicable to pipelines carrying wet gas. Internal corrosion control for pipelines outside of the storage fields is covered in [CORR 1. Ameren Illinois' \(AIC\) Operation and Maintenance \(O&M\) Plan](#).

C. Fluids existing on the interior of pipeline systems provide environments conducive to corrosion. Liquid measurements can be used to predict changes in corrosivity arising from changes in process conditions.

2. Part 192 Reference

49 CFR §§ 192.475, 192.476

3. Safety Considerations

Refer to [GSIC 1.02](#) - Safety Considerations. Wear eye protection and gloves as prescribed below.

4. Sample Equipment Description

A. Sample equipment consists of

(1) Plastic Gloves

(2) Eye Protection

(3) New plastic bottle(s) with label marked to identify chemical treatment type, if any. Plastic bottles may contain treatment chemical (preservative), identified as part of the bottle label

(4) Optional - One wide mouth plastic container to collect sample and decant into 4 oz plastic bottles.

(5) For pig runs a large bucket may be used.

5. Annual Liquid Sampling Location Selection

A. Obtain liquid samples at a location most representative of the system.

(1) Approval to perform the sampling and selection of the location should always be obtained from the responsible person.

(2) Consider flow dynamics and how they will influence the sample.

B. Sample at locations such as drips, low area flows, separators, etc.

C. Samples may be obtained from either pipeline (flowing) or storage tank (static) systems.

D. Pipeline fluids can contain suspended solids, which are particles distributed throughout the fluid. These particles tend to make the fluid cloudy when thoroughly mixed. In static fluids, particles will settle out when they have sufficient size and density.

UNCONTROLLED IF PRINTED

E. Sources for field water testing kits include:

- (1) **ChampionX**
- (2) **PDC Laboratories**
- (3) Chemetrics
- (4) Hach Company
- (5) LaMotte Company
- (6) MSES Consultant

6. Testing Process

A. Wear clean latex gloves (or equivalent) when obtaining sample.

B. Wear suitable eye protection

C. Collecting Sample

(1) If the sample source valve provides adequate control to directly decant the fluid directly into the plastic bottle

(a) Place the neck of the bottle at the bottom of the sample source valve.

(b) Open the sample source valve and flow liquid into the bottle, allowing the fluid to eventually reach the neck of the bottle and overflow.

(2) If the sample source valve only provides adequate control to decant the fluid into the wide mouth sample container

(a) Place the wide mouth sample container at the outlet of the sample source valve

(b) Slowly open the sample source valve and fill the wide mouth sample container

(c) Decant the fluid from the wide mouth sample container into the bottle. If multiple bottles are needed to complete the sample they may be decanted from one fill of the wide mouth sample container

D. Completely fill each plastic bottle with the liquid/water sample. The bottle should be full to displace air.

(1) Sufficient volume of fluid may be required to flow in order to displace the dead volume and provide a better representative sample.

(2) Annual internal corrosion monitoring typically requires three (3) plastic bottles, provided by the laboratory, as follows:

(a) **One** bottle, no preservative: Used to sample for Chlorides, Sulfates, Alkalinity (Total As CaCO_3), Silicon

(b) **One** bottle, Zinc Acetate or Sodium Hydroxide treatment: Used to sample for Sulfide

(c) **One** bottle, Nitric Acid **or equivalent** treatment: Used to sample for Magnesium, Barium, Iron, Manganese, Calcium, Sodium, Potassium

(3) Additional sample bottles may be required to evaluate chemical treatment residuals.

(4) For testing that requires preservatives, follow the laboratory instructions for obtaining the sample.

(5) Smaller samples may be used if only performing specific tests. Likewise, if a full sample size is not available, the number of tests may be limited in order to optimize the type and quantity of results obtained.

(6) Priority should be given to pH, temperature, and bacteria tests.

E. Perform pH field test immediately and document the result as exposure to the outside environment can rapidly affect pH values. If an electronic pH meter will be used, calibrate per manufacturer instructions.

F. If requested by Corrosion Control personnel, perform carbon dioxide (CO₂), hydrogen sulfide (H₂S) and alkalinity field tests immediately and document results as exposure to the outside environment can rapidly affect these parameters.

(1) Field testing should be done within four (4) hours of collection.

(2) Field testing requires purchasing a specific test kit. Examples include:

(3) MSES Consultants, Inc. - CO₂ (SKU 5001 or 5002); Sulfide (SKU 5003); Alkalinity (SKU 5004)

(4) HACH Company - CO₂ (Model CA-23 or CA-DT); H₂S (Model HS-WR or HS-C); Alkalinity (Model AL-DT, AL-TA or AL-AP)

G. If multiple samples are taken, record the following information on Form GSIC-2.03-1 or other similar form during sampling:

(1) Date and location of the sample

(2) Sample pH

(3) Color of the sample. Use clear, brown, black, gray, etc.

(4) Sample temperature

(5) The amount of suspended matter. Use none, small, moderate and severe

(6) Identify any odor (specifically hydrogen sulfide) and the presence of slime or deposits in the water sample.

H. Perform testing to determine the presence of microbiological bacteria (SRB and APB) per [GSIC 2.06](#) - Field Testing for Bacteria (MIC).

(1) Obtain the test liquid from a bottle that does not contain any reactant or substance (preservative).

(2) Tightly close and label the bottles with the following information:

(a) Location and/or Line name

(b) Sample number (including date)

Example of sample numbering format as follows:

XX-MMDDYY-ZZ

where,

XX = 2-letter code for storage field

MMDDYY = month, date, year

ZZ = 2-digit sequential number

Example: The first sample taken on July 16, 2009 at Johnston City storage field would be labeled **JC-071609-01**.

(3) If multiple samples are taken at the same location, it is recommended to enclose the bottles in a 1 gallon plastic bag and label the bag with the Sample Identification and Location matching the individual bottles.

I. Deliver the samples to the laboratory as soon as possible.

(1) Analysis should be performed by a qualified laboratory.

(2) If possible, samples taken for laboratory analysis should be transported in an insulated container with minimum agitation.

(a) If possible, samples should be tested within 36 hours of collection.

(b) Depending on ambient conditions a refrigerated container may be used. Annual sampling for internal corrosion is typically performed during winter months where additional refrigeration is not necessary.

(3) National Environmental Laboratory Accreditation Program (NELAP) accreditation is recommended however a preferred laboratory with industry certification may be used at the discretion of the Corrosion Control personnel.

7. Documentation

A. Maintain all documentation and laboratory results in the following Project File:

(1) Routine / Regular Maintenance

(2) Facility (Storage Field)

(a) Well

(b) Segment

GAS STORAGE INTERNAL CORROSION MONITORING
 GSIC 2.04 Sampling Natural Gas for Laboratory Analysis

April 1, 2023

1. General

A. This procedure describes a standardized method for obtaining high pressure natural gas samples for subsequent analysis by gas chromatography.

B. Gas sampling is focused in "spot" samples of natural gas from storage field pressure sources in containers which are suitable for transporting the sample to a laboratory.

C. This procedure is suitable for sampling "wet" gas and/or "dry" gas. There is a pressure restriction for "wet" gas set at 1100 psi.^[1]

D. Several components in natural gas can affect the internal corrosion of pipelines. Knowledge of gas quality aids the corrosion engineer in determining the potential impact these components might have on the integrity of a system.

2. Part 192 Reference

49 CFR §§ 192.475, 192.476

3. Safety Considerations

Refer to [GSIC 1.02](#) - Safety Considerations. Observe guideline precautions for venting natural gas with potential H₂S concentrations.

4. Field Tests

The "Purging Fill and Empty" method for collecting natural gas samples is preferred.

5. Cylinder Preparation & Transport

A. Use only stainless steel gas sample cylinders, valves, stainless steel tubing, and fittings suitable for the safe handling of the high gas pressures involved.

(1) Standard fittings are: ¼-inch NPT fittings, ¼-inch stainless steel tubing, and the ¼-inch compression fittings.

(2) Do not use copper, high pressure polypropylene, or Nylon tubing.

(3) The following table lists gas sampling equipment and fittings acceptable for pressures up to 1800 psig. For operating pressures greater than 1800 psig special sampling cylinders must be used.

Item ID	Item	Description	Part Number
1	Gas Sample Cylinder	Stainless Steel Double Ended Cylinder, ¼" FNPT, 500cc, 1800 psig	Swagelok® 316L-HDF4-500
2	Valve, Needle	Stainless Steel Non-Rotating Stem Valve, ¼" MNPT - ¼" FNPT	Swagelok® SS-16DKM4-F4
3	Valve, Needle	Stainless Steel Non-Rotating Stem Valve, ¼" MNPT - ¼"MNPT With Rupture Disc	Swagelok® SS-16DKM4F4-2

UNCONTROLLED IF PRINTED

4	Valve, Ball Shut-Off	Stainless Steel, 1-Piece Ball Valve, 1/4", FNPT	Swagelok® SS-43GEF4
5	Tee	Stainless Steel Tee, 1/4", FNPT	Swagelok® SS-4-T
6	Nipple	Stainless Steel Hex Long Nipple, 1/4" MNPT, 2" Length	Swagelok® SS-4-HLN-2.00
7	Tubing	316L Seamless Stainless Steel Tubing, 1/4"OD x 0.035" Wall	Swagelok® SS-T4-S-035
8	Connector	Stainless Steel Female Connector, 1/4" OD - 1/4" FNPT	Swagelok® SS-400-7-4
9	Connector	Stainless Steel Male Connector, 1/4" OD - 1/4" MNPT	Swagelok® SS-400-1-4
Not Shown	Plug	Stainless Steel Pipe Plug, 1/4" MNPT	Swagelok® SS-400-P
Not Shown	Cap	Stainless Steel Pipe Cap, 1/4" FNPT	Swagelok® SS-400-C
10	Metal flexible hose	PTFE-Lined, Stainless Steel Braided Hose	Swagelok® SS-TH6TA4TA4-28

(4) Components from other manufacturers/suppliers that meet or exceed the same specifications are acceptable.

(5) If tests for hydrogen sulfide and other sulfur compounds will be performed, special sample cylinders lined with Teflon® must be used because sulfur-containing compounds react with stainless steel surfaces.

(6) Contact the Corrosion Control personnel to determine whether sampling for hydrogen sulfide and sulfur compounds is required.

(7) Contact the appropriate Storage Field Operations personnel with questions regarding sampling equipment compatibility.

B. Ensure that test sample cylinders have been tested according to U.S. DOT requirements.

(1) The cylinder provider will test the cylinders annually according to US DOT Requirements and maintain documentation of the following:

- (a) Test (inspection) date
- (b) Conditions and results of the pressure test
- (c) Cylinder provider's signature

C. Natural gas carries a hazardous substance designation. Filled sample cylinders require special labeling, packaging, handling, and must be accompanied by supporting transmittal documentation when being shipped/transported to a laboratory.

(1) The proper shipping designation for sample cylinders containing natural gas as a hazardous substance is: "Natural Gas, Compressed, 2.1, UN1971, II".

(2) Shipping requirements for filled natural gas sample cylinders can vary from region to region. Consult with the carrier prior to sampling regarding specific packaging and documentation requirements

(3) Transport filled natural gas sample cylinder(s) from sampling site to the laboratory using foam filled cases labeled with the appropriate NFPA 704 system information.

(4) Chain of custody forms are provided by cylinder provider and should be completed once all samples have been collected at the specific storage field.

UNCONTROLLED IF PRINTED

D. The use of IsoTubes can be applied to collect a gas sample when H₂S levels are below 5 ppmv.

(1) A Wellhead sampler is needed for the IsoTubes to be properly utilized when collecting a gas sample.

(2) IsoTubes are intended for a one-time use.

6. Sampling Guidelines

A. Obtain gas samples at a location most representative of the system. Gas samples should be taken upstream of any treatment equipment or device that would alter the characteristics of the gas.

B. Collect samples on the upstream side of gas metering or points of pressure drop to avoid any condensation.

C. Collect samples from a source at or near the top center of the pipe (vessel). Side stream samples are acceptable where access is limited.

7. Purging - Fill and Empty Method

A. For sampling of a known dry gas stream, proceed to install a sampling line and bleeding valve according to the following figure. Gas streams suspected of having entrained liquids at the time of sampling require the use of a gas sampling separator. This guideline does not address such situations.

B. The sampling setup includes the following components:

(1) Source Valve

(2) Bleeding Valve (Valve A)

(3) Sample Line (i.e. metal flexible hose)

(4) Gas Sample Cylinder

(5) Gas Sample Cylinder Valves (Valves B & C)

(6) Sampling Control Valve (Valve D)

(7) Extension Tubing

Figure 1. Diagram of the Setup for Gas Sampling

C. Set-Up

- (1) Open and close the source valve to clear any debris from the valve before making any connections.
- (2) Wrap all NPT fitting connections with two wraps of Teflon[®] tape (or equivalent) to seal and protect the threads.
- (3) Connect the Sample Line (metal flexible hose) equipped with a bleeding valve (Valve A) to the Source Valve.
- (4) Keep the Sample Line length to a minimum.
- (5) If the atmospheric temperature is significantly below the gas temperature, warming the Sample Line may help prevent condensation. Do not use an open flame.
- (6) Ensure that Valves B and C are fully closed.
- (7) Install valves with their flow indicator arrows directed away from the cylinder.
- (8) Remove the caps from the compression fittings on the Gas Sample Cylinder valves. (Valves B and C)
- (9) Connect the opposite end of the Sample Line to Valve B on the Gas Sample Cylinder inlet.
- (10) Attach Extension Tubing to Valve C.
- (11) This tubing should be at least 18" long to prevent Joule-Thompson cooling from influencing the condition of the gas filling the cylinder.
- (12) Connect the opposite end of the Extension Tubing to Valve D (sampling control valve).

WARNING: Ensure that the Sampling Control Valve (Valve D) discharge vents natural gas away from the person(s) collecting the sample due to high pressure.

D. Purging

- (1) Orient the Gas Sample Cylinder in a vertical position. Refer to the figure above.
- (2) Support the cylinder to prevent stress on the fittings and tubing.
- (3) With Valves A, B, C and D closed, carefully open the Source Valve to the fully open position.
- (4) Slightly open Valve A to remove any residual air until the flexible sampling line is purged.
- (5) Close Valve A.
- (6) Open Valve B. When a partial vacuum exists, one can hear the natural gas moving into the cylinder.
- (7) When the movement has stopped, open Valve C.
- (8) Check all connections up to Valve D using a dilute soap solution (e.g. Snoop[®]).
- (9) Tighten fittings that are leaking.
- (10) Slightly open Valve D to remove any residual air until the entire sampling system is purged.
- (11) Close Valve D.
- (12) Close Valve B.
- (13) Open Valve D and slowly vent the Gas Sample Cylinder to just above atmospheric pressure.
- (14) Close Valve D.
- (15) Open Valve B to refill the Gas Sample Cylinder.
- (16) Repeat Step (12) through (15) a total of four (4) times.

E. Gas Sample Collection

- (1) When the purging process is complete and Gas Sample Cylinder is at full pressure, close Valve C.
- (2) Close Valve B.
- (3) Record the gas pressure, gas temperature and time on [Form GSIC-2.04-1](#), Field Gas Sampling.
- (4) Carefully open Valve D to vent the Extension Tubing.

F. H₂S Testing

- (1) Connect 1/4" plastic tubing to Valve A (bleeding valve).
- (2) Test for H₂S content per procedure "[Field Testing Natural Gas for Hydrogen Sulfide](#)".
- (3) Close Valve A after H₂S testing.
- (4) Disconnect plastic tubing from Valve A.
- (5) Close Source Valve.

G. Securing the Gas Sample

- (1) Open Valve A to vent the segment (sampling line)
- (2) Disconnect the tubing from Valves B and C.

UNCONTROLLED IF PRINTED

- (3) Disconnect the tubing from Source Valve.
- (4) Check for leaks using a dilute detergent solution at the threads and around the stems on Valves B and C (Gas Sample Cylinder).
- (5) Install plugs or caps on the open ends of the valves on the Gas Sample Cylinder to protect the threads.
- (6) Tag each cylinder with the following information:
 - (a) Name of Company Submitting Sample for Analysis
 - (b) Sample Identification (ID)
 - (c) Gas Temperature and Pressure
 - (d) Date and Time of Sample Collection
 - (e) Sampling location
 - (f) H₂S reading

H. Collection of Natural Gas Sample with use of IsoTube

- (1) Locate a suitable, vertical port for collecting a sample. A suitable port will supply a dry, liquid free gas sample and should consist of both a 1/4" female NPT port, and a control valve that can be used to turn the gas on and off.
- (2) Make sure that the threads on the Wellhead Sampler are clean and wrap 2 or 3 layers of Teflon[®] tape, clockwise onto the male threads of the filter.
- (3) Screw the Wellhead Sampler into the sampling port and then tighten by using a wrench on the body of the filter
- (4) With the Wellhead Sampler valve in the "shut" position, slowly open the control valve on the sampling port. Line pressure will be indicated on the inlet pressure gauge.
- (5) Insert the bottom IsoTube[®] valve into the Wellhead Sampler by simply pushing it firmly into the chuck (there are cogs in the chuck which grip the threads on the IsoTube[®] valve and hold it in place). To further tighten the IsoTube[®] in place, lightly rotate it with your fingers, screwing it into the chuck.
- (6) Turn the handle on the 3-way valve to the "open" position (vertical). The IsoTube[®] will fill with gas. Note the pressure on the outlet gauge. The pressure should be less than 80 psig.
- (7) With the 3-way valve still in "open" position, the Wellhead Sampler and the IsoTube[®] can be purged by depressing the spring valve in the tip of the top IsoTube[®] valve (like letting the air out of a tire). Hold the spring valve open for a few seconds. This shortcut should be minimized if you are sampling very wet gases or under very cold conditions as it can result in condensing liquids in the IsoTube[®].
- (8) Final purging and filling of the IsoTube[®] is accomplished by rotating the handle on the 3-way valve "open" and "shut" to alternately pressurize and vent the IsoTube[®].
- (9) The IsoTube[®] should be filled to the output pressure of the regulator and then vented to atmospheric pressure by watching the outlet pressure gauge and listening to the flow of gas out the vent. The more times this process is repeated, the less the chance of atmospheric contamination of the sample. A minimum of 10 cycles is recommended.
- (10) After the IsoTube[®] is filled for the last time, leave the 3-way valve in the "open" position.
- (11) The IsoTube[®] may now be removed from the chuck by sliding the knurled sleeve on the outside of the chuck down, away from the IsoTube[®]. This process should be done quickly so as to minimize

UNCONTROLLED IF PRINTED

the amount of gas lost. If the IsoTube® is held very lightly, it will generally pop up out of the chuck from the spring action of the valve and the gas pressure. Be ready to catch it.

(12) Replace the end caps on the IsoTube® valves and fill out one of the adhesive-backed labels with the sample identification information using the ball point pen provided (press hard as three copies are made). Attach the label to the IsoTube® in the location marked and return the IsoTube® to the shipping carton. When an entire sheet of sample tags has been used, one of the copies should be placed in the box with the IsoTubes® and the other can be retained for your records

(13) Seal the box, attach the appropriate hazardous material labels, and ship the samples as described on the enclosed shipping instructions.

NOTE:	Hazardous materials can only be shipped by someone properly certified to do so; shipping instructions are included with each box of IsoTubes® merely to simplify the shipping process.
--------------	--

where

8. Laboratory Analysis

A. Routine analysis should include, but not be limited to, the following:

Component	Units
Nitrogen (N2)	Mole Percent
Carbon Dioxide (CO2)	Mole Percent
Oxygen (O2)	Parts Per Million
Methane (C1)	Mole Percent
Ethane (C2)	Mole Percent
Propane (C3)	Mole Percent
Isobutane (iC4)	Mole Percent
Normal Butane (nC4)	Mole Percent
Isopentane (iC5)	Mole Percent
Normal Pentane (nC5)	Mole Percent
Hexanes Plus (C6+)	Mole Percent
Other Sulfur Species	Parts Per Million
Relative density	N/A
Heating Value (dry)	Btu/Scf
Heating Value (sat)	Btu/Scf

B. For gases, mole percent value is equivalent to volume percent.

C. Tests for other sulfur species not typically included in a routine analysis are available by special request.

D. Tests for hydrogen sulfide and other sulfur compounds are not typically included in a routine analysis but are available by special request. These are recommended for storage fields with historically high hydrogen sulfide levels.

9. On-Site Chromatographs

If a chromatograph exists on-site, the normalized component data of only injection gas from such equipment can be used in lieu of sampling.

10. Documentation

A. Document the following for each sample:

- (1) Sample Identification
- (2) Cylinder Identification
- (3) Sample Source/Description
- (4) Date and Time of Sample Collection
- (5) Gas Temperature and Pressure
- (6) Notation of Any Prevailing Issues Pertaining to the Sampling Process
- (7) H₂S reading

B. Complete [Form GSIC-2.04-1 - Field Gas Sampling](#).

C. If required, complete Chain of Custody Record and Request and provide to the laboratory.

GAS STORAGE INTERNAL CORROSION MONITORING
GSIC 2.05 Field Testing Natural Gas for Hydrogen Sulfide

January 1, 2013

1. General

A. This procedure describes a standardized method for determining the amount of Hydrogen Sulfide (H₂S) in the gas using an H₂S stain tube or an electrochemical sensor during the following: routine sampling (i.e. annually, weekly, daily), spot sampling, validation of sampling equipment.

B. This procedure applies to field testing for H₂S in storage field gathering system piping carrying dry gas, wet gas or both. Internal corrosion control for pipelines outside of the storage fields is covered in [CORR 1](#). Ameren Illinois' Operation and Maintenance (O&M) Plan.

C. The determination of H₂S concentrations in gas is important due to the corrosive nature of H₂S on pipeline and vessel materials. This process provides practical field determination of hydrogen sulfide concentration.

2. Part 192 Reference

49 CFR §§ 192.475, 192.476

3. Safety Considerations

Please refer to [GSIC 1.02](#) - Safety Considerations. Observe guideline precautions for venting natural gas with potential H₂S concentrations.

4. Test Setup

A. Obtain gas samples at representative locations such as the following:

- (1) Wellhead piping upstream of any gas treatment equipment
- (2) Sulfa-treat towers
- (3) Station piping

B. Approval to perform the sampling and selection of the location should always be obtained from the responsible storage field personnel.

C. Consider the flow dynamics and how they will influence the sample. For example, the sample may be influenced by the well status (i.e. active, shut-in or no flow down hole pressure monitor).

D. Collect samples on the upstream side of gas metering or pressure drop points to avoid any condensation.

E. Collect samples from a controlled source such as a small valve at or near the top center of the pipe (vessel). Side stream samples are acceptable where access is limited.

F. Open the controlled source briefly to clear residual debris and moisture.

G. Setup one of the following Sampling Chambers in order to test for H₂S.

- (1) Plastic Bag with holes to relieve pressure
- (2) Plastic Connecting Tube with a plastic tee
- (3) Jacobs Mixing Chamber (i.e. bottle with holes)

UNCONTROLLED IF PRINTED

H. If using a connecting tube, use sufficient length to carry the natural gas a safe distance during the sampling process.

I. Connect Sampling Chamber (see figures below) as follows:

- (1) Plastic Bag - Tie the bag around the Source Valve.
- (2) Connecting Tube - Attach one end of the tube to the Source Valve.
- (3) Jacobs Mixing Chamber - Screw the threaded end onto the Source Valve. (Recommended)

J. Example of Testing Configuration

OR

K. Select a Length-of-Stain Detector Tube for the component being tested.

L. Use a stain tube suited for the expected concentration range.

5. Sample Equipment Preparation

A. H₂S Stain Tubes

- (1) Use a hand operated pump capable of drawing a minimum of 100 ml sample per stroke through the stain tube with an accuracy of ± 2 ml.

UNCONTROLLED IF PRINTED

- (2) Ensure the pump is designed for use with stain tubes.
- (3) Ensure stain tubes fit the pump being used.
- (4) Verify the stain tubes have not expired. Expiration dates are typically marked on the manufacturer's box.
- (5) Ensure that sampling lines are not made of material that reacts with or absorbs H₂S such as:
 - (a) TFE-fluorocarbon
 - (b) Vinyl
 - (c) Polyethylene
 - (d) Stainless steel
- (6) Tygon SE-200 3/8 Inch OD by 1/4 Inch ID tubing and nylon or Polyvinylidene fluoride (PVDF) tee for 1/4 Inch ID tubing is an acceptable alternative.
- (7) Perform a pump field leakage test prior to use. The pump need not be tested more than once per day.
- (8) Insert an unbroken stain tube into the Gas Pump connector to plug the pump inlet.
- (9) Stroke the pump (one stroke) and wait thirty (30) seconds.
 - (a) No loss of vacuum (diaphragm travel) indicates a successful test.
 - (b) If the check fails, confirm that the connection between the connector on the pump and stain tube is tight and try again.
 - (c) If the stain tube is intact but vacuum is not maintained, the pump is leaking and another pump should be used.

B. H₂S Electrochemical Sensor

- (1) Calibrate gas meter according to manufacturing instructions prior to use.
- (2) Follow the manufacturer's directions for calibration.
- (3) Need not be calibrated more than once per day.

6. Testing Process

A. Record the gas temperature and source pressure. Gas temperature should be between 32°F to 100°F.

B. Connect (insert) the sample tubing to the controlled source.

C. H₂S Stain Tubes

- (1) Carefully break the tips at both ends of the Length-of-Stain Detector Tube. Scoring the tips helps ensure a clean break.
- (2) Insert the outlet end into the Gas Pump Connector (arrow on stain tube must point toward the pump).
- (3) Reset the counter on pump to read zero (0), if necessary.
- (4) Insert the other end of the stain tube into the connecting tubing attached to source.

UNCONTROLLED IF PRINTED

(5) Slowly open source valve to obtain a gradual flow through the connecting tubing and tube access point.

CAUTION: Do not over-pressurize the gas sampling line.

(6) Stroke the Gas Pump, drawing the required measured volume of gas through the Length-of-Stain Detector Tube. (On most pumps, one full stroke is considered to be 100 ml.)

(7) Perform 1 to 10 strokes, not to exceed the stroke (n) value specified on the desired scale on the stain tube.

(a) If the stain extends beyond the end of the scale, repeat sampling using a Length-of-Stain Detector Tube with a higher concentration range or use partial stroke.

(b) After the initial stroke, if the stain extends beyond the first line, that concentration can be used. If the stain does not extend beyond the first line, additional strokes are required.

(c) Keep track of the number of strokes taken.

Note: Samples with higher H₂S concentrations may only require partial pump strokes. Multiple pump strokes may be needed at lower concentrations.

(8) Read concentration listed on the calibration scale at the interface of the stained-to-unstained reagent (see diagram) within 2 minutes after testing.

(9) Calculate the concentration of H₂S using the following equation. For calculation use n=10.

$$\text{ppm H}_2\text{S} = \frac{\text{No. of strokes on stain tube}}{n} \times \text{concentration on calibration scale}$$

D. H₂S Electrochemical Sensor

(1) Place sensor in sampling chamber.

(2) Use according to manufacturer's instructions.

7. Documentation

A. Complete Form [GSIC-2.05-1 - Annual On-Site H₂S Readings](#), when performing annual testing.

UNCONTROLLED IF PRINTED

- (1) Record weekly/daily H₂S results on field specific spreadsheet.
- (2) Document the following for each sample:
 - (a) Testing source / description
 - (b) Date
 - (c) Gas temperature and pressure
 - (d) Number of pump strokes
 - (e) Stain tube reading
 - (f) Concentration(s) of H₂S tested as calculated
 - (g) Document any issues that occurred during the sampling process
- (3) Maintain documentation in the project file.

GAS STORAGE INTERNAL CORROSION MONITORING
 GSIC 2.06 Field Testing for Bacteria MIC

January 1, 2013

1. General

- A. This process establishes a standardized method for the collection and analysis of interior pipeline fluid samples for the presence of bacteria known to influence corrosion. Aspects of both sessile and planktonic forms of bacteria are covered.
- B. This procedure is intended for estimating the planktonic bacterial population present in natural gas and liquid piping systems. It is not intended to evaluate other types of organisms.
- C. This process encompasses a technique known as serial dilution. This approach provides qualitative and semi-quantitative means for determining the existence and relative magnitude of the particular bacteria of interest.
- D. Certain microbes (bacteria) have the potential to impact or influence the internal corrosion of pipelines. These microbes represent primarily two anaerobic types, the acid-producing bacteria (APB) and sulfate-reducing bacteria (SRB).
- E. As anaerobes, they are extremely intolerant of air (oxygen). Bacteria in a "free-floating" state are known as planktonic bacteria and can only be determined from fluid samples. To identify their presence, they must be cultured immediately upon sample collection to prevent any exposure to air.
- F. Microbe culture media consist of bottles containing a nutrient under anaerobic conditions where the bacteria can thrive and reproduce during a certain incubation period. The culture media contain specific indicators which respond upon the presence and reproduction of the APB and SRB-types.

2. Part 192 Reference

49 CFR §§ 192.475, 192.476

3. Safety Considerations

- A. This procedure entails the use of syringes and needles. All syringes shall be destroyed following use. Failure to do so is unlawful pursuant to Federal regulations.
- B. After use, syringes should be deposited in a Sharps Container. If a Sharps container is not available, the plunger is removed from the syringe, needles are cut/broken and the syringe barrels crushed prior to disposal.
- C. Refer to [GSIC 1.02](#) - Safety Considerations.

4. Bacteria Culture Vial Preparation

- A. Use only clean, new containers for sampling collection.
- B. Never rinse the container prior to use.
- C. Table A lists equipment that may be necessary to collect liquid, solid and/or surface wipe samples in the field.

Table A. Sampling Equipment
Description

Item	Description
Bacteria Culture Vials - SRB	Modified Postgate Media B Vials

UNCONTROLLED IF PRINTED

Bacteria Culture Vials - APB
Culture Bottle with Cap
Bottle, Glass
Syringes, Disposable
Container for Syringe Disposal
Tongue Depressors
Cotton Swabs
Alcohol Pads
Marking Pen, Permanent
Gloves

Anaerobic Acid Producing Vials
Anaerobic Diluent Solution (ADS)
Bottle, Clear Glass, 500 ml.
Syringe with Needle, Slip Tip, 3 ml.
Sharps Container, 1 gal.
Tongue Depressor, Sterile, 6"L x 3/4"W
Cotton Swab, Sterile
Alcohol Pads, Sterile
Example: Sharpie Pen
Latex or non-latex

D. Preparation of Serial Dilution Vials

- (1) Verify the vials are within their usable shelf-life.
- (2) The media within the vials have a shelf-life of six months subsequent to formulation.
- (3) Expiration dates are typically marked on the shipping container.
- (4) Discard vials existing beyond this date and do not use for testing.
- (5) Internal corrosion monitoring typically requires two types of Bacteria Culture Vials:
- (6) Anaerobic Sulfate Reducing Bacteria (SRB)
- (7) Anaerobic Acid Producing Bacteria (APB)
- (8) Sample sets may be purchased as a pre-packaged kit. Examples include:
- (9) MSES Consultants, Inc. - SKU 510, 520 or 530
- (10) Dixie Testing and Products, Inc. - Test Kit Number 4
- (11) Alternatively, individual bacteria culture vials may be assembled into sets of five (5) vials^[1]
- (12) Number the vials 1 through 5 in each set.
- (13) If duplicate sampling of a particular source is warranted, prepare a second set of Bacteria Culture Vials in the same manner and identify with the same sample number.

5. Testing Guidelines

A. Obtain liquid samples at a location most representative of the system.

- (1) Approval to perform the sampling and selection of the location should always be obtained from the responsible person.
- (2) Consider the flow dynamics and how they will influence the sample.
- (3) For example, a sample will be influenced by well status (i.e., shut-in or active).

B. Sample at locations such as drips, low area flows, separators, etc.

C. Samples may be obtained from either pipeline (flowing) or storage tank (static) systems.

D. Pipeline fluids can contain suspended solids which are particles that are distributed throughout the fluid and tend to make the fluid cloudy when thoroughly mixed.

- (1) Solids can be separated from the fluid with filtration.
- (2) In static fluids, particles will settle out when they have sufficient size and density.

E. Sufficient volume of fluid may be required to flow in order to displace the dead volume and provide a better representative sample.

F. To maintain sample integrity, it is essential that samples have minimal exposure to the atmosphere.

6. Field Testing Process

A. Ensure gloves are worn once sampling begins.

B. Remove a sterile 3 mL syringe from the paper packet leaving the needle cover in place.

C. Prepare the initial Bacteria Culture Vial(s) from each set described in section 4. D. (7) and 4. D. (8) above.

(1) Remove the metal tab from the top of the vial labeled #1 within each set of vials with a clean tool.

(2) Do not remove the metal septum retainer in the process of removing the tab.

(3) Wipe the top of vial/septum with a clean alcohol pad.

D. Record the sample information on form provided in the test kit or on [Form GSIC-2.06-1 - Field Analysis for MIC](#).

(1) Label the bacteria kit with the following information:

(a) Location and/or Line name or Wellhead name

(b) Sample number (including date)

(2) Sampling numbering format

Example of sample numbering format as follows:

XX-MMDDYY-ZZ

where,

XX = 2-letter code for storage field

MMDDYY = month, date, year

ZZ = 2-digit sequential number

Example: The first sample taken on July 16, 2009 at Johnston City storage field would be labeled **JC-071609-01**.

(3) Bacteria testing performed as part of the annual liquid sampling process will include the wellhead name rather than a sequential number.

E. Liquid Samples (Planktonic Bacteria)

(1) Obtain a sample according to Gas Storage Internal Corrosion Monitoring [GSIC 2.03](#) - Collecting and Testing of Fluid Samples.

(2) Test a sample from a bottle that does not contain any reactant or preservative.

(3) The liquid sample may be tested directly into the first bacteria culture vial. Refer to section 6. G through 6. N for inoculating the vials.

UNCONTROLLED IF PRINTED

F. Solid Samples (Sessile Bacteria)

- (1) Obtain a sample according to [GSIC 2.01](#) - Internal Corrosion Examination.
- (2) Collect one-half (½) teaspoon of solid material.
- (3) If biofilm or soft corrosion product is being tested, swab the area (1 in.2) using a sterile cotton swab wetted with Anaerobic Diluting Solution (ADS).
- (4) Add solid material to ADS tube.
- (5) If a cotton swab was used, break the tip off into the ADS.
- (6) Shake the ADS tube well to disperse any solids and microorganisms.
- (7) The ADS liquid will then be tested in the bacteria culture vials.

G. Withdraw approximately 3 mL of sample into the syringe. Avoid the introducing any air bubbles into the syringe.

H. Tap the barrel of the syringe, turn the syringe/needle upward and discharge all but 1 mL of sample. This will eliminate any gas bubbles that are present.

I. Insert the needle through the septum of Vial #1 and discharge the remaining 1 mL sample into the vial.

J. Thoroughly shake the vial to mix the sample with the test media.

K. An immediate color change from clear to black on an SRB test may indicate sample contamination. Repeat the test with a new syringe/needle and vial set.

L. If occurs again, SRB concentrations may be high.

M. Remove the needle/syringe from the bottle and dispose of the syringe into a Sharps container, if available. See figure below.

N. Repeat for Vial #1 of each Bacteria Culture set.

7. Serial Dilution

A. Prepare the remaining vials for inoculation.

- (1) Inoculation of subsequent vials may be done immediately in the field or within a few hours.

UNCONTROLLED IF PRINTED

(2) Remove the tab tops from the remaining vials with a clean tool. Thoroughly wipe the tops and septa of all vials with a clean alcohol pad.

B. Using a new sterile syringe/needle and holding the vial set up-side-down, insert the needle into Vial #1.

(1) Withdraw approximately 1 milliliter of the contents into the syringe.

(2) Without removing the needle, carefully and slowly discharge the contents back into the same vial.

(3) Avoid creating any gas bubbles.

(4) Repeat this process a total of at least three times.

C. Draw 1 mL of fluid into the syringe from Vial #1 and discharge into Vial #2.

(1) Withdraw approximately 1 mL of the contents and slowly discharge back into the same vial. Repeat this process at least three times

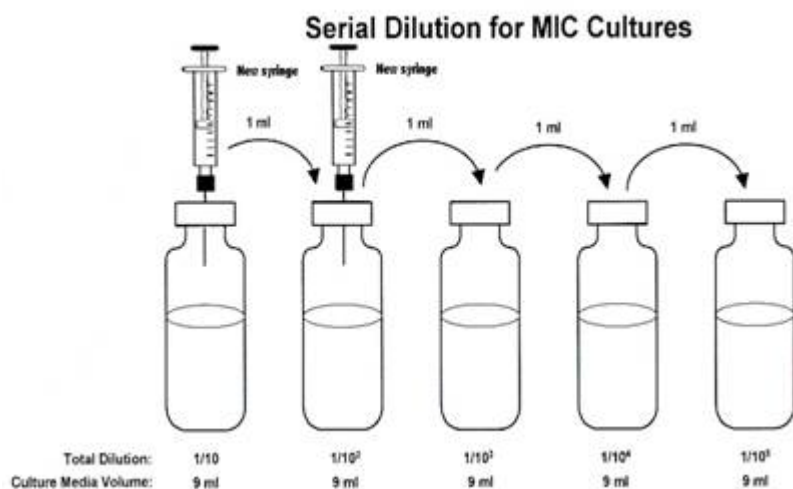

(2) Do not remove the needle from the vial.

(3) Avoid creating any gas bubbles.

D. Repeat Step C, taking fluid from Vial #2 into Vial #3 and consecutively with the remaining vials until all five vials are inoculated.

(1) Use the same syringe and needle for the entire serial dilution process.

(2) The following diagram shows the above serial dilution process.

E. After all vials in the series are inoculated, dispose the syringe/needle into a Sharps Container (if available).

F. Repeat the process for each Bacteria Culture type being tested.

G. Dispose of the latex gloves.

8. Incubation and Results

A. Incubate the inoculated vials.

(1) The incubation temperature should be within $\pm 10^{\circ}\text{C}$ (18°F) of the water temperature at the time the sample was obtained.

(2) The incubation period will vary according to the test type.

UNCONTROLLED IF PRINTED

B. Acid-Producing Bacteria (APB) Determination

- (1) Incubation period for APB vials should be a minimum of 5 days to a maximum of 14 days.
- (2) Interim (daily or weekly) results may be recorded for information purposes only.
- (3) Positive vials are confirmed when phenol red dextrose media changes color from red to yellow along with increased turbidity (cloudiness).
- (4) Estimate the bacteria level using Table B.

C. Sulfate-Reducing Bacteria (SRB) Determination

- (1) Incubation period for SRB vials should be a minimum of 28 days.
- (2) Interim (daily or weekly) results may be recorded for information purposes only.
- (3) Positive vials are confirmed when sulfate reducer nutrient vials turn black.
- (4) Estimate the bacteria level using Table B.

D. The bacteria levels can be estimated by utilizing Table B below.

Table B. Interpretations of Observations

# of Positive Vials	Actual Dilution of Sample	Growth (+) Indicates (Bacteria per mL)	Reported Bacteria Colonies per mL
1	1:10	1 to 9	10
2	1:100	10 to 99	102
3	1:1,000	100 to 999	103
4	1:10,000	1,000 to 9,999	104
5	1:100,000	10,000 to 99,999	105

- (1) If waters produce positive results in all the vials tested, the sample is infected and the test results should be reported as greater than or equal to 10n, n being the number of vials used.
- (2) If a gap or skip occurs within the dilution series, the interpretation of the results is based on the number of positive vials.
- (3) The skip may be noted in the comments section of the form as additional information.
- (4) Contamination of the vials may have occurred if there is more than one negative vial between positive vials. If this occurs, disregard the odd positive vial.

Example 1: 3 Positive Vials (normal condition)

Example 2: Ignore "Skip". Record as 3 positive vials

Example 3: Disregard "Odd Positive". Record as 2 positive vials

Figure 1. Interpretation Examples

9. Documentation

A. Complete test kit form or [Form GSIC-2.06-1 - Field Analysis for MIC](#). Equivalent forms may also be utilized.

B. Maintain documentation in the project file.

GAS STORAGE INTERNAL CORROSION MONITORING
GSIC 2.07 Electric Resistance Corrosion Probe

January 1, 2013

1. General

A. This procedure describes a standardized method for field data collection from electric resistance (ER) corrosion probes during exposure while inserted in the process stream. Insertion and removal of the ER probes is covered under [GSIC 2.10](#) - Coupon/Probe Retractor Operation.

B. The following procedure is based on the Metal Samples ER4100 cylindrical probe and MS1500E Intrinsically Safe ER Probe Reader. For other devices consult the manufacturer's information.

C. The process of field ER probe monitoring is applicable to the storage field gathering system and station piping.

D. Per 49 CFR § 192.477, coupons or "other suitable means" must be evaluated two (2) times each calendar year, with intervals not to exceed 7 ½ months. Ameren Illinois typically collects ER probe data at various locations within each storage field coinciding with the injection and withdrawal seasons. Shorter periods between ER probe exposures may also be used on a case-by-case basis.

E. Corrosion monitoring devices should be placed in a location where corrosion is most likely to occur.

2. Part 192 Reference

49 CFR §§ 192.475, 192.476, & 192.477

3. Safety Considerations

Refer to [GSIC 1.02](#) - Safety Considerations. The data collection device should be rated as Intrinsically Safe or have other suitable rating to not be an ignition hazard.

4. Collecting ER Probe Data

A. Refer to the specific ER Probe Reader Manual for instructions.

(1) Ensure the ER probe reading device is compatible with installed ER probe.

(2) Review the equipment specification to become familiar with the equipment.

CAUTION: Operating electronic devices may present a flammable gas ignition hazard. Verify electronic reader is Intrinsically Safe for the operating conditions or alternate means are provided to attain the required ignition safety conditions.

B. Connect ER probe to the reader to collect readings.

C. Save the data in the reader

D. Download or otherwise transfer the data to the applicable form

5. Calculation of Corrosion Rate

UNCONTROLLED IF PRINTED

- A. The output from the ER probe is a signal proportional to the element's metal loss. The corrosion rate is then calculated using multipliers specific to the probe type. The corrosion rate can then be expressed as the change in metal loss over time.
- B. Determine the probe multiplier based on the element type. This is typically labeled as Probe Life. Ameren typically uses ER probes with cylindrical element type.
- C. Obtain the signal readings and time from the applicable form.
- D. Use the following equation to determine the corrosion rate of the probe.

$$\text{Corrosion Rate (mpy)} = \frac{P \times 365}{1000} \times \frac{\Delta S}{\Delta t}$$

Where,

P = Probe Multiplier (dimensionless)

ΔS = Change in Signal (dimensionless)

Δt = Time between Readings (days)

6. Documentation

- A. The probe reading value, date and time of data storage should be recorded.
- B. Maintain documentation in the project file.

GAS STORAGE INTERNAL CORROSION MONITORING
GSIC 2.08 Linear Polarization Resistance (LPR) Probe

January 1, 2013

1. General

A. This procedure describes a standardized method for field data collection from linear polarization resistance (LPR) corrosion probes during exposure while inserted in the process stream. Insertion and removal of the LPR probes is covered under [GSIC 2.10](#) - Coupon/ Probe Retractor Operation.

B. The following procedure is based on the Metal Samples LP4100 probe and MS3500L Intrinsically Safe LPR Probe Reader. For other devices consult the manufacture's information.

C. The process of field LPR probe monitoring is applicable only to the storage field gathering system piping.

D. Per 49 CFR § 192.477, coupons or "other suitable means" must be evaluated two (2) times each calendar year, with intervals not to exceed 7 ½ months. Ameren typically collects LPR probe data at various locations within each storage field coinciding with the injection and withdrawal seasons. Shorter periods between LPR probe exposures may also be used on a case-by-case basis.

E. Corrosion monitoring devices should be placed in a location where corrosion is most likely to occur.

2. Part 192 Reference

49 CFR §§ 192.475, 192.476, & 192.477

3. Safety Considerations

A. Please refer to [GSIC 1.02](#) - Safety Considerations.

B. The Metal Samples MS3500L is rated as electrically Intrinsically Safe to be suitable for use in an ignition hazardous environment.

4. Collecting LPR Probe Data

A. Refer to the specific LPR Probe Reader Manual for instructions.

B. Ensure the LPR probe reading device is compatible with installed LPR probe.

C. Review the equipment specification to become familiar with the equipment.

CAUTION: Operating electronic devices may present a flammable gas ignition hazard. Verify electronic reader is Intrinsically Safe for the operating conditions or alternate means are provided to attain the required ignition safety conditions.

D. Connect LPR probe to the reader to collect readings.

E. Save the data in the reader

F. Download or otherwise transfer the data to the applicable form

G. The output from the LPR probe is typically a corrosion rate with units of mills per year (mpy).

5. Documentation

UNCONTROLLED IF PRINTED

- A. The probe reading value, date and time of data storage should be recorded.
- B. Maintain documentation in the project file

GAS STORAGE INTERNAL CORROSION MONITORING
GSIC 2.09 Field Testing Natural Gas for Oxygen

January 1, 2013

1. General

- A. This procedure describes a standardized method for field testing natural gas for trace oxygen content.
- B. This procedure is suitable for sampling "wet" gas and/or "dry" gas. The regulator and separator device set at the sample tap has a pressure range of 1 to 1000 psig.
- C. This procedure is based on using the Advanced Micro Instruments (AMI) model 1000RS portable Trace Oxygen Analyzer. The Corrosion Control personnel will determine if trace oxygen content testing is needed.
- D. Trace oxygen content testing if assigned, would most likely be performed when obtaining a high pressure natural gas spot sample for chromatograph analysis. See [GSIC 2.04](#) - Sampling Natural Gas for Laboratory Analysis.

2. Part 192 Reference

49 CFR §§ 192.475, 192.476, & 192.477

3. Safety Considerations

- A. Please refer to [GSIC 1.02](#) - Safety Considerations.
- B. The AMI 1000RS trace oxygen analyzer is rated as electrically Intrinsically Safe to be suitable for use in an ignition hazardous environment.

4. Analyzer Precautions

- A. The expected hydrogen sulfide content at the sampling location should be less than 10 ppm with normally supplied T-2 element. Refer to the equipment manual for hydrogen sulfide concentrations exceeding 10 ppm.
- B. During winter months, the instrument should be stored in a heated area when not in use.
- C. The analyzer should be calibrated on a monthly basis when used continuously.

5. Collecting Oxygen Measurements

- A. Refer to Oxygen Analyzer Manual for additional instructions.
- B. Rotate the Sample/Bypass valve to "On" so gas flows by the sensor. Refer to Figure 3 below.

CAUTION: The SAMPLE/BYPASS VALVE on the lower right front of the instrument must remain in the CLOSED POSITION except when the flow gas needs to be in contact with the sensor element. Sensor element contact with air significantly degrades instruments measurement performance.

- C. Allow several minutes for oxygen reading to stabilize, before collecting the concentration. The instrument measurement range is from 0.01 ppm to 100% oxygen concentration.

UNCONTROLLED IF PRINTED

D. When finished, rotate the Sample/Bypass valve to the "Off" position and disconnect the sample line. Due to the sensitivity of the instrument, it should be sealed off when not in use to prevent damage to the sensor.

E. Record or download the data stored on the instrument.

Figure 3 Sampling from a pipeline

6. Documentation

A. Record the oxygen content with units of ppm or % Oxygen on form [GSIC-2.04-1 - Field Gas Sampling](#), in the "Comments" column.

B. Retain documentation with the project file.

GAS STORAGE INTERNAL CORROSION MONITORING

January 1, 2013

GSIC 2.10 Coupon/Probe Retractor Operation

1. General

A. This procedure describes a standardized method for insertion and removal of the electric resistance (ER), Linear Polarization (LP) corrosion probes and metal loss coupons from a gas pipeline operating at line pressure.

B. Field data collection from (ER) or (LP) corrosion probes during exposure while inserted in the process stream is covered under [GSIC 2.07](#) - Electric Resistance (ER) Corrosion Probe and [GSIC 2.08](#) - Linear Polarization (LPR) Corrosion Probe. For specific instructions on field handling of corrosion metal coupons prior to or after exposure, refer to [GSIC 2.02](#) - Monitoring Corrosion Weight Loss Coupons.

C. The following procedure is based on the Metal Samples ER4100 ER probe, a LP 4100 LP probe, and/or the following metal loss coupon holders utilized at various storage fields. For other devices consult the manufacturer's information. These devices include the following:

- (1) Model M-1A Hand Insertable / Retractable Corrosion Coupon Holder
- (2) Model LP-750 Hand Insertable / Retractable Corrosion Coupon Holder
- (3) Model LP-500 Hand Insertable / Retractable Corrosion Coupon Holder

D. The process of field probe retraction or insertion is applicable only to the storage field gathering system piping.

2. Part 192 Reference

49 CFR §§ 192.475, 192.476, & 192.477

3. Tool Selection

A. The appropriate model of tool must be chosen based on Maximum Operating Pressures, Maximum Allowable Operating Pressures (MAOP), and Maximum Allowable Temperatures.

Note: For safe Hand Insertion process pressures may require a reduction in operating pressure.

B. Information pertaining to the typical tool models used by Ameren is provided below. For other devices consult with the manufacturer's information prior to use.

C. Metal Samples specifies that a SR2159 Easy Tool Retraction System be use when inserting or retracting the ER/LP Series 4100 probes from an operational pipeline process **with an operating pressure greater than 150 psig**.

D. For this procedure, the operating pressure is assumed to be greater than 150 psig and a retraction system **IS REQUIRED**.

E. Accurate Tool Company specifies that the following tools may be used under the specified operation pipeline conditions. These tools do not require an insertion tool when pressures are under the MOP.

Tool Name	Description	Maximum Operating Pressure (MOP) psi	Maximum Allowable Operating Pressure (MAOP) psi	Temperature (Degrees F)
M-1A	1/4" OD Rod	1000	1500	100

UNCONTROLLED IF PRINTED

LP-500FHT	1/4" OD Probe/Rod	500	1440	1000

4. Safety Considerations

- A. Please refer to [GSIC 1.02](#) - Safety Considerations.
- B. Personal injury may occur to personnel performing or standing nearby improper operation of a probe/coupon retractor or retraction without a retractor.
- C. If the observations required during the insertion or retraction process do not meet specified requirements, cease operation and contact a supervisor.

5. Preparation

- A. Complete section for tasks prior to starting work on [Form GSIC-2.10-1- Insertion/Retraction Safety Check List](#).
- B. Obtain approval for the described tasks required prior to starting work
- C. Review the equipment specification to acquaint self with the equipment.
- D. Review pressure restrictions for insertion by hand per manufacturing instructions.
- E. Secure materials to perform work.

6. Insertion/Retraction of Device

- A. Identify the insertion/retraction tool to be used.
 - (1) Refer to section 3, Tool Selection, for tool specifications.
 - (2) Figure 1 and Figure 2, at the end of this document; provide an overview of the Metal Samples and Accurate Tool Company insertion/retraction tool.
- B. Review the manufacturing instructions for the specific insertion/retraction tool selected.
- C. Follow the insertion/retraction instructions for the specific tool selected.
 - (1) Insert the device (probe or coupon) with the insertion tool
 - (2) Recommend installing the device approximately 1/2 - inch from the bottom of the pipe or vessel.
 - (3) Install the safety chain with as little slack as possible per the Safety Chain instructions.
 - (4) Retract probe or coupon with tool.
 - (5) Re-install the Insertion tool per section 6. C.

7. Documentation

- A. Complete remaining portion of [Form GSIC-2.10-1- Insertion/Retraction Safety Check List](#).
- B. Maintain documentation in the project file.

DESIGN, CONSTRUCTION STORAGE WELLS
SECT 6.2 Wellhead Equipment and Valves

October 15, 2018

1. General

A. This section describes new and replacement wellhead equipment, including associated fittings, flanges, and valves. All should conform to API 6A.

B. This section addresses API RP 1171 6.2.1-6.2.5.

2. Reference

A. API RP 1171 Section 6.2 (pg. 13-14)

B. API 6A Specification of Wellhead and Christmas Tree

C. API 14A Specification of Subsurface Safety Valve Equipment

D. API 14B Design, Installation, Operation, Test, and Redress of Subsurface Safety Valve Systems

3. Wellhead Equipment Design

A. New and replacement wellheads shall allow for full-diameter entry to the wellbore.

B. Well shall be equipped with valves to provide isolation of the well from the pipeline system and to allow for entry into the well.

4. Pressure Rating

A. Wellhead equipment shall have operating pressure ratings sufficient to exceed the maximum anticipated operating pressure.

B. Wellhead design should include evaluation of the following:

(a) Treating and stimulation pressures

(b) Flow rates

(c) Fluid chemical composition of produced fluids and fluids used in well stimulation

(d) Possible solids production

(e) Possible increase in the maximum operating pressure

(f) Intended flow path

(g) Accommodation for pressure and/or temperature monitoring of tubular and annular spaces

5. Existing Equipment

A. Existing wellhead equipment is accepted if it has demonstrated containment of maximum operating pressure, but shall be further evaluated for suitability before increasing the operating pressure beyond the historical maximum.

UNCONTROLLED IF PRINTED

6. Emergency Shutdown Valves

A. The operator shall evaluate the need for any type of emergency shutdown valve by reviewing the following:

- (1) Distance from dwellings of human occupancy or other areas where people assemble
- (2) Gas composition, total fluid flow, and maximum flow potential
- (3) Distance between wellheads or between a wellhead and other facilities, and access availability for drilling and service rigs
- (4) Added risks created by installation and servicing requirements of safety valves
- (5) Risk to and from the well related to roadways, rights of way, railways, airports, and industrial facilities
- (6) Alternative protection measures that could be afforded by barricaded or distance or other measures
- (7) Present and predicted development of the surrounding area, topography, and regional drainage systems and environmental considerations

DESIGN, CONSTRUCTION STORAGE WELLS
SECT 6.3 - Well Casing

April 1, 2021

1. General

A. New well construction shall be completed with two or more strings of casing as needed to:

- (1) Protect groundwater
- (2) Control wellbore conditions
- (3) Isolate the storage gas within the storage reservoir
- (4) Inject storage gas from the pipeline into and withdraw out of the storage reservoir to the pipeline
- (5) Designed in accordance with API-5C3.
- (6) Conform to state regulations

B. This section addresses API RP 1171 6.3.1-6.3.7

2. Reference

A. API RP 1171 Section 6.3 (pg. 15-16)

B. API 5C3 -Bulletin On Formulas And Calculations For Casing, Tubing, Drill Pipe And Line Pipe Properties

C. API 14E -Recommended Practice for Design and Installation of Offshore Production Platform Piping Systems

D. API 5CT -Specification for Casing and Tubing

E. API 5A3 -Evaluation and testing of thread compounds for use with casing, tubing, line pipe and drill stem elements

3. Surface Casing

A. The surface casing shall be of sufficient size, grade and depth to support subsequent drilling operations and to protect groundwater.

4. Production Casing

A. The production casing shall be of adequate size and strength to maintain the well integrity and be compatible with fluid chemical compositions.

B. The production casing shall be free of open perforations or holes other than the planned completion intervals. Perforations created for investigative or remedial work shall be sealed to establish hydraulic isolation.

5. Handling

A. Casing shall be stored, transported, lifted and installed as specified by the manufacturer and in accordance with API 5C1.

UNCONTROLLED IF PRINTED

6. Connectors

- A. Casing connections shall be designed to accommodate loads associated with placement.
- B. Casing shall maintain a gas seal under anticipated wellbore flow conditions and subsequent work in the wellbore.
- C. Casing connections shall be made up according to manufacturer specification or in accordance with API 5CT.
- D. Thread compound or lubricant shall be compatible with the expected wellbore environment and shall be consistent with the manufacturer's recommended lubricant or API 5A3.

DESIGN, CONSTRUCTION STORAGE WELLS
SECT 6.4 - Casing Cementing Practices

October 15, 2018

1. General

A. This section describes the purpose of cement in the construction of new or reworked natural gas storage well. The cement is to maintain the integrity of the storage reservoir by providing isolation of the reservoir from communication with other sources of permeability or porosity through the drilled wellbore. In new construction, isolation is accomplished by filling the annular space between the casing and formation with competent cement to create a seal so that communication of fluids between the wellbore and the storage zone or other zones of interest is prevented.

B. This section addresses API RP 1171 6.4.1-6.4.6.

2. Reference

A. API RP 1171 Section 6.4 (pg. 17-19)

B. API 10A-Specification for Cements and Materials for Well Cementing

C. ASTM C150/C150M-Standard Specification for Portland Cement

D. API 10TR1-Principles and practices regarding the evaluation and repair of primary cementation of casing strings in oil and gas wells

E. API 10D-2-Recommended Practice for Centralizer Placement and Stop Collar Testing

F. API 10TR4-Technical Report on Considerations Regarding Selection of Centralizers for Primary Cementing Operations

G. API 65-2- Isolating Potential Flow Zones

3. Cement in Well Construction and Remedial Work

A. Cement functions in construction, remediation and plugging of gas storage wells:

(1) Production Casing and Liners: Use cement slurry designed for hydrostatic weight control and strength requirements. The cement should be designed for sufficient volume to:

(a) Circulate to surface, or

(b) Circulate to a point within the next casing string, or

(c) Establish zonal isolation of permeable zones

(2) Cement slurry for plugs should be designed for both cement blend and placement to have mechanical and isolation properties.

(3) Remedial cementing such as used to squeeze cement outside of the casing in order to restore wellbore, integrity, seal communicating zone, or provide isolation should be designed so that isolation of the storage zone from all other sources of porosity and permeability is achieved.

4. Cement Slurry Design and Controls

UNCONTROLLED IF PRINTED

- A. Design cement slurry by reviewing type of formations, temperature, and requirements such as water ratio, desired, compressive strength, prevention from contamination by formation fluids and various additives to control fluid rheology and reaction time.
- B. Density of cement shall be designed such that the fracture gradient of the storage zone is not exceeded and such that lost circulation potential of any exposed zone is minimized.

5. Cement Pumping Design

- A. The proper placement of the cement slurry provides well integrity by isolating the reservoir from communication with other sources of potential fluid flow.
- B. The operator should use spacers and/or pre-flushes to help remove any mud cake that may exist. The spacers should isolate dissimilar fluids to prevent potential cement contamination.

6. Cement Evaluation and Location

- A. Evaluation of cement placement and quality is done to determine that a competent seal exists to prevent the communication of fluids from the storage zone or other zones of interest.
 - (1) The location and quality of the cement bond or seal between the production casing, or liner if applicable, and the formation shall be evaluated to determine whether adequate formation and pipe bonding has been achieved to prevent the migration of gas and fluids between zones.
 - (2) Cement placement and bond quality shall be evaluated with a cement bond log or other means that can demonstrate the sealing potential of the cement.

DESIGN, CONSTRUCTION STORAGE WELLS
SECT 6.5 - Completion and Stimulation

October 15, 2018

1. General

- A. This section describes well completion and stimulation operations to verify that pressure, flow rates, and other mechanical conditions have no adverse impact on the storage reservoir, caprock, or the mechanical integrity of the well.
- B. Casing and wellhead design, installation parameter workover history, and previous mechanical integrity tests should be reviewed to verify that stimulation and completions loads do not exceed the pressure limits and safety factors causing failure to the well's mechanical integrity.
- C. This section addresses API RP 1171 6.5.1-6.5.3.

2. Reference

- A. API RP 1171 Section 6.5 (pg.19)
- B. API HF1-Hydraulic Fracturing Operations-Well Construction and Integrity Guidelines
- C. API HF2-Water Management Associated with Hydraulic Fracturing
- D. API HF3-Practices for Mitigating Surface Impacts Associated with Hydraulic Fracturing

3. Fracture Stimulation

- A. When a fracture treatment is applied, it shall be conducted in a manner such that the fracture height or length does not compromise the integrity of the storage reservoir.

DESIGN, CONSTRUCTION STORAGE WELLS
SECT 6.7 - Well Closure - Plugging and Abandonment

April 1, 2021

1. General

- A. This section describes the design and well abandonment for long-term isolation of the storage zone in order to prevent fluid flow between the storage zone and any other penetrated zone and the surface.
- B. This section addresses API RP 1171 6.7.1-6.7.3.

2. Reference

- A. API RP 1171 Section 6.7 (pg.20-21)
- B. API E3-Well Abandonment and Inactive Well Practices for U.S. Exploration and Production Operations
- C. API 10A-Specification for Cements and Materials for Well Cementing
- D. ASTM C150/C150M-Standard Specification for Portland Cement

3. Storage Zone Isolation

- A. Use cement plugs and/or mechanical plugs to isolate the storage zone from fluid migration. The use of hydrostatic pressure as a sole means of isolation shall not be acceptable.
- B. The operator shall determine the location of groundwater and hydrocarbon bearing zones penetrated by the well to be abandoned, and the condition of the casing and cement across those zones to prevent communication between any those zones during and after plugging the well.
- C. Condition of the well should be evaluated to determine if any issue would limit access to wellbore or hinder placing plugs across storage zone.
- D. The operator shall verify that the casing-borehole cement seals the storage interval in the well being abandoned in order to achieve annular isolation and prevent communication.
- E. The operator shall verify the presence and location of a cement plug after the plug has set and has reached a sufficient compressive strength.
- F. The operator shall correct deviations which may threaten isolation objectives of the plug.

4. Abandoned and Well Maintenance

- A. The operator shall repair a failed plug.
- B. The operator shall repair a well with any leak indication that may suggest a lack of isolation of the storage reservoir.
- C. The operator shall install a surface plug and cap to maintain physical and site security and will include the API number or other form of identification.

UNCONTROLLED IF PRINTED

DESIGN, CONSTRUCTION STORAGE WELLS
SECT 6.9 - Testing and Commissioning

April 1, 2023

1. General

A. This section describes the minimum requirements for testing and commissioning the functional integrity in the design and construction of natural gas storage wells.

B. This section addresses API RP 1171 6.9.

2. Reference

A. API RP 1171 Section 6.9 (pg. 22)

3. Testing Methods

A. A new well, or a well that has had its existing production casing modified from its previous condition during workover activities, shall be tested to demonstrate mechanical integrity and suitability for the designed operating conditions prior to commissioning by one of the following test:

(a) For new well construction, the production casing shall be tested prior to drilling out the shoe, taking into account the cement design factors so that this test does not compromise the cement integrity.

(b) For existing production casing, the production casing shall be tested after setting a retrievable plug as close as practical to the top of the storage formation.

(c) For a well completed with tubing and packer, the tubing-casing annulus shall be tested.

B. The operator shall design a test so the maximum pressure on the packer seat and the pressure at any point in the wellbore during the test does not compromise the mechanical integrity of the well.

NOTE:

A commonly used test parameter is an initial test pressure of 1.1 times the maximum allowable operating pressure, with test duration of at least 30 minutes and a pressure drop not exceeding 10% of the initial test pressure.

DESIGN, CONSTRUCTION STORAGE WELLS
SECT 6.10 - Monitoring of Construction Activities

April 1, 2023

1. General

- A. This section describes the minimum requirements for monitoring of construction activities.
- B. This section addresses API RP 1171 6.10.

2. Reference

- A. API RP 1171 Section 6.10 (pg. 22-23)
- B. Gas Storage Form 11.11.1 Management of Change**

3. Resolution of Issues

- A. The operator should monitor and address issues or problems encountered during drilling, completion, and stimulation of a well. If the resolution of encountered issues or problems causes the operator to deviate from the original design or to alter the procedures for a well, the operator shall document the changes and keep the document in the daily well records.
- B. The operator shall resolve issues in a manner that maintains functional integrity of the well and storage reservoir prior to commissioning the well for service.

ATTAINMENT OF MAXIMUM RESERVOIR PRESSURE AND TOTAL CAPACITY
OCTOBER 15, 2018
SECT 7.2 - Testing and Commissioning

1. General

- A. This section describes the minimum requirements for testing and commissioning the functional integrity of the natural gas storage reservoir and wells established.
- B. This section addresses API RP 1171 7.2.

2. Reference

- A. API RP 1171 Section 7.2 (pg. 25-26)

3. Integrity Assurance

- A. Mechanical integrity test and/or mechanical condition evaluation shall be performed prior to project commissioning in order to verify that each well is capable of meeting the designed operating conditions. Requirements related to well mechanical integrity testing are covered in API 1171 section 6.9 (pg. 22).

ATTAINMENT OF MAXIMUM RESERVOIR PRESSURE AND TOTAL CAPACITY - October 15, 2018

SECT 7.3 - Reservoir Integrity Monitoring

1. General

- A. This section describes the minimum requirements for reservoir integrity monitoring and the methods for analysis.
- B. The material balance behavior of a storage reservoir shall be monitored relative to the original design and expected reservoir behavior established prior to commissioning and start-up.
- C. Unexpected conditions detected during monitoring shall be evaluated and corrected in order to avoid an incident or loss.
- D. Monitoring frequency should be based on factors such as reservoir and well fluid loss and flow potential.
- E. This section addresses API RP 1171 7.3.

2. Reference

- A. API RP 1171 Section 7.3 (pg. 26)

3. Monitoring and Analysis Methods

- A. Average reservoir pressure versus inventory shall be monitored and compared to expected conditions in order to allow for the discovery and correction of any unexpected conditions.
- B. Typically a shut-in key indicator well(s) or an observation well(s) that represents the average shut-in reservoir pressure provides the most useful pressure-inventory relationship.
- C. In lieu of shut-in observation wells, the relationship may be based on a flowing well pressure.
- D. Liquid level should be taken into account when using observation wells.

ATTAINMENT OF MAXIMUM RESERVOIR PRESSURE AND TOTAL CAPACITY - October 15, 2018

SECT 7.5 - Recordkeeping

1. General

A. This section describes the minimum requirements for recordkeeping on natural gas storage records related to its monitoring and testing.

B. This section addresses API RP 1171 7.5.

2. Reference

A. API RP 1171 Section 7.5 (pg. 27)

3. Recordkeeping

A. Records of natural gas storage testing and monitoring activities covered under this section shall be maintained for the life of the facility.

B. The records shall include, as applicable and available:

(1) Reservoir and well mechanical integrity records that demonstrate functional integrity during commissioning, including monitoring data and analyses.

(2) Well testing records and records of well actions taken during commissioning.

(3) Regulatory records for project commissioning include permit applications, permits, and all reports and correspondence with regulatory agencies.

RISK MANAGEMENT FOR STORAGE OPERATIONS
SECT 8.2 - Risk Management

October 15, 2018

1. General

- A. This section describes the minimum requirements for developing, implementing, and documenting a program to manage risk.
- B. This section addresses API RP 1171 8.2.

2. Reference

- A. API RP 1171 Section 8.2 (pg. 28)

3. Risk Management Requirements

- A. The operator shall develop, implement, and document a program to manage risk.
- B. The program to manage risk should include:
 - (1) Data collection
 - (2) Identification of potential threats and hazards to the storage operation
 - (3) Risk analysis including estimation of the likelihood of occurrence of events related to each threat
 - (4) The likelihood of occurrence and potential severity of the consequence of such events
 - (5) The preventative, mitigative, and monitoring process to reduce the likelihood of occurrence
 - (6) The likelihood and severity of consequences
 - (7) A periodic review and reassessment of the processes

4. Documentation

- A. The risk management program for each of Ameren's storage fields is stored electronically.
- B. Each of the 12 storage fields has an individual risk management program; each risk management program shall be reviewed and reassessed as described in [SECT 8.7.4](#).

RISK MANAGEMENT FOR STORAGE OPERATIONS
SECT 8.3 - Data Collection and Integration

October 15, 2018

1. General

- A. This section describes the minimum requirements for data collection and integration relevant to a storage field for risk management.
- B. This section addresses API RP 1171 8.3.

2. Reference

- A. API RP 1171 Section 8.3 (pg. 28)

3. Data Sources

- A. The operator shall use available information such as performance data collected through:
 - (1) The field history
 - (2) Operations and maintenance (O&M) activities
 - (3) Geotechnical data such as well logs
 - (4) Engineering data
 - (5) Completion reports

4. Documentation

- A. The risk management program for each of Ameren's storage fields is stored electronically.
- B. The specifications and processes used in the data collection and integration process to evaluate risk for each of Ameren's gas storage wells can be viewed electronically.

RISK MANAGEMENT FOR STORAGE OPERATIONS
SECT 8.4 - Threat and Hazard Identification and Analysis

March 28, 2022

1. General

- A. This section describes the minimum requirements for threat and hazard identification and analysis.
- B. A hazard is a situation or condition that has the potential to cause loss, damage, or harm to a storage well, well site or reservoir and thus affect the functional integrity of the storage operation.
- C. A threat to storage functional integrity can be created by an encounter with or an activation of a hazard in the course of the storage operation.
- D. The operator may determine that some facilities are not susceptible to specific threats based on existing information, in which case the operator can provide justification and documentation for the exclusion of a specific threat.
- E. A lack of data or information should not be used as justification to exclude a specific threat.
- F. This section addresses API RP 1171 8.4.

2. Reference

- A. API RP 1171 Section 8.4 (pg. 28)
- B. Risk Management Well Integrity Paper

3. Methodology

- A. The operator shall evaluate the potential threats and hazards impacting storage wells and reservoirs.
- B. Each well and reservoir threat and hazard identified and evaluated in the risk model are listed in the Risk Management Well Integrity Paper.

4. Documentation

- A. The risk management document for each of Ameren's storage fields are stored electronically.
- B. The specifications and processes used in the data collection and integration process to evaluate risk for each of Ameren's gas storage wells can be viewed electronically in the Risk Model and the Risk Management Well Integrity Paper.

Supersedes: October 15, 2018

RISK MANAGEMENT FOR STORAGE OPERATIONS
SECT 8.5 - Risk Assessment

October 15, 2018

1. General

A. This section describes the minimum requirements for developing a risk assessment using tools and techniques that will evaluate and prioritize risks, to direct risk management activities that promote functional integrity of the storage operation.

B. This section addresses API RP 1171 8.5

2. Reference

A. API RP 1171 Section 8.5 (pg. 31)

3. Methodology

A. The operator shall assess risk related to the storage operation using a consistent process.

B. The operator shall review the results of the risk assessment to determine whether the risk assessment, resulting prioritization, or ranking represents its facilities and characterizes the risks.

4. Documentation

A. Risk Model Recordkeeping Form - Form 8.8 stored electronically.

RISK MANAGEMENT FOR STORAGE OPERATIONS
SECT 8.7 - Periodic Review and Reassessment

October 15, 2018

1. General

- A. This section describes the minimum requirements for the periodic review and reassessment of risk management programs and activities.
- B. The operator shall assess the effectiveness of risk monitoring and risk management programs and maintain a continual review and improvement cycle in risk management activities to provide functional integrity of the storage operation.
- C. This section addresses API RP 1171 8.7.1 - 8.7.6

2. Reference

- A. API RP 1171 Section 8.7 (pg. 35)

3. Frequency

- A. The operator shall define a review frequency for the risk assessment and perform a review and update of the risk assessment in accordance with the defined frequency
- B. The frequency is defined in [SECT 8.7.4](#).

4. New Threats and Hazards

- A. If during the course of operations new threats or hazards are identified, or the impact of threats or hazards changes markedly, the operator shall assess the risk associated with new conditions and evaluate the prioritize risk management options in accordance with the risk assessment.

5. Documentation

- A. The risk management program for each of Ameren's storage fields is stored electronically.
- B. The procedure defined in [SECT 8.7.4](#) is stored electronically.

RISK MANAGEMENT FOR STORAGE OPERATIONS

April 1, 2023

1. General

- A. This procedure describes a standardized method for defining the data to be reviewed for the risk management well integrity model.
- B. This procedure addresses API RP 1171 8.7.4.
- C. This procedure will also define the frequency that the risk model shall be reviewed and evaluated referenced in API 1171 8.7.2, and 8.4.2, and it will define the records retention schedule referenced in API 1171 8.8.

2. Reference

- A. API RP 1171 Section 8.7.4 (pg. 35)

3. Timeline

- A. Both the risk model and the third party damage prevention model for each of Ameren's 12 storage fields shall be reviewed once per calendar year not to exceed fifteen (15) months
- B. Updates can be made more regularly, but the data for each field shall be analyzed each calendar year at intervals not exceeding fifteen (15) months.
- C. The records retention schedule defined in API 1171 8.8 shall also be reviewed and filed each calendar year at intervals not exceeding fifteen (15) months.
- D. Records shall be retained for the life of the field plus one year.

4. Data to be Reviewed

- A. The expected data to be reviewed is as follows:
 - (1) Corrosion log dates, type of corrosion log, wall loss value, and depth of wall loss.
 - (2) The installation or removal of tubing and/or a packer.
 - (3) The installation or removal of a surface controlled subsurface safety valve.
 - (4) The permit status change of any well.
 - (5) Any structures or roads within the wellhead safety zone of a well that have been added or removed.
 - (6) Any new wells drilled need to be added to the risk model.
 - (7) Annulus pressures for each well shall be updated
 - (8) Cement Bond Log data and cement tops shall be updated.
 - (9) The absolute open flow potential of a well shall be updated if a well was flow tested.
 - (10) H²S levels shall be updated in the risk model.
 - (11) The **Third-Party Damage Prevention Risk Model** shall be updated.
 - (12) Inventory analysis and third-party drilling shall be re-evaluated.

UNCONTROLLED IF PRINTED

(13) Any wells plugged and abandoned shall be updated in the risk model.

5. Documentation

A. All values for each storage field shall be documented in the designated risk model column for each well and stored electronically.

Document Rescission

SECT 8.7.4 Risk Management for Storage Operations: Risk Assessment Procedures, May 15, 2022

Revision Notes

Location of Changes	Summary of Changes
Subsection 4. A. (11)	Updated: Third Party Damage Prevention Risk Model
Subsection 4. A. (13)	New – Any wells plugged and abandoned shall be updated in the risk model.

RISK MANAGEMENT FOR STORAGE OPERATIONS
SECT 8.8 - Recordkeeping

October 15, 2018

1. General

- A. This section describes the minimum requirements for recordkeeping of the risk management records.
- B. The operator shall develop a risk management records retention schedule and management plan.
- C. This section addresses API RP 1171 8.8.

2. Reference

- A. API RP 1171 Section 8.8 (pg. 35)

3. Recordkeeping

- A. The risk management records retention schedule and management plan is defined in [SECT 8.7.4](#).

4. Documentation

- A. The risk management program for each of Ameren's storage fields is stored electronically.
- B. The data collection and integration process to evaluate risk for each of Ameren's gas storage wells can be viewed electronically.
- C. Each of the 12 storage fields has an individual risk management program; each risk management program shall be reviewed and reassessed as described in [SECT 8.7.4](#), documented in the 8.8 recordkeeping document and saved electronically.

SECT 9.2 - Overview

1. General

- A. This section describes the minimum requirements for integrity maintenance and risk-based evaluations.
- B. This section addresses API RP 1171 9.2

2. Reference

- A. API RP 1171 Section 9.2

3. Integrity Maintenance

- A. The operator shall maintain functional integrity of storage wells and reservoirs. Storage wells and reservoirs can have different characteristics resulting in unique requirements in approaching integrity demonstration, verification, and monitoring.

4. Risk-Based Evaluation

- A. Risk assessments shall be used as a basis for developing the integrity demonstration, verification, and monitoring tasks and evaluation their frequency requirements.

5. Documentation

- A. The risk management program for each of Ameren's storage fields is stored electronically.
- B. Each of the 12 storage fields has an individual risk management program. Each risk management program shall be reviewed and reassessed as described in [SECT 8.7.4](#).

INTEGRITY DEMONSTRATION, VERIFICATION AND MONITORING PRACTICES

April 1,
2020

SECT 9.3.2 - Well Integrity Monitoring

1. General

- A. This section describes the minimum requirement for well integrity monitoring.
- B. This section addresses API RP 1171 9.3.2

2. Reference

- A. API RP 1171 Section 9.3.2 (pg. 36-37)

3. Monitoring Requirements

- A. The operator shall monitor for the presence of annulus gas by measuring and recording annular pressure and/or annular gas flow, as outlined in the Annulus Pressure Monitoring Form, two times per calendar year, maximum interval of 7-1/2 months.
- B. The operator shall evaluate each annular gas occurrence that exceeds operator defined threshold levels determined from well integrity evaluation and from risk assessment.
- C. The operator shall visually inspect each wellhead assembly for leaks one time per calendar year maximum interval 15 months.
- D. The operator shall test the operation of the master valve and wellhead pipeline isolation valve for proper function and ability to isolate the well one time per calendar year, maximum interval of 15 months. The valves shall be maintained, repaired, or replaced in accordance with the operator's valve maintenance program for isolation valves.
- E. Surface and subsurface safety valve systems, where installed, shall be function tested one time per calendar year, maximum interval of 15 months. The tests shall be conducted in accordance with manufacturer's recommendations and the operator's procedures. A closed storage well safety valve system shall be manually reopened at the site of the valve after an inspection and not opened from a remote location.
- F. Well site inspections at locations with well access roads shall be performed one time per calendar month, maximum interval of 1-1/2 months. Well site inspections for locations without well access roads shall be performed four times per calendar year, maximum interval of 4-1/2 months.

4. Documentation

- A. Form 932-1A
- B. As defined in API RP 90-2.
- C. Reference Annual Leak Survey
- D. Form 932-1D
- E. SCSSSV form 932-2

Supersedes: October 1, 2019

INTEGRITY DEMONSTRATION, VERIFICATION AND MONITORING PRACTICES October 15, 2018
SECT 9.3.1 - Well Integrity Evaluation

1. General

- A. This section describes the minimum requirement for well integrity evaluation.
- B. Wells to evaluate are both company owned and third party.
- C. This section addresses API RP 1171 9.3.1

2. Reference

- A. API RP 1171 Section 9.3.1 (pg. 36)

3. Evaluation Requirements

- A. Operator shall evaluate mechanical integrity of each active well that penetrates the storage zone and buffer zone or area of influence by storage operations.
- B. Operator shall request well integrity evaluation data for third-party well owner/operators following the frequency established using conclusions from the initial evaluation.
- C. Active well mechanical integrity evaluations shall include initial and subsequent evaluations as determined using the risk assessment and the information derived from the initial evaluation.

4. Documentation

- A. All mechanical integrity evaluation will be stored electronically.
- B. Reference letter and certified mail receipt.
- C. Well mechanical integrity evaluations will be assessed through a risk model.

INTEGRITY DEMONSTRATION, VERIFICATION AND MONITORING PRACTICES
SECT 9.8 - Recordkeeping

October 1,
2019

1. General

- A. This section describes the minimum requirements for the documentation and retention of records.
- B. This section addresses API RP 1171 9.8 and API RP 1171 11.2.4

2. Reference

- A. API RP 1171 Section 9.8 (pg. 40)

3. Retention

- A. The operator shall maintain records of storage inventory assessments for the life of the facility.
- B. The operator shall maintain all necessary well records for the life of the field plus one year.
- C. The operator should retain records necessary to properly administer the procedures and establish retention requirements for specific records.
- D. Inspections, tests, patrols, or analyses shall be documented according to the operator's procedures.

4. Documentation

- A. All evaluations shall be stored electronically.

Supersedes: October 15, 2018

SITE SECURITY, SAFETY, INSPECTIONS AND EMERGENCY PREPARED-
NESS AND RESPONSE
SECT 10.2 - Site Security and Safety

October 1,
2021

1. General

A. These sections describe the minimum requirements for assessment and monitoring of site security and safety, and ingress and egress. These requirements are site specific and vary based on local conditions, such as terrain, land use, and environment of areas adjacent to the wells.

B. This section addresses API RP 1171 10.2

2. Reference

A. API RP 1171 Section 10.2 General (pg. 40)

3. Evaluation Requirements

A. The operator should maintain a process to limit access to storage wells during drilling, workover, operation, and abandonment activities.

B. The operator should evaluate local and site-specific conditions in developing the security measures and may include requirements for: barricades such as bollards, jersey barriers, or concrete impediments; windsocks; wellhead enclosures; valve handles removed, or valves secured; and other means of preventing unauthorized entry or operation of storage facilities.

C. The operator may employ additional measure to enhance site security and safety based on an analysis of the site-specific factors.

D. Each well is evaluated in the Third Party Damage Prevention Risk Model

4. Documentation

A. Third Party Damage Prevention Risk Model

SITE SECURITY, SAFETY, INSPECTIONS AND EMERGENCY PREPARED-
NESS AND RESPONSE
SECT 10.4 - Signage

October 15,
2018

1. General

- A. This section describes the minimum requirements for signage at the well site.
- B. This section addresses API RP 1171 10.4

2. Reference

- A. API RP 1171 Section 10.4

3. Signage Information

A. The operator shall install permanent weatherproof signage at each well site for identification purposes. Signage should contain the following information, at a minimum.

- (1) Storage facility name, well name, and/or identification number
- (2) Operator name; and
- (3) Operator's 24 hour emergency contact number

B. The operator can add other information or signage to enhance site security and safety; such as applicable location information or warnings for areas containing potentially hazardous, flammable, or noxious vapors, etc.

4. Illinois State Requirements

- A. Illinois Administrative Code 62 - Section 240.805 Lease and Well Identification

SITE SECURITY, SAFETY, INSPECTIONS AND EMERGENCY PREPAREDNESS AND RESPONSE April 1, 2023

SECT 10.6 - Emergency Preparedness and Response

1. General

A. This section describes the minimum requirements for emergency preparedness and response plan at the well site and facilities.

B. This requirement is a result of API RP 1171 10.6

2. Reference

A. API RP 1171 Section 10.6

B. EMER 2.11 Gas Storage

3. Emergency Preparedness and Response Plan

A. For site security and safety, the operator shall develop and implement a structured emergency preparedness and response plan in order to:

- (1) Address accidental releases
- (2) Equipment failure
- (3) Natural disasters
- (4) Third party emergencies

B. The operator should integrate natural gas storage emergency procedures with regulatory required procedures covering pipeline facilities rather than creating storage-specific documents.

C. The Emergency Preparedness and Response plan well-specific information can be updated as needed, and the plan is reviewed once per calendar year not to exceed 15 months for effectiveness of existing procedures.

D. The emergency preparedness and response plan for Ameren's storage fields is located on the Gas Storage SharePoint site or electronic equivalent.

4. Training

A. Storage operations and applicable staff shall receive training in the use of the emergency preparedness/response plan once per calendar year, maximum interval of 15 months and training will be documented electronically.

B. The training can include mock drills and participation in table-top exercises and CBT modules.

C. The table-top exercises or mock drills can include civil emergency responders to enhance understanding and successful incident response.

D. Personnel not present for annual training shall cover training material and document electronically.

SECT 10.6.3 - Blowout Contingency Plan

October 15,
2018

1. General

- A. The operator shall have a blowout contingency plan in place.
- B. These requirements addresses API RP 1171 10.6.3
- C. The operator can consult with well control experts in developing a blowout contingency plan.

2. Reference

- A. API RP 1171 Section 10.6.3

3. Blowout Contingency Plan

- A. A blowout contingency plan is company specific and should identify:
 - (1) The procedures
 - (2) Equipment
 - (3) Personnel needed to avoid or respond to a loss of well control situation

4. Blowout Contingency Plan Sources

- A. The blowout contingency plan for Ameren's storage fields is stored electronically.
- B. The specifications and processes used in the data collection and integration process to evaluate the blowout contingency plan for each of Ameren's gas storage wells can be viewed electronically.
- C. All of the information stated in 10.6.3 will be used to determine susceptibility to threat and hazard-related events and to assess threat and hazard interaction.
- D. Each of the 12 storage fields has an data gathered assessment by well control experts; each storage field shall be reviewed and reassessed as described in procedure stored electronically.

1. General

A. This section describes the minimum requirement for construction, operation, and maintenance procedures.

2. Reference

A. API RP 1171 Section 11.2.1

3. Procedures

A. Operator shall develop and follow procedures for the construction, operation, and maintenance of natural gas storage wells and reservoirs to establish and maintain the functional integrity. When practicable, the operator's procedures should incorporate applicable industry recommended practices that promote personal and process safety, resource conservation, environmental stewardship, mechanical integrity, and reliable performance.

B. Current procedures shall be available and readily accessible to operations, maintenance, and storage personnel. Procedures may in paper or electronic format.

PROCEDURES AND TRAINING
SECT 11.4 - Emergency Plans

October 15, 2018

1. General

A. This document describes emergency preparedness/response and blowout contingency plans referenced in [SECT 10.6](#).

B. This section addressed API RP 1171 11.4.

2. Reference

A. API RP 1171 Section 11.7.4

B. API RP 1171 Section 10.6

3. Plan Effectiveness

A. The operator shall establish a program to determine operator familiarity with emergency plans and procedures and periodic testing of the effectiveness of the plan in accordance with [SECT 10.6](#).

PROCEDURES AND TRAINING
SECT 11.7 - Interaction with Control Room

May 15, 2022

1. General

- A. This section describes the guidelines for Storage communication with the Control Room.
- B. These requirements address API RP 1171 Section 11.7.

2. Reference

- A. API RP 1171 Section 11.7.1 and Section 11.7.2

3. Interaction Requirements

- A. Storage personnel shall be responsible for preparing and communicating guidelines for maintaining reservoir and well functional integrity.

4. Procedures

A. Preparing and Communicating

(1) The Reservoir Group:

(a) Prepare and send monthly injection and/or withdraw schedule that reflect estimated start and end dates, planned outages (whenever possible), estimated monthly targets.

(b) Prepare and send weekly planners that will include minimum, maximum, and target rates for each Gas Storage Field with comments for any upcoming work that will hinder flow capability.

(c) Participate in the weekly planning call with Gas Control and Gas Supply

(2) Under normal flow conditions, the field supervisors and operators will have the authority for initiating flow, operating, and shutting in natural gas storage facilities according to the schedules and targets set by the reservoir group.

(3) Under abnormal and emergency conditions, the field supervisors and operators will have the authority to initiating flow, operating and shutting in natural gas storage facilities as dictated by the O&M section for Emergency Plan.

5. Documentation

A. Documented electronically through insight Control Room Management Team Training course.

B. Monthly injection/withdrawal schedules documented electronically

C. Weekly gas planning spreadsheets documented electronically

PROCEDURES AND TRAINING
SECT 11.9 - Safety and Environmental Programs

October 15, 2018

1. General

- A. This section describes the minimum requirements for developing safety and environmental programs.
- B. This section addresses API RP 1171 11.9.1

2. Reference

- A. API RP 1171 Section 11.9.1
- B. Ameren Safety Manual
- C. Ameren O&M Manual

3. Scope of Procedures

- A. The operator shall develop programs incorporating safeguards to the environment, site security, and safety and health into storage design, construction, and operations.

4. Documentation

- A. Pre-Job Safety Briefing Form
- B. Emergency Manual
- C. Operator Mock Emergency Drills
- D. Reservoir Wild Well Control Class/Certification

PROCEDURES AND TRAINING
SECT 11.11 - Management of Change

October 15, 2018

1. General

A. This section describes the minimum requirements for developing Management of Change processes and procedures.

B. This section address API RP 11.11.

2. Reference

A. API RP 1171 Section 11.11

3. Scope

A. Revisions of procedures and processes is an acceptable practice, but the operator shall require changes to be accomplished in a controlled manner.

B. The program documentation, framework, and procedures shall be revised before the change can be implemented. Not all changes need to be approved through a formal MOC process. Some changes are expected and may not be subject to a formal change control process.

4. Documentation

A. Form 11.11.1 to be stored electronically

PROCEDURES AND TRAINING
SECT 11.13 - Records

October 15, 2018

1. General

A. This section describes maintaining records as required in section 11 (Procedure and Training).

B. This section addresses API RP 1171 11.13

2. Reference

A. API RP 1171 Section 11.13

3. Records Documentation

A. The operator shall maintain records to document establishment of and compliance with procedures as required in Section 11 (Procedures and Training).

B. Records may be kept in an appropriate format (paper or electronic). The integrity of the records, especially electronic, should be verifiable. Records should include superseded procedures.

4. Training Records

A. The operator shall maintain records that demonstrates compliance with this subsection.

5. Retention

A. The operator shall establish retention intervals for records that meet regulatory requirements; where no regulatory requirements exist, retention intervals should be determined by the operator.

B. Retention rate and intervals are addressed in Ameren Record Retention program.

6. Documentation

A. All training documented in Insight.

CHANGE SUMMARY

April 1, 2023

Complete Change Summary			
Document	Change Summary	Previous Date Document	Current Document Dated
ACIG 1	<p>Requirements</p> <p>4.2 Mechanical Sparking and Electric Arcing</p> <p>4.2.1 Revised – Where possible of accidental ignition of a gas-in-air mixture exists, use only flashlights, work lights, tools, equipment and communication devices that are labelled or certified as intrinsically safe and approved for use in a Class 1 Division 1 hazardous environment.</p> <p>1. Class 1 the environment contains flammable gases, vapors, and liquids</p> <p>2. Division 1 an environment where ignitable gases, vapors, or liquids can exist under normal conditions, maintenance work, or because of leakage.</p> <p>The devices that were listed in the tables were not 100% intrinsically safe so Tables have been removed. Language was modified to use only tools, equipment, and devices that are labelled intrinsically safe for use in Class 1 Division 1 hazardous environment.</p> <p>4.2.2 – Removed – This includes the use of devices in Table 2</p> <p>Table 2 was removed so this reference is not needed.</p> <p>4.3 Static Electricity Arcing</p> <p>4.3.1 – Added "steel" - It is steel pipe that requires an electric bond when cutting the pipe.</p> <p>4.3.2 Grammatical revision – Ground the squeeze-off tool prior to squeezing off PE pipe, See POLY 2.2 Subsection 5.1 Before Start-</p>	October 1, 2021	April 1, 2023

	<p>ing Squeeze-off, for eliminating external static charge on 1-1/4 inches PE pipe and larger.</p> <p>Rearranged wording and improve reference link.</p>		
<u>ACIG 2</u>	<p>Work Area Protection</p> <p>Throughout document updated EXCV 2.9. for EXCV 2.09.</p> <p>7.0 Working with Plastic Pipe</p> <p>7.1 New – Ground squeeze-off tool prior to squeezing PE pipe.</p> <p>Reminder that squeeze-off tool must be ground before beginning the squeeze.</p> <p>7.2 Revised – Refer to POLY 2.2 Subsection 5.1 Before Starting Squeeze-off for additional steps for eliminating external static charge on 1-1/4 inches PE pipe and larger.</p> <p>7.3 NOTE – Removed the note that soapy rags are not required on above-ground squeezers.</p> <p>Avoiding potential inconsistencies in ways to eliminate external static by replacing the list with a reference link to POLY 2.2 Subsection 5.1 Before Starting Squeeze-Off. This subsection lists the ways to eliminate the external static.</p>	October 1, 2021	April 1, 2023
<u>BORE 2.1</u>	<p>Boring Operations and Pipe Installation</p> <p>4.0 Boring Operations</p> <p>4.2 Boring Safety</p> <p>4.2.3 Since boring operations may encounter an energized electric cable</p> <p>5. Corrected language – During work in muddy or wet conditions, rubber insulated EH-rated boots (either over-boots or safety-toed boots) shall be worn.</p> <p>This is the language in the Subsurface Utility Protection section of the AIC Safety Manual.</p> <p>4.3 Prior to Beginning Operations</p> <p>4.3.2 – "The Subsurface Utility Protection section" of the AIC Field Safety Manual replaces "provision of Section 33.4".</p> <p>The new Field Safety Manual will have a different section number for Subsurface Utility Protection. Sr Safety Specialists recommending referencing the title of a section rather than a section number which are subject to change with updates.</p> <p>7.0 Directional Drilling</p> <p>7.7 Revise – Begin boring by drilling the pilot hole, mark the bore head progression with spray paint.</p> <p>Marking the bore head progression was missing in the current procedures.</p> <p>7.13 – Added NOTE: The terms and conditions listed in a required boring permit may limit the back-reamer size.</p> <p>Railroad boring permits are reported to limit the back-reamer size to less than the AIC's recommended 1.5 times the pipe's nominal diameter. Typical the limitation is one or two pipe sizes larger than the pipe being installed.</p> <p>9.0 Pipe Installation</p>	May 15, 2022	April 1, 2023

	<p>9.1 General</p> <p>9.1.5 – New – Completed pipe installations shall be back flagged in accordance with DAMG 1 Section 11.0 Back-Flagging.</p> <p>SMR Team felt reference to back flagging the completed installation should be included in the BORE 2.1 eventhough it is referenced in MAIN 1 and SERV 1.</p>		
<p><u>CORR 1</u></p>	<p>Requirements</p> <p>16.0 Painting Pipeline Facilities</p> <p>16.1.1 – Revised- All uncoated new above grade facilities should be cleaned and coated with an approved coating at time of installation. If not possible, Gas Supervisor or Operations Coordinator should schedule it to be done. See CORR 2.3 Section 10.0 Approved Paint Specification and Appendix J.</p> <p>Language was expanded so that this subsection could be referenced in the METR sections where painting meters sets is addressed. In addition, clarifies that if the painting is not performed at time of installation, the Gas Supervisor or Operation Coordinator should schedule the facility for painting. Maximo does not create work orders for facilities needing paint.</p> <p>Appendix A-2 Competition of Buried Pipe Examination Form</p> <p>1. F. A Buried Pipe Examination form should not be performed when:</p> <p>(4) New – Pipe is located in a vault or pit.</p> <p>Clarification that an exposed pipe in a vault or pit does not require completion of Buried Pipe Examination form.</p>	<p>October 1, 2022</p>	<p>April 1, 2023</p>
<p><u>CORR 2.3</u></p>	<p>Coatings</p> <p>4.0 Approved Coatings</p> <p>4.1 New Pipe Installation</p> <p>4.1.2 Directional Drilling</p> <p>4. Installation instructions</p> <p>4 b. Moisture Cured Wrap (MCW)</p> <p>4 b. (i) – Trenton MC110 Outerwrap or Denso Glass Outerwrap – See Appendix I-5.</p> <p>Updated Trenton MC110 Outerwrap replaces Trenton MC Outerwrap.</p> <p>4.5 Fittings</p> <p>4.5.2 – New – Coating on below grade valves provided by the valve manufacturer, valve supplier, or fabricating shop can be used in-lieu of AIC approved coating if approved by the Superintendent of Corrosion Control.</p> <p>Allows for approved precoated below grade valves to be installed without any additional coating applied.</p> <p>4.6 Soil-t0-Air Interface Zone</p> <p>4.6.6 NOTE – Added – MCW shall extend a minimum of 2 inches passed the other coating material per Trenton MC110 Outerwrap Application Instructions. See CORR 3.</p> <p>Emphasis to ensure there is a good seal between the outerwrap and the pipe.</p> <p>6.0 Approved Cold Applied Tape</p>	<p>October 1, 2022</p>	<p>April 1, 2023 April 1, 2023</p>

6.1 – Removed "exposed to soil". No wrinkles in the cold applied tape shall be left. All wrinkles must be cut out and retaped.

Appendix B Coating Repair

B-1 & B-2 - Throughout "inches" replaced " or inch

Appendix G Moisture Cured Wrap

Updated Trenton MC110 Outerwrap

Appendix H General Wrapping Instructions

"inches" replaced inch

4. A. – Added "cold applied" to wax tape.

Clarify that cold applied tape and cold applied wax tape are two separate products.

Appendix I Specific Coatings

Appendix I-1 Tapecoat 20

2. C. (2) - "inches" replaced inch

Appendix I-3 Tapecoat H35

1. B. Revised - No wrinkles in cold tape shall be left. Removed "exposed to soil"

3. A. - "inches" replaced inch

Appendix I-4 Denso Butyl 35

1. B. Revised - No wrinkles in cold tape shall be left. Removed "exposed to soil"

There are to be no wrinkles left in cold tape wrap regardless if it above grade or below grade, Wrinkles allow water to get trapped.

Appendix I-5 Moisture Cured Wrap

1. C. - "inches" replaced inch

2. A. - "inches" replaced inch

2. Application Procedures for Girth Welds.

Rearranged some of the steps and split some of original steps into individual line items.

3. Completion and Curing of MCW Wrap

A. (1) – Capitalized "OR"

C. – Moved 1st sentence into a NOTE.

4. Application Procedures at Soil Air Interface Zone

4. B – Reformatted into individual steps.

4. H. – Separated from 4. G.

4. L. – Separated from 4. K.

4. N. – Removed "as stated above"

5. Moisture Cured Wrap Coverage Table

NOTE below table – "inches" replaced inch

Appendix I-6 Tapecoat TC Color Coat

3. A. Table, Note - "inches" replaced inch

Appendix 1-7 Trenton #2 Wax Tape

3. A. - "inches" replaced inch

3. B –"lbs." replaced lb.

Appendix J Approved Paints

Added – Tnemec Series 1095 paint

UNCONTROLLED IF PRINTED

	The Series 1095 is an approved alternative for the Tnemec Series 73 paint which is in short supply		
<u>CORR 3</u>	<p>Forms and Reference Materials</p> <p>Added:</p> <p>Tnemec Endura Shield Series 1095 paint</p> <p>Tnemec Omnithane Series 1 Primer</p>	October 1, 2020	April 1, 2023
<u>DAMG 0</u>	<p>Table of Contents</p> <p>DAMG 1</p> <p>New section 11.0 Back-Flagging</p>	October 1, 2020	April 1, 2023
<u>DAMG 1</u>	<p>Requirements</p> <p>2.0 Scope</p> <p>Added Section 11.0 Back Flagging</p> <p>11.0 Back Flagging – New section</p> <p>Moved language from previous Paragraph 5.1.4 into new section.</p> <p>This emphasizes the importance of back flagging newly installed facilities.</p> <p>13.0 Records and Reports</p> <p>13.4 – Removed – Damage Prevention Incident Report was removed earlier from the O&M DAMG Forms and Reference Materials section so the information is no longer valid</p>	October 1, 2022	April 1, 2023
<u>EMER 2.2</u>	<p>Dispatch Center</p> <p>7.0 Cold Weather Electric Outage and Restoring Service</p> <p>7.3 Contact Lists for GTS and Gas Planning</p> <p>Table 2 Gas Planning – Updated contact information</p>	October 1, 2022	April 1, 2023
<u>EMER 2.4.4</u>	<p>Dispatched to Gas in Sewer – Hazardous Condition</p> <p>1.3 Sample the environment below the rim of the manhole cover with CGI.</p> <p>1.3.1 –Replaced (See Figure 1) with See LEAK 3 for ethane identifier instrument instructions.</p> <p>Removed Figure 1 – Heath EI-4 Ethane Identifier.</p> <p>The Heath EI-4 is no longer being used by Operations. The Sensit IRED is now being used. To avoid future O&M changes if a different ethane identifier is being used, the reference to LEAK 3 was added. This is where the instructions for approved leak investigation instruments are being maintained.</p> <p>1.3.2 – Grammatical – A hazardous condition exists if CGI reads 30% LEL (1.5% gas-in-air) or greater.</p>	October 1, 2021	April 1, 2023
<u>EMER 2.4.6</u>	<p>Gas Field Personnel Dispatched to Non-Gas Related Fire, Ignition, or Explosion</p> <p>1.4 Note – Revised – If a determination has not been made, advise your Gas Supervisor or Duty Supervisor and request guidance if follow-up action is necessary.</p>	October 1, 2022	April 1, 2023

UNCONTROLLED IF PRINTED

	<p>Previous language said to handle as a Gas Related Fire which caused confusion because procedures for Gas Related Fire are very detailed which would require more resources. Professional judgment of the gas field personnel and the Gas Supervisor should be able to determine what, if any, additional action should be performed.</p> <p>1.5.3 If the Fire Department has shut-off the gas.....</p> <p>2. Check to see what valves are present and which one is or can be shut off</p> <p>2 a. Incorporated 2 a. (i) – If a customer convenience valve (CCV) is present, it can be used to shut-off gas to the structure. The meter valve can either be turned back on or left off.</p> <p>2 a. (ii) – Removed checking to make sure gas is not passing through the closed CCV.</p> <p>Since checking the closed CCV is not required in any other EMER or LEAK section, the SMR team requested it be removed.</p>		
<u>EMER 3</u>	<p>Forms and Reference Materials</p> <p>Updated Electric Cold Load Restoration Policy</p>	October 1, 2022	April 1, 2023

	<p>OmegaWrap Installation Procedures</p>		
<p><u>SERV 1</u></p>	<p>Requirements</p> <p>7.0 Location</p> <p>7.3 Service Risers</p> <p>7.3.3 Added – A plastic sleeve should be installed around newly installed gas risers that are planned to be encased in a hard surface. The sleeve should extend above the hard surface.</p> <p>Provides protection against an adverse reaction between the concrete and the anodeless riser. Also provides a path to an open environment for leaking gas.</p> <p>13.0 Back-Flagging</p> <p>13.1 – Updated reference link to DAMG 1 Section 11.0.</p> <p>Appendix A-3 – Residential Meter Set Locations Restrictions</p> <p>Replace picture with the one in AIC Gas Service brochure.</p> <p>Appendix B-1 – 1/2" PE Service Line, Flex Riser- Installation</p> <p>1. Revise – PE4710 service line is utilized for all 1/2-inch PE service lines with a MAOP of 125 psig or less.</p> <p>Appendix B-1 – 1/2" PE Service Line, Flex Riser- Material Table</p> <p>Eliminated PE2406/PE2708 Table</p> <p>Expanded the PE4710 Table to include the larger service tees that were in the PE2406/PE2708 Table.</p> <p>Removed PE3408 within the tables.</p> <p>Appendix B-2 – 1/2" PE Service Line, Rigid Riser- Installation</p> <p>1. Revise – PE4710 service line is utilized for all 1/2-inch PE service lines with a MAOP of 125 psig or less.</p> <p>Appendix B-2 – 1/2" PE Service Line, Flex Riser- Material Table</p> <p>Eliminated PE2406/PE2708 Table</p> <p>Expanded the PE4710 Table to include the larger service tees that were in the PE2406/PE2708 Table.</p> <p>Removed PE3408 within the Material tables</p> <p>AIC no longer purchases 1/2"CTS PE2406/PE2708 pipe. PE4710 pipe is used for all 1/2"CTS service lines.</p> <p>Appendix B-3 -1" PE Service Line, Flex Riser - Installation</p> <p>1. Updated PE2708 pipe designation for service line</p> <p>2. Revised – PE4710 service line shall be utilized on 1- inch service lines with a MAOP of between 61 and 125 psig. PE4710 can also be installed in systems with MAOP less than 61 psig.</p> <p>Removed PE3408 within the Material tables</p> <p>3. Updated PE4710 pipe designation for service line</p> <p>Appendix B-4 -1" PE Service Line, Rigid Riser - Installation</p> <p>1. Updated PE2708 pipe designation for service line</p> <p>2. Revised – PE4710 service line shall be utilized on 1-inch service lines with a MAOP of between 61 and 125 psig. PE4710 can also be installed in systems with MAOP less than 61 psig.</p>	<p>October 1, 2022</p>	<p>April 1, 2023</p>

	<p>3. Updated PE4710 pipe designation for service line Removed PE3408 within the Material tables Appendix B-5 – 2" PE Service Line, Rigid Riser – Installation</p> <p>1. Updated PE2708 pipe designation for service line. 2. Updated - PE4710 service line shall be utilized on 2-inch service lines with an MAOP of between 61 and 125 psig. PE4710 can also be installed in systems with MAOP less than 61 psig. 3. Updated PE4710 pipe designation for service line.</p> <p>Added Note 10. The EFV shall be installed in accordance with SERV 2.2 Excess Flow Valves of Manual Shut-off Valves Removed PE3408 within the Material tables</p> <p>Updated PE pipe designations, PE2708 and PE4710, to match Performance Pipe's designations</p>		
<p><u>SERV 2.2</u></p>	<p>Excess Flow Valve or Manual Shut-off Valve 4.0 Requirements 4.3 Single small commercial service installed or replaced after April 14, 2017. 4.3.3 – Revised – For branch service, an EFV shall be installed on each service line to a small commercial customer. PHMSA clarified in a recently published FAQ that a EFV is required on each service line of a branch service line to a small commercial customer.</p> <p>4.9 Customer Request to Install an EFV 4.9.1 – Revised – Existing natural gas customers shall receive annual notification of their right to request an EFV to be installed on their existing service line. Annual notification is through the direct mailing or electronic billing insert of the Natural Gas Safety Flyer, see PUBL 3 for the Flyer. Existing language states the customers will be notified. This additional language describes how existing customers are notified that they can request an EFV to be installed on their existing service line.</p> <p>4.9.2 – Grammatical correction – "customer's" replace "customers" 4.9.5 – Updated Paragraph reference links – 4.8.3 and 4.8.4. Adjustment to reference links is due to insertion of Summary Table in 4.4.</p>	<p>December 15, 2021</p>	<p>April 1, 2023</p>
<p><u>STLP 1</u></p>	<p>Requirements 12.0 Pipe Thread Sealers 12.2 – Removed This subsection contained specifications for thread sealers. Gas Standards and Material is responsible for approving products based on their review and evaluation. These specifications do not provide any value to the O&M.</p>	<p>October 1, 2022</p>	<p>April 1, 2023</p>
<p><u>STLP 3.1</u></p>	<p>Weld Fittings Appendix D Reducing Tees and Concentric Tees Title – Added - Tees Removed Stock Code 19 33 234 – 1-1/4" x 3/4" Reducing Tee AIC no longer uses and the MDF no longer stocks</p>	<p>April 1, 2021</p>	<p>April 1, 2023</p>

UNCONTROLLED IF PRINTED

<p><u>TURN 2.1</u></p>	<p>Residential/Small Commercial Customer 12.0 Lighting Appliances 12.4 Residential Boilers 12.4.1 – Corrected Reference Link – TURN 2.4 Section 7.0</p>	<p>October 1, 2022</p>	<p>April 1, 2023</p>
<p><u>TURN 2.3</u></p>	<p>Discontinuance or Transfer of Gas Service 7.0 Hard Disconnect (Terminate Service) 7.6 NOTE – Revised – If piping or meter is removed, cap or plug all open ends of piping, meter, and valves. An O&M Change Request was submitted to add meter to the NOTE. This makes it clear when the meter is removed the meter bar spuds are to be capped or plugged. The inlet spud is a potential route for gas to escape to the atmosphere</p>	<p>April 1, 2021</p>	<p>April 1, 2023</p>
<p><u>UPRT 0</u></p>	<p>Table of Contents UPRT 1 Section 5.0 – Increasing MAOP Up to 125 psig Section 6.0 – Increasing MAOP Above 125 psig</p>	<p>October 1, 2020</p>	<p>April 1, 2023</p>
<p><u>UPRT 1</u></p>	<p>Requirements 2.0 Scope 5.0 Increasing MAOP Up to 125 psig 6.0 Increasing MAOP Above 125 psig 5.0 – Updated - Increasing MAOP Up to 125 psig 5.2 – New – Polyethylene (PE) Systems 5.2.1 - PE systems can be uprated to a new MAOP that does not exceed the MAOP shown in <u>POLY 2.1 Section 6.0 MAOP Limitations for PE Pipe</u> if: 5.2.2 - The review steps as outlined in Paragraph 5.1.1 through 5.1.6 have been successfully completed. AND 5.2.3 - The existing PE system has records that demonstrate the system had been tested at 1.5 times the proposed MAOP, at a minimum. OR 5.2.4 - If there are no test records that substantiate the proposed Design MAOP, the PE pipe system can be uprated after being retested if: 1. The system is taken out of service and-tested to 1.5 times the proposed MAOP, at a minimum, in accordance with PTST 1. 2. The system operating pressure shall be established at, or below, the new MAOP before the PE system is placed back in-service. PHMSA's regulations for Uprating handle PE systems different than Steel systems. The Code requires PE systems be tested at 1.5 times the MAOP before being placed in-service. 5.3 Uprating 5.3.2 The pressure shall be increased gradually at a rate that can be controlled 1. – Updated the reference to 5.3.2 Item 1. 6.0 Increasing MAOP Above 125 PSIG.</p>	<p>October 1, 2020</p>	<p>April 1, 2023</p>

	<p>6.1 – Updated – "to or above 125 PSIG"</p> <p>Changing the MAOP from 100 psig to 125 psig is due to under certain circumstances PE systems can now have an MAOP of 125 psig as described in POLY 2.1 Design Pressure.</p>		
<u>WELD 2.3</u>	<p>Construction of Pipelines</p> <p>9.0 Welding Requirements</p> <p>9.16 Inter-pass Cleaning and Removal of Visual Defects</p> <p>9.16.3 – Removed "starts and stops". Clusters of surface porosity and high points shall be removed by grinding prior to installation of the next pass.</p> <p>Welding trainer indicated that starts and stops on the inter-passes can be cleaned by wire brushing and grinding is not necessary. Start and stops on the root bead do need grinding and that is covered in Paragraph 9.12.1.</p>	October 1, 2020	April 1, 2023
<u>WIGE 0</u>	<p>Table of Contents</p> <p>WIGE 3 Forms and Reference Materials - New</p>	April 1, 2021	April 1, 2023
<u>WIGE 2.1</u>	<p>Hazardous Environment</p> <p>4.0 General</p> <p>4.1 – "CGI" replaced "gas detection instrument"</p> <p>Added:</p> <p>4.1.1 - An approved hands-free air monitor can be used in-lieu of a CGI for monitoring the work area environment. See WIGE 3 for manufacturer's instructions.</p> <p>4.1.3 – Follow the manufacturer's instructions for operating, calibrating, and maintaining.</p> <p>SMR Team feels the use of personal air monitors would be an additional safety precaution when working in a gaseous environment. Allows for the use of both hands in the work area.</p> <p>7.0 Working in a Hazardous Outdoor Atmosphere Due to Gas-In-Air</p> <p>7.1.1 – Updated reference EXCV 2.9</p> <p>8.0 Shut Down Options When Working in a Hazardous Outdoor Environment Due to Gas-In-Air</p> <p>8.1.1, Item 3 – Above grade. Added reference link STLP 2.3 Steel Pipe Squeeze-Off.</p> <p>8.1.2, Item 3 – Below grade. Added reference link STLP 2.3 Steel Pipe Squeeze-Off.</p> <p>Document Rescission</p> <p>Updated – WIGE 2.1 Working in Gaseous Environment</p>	April 1, 2021	April 1, 2023
<u>WIGE 3</u>	<p>Forms and Reference Materials</p> <p>Reference Materials</p> <p>RKI GX-3R Manual</p> <p>AIC approved the RKI GX-3R personal air monitor for use when working in hazardous environment as an additional safety item.</p>	N/A	April 1, 2023

<p><u>CORR</u> <u>2.1</u></p>	<p>Cathodic Protection Design</p> <p>8.0 Insulating Materials</p> <p>8.4 Insulating Unions</p>	<p>May 15, 2022</p>	<p>October 1, 2022</p>

	<p>Table 3 Insulating Unions – Updated column heading to Class 150 and Class 3000. Corrected Stock Code for 1-1/4" Class 150 union New Table 4 – Pressure – Temperature Ratings. <i>After consultation with the manufacturers, it was confirmed the previously listed 150 psig Insulating Union are Class 150 with a pressure rating of 300 psig at temperatures between -20°F to 150°F.</i> <i>Table 4 was added to show the pressure ratings at higher temperatures.</i></p>		
<p><u>CORR</u> <u>2.3</u></p>	<p>Coatings 2.0 Scope Added Section 12.0 Approved Epoxy Coating for Submerged Facilities Appendices: Added- Appendix M - Approved Epoxy Coatings for Submerged Facilities 4.0 Approved Coatings 4.1 – Grammatical – added "lists" 4.1.2 – Grammatical – "inches" replaced "inch" 11.0 Coating Inspection 11.1 – Grammatical – Removed "All" 11.2 Inspection Requirements 11.2.1 All pipe coating shall be visually inspected ... 2 b. – New – Inspect coating on pipe that does not require use of holiday detector, per Appendix K-1, by sliding hands along the pipe feeling for rough spots then visually inspect those locations. 12.0 Approved Applied Epoxy Coating for Submerged Facilities – New section. Information for the application of Denso SeaShield 525 and SeaShield 526 Epoxy coating on facilities that are either subjected to routinely or permanently submerged. <i>This addition is a result of a request from GTE to approve these two products for coating facilities that are subjected to routine or permanent submergence. Corrosion control approved these products for that specific purpose.</i> Appendix G – Moisture Cured Wrap Updated Stock Code for Polyethylene/Stretch Wrap – 49 22 492. Appendix I – Specific Coatings I-5 Moisture Cured Wrap 5. MCW Coverage Table.</p>	<p>October 1, 2021</p>	<p>October 1, 2022</p>

	<p>Updated table with all of the roll sizes currently stocked.</p> <p>Appendix L – Protal Applications</p> <p>5. Protal Coverage Tables</p> <p>Added coverage tables for:</p> <p>5. B. Weld Joints</p> <p>5. C. Bore Joints</p> <p>5. D. Product Coverage</p> <p>Protal Coverage Tables had been previously removed from the O&M but GTS requested they added back. Coverage tables come from Denso Protal Liquid Coatings Quantity Estimate Sheet.</p> <p>Appendix M – Epoxy Coating for Submerged Facilities.</p> <p>Stock Codes for Denso SeaShield 525 and SeaShield 526.</p>		
<p><u>CORR</u> <u>2.10</u></p>	<p>Rectifier Maintenance and Troubleshooting</p> <p>Appendix A – Rectifier Installation</p> <p>3.3 Material List – Dryconn VisiLock with Smart Gel replaced #90-B-1 Epoxy Splice Kit</p> <p>4.1.1 – Grammatical – Reworded – The Dryconn splice box does not have a shelf life or temperature restraints whereas the 3M A Scotchcast Resin Kit does.</p> <p>Corrosion control has made this substitution due to better sealing of the connection.</p>	<p>October 1, 2020</p>	<p>October 1, 2022</p>
<p><u>DAMG 1</u></p>	<p>Requirements</p> <p>2.0 Scope</p> <p>Removed Section 8.0 Protection of Excavated Facilities</p> <p>4.0 Types of Locate Requests</p> <p>4.1.3 – Added – A locate request is submitted to JULIE through one of the following means:</p> <p>1. Remote Ticket Entry – For professional excavators. AIC utilizes RTE.</p> <p>2. On-line with E-Request – for non-emergency locate requests- for homeowners and excavators.</p> <p>This was added to match information on Illinois1call website.</p> <p>5.2.4 Difficult to Locate Facilities</p> <p>2 e. – Coordinate with excavator for such action as:</p> <p>Moved - gas field personnel stand-by while excavation crossed the facility, as a Last Resort.</p> <p>QA and OQ sections felt stand-by should be the last resort since AIC has the ability to locate these facilities.</p>	<p>October 1, 2021</p>	<p>October 1, 2022</p>

	<p>Removed 8.0 Protection of Excavated Facilities Safety Wrap that is addressed in this section is no longer being manufactured and there is no replacement for that product.</p> <p>Reference Documents Removed - The Illinois Underground Utility Facilities Damage Prevention Act. This Act is included in the JULIE Excavator Handbook which is also a Reference Document.</p>		
DAMG 2	<p>Reporting JULIE Violations</p> <p>4.0 Reportable Violations</p> <p>4.1.5 – Item 2 – 18 inches replaced 1 ½ feet on either side of marked facilities. Tolerance Zone QA and OQ requested since the JULIE website refers to 18 inches rather than 1 ½ feet.</p> <p>Reference Documents Removed - The Illinois Underground Utility Facilities Damage Prevention Act. This Act is included in the JULIE Excavator Handbook which is also a Reference Document.</p>	October 1, 2020	October 1, 2022
EMER 0	<p>Table of Contents</p> <p>New EMER 2.11 Gas Storage</p>	April 1, 2021	October 1, 2022
EMER 1	<p>Requirements</p> <p>5.0 Procedures</p> <p>Added 5.1.12 Gas Storage Emergency Plan Compliance Requirements:</p> <p>Added 49 CFR §192,12 Underground Natural Gas Storage Facilities.</p> <p>Reference Documents</p> <p>Added EMER 2.11 Emergency Plan: Gas Storage</p>	April 1, 2021	July 22, 2022
EMER 2.2	<p>Dispatch Center</p> <p>3.0 Target Audience</p> <p>Updated a couple of job titles:</p> <p>Gas Distribution System Operating Supervisor (GDSOS)</p> <p>Gas Dispatch Superintendent</p> <p>5.0 Dispatching Gas Field Personnel to Emergency Call</p> <p>Throughout Section 5.0 – GDSOS replaced Dispatcher</p> <p>NOTE: Customer Care Center replaced Customer Service Representative.</p> <p>Gas Dispatch replaced Dispatch Center.</p> <p>GDSOS replaced Dispatcher.</p>	May 15, 2022	October 1, 2022

	<p>5.6 NOTE – Added Electric – Electric Distribution Control has compiled and maintains the 911 numbers</p> <p>6.0 Action Required of Supervisory Personnel Throughout Section 6.0 – GDSOS replaced Dispatcher</p> <p>7.0 Cold Weather Electrical Outage and Restoring Service</p> <p>7.1.1 – Grammatical – "instantaneous gas load can exceed the capacity of the affected gas systems" replaced "hundreds of gas furnaces simultaneously call for heat"</p> <p>7.1.2 – Grammatical – "operating pressures well below their designated setpoints" replaced "low pressure".</p> <p>7.1.3 – Revised – Conditions identified that will enact the Electric Cold Load Restoration Policy, refer to EMER 3 for the policy:</p> <ol style="list-style-type: none"> 1. Ambient temperature 20 °F or less at the location of outage. AND 2. Duration of the electric outage in excess of 4 hours. 3. High Risk Gas Systems have been identified for pressure monitoring and/or electric circuit segmentation during restoration efforts. These high-risk Gas Systems are located in the ElectricColdLoadPickup.xlsx file. <p>Removed the Table showing the High and Moderate Risk Gas System Risk Level designations.</p> <p>Manager Gas Tech Services and Gas Control updated the Electric Cold Load Restoration Policy. The 20°F replaced 32°F and the 4-hour duration replaced 2-hour duration. The Gas Risk level is now identified in the Electric Cold Load Pickup spreadsheet.</p> <p>The update Electric Cold Load Restoration Policy is already being used by Electric Distribution Control.</p> <p>7.2 – Grammatical – Distribution System Operations Supervisor (DSOS) replaced Electric Distribution System Operations Supervisor (EDSOS). "electric outage exists over an identified Gas System and will exceed both of the thresholds" replaced "electric outage and will exceed the thresholds".</p> <p>GTS replaces Gas Tech Services.</p> <p>7.3 Contact Lists for Gas Tech Services (GTS) replaced Gas Tech Support.</p>		
<p>EMER 2.4</p>	<p>Gas Field Personnel – General</p>	<p>October 1, 2021</p>	<p>October 1, 2022</p>

	<p>4.2.1 – Grammatical – Check the meter, riser, and customer fuel line with volt stick.</p> <p>1. Updated link – Volt stick alarms; See METR 2.2 Subsection 7.3 AC Voltage Action Table.</p> <p>2. Moved from 4.2.2 - Volt stick alarms on riser, do not shut-off meter valve.</p>		
<u>EMER 2.4.3</u>	<p>Gas Field Personnel – Dispatched to Major Leak or Line Break</p> <p>1.5.1 If the leak or line break is freely blowing:</p> <p>1. Revised – Maintain a safe zone from the blowing gas in accordance with WIGE 2.1 Section 6.0 Safety Zone.</p> <p>Revised to be consistent with WIGE 2.1 Section 6.0. Removed the minimum 20 feet because it appeared to conflict with WIGE 2.1.</p>	October 1, 2021	October 1, 2022
<u>EMER 2.4.5</u>	<p>Dispatched to Gas Related Fire, Ignition, or Explosion</p> <p>1.10 If Fire Department is already on site:</p> <p>1.10.1 – Revised – Has Fire Department shut off gas to the burning structure?</p> <p>1. Revised – If shut off done, ask for permission to inspect the meter set.</p> <p>Firemen are not authorized to shut off our meter valves so reference to our meter valve is being removed.</p> <p>1.10.2 – Revised – Fire Department has shut off the gas and granted permission to inspect the meter set.</p> <p>2. Confirm if the meter valve or a customer convenience valve (CCV) had been shut off.</p> <p>2 a. – If CCV has been shut off, the meter valve can be left open.</p> <p>2.b. – If meter valve has been shut off, red pin the meter valve.</p> <p>Remove 2 c. If the valve is NOT shut off, shut off the valve and red pin the meter valve.</p> <p>If the Fire Department has shut off the CCV, the meter valve can be left open unless the Fire Department wants our meter valve shut off.</p>	October 1, 2020	October 1, 2022
<u>EMER 2.4.6</u>	<p>Dispatched to Non-Gas Related Fire, Ignition, or Explosion</p> <p>1.4 Make Contact with Fire Chief or fireman in charge.</p> <p>1.4.1 Revised – Has Fire Department shut off the gas to the structure or do they want the gas shut off?</p> <p>1.4.2 Revised – If Fire Department has shut off the gas, ask permission to inspect the meter set.</p>	October 1, 2020	October 1, 2022

	<p>2. Revised – If permission is granted, need to verify gas has been correctly shut off.</p> <p>3 b. Added – Determine what follow-up action is needed</p> <p>This was added if the gas meter cannot be safely approached.</p> <p>4. New – Confirm if the meter valve or a customer convenience valve (CCV) has been shut off.</p> <p>4 a. New – If CCV has been shut off, the meter valve can be left open.</p> <p>4 b. Revised – If the meter valve has been shut off, red pin the valve.</p> <p>1.4.3 Revised – If the supply needs shut off and the gas meter set can be safely approached:</p> <p>2. Revised – Shut off the CCV, if one is available, and leave meter valve on, OR</p> <p>3, New - Shut off and red pin the meter valve.</p> <p>1.4.4 – New – If the gas supply does not need to be shut off, the meter valve and CCV, if present, can be left on. See Subsection 1.6.</p> <p>1, New – Enter comment on OAS 63 screen that gas service did not need to be shut off.</p> <p>1.7 New – Service cannot be restored to the customer until:</p> <p>1.7.1 New – Fire Department has completed their investigation or has released the scene. AND</p> <p>1.7.2 New – Gas field personnel have inspected the facilities for damage. AND</p> <p>1.7.3 – No damage was found. OR</p> <p>1.7.3 New – Damaged facilities isolated, replaced, or repaired.</p>		
<p><u>EMER</u> <u>2.5</u></p>	<p>Natural Disasters or Civil Disobedience</p> <p>5.0 Natural Disasters: Floods</p> <p>5.1 Prior to Flooding:</p> <p>5.1.3 Leave the system pressurized</p> <p>1. New – Service can be left on as long as the regulator and relief vent are extended above the expected high-water line.</p> <p>2. New – Gas meter will function when submerged, but the AMI device will require replacement following submergence</p> <p>5.1.4 – Revised – Shutting off and locking individual services where regulator and relief vents could be submerged, with priority given to inside services.</p>	<p>October 1, 2021</p>	<p>October 1, 2022</p>

5.2 During the Flood – Changed from Flooded Area

5.2.6 – Revised – Determine whether facilities (such as meter sets, regulator stations, valve stations, farm taps, and relief vent lines) that have become submerged could be struck by watercraft or floating debris.

5.3 Following the flood, the Gas Supervisor or GTS Supervisor, where applicable, shall ensure the following actions are taken. – Changed from Following the Flood

5.3.3 New – Replace AMI devices on all gas meters that were submerged during the flood.

1. AMI can be replaced on the existing meter, OR
2. Exchange the meter and ship to the Gas Meter Shop. The meter shall be tagged "Submerged".

5.3.4 Move from 5.1.5 – Issue a Warning Tag if:

1. Water had covered the control valves on interior appliances, OR
2. If service has been shut off. Refer to TURN 2.7 Warning Tag.

Grammatical change in sections 5.3.3 through 5.3.11:

Created action verbs by removing "ing".

Provides more information addressing gas facilities that have or could be submerged due to flooding especially the AMI devices which must be replace if submerged

	<p>Gas Control Technicians (GCT) Removed: Gas Supervisors Gas Field Personnel 6.0 Turbine Meters 6.5 Minimum Spin Times 6.5.1 – Added Table 3 Table 3: Sensus Auto-Adjust Turbine Meters – Spin Times. Table shows the minimum spin time at various ambient air temperature ranges from Above 59°F down to 19°F .for Main Rotor and Sense Rotor. Minimum spin times were needed for the Sensus Auto-Adjust turbines that AIC has in their gas system. 7.0 Ultrasonic Meter Testing 7.3 Transmitter Inspection 7.3.4 – Grammatical – Confirm that the transmitter output scaling matches the on-site flow computer output.</p>		
<p><u>METR 2.5</u></p>	<p>Gas Meter Bypass 2.0 Scope Added Section 8.0 – Refilling Portable CNG Bottles 8.0 Refilling Portable CNG Bottles Operating instructions for refilling portable CNG bottles from the CNG Trailer. Modifications to the CNG trailers have been made to enable the safely refilling of portable CNG bottles used by AIC gas personnel for bypass operations.</p>	<p>April 1, 2021</p>	<p>October 1, 2022</p>
<p><u>METR 2.7</u></p>	<p>Gas Metering Corrections 2.0 Scope Inserted a new Section 5.0 Electronic Corrector New Installation, Field Exchange or Transfer Process Section 9.0 – AMI Reading Verification – Removed AMR. 4.0 General 4.4 – Removed, the information is being added in other sections. 5.0 Electronic Corrector New Installation, Field Exchange or Transfer Process – New Outlines the required tasks the Gas Meter Shop personnel, Region's gas field personnel and GTS Technicians are responsible for performing</p>	<p>October 1, 2020</p>	<p>October 1, 2022</p>

when an electronic corrector is installed or transferred.

Gas Metering and GTS personnel prepared these instructions to ensure that the electronic correctors are installed and programmed correctly,

6.0 Electronic Corrector Inspection – Verification Schedule

6.2 – New - During the verification process, the activities and particulars outlined in Appendix A Electronic Corrector Documentation shall be documented on Appendix C Electronic Corrector Verification Form

6.3 New - Customer Service System (CSS) will automatically initiate the generation of an OAS order (MJ44) immediately after the corrector is installed on an account in CSS, or after being transferred to a gas meter at the premise based upon "set date".

These procedures ensure that electronic corrector verifications are being properly scheduled, performed and documented. Illinois Administrative Code 501 requires the verification to be performed within 60 days after the corrector was installed.

Instructions

9.0 AMI Reading Verification – Removed AMR

9.1 – Removed references to AMR.

AMI's has replaced AMR's

Appendix A Electronic Corrector Documentation

A-1 – Added - "exchange" along with installation and transfer that require documentation

A-3.1.8 – Added - Ch. A Output (#93 CorVol Pulses)

A-3.1.12 – Expanded - Fixed Temp Factor (#111 – specific to TC on meter "Live" if meter is non-TC with no temperature probe. If Temp is fixed, Item #1055 must be "No" and #1162 must be "60" on an EC350.)

A-3.1.15 – New - Ch. A Pulse On/Off (#1014 should be Closed – 50 ms and Open – 250+ ms)

A-3.1.16 – New - Ch. A Pulse output (#1193 – 1000 CF)

A-7 – Removed AMR

A-7.1 - Removed AMR

A-7-2 - Removed AMR

Appendix B – Electronic Corrector Maintenance

B-7 - Removed AMR

B-7.1 – Removed AMR

UNCONTROLLED IF PRINTED

	<p>B-7.2 – Removed AMR</p> <p>Appendix C – Electronic Corrector Verification Form</p> <p>AMI replaced AMR</p> <p>Under Device Programming – Added</p> <p>93 Ch. A Output</p> <p>1014 Ch. <u>OQAL 2.1</u>	<p>Covered Task</p> <p>Added:</p> <p>1671 – Inspect and Maintain a Pipeline Heater</p>	April 1, 2021	October 1, 2022

UNCONTROLLED IF PRINTED

<p><u>QCAL</u> <u>2.2</u></p>	<p>Covered Task with AOC's Added 1671 – Inspect and Maintain a Pipeline Heater</p>	<p>October 1, 2021</p>	<p>October 1, 2022</p>
<p><u>PMRK 2</u></p>	<p>Pipeline Facility Markers Appendix B-4 Navigable Water Crossing Sign 1. Sign is to be installed so that it is readable from the waterway and will be installed on both sides of the channel if required by the governing agency. Clarifies the agency with jurisdiction over the waterway may require the sign to be installed on both sides of the channel.</p>	<p>May 15, 2022</p>	<p>October 1, 2022</p>
<p><u>POLY</u> <u>2.2</u></p>	<p>Squeeze Off 4.0 General 4.1 – Revised – Gas flow in PE pipe can be controlled by squeezing the pipe with a squeeze-off tool marked ASTM F1563 or is certified as complying with ASTM F1563. NOTE: ASTM F1563 is Standard Specification for Tools to Squeeze-off PE Gas Pipe. 4.3 – New - All squeeze-off tools are required to be grounded when squeezing PE pipe. 4.4 – New – Squeeze-off tool manufacturer's information is in POLY 4 Reference Materials. 5.0 Operations 5.1 Before Starting Squeeze Off 5.1.1 – Added "the proper" – Do Not use squeeze tools without the proper pipe gap stops. 5.1.3 – Revised – Prevent the build-up of static electricity charge in PE pipe by: 1. Grounding the squeeze tool, AND 2. Spraying the 1-1/4 inches and larger pipe with Ionix Static Suppressor or wrapping the pipe with wet or soapy non-synthetic rags near point of cutting or repairs. All squeeze-off tools must be grounded per the ASTM Standards regardless of the pipe size being squeezed. The 1-1/4 inches and larger pipe will require additional static suppression due to the size of pipe and volume of gas affected by the squeeze. 5.2 Squeeze Off Tool Location and Operation 5.2.2 Locate squeeze tool minimum of 3 pipe diameters from: See Table 1 Table 1 - Revised the minimum distance.</p>	<p>May 1, 2022</p>	<p>October 1, 2021</p>

For pipe size less than 2 inches, the minimum distance was changed to 5 inches to make it easier for the field people to remember. Minimum distance for pipe 2 inches and larger was rounded to the next whole number.

5.2.4 – Revise – Operate the screw operated or hydraulic operated tool in a slow continuous manner, with a compression rate of approximately 2 inches per minute based on the pipe's outside diameter, to allow stress relaxation of the pipe. See Table 2 – Approximate Squeeze-off and Release Times.

NOTE: If air temperature is below freezing, squeeze rate should be slowed to approximately 1 inch per minute of pipe's outside diameter.

Table 2 – New - Approximate Squeeze-off and Release Times.

Table has the squeeze rate and release rate for PE pipe 1/2 inch through 12 inches.

Language was revised to be consistent with manufacturer's instruction. The squeeze rate in the earlier versions of the O&M was incorrectly worded which resulted in a slower squeeze rate,

Table was added to provide the field with the information so they would not have to make a calculation.

1. Do Not over-squeeze the pipe.

1 a. - New – The correct stops limit the minimum gap to 70% times twice the wall thickness of the PE pipe for screw and hydraulic operated squeeze-off tools.

1 b.- New – The 1" CTS PE 2708 pipe requires a pipe gap for 0.099 inches wall thickness.

1 c. - New - The 1" CTS PE 4710 pipe requires a pipe gap for 0.101 inches wall thickness.

5.2.5 - Revised - Operate the hand squeeze tool for PE pipe 2 inches or smaller in accordance with manufacturer's instructions.

1. – New - The correct stops limit the minimum gap to 85% times twice the wall thickness of the PE pipe for a hand squeeze-off tool such as a Timberline TC1-S.

5.3 Squeeze-Off Tool Removal

5.3.1 – Revised – When placing pipe back in service, slowly release the screw operated or hydraulic operated squeezer at approximately 0.5 inches per minute of pipe's outside diameter to allow the pipe to relax.

	<p>1. – New – If air temperature is below freezing, release rate should be slowed to approximately 0.25 inches per minute.</p> <p>5.3.2 – New – Hand squeeze tool shall be released in accordance with the manufacturer's instructions.</p> <p>The changes in PE pipe squeeze-off procedure were made to be consistent with Performance Pipe's PP801 – TN bulletin, Plastic Pipe Institute (PPI) TN 54 bulletin, ASTM F1563, and squeeze tool manufacturer's instructions.</p> <p>5.3.3 – After removing the squeeze tool:</p> <p>2. – New – Check for possible leaks, due to static electricity penetrating the pipe wall, with leak detection fluid.</p> <p>3. – Added "leaks" – If there are any leaks, cracks, cuts, or other indication of damage in the squeeze area, cut out and replace the damage section. Refer to REPR 1 Section 9.0 Polyethylene (PE) Pipe Repair.</p> <p>Squeeze tool manufacturer recommends checking for leaks in the squeeze area to ensure static electricity has not penetrated the pipe wall.</p> <p>6.0 Above Grade Squeeze</p> <p>6.1 – Added "and wall thickness" and "with gap stops"– The above squeeze tool shall have gap stops specific for the size of pipe and wall thickness.</p> <p>6.3 – Added "applying Ionix Static Suppressor to" – Applying the Ionix spray is not required when above grade squeeze tool is used.</p> <p>Reference Documents:</p> <p>Placed copies of the following in POLY 4:</p> <p>Plastic Pipe Institute "PE Pipe Squeeze-Off Compression and Release Times" Table.</p> <p>Performance Pipe PP801-TN Squeeze -Off.</p> <p>Linked Gas Standards SharePoint site – Specifications and Standards for:</p> <p>ASTM F1563 – Standard Specifications for Squeeze-Off Tools.</p>		
<p><u>POLY 2.5</u></p>	<p>Electrofusion</p> <p>15.0 Tapping</p> <p>15.3 Remove cap from the tee</p> <p>15.3.6 – Check the assembly for leakage. "Check" replaced "Test".</p>	<p>May 15, 2022</p>	<p>October 1, 2022</p>
<p><u>POLY 2.6</u></p>	<p>Mechanical Joining</p> <p>5.0 Stab Fittings</p>	<p>October 1, 2021</p>	<p>October 1, 2022</p>

UNCONTROLLED IF PRINTED

	<p>5.1 Stab fittings shall only be used on 1/2" through 1" PE pipe sizes.</p> <p>5.1.3 – Grammatical – An electrofusion coupling is required to 1" CTS PE 4710 pipe to the service riser pigtail on 1/2" through 1" PE service lines.</p>		
POLY 4	<p>Forms and Reference Materials</p> <p>Added:</p> <p>Manufacturers' Operating Instructions for AIC's Approved Squeeze-Off Tools.</p> <p>Performance Pipe PP 801-TN PE Pipe Squeeze-Off</p> <p>Plastic Pipe Institute PPI TN 54 – 2017 – Squeeze-Off PE Pipe</p> <p>Updated:</p> <p>Performance Pipe PP 750 Heat Fusion Procedures (June 2021)</p> <p>Removed all of the manufacturers' website links since so many of them were no longer valid links.</p>	May 15, 2022	October 1, 2022
PTST 1	<p>Requirements</p> <p>4.0 General</p> <p>4.6 – Grammatical – "main" replaced "pipeline segment"</p> <p>5.0 Safety</p> <p>5.1 – Avoid positioning anyone in the "line-of-fire"</p> <p>5.1.2 – Added – McElroy test cap has a maximum pressure rating of 165 psig. Refer to POLY 4 McElroy TP 300 Series Test Cap.</p> <p>7.0 Test Medium</p> <p>7.1 – Revised – Natural gas should only be used for Uprates and Tie-Ins.</p> <p>Concern here is the safety to the public and workers if natural gas is used to establish MAOP and there is leak or failure in the buried line. Upgrades require a leak survey at each pressure increase step that isn't required when establishing MAOP. Tie-Ins are check for leaks at the time for the tie-in.</p> <p>11.0 Plastic Pipe Testing</p> <p>11.1 Before testing</p> <p>11.1.1 – Correction – Do not test PE pipe if the temperature of the pipe is greater than 140°F.</p> <p>Performance Pipe limits the HDB at 140°F for both the PE2408 and PE4710. This a correction from 100°F. Part 192.513(d) has the 100°F or the temperature at which the material's long</p>	December 15, 2021	October 1, 2022

	<p>term hydrostatic strength has been determined, whichever is higher.</p> <p>11.2 – New – If McElroy Test Cap is being utilized, follow the manufacturer's operating instructions. Refer to POLY 4 McElroy TP 300 Series Test Cap.</p> <p>1. McElroy Test Cap is limited to a maximum test pressure of 165 psig.</p> <p>2. McElroy Test Cap shall not be used when testing HDPE for a MAOP of 125 psig.</p> <p>QA field audits were finding the use of these test caps was not following the manufacturer's instructions which are included in the POLY 4 Reference Material section. The recommendation was to include more specific information on these test caps with reference to manufacturer's instructions. In particular, following the pressure test, the end of the PE pipe where the test cap was attached was not being remove 1 inch beyond the where the safety lanyard had been located..</p>		
<u>PTST 1.1</u>	<p>Test Pressure and Duration Tables</p> <p>Appendix A-1 – Maximum test pressure for MDPE and HDPE with Design MAOP of 60 psig changed to 180 psig from 260 psig and removed reference to Note (3).</p> <p>Made this consistent with Appendix A-2.</p>	October 1, 2021	October 1, 2022
<u>PTST 3</u>	<p>Forms and Reference Materials</p> <p>Update – Hydrotest Strength Test Form</p>	December 15, 2021	October 1, 2022
<u>PUBL 0</u>	<p>Table of Contents</p> <p>PUBL 2.2 – Removed Section 8.0 Natural Gas Emergency Procedure.</p> <p>This section applies to Emergency Response Agencies who do not have access to the O&M. Instructions to these agencies is covered in face-to-face session with AIC's Public Education personnel.</p>	October 1, 2020	October 1, 2022
<u>PURG 1</u>	<p>Liaisons with Fire, Police, and Public Officials</p> <p>Remove Section 8.0 Natural Gas Emergency Procedure.</p>	May 15, 2022	October 1, 2022
<u>PURG 1</u>	<p>Requirements</p> <p>4.0 General</p> <p>4.1 Gas Engineering, GTE, or GSE will provide detailed purge plans prior to blowdown operations for:</p> <p>4.1.5 – Added – Joint abandonment of distribution mains and services.</p>	December 15, 2021	October 1, 2022

	<p>Added to be consistent with Appendix A – Purge Plan and Documentation Requirements.</p> <p>4.8 – Grammatical – "in gaseous environment" replaced "with blowing gas".</p> <p>6.0 Transmission Lines and High-Pressure Distribution Mains.</p> <p>6.2 – Grammatical – Added "drawdown" as a clarifier to "transferring".</p>		
<p><u>PURG 2</u></p>	<p>Methods</p> <p>4.0 Safety</p> <p>4.1 – Added – In general, this requires a vent pipe long enough to carry the gases above the heads of the workers on equipment located outdoors.</p> <p>Additional guidance on length of vent pipe. Field conditions and surrounding area will dictate a suitable length to avoid creating a hazardous situation or environment.</p> <p>6.0 Purging of Gas with Air During Abandonment</p> <p>6.2 – Correction – Do not exceed the MAOP or Operating Pressure at time for Stop.</p> <p>To avoid the potential for injecting air into a live gas system, the injection pressure should not exceed the pressure being restrained by the stopping equipment.</p> <p>7.0 Using an Inert Gas Slug when Purging</p> <p>7.3 – Removed this section that addressed how to calculate the volume in various size of cylinder to get a 1 psig pressure drop.</p> <p>This is a confusing section and difficult to understand or utilize. Operations typically does not utilize this method. Engineering is looking at alternative methods for determining the required volume for an inert plug.</p> <p>12.0 Venting of Gas</p> <p>12.1 - In general, this requires a vent pipe long enough to carry the gases above the heads of the workers on equipment located outdoors.</p> <p>Additional guidance on length of vent pipe. Field conditions and surrounding area will dictate a suitable length to avoid creating a hazardous situation or environment.</p> <p>12.2 – New – Refer to ACIG 2 Work Area Protection for placement of VEU or Compression System, such as ZEVAC, away from ignition sources.</p> <p>ZEVAC manufacturer recommends keeping the ZEVAC unit at least 15 feet away from an ignition source such as the gasoline/diesel engine</p>	<p>December 15, 2021</p>	<p>October 1, 2022</p>

	that provide the power the VEU and ZEVAC unit. This information was added to ACIG 2.

<p><u>SAFT 1</u></p>	<p>Requirements</p> <p>2.0 Scope</p> <p>Appendices – Updated with new GTPC Guidelines for:</p> <p>Determination of Reporting Requirements for Safety-Related Conditions for Pipeline Facilities Other than Underground Natural Gas Storage Facilities;</p> <p>Determination of Reporting Requirements for Safety-Related Conditions for Underground Natural Gas Storage Facilities</p> <p>GTPC published updated Guidelines for reporting Safety-Related Conditions. Guidelines for Underground Natural Gas Storage Facilities are new.</p> <p>4.0 Regulatory Requirements</p> <p>4,1 Definition</p> <p>4.1.3 – Update Attachment 1 title - Pipeline Facilities Other than Underground Natural Gas Storage Facilities.</p> <p>4.1.4 – New - Refer to Attachment 2 Determination of Reporting Requirements for Safety-Related Conditions for Underground Natural Gas Storage Facilities for determining the requirements to report SRCs to PHM-SA, and IDNR.</p> <p>4.2 Pipeline facilities: Situations that may result in an SRC are as follows:</p> <p>4.2.6 – Grammatical – Removed reference to Class 1 leak and LEAK 1 Section 5.0.</p> <p>A pipeline leak that constitutes an emergency.</p> <p>Based on discussion with Compliance it was decide for consistency to utilize the Part 191.23 language.</p> <p>Attachments</p> <p>Updated with the new GTPC Guidelines</p>	<p>October 1, 2021</p>	<p>October 1, 2022</p>
<p><u>SERV 1</u></p>	<p>Requirements</p> <p>4.0 Depth of Service Line</p> <p>4.4. Underground structure conflicts with service line location:</p> <p>4.4.1. Item 3 c. – Removed – Safety Wrap is no longer being manufactured and there is no alternative product.</p> <p>7.0 Location</p> <p>7.1 Services</p> <p>7.1.2 – New – New, relocated, or replaced service lines shall not be installed under buildings unless:</p>	<p>May 1, 2022</p>	<p>October 1, 2022</p>

1. Installation is approved by Gas Engineering, AND
2. Service line is installed in a gastight casing to prevent gas leakage into the building, AND
3. Service line and casing must extend into a normally usable and accessible part of the building, AND
4. The casing vented to a nonhazardous atmosphere outside the building with a rain or insect resistant fitting.

This was the language in the Gas O&M for several years prior to the Rewrite project. It was inadvertently left out of the O&M since October 1, 2020. This procedural language is consistent with the Federal Code on service line installation.

7.2 Branch Service – New section

7.2.1 – Any branch service, installed on or after October 1, 2022, shall only serve 2 service risers from a single service line tap.

7.2.2 Each of the service lines shall meet the same requirements as a single service line.

7.2.3 SERV 2.2 Paragraph 4.1.2 addresses EFV requirements for branch services

Clarifies that a single service line can be split (branched) to serve a second riser on adjoining or adjacent premise. No more than two risers are to be served from a single service line tap.

7.3 Service Risers

7.3.2 – Revised – Alternate location would be a mutually agreed location that is readily accessible and meets the clearance requirements in Table 1 Meter Riser Clearance Requirements.

Language was revised to allow for more flexibility in the location of the service riser and meter set. It is important that the gas meter must be in a readily accessible location.

11.0 Pressure Testing - Added reference to 192.513

11.1 – Revised – All of the following shall be pressure tested in accordance with PTST 1 Section 10.0 Testing.

Removed reference to test medium since that is covered in PTST 1 Section 7.0.

Appendix A – Service Line Location

A-3 Residential Meter Set Locations Restrictions

Added Note – A 15 feet horizontal radius from the relief vent is required for gas risers greater than 2" IPS (2.375 inches in diameter).

UNCONTROLLED IF PRINTED

	<p>The National Electric Code and the AGA both recommend an increase in the clearance distance to potential ignitions sources for risers greater than 2"IPS due the potential of a release of a larger volume of gas. There is an effort to standardized AIC's Electric and Gas Service Standards so that they both meeting applicable Code requirements and recommendations.</p> <p>Appendix B-1 through B-5: PE3408/PE4710 service lines: Added – but can be installed in systems with MAOP less than 61 psig.</p> <p>Clarifies that PE3408/PE4710 service line pipe can be installed in lieu of PE2406/PE2708 in systems with MAOP of 60 psig or less. This is already occurring in some areas due to preference or supply shortage of the MDPE pipe.</p> <p>Appendix B-3 – 1" PE Service Line, Flex Riser Inserted new Item 7 – The EFV can be butt fused to the service tee outlet and PE 2708 or PE 4710 service line.</p> <p>Appendix B-4 - 1" PE Service Line, Rigid Riser Inserted new Item 7 – The EFV can be butt fused to the service tee outlet and PE 2708 or PE 4710 service line.</p> <p>Allows Operations or contractors that have 1 inch butt fusion equipment to butt fusion in lieu of electrofusion the EFV connection.</p>		
<p><u>SERV 2.3</u></p>	<p>Farm Tap</p> <p>4.0 Farm Tap Requirements</p> <p>4.1 – MAOP replaces operating pressure</p> <p>Former 4.5 – Removed, same information as 4.1</p> <p>6.0 Farm Tap Installation</p> <p>6.1 Farm Tap Type</p> <p>"MAOP" replaces "operating pressure"</p> <p>Appendix A-1 – MAOP replaced Pressure</p> <p>Appendix A-2 – MAOP replaced Pressure</p> <p>Bill of Material – Item 19 Riser – Corrected riser description to match Appendix A-1.</p>	<p>February 22, 2022</p>	<p>October 1, 2022</p>
<p><u>SERV 2.7</u></p>	<p>Gas Service Card Form and Gas Sketch Card</p> <p>5.0 Service Sketches</p> <p>5.1 Service Sketch shall be completed</p> <p>5.1.6 – Grammatical - Partially retired when 18 inches or longer of existing pipe remains connected to source of gas.</p> <p>5.2 – Revised – The following information shall be provided in ClickMobile:</p>	<p>May 15, 2022</p>	<p>October 1, 2022</p>

CHANGE SUMMARY

December 15, 2021

Document	Change Summary	Previous Document Date	Current Document Date
	<p>Changes due to Regulatory Updates or Operational Requests</p>		
<p>INCD 1</p>	<p>Requirements</p> <p>10.2.4 Retracting reports</p> <p>1. – Updated – PHMSA no longer request operators to retract erroneously reported 1 Hour or 48 Hour NRC Notification Reports.</p> <p>2. – New – If an incident is subsequently determined to be caused by non-jurisdictional piping, an email is sent to PHMSA and ICC, prior to the 30 day report requirement, advising that AIC will not be submitting a 30 day report.</p> <p>3. – Updated the process for requesting that the 30 day report be retracted when further investigation reveals a reported incident was not an incident.</p> <p>4. – Is the former Item 3 which addresses notification to ICC and AIC internal recipients of the 30 day report.</p> <p>PHMSA General Instructions for Incident Report</p>	<p>October 1, 2021</p>	<p>December 15, 2021</p>
<p>LEAK 1</p>	<p>Requirements</p> <p>5.0 Leak Detection and Classification</p> <p>5.9 – New- Leaks identified during routine work activities shall follow the same classification procedures outlined in this procedure.</p> <p>PIPE's Act 2020</p>	<p>October 1, 2021</p>	<p>December 15, 2021</p>
<p>MAIN 1</p>	<p>Requirements</p> <p>2.0 Scope</p> <p>Inserted new Section 18.0 Design Considerations</p> <p>18.0 Design Considerations</p> <p>18.1 When designing a new pipeline or replacement project, care should be taken to consider safety of the public and co-workers as a top priority. Considerations include:</p> <p>18.2 Additional considerations should be taken for the protection of the environment. Considerations include:</p>	<p>October 1, 2021</p>	<p>December 15, 2021</p>

UNCONTROLLED IF PRINTED

	<p>18.3 Prone-to-leak facilities should be considered for replacement opportunistically and on a program level based on risk results. These include:</p> <p>PIPE's Act 2020</p>		
METR 1	<p>Requirements</p> <p>6.0 Meter Location</p> <p>6.3 Unacceptable Meter Locations</p> <p>6.3.10 – Where the service regulator vent is:</p> <p>4. Added – BelGas P100SX and PF FE 25 as approved slam-shut regulators.</p> <p>October 1, 2021 Update did not list the approved regulators.</p> <p>8.0 Regulator Vent Lines</p> <p>8.2 All relief vent lines shall be the same diameter, or larger, than the regulator vent opening.</p> <p>8.2.1 – increase the relief vent diameter one pipe size for every 10 feet to minimize flow restriction.</p> <p>1. New – The 10 feet may include up to 4 threaded fittings, (elbows, tees, etc.).</p> <p>2. New – If more than 4 threaded fittings are needed in the relief vent line, contact engineering for support.</p> <p>Clarification of a FAQ, the equivalent pipe footage of an elbow is not to be included in the 10 feet. (Equivalent pipe footage of 1" elbow is 2.6 feet.)</p>		
PURG 1	<p>Requirements</p> <p>4.0 General</p> <p>4.2 New – When planning projects, consider options to eliminate hazards and minimize the release of natural gas. See MAIN 1 Section 18.0 Design Considerations.</p> <p>PIPE's Act 2020</p>	October 1, 2021	December 15, 2021
PURG 2	<p>Methods</p> <p>2.0 Scope</p> <p>New Section 15.0 Use of Compression System</p> <p>15.0 Use of Compression System</p> <p>15.1 As determined by engineering, a compression system, such as a ZEVAC system, may be used to reduce the amount of natural gas released to the atmosphere.</p> <p>15.2 Only rated compressors may be used.</p> <p>15.3 Prior to compressing gas, engineering shall develop procedures outlining:</p> <p>Volume of gas, expected time for drawdown, expected final pressure, pressure monitoring plan and connection points.</p>	October 1, 2021	December 15, 2021

UNCONTROLLED IF PRINTED

leak and strength test on lines with Design MAOP of 20% SMYS or greater.

10.0 Testing

10.3 – PTST

1.1

10.3.2 – Revised – Table B: Plastic Main – All PE Pipe Sizes Thru 12": with Design MAOP 125 psig or Less.

10.5 – Added – Refer to Subsection 10.6 for PE4710 testing and meter valve limitations.

10.6 – New - PE4710 mains and service lines with Design MAOP of 125 psig shall be tested separately, due to meter valve limitations, unless approved by the gas engineer.

10.6.1 - Meter valves rated for 175 psig shall not be exposed to a pressure of 200 psig or higher for more than 2 hours. Ex-

ceeding 200 psig for longer periods may cause damage to the valve.

1. The minimum test pressure for a MAOP of 125 psig is 188.0 psig.

2. Testing the PE4710 service line separately should limit the test duration to less than 2 hours and allow the pressure on the service line to be relieved or lowered to below 200 psig following completion of the pressure test.

3. The meter valve pressure limitations stated above applies to all service lines, PE2708, PE4710 and steel.

13.0 Components

13.1 – Removed "after installation"

13.1.3 – New – Components shall

be tested for leaks using leak detection fluids, leak detection instrument or via gauge test.

1. Gauge test shall be held for a minimum of 10 minutes.

2. Leak detection fluids or leak detection instruments have no minimum duration.

13.1.4 – New – Tapping and stopping components shall be tested for leaks PRIOR to tapping.

13.1.5 – Revised – A component (cap, valve, elbow) installed within an existing pipeline: Connection shall be tested for leaks at operating pressure of the pipeline using leak detection fluid or leak detection instrument.

13.1.6 —New – Component with a nominal diameter of

less than 2" shall be, at a minimum, tested for leaks at operating pressure of the pipeline using leak detection fluids or leak detection instruments. Engineering may specify gauge tests prior to tapping on critical applications.

13.2 – Component does not have to be strength tested to substantiate MAOP:

13.2.2 Item 1. – thread-o-let replaces weld-o-let. Specified it is service tees with mechanical connection.

Removed valve tee, Reinforcing saddle, Full encirclement split sleeve and Plidco Split+Sleeve.

14.0 Test Records

14.1.1 – Inserted a new Item 5. – A separate leak test is not required

when hydrostatic pressure testing lines or facilities.

14.1.2 – New Item 3. The Hydrotest Strength Test Form (PTST 3 Form 03) is included with projects generated by Gas Tech Engineering or Gas Storage Engineer when hydrostatic pressure testing is required.

14.2.1 – Added - or Hydrotest Strength Test Form

14.2.2 - Added - or Hydrotest Strength Test Form

14.2.3 – Item 11 - NOTE added – When hydrostatic test is being performed, location of the pressure recording devices shall be recorded and maintained in the final as constructed job packet.

	<p>14.2.3 – Item 14 a. – Pressure fluctuations that occur during the test must be approved by Integrity Management, GTE or GSE prior to acceptance of the test.</p> <p>Removed the Temperature factor formula.</p>		
<p>PTST 1.1</p>	<p>Test Pressure and Duration Tables</p> <p>1.0 Purpose</p> <p>PE2708 (MDPE), PE4710 (HDPE) replaces PE</p> <p>2.0 Tables</p> <p>2.2 – Appendix B – Plastic Main – All PE Pipe Sizes Thru 12" with Design MAOP 125 psig or less.</p> <p>Appendix A Service Line Less than 2", Plastic or Steel:</p> <p>HDPE - Design MAOP changed to 125 psig, minimum test pressure 188 psig, maximum test</p>	<p>April 1, 2021</p>	<p>October 1, 2021</p>

**pressure 260
psig.**

**Added Note
(3) – Maxi-
mum pres-
sure shall be
lowered to
below 200

CHANGE SUMMARY

April 1, 2021

Complete Change Summary			
Document	Change Summary	Previous Document Dated	Current Document Dated
<u>ABND 1</u>	<p>Requirements</p> <p>5.0 Project Specific Procedures</p> <p>5.1 GTE or GTS shall prepare written specific plan.</p> <p>5.1.3. NOTE: Revised – If the abandonment is a result of an emergency project or maintenance project, procedures can be developed as a joint effort between Region engineering and GTE. The Regional Gas Supervising Engineer shall ensure the abandonment job packet is submitted to GTE.</p> <p><i>In emergency situations, local Region Engineer can prepare the procedures with input from GTE. The completed job packet must be sent to GTE for their records.</i></p> <p>Paragraph 5.3.2 Item 7. NOTE: Revised – The responsible Engineer or Engineering group should be consulted with prior to making any significant changes such as: the cut-off location, abandonment method, method to purge.</p> <p><i>Ensures significant changes are reviewed and approved by engineering prior to implementation.</i></p>	October 1, 2020	April 1, 2021
<u>ABND 2.1</u>	<p>Abandonment of Gas Facilities</p> <p>5.1.1 – Revised – Pressure gauges will be installed to monitor the pressure on the remaining system and the section on main to be retired.</p> <p><i>Addition of gauge on the line being abandoned which is needed to monitor purging the gas from that section.</i></p> <p>6.3 Steel Service Lines</p> <p>6.3.6, 3. – Correction - "services" replace "main"</p>	December 1, 2020	April 1, 2021
<u>CNTS 2</u>	<p>Surface Subsidence Areas</p> <p>6.0 Active Surface Subsidence Area</p> <p>6.3.5 Table 1 – Removed 3/4" x 3' Long Flex Braided Connector.</p>	October 1, 2020	April 1, 2021
<u>CONS 1</u>	<p>Requirements</p> <p>4.0 Records, Maps, and Operating History</p> <p>4.1 – local Operating Center replaces Supervisor</p>	October 1, 2020	April 1, 2021

	<p>4.2 – map viewer replaces mapping system</p> <p>4.3 – Revised – Portions of the operating history are typically maintained in Maximo</p> <p>6.0 Responsibilities</p> <p>6.1 – Inserted the word "the" Construction Inspector.</p> <p>7.0 Construction Inspection</p> <p>7.1 – Inserted the word "an" inspector</p> <p>7.1.3 – Inserted "will require a" full time inspector</p> <p>7.1.3. NOTE – Inserted the word "a" full time inspector.</p>		
<u>CONS 2</u>	<p>Inspector Responsibilities</p> <p>4.0 Pre-job Considerations</p> <p>4.2.1 – Revised – Familiarize themselves with the work packet and ensure it includes:</p> <p>4.4 – confirm replaces check – Inspector should confirm that affected customers have been notified.</p> <p>8.0 Record Requirements</p> <p>8.6 – Inserted the word "appropriate" Gas Supervisor</p>	October 1, 2020	April 1, 2021
<u>CORR 1</u>	<p>Requirements</p> <p>15.0 Atmospheric Corrosion</p> <p>15.3 Monitoring of Atmospheric Corrosion</p> <p>15.3.4 – New - 3a. Where preformed FRP spacers are present, pay attention to the presence of cracks in the epoxy or air gaps between the epoxy and the pipe.</p> <p>3b. If rust stains are present, the spacer should be removed and the pipe inspected for corrosion.</p> <p>15.6 Note – New – See CORR 2.7 Subsection 12.2 for additional measures to be taken when pipe is on pipe supports.</p> <p>16.0 Painting Pipeline Facilities</p> <p>16.3.2 Do not paint</p> <p>8. – Correction –Stainless steel control lines, fittings or valves.</p>	October 1, 2020	April 1, 2021
<u>CORR 2.1</u>	<p>Cathodic Protection Design</p> <p>7.0 Insulating Points</p> <p>7.4 bonding</p> <p>Removed 7.4.3 Creating a System Loop – Plastic</p> <p>Tracer wire on plastic loop systems can be continuous with no need for a test station.</p> <p>8.0 Insulating Materials</p>	October 1, 2020	April 1, 2021

	<p>8.4 Insulating Unions Table 3 – Updated stock codes</p> <p>Appendix A insulating Kits for Flanges - Updated Stock Codes</p>		
<u>CORR 2.2</u>	<p>Anode Requirements and Installation</p> <p>6.0 Anode Requirements</p> <p>6.1 Table 3 – Service lines, repaired steel mains and service lines.</p> <p>Changed the threshold for anode installation to -1.0 V from -0.950 V.</p> <p><i>Provides for more time to take corrective action before the line drops to below -0.850 v.</i></p>	October 1, 2020	April 1, 2021
<u>CORR 2.3</u>	<p>Coating</p> <p>Appendix B – Pipe Coating Repair & Fitting Coating Repair</p> <p>Pipe 6 inch and larger can have damaged or bare areas covered without full encirclement wrap.</p> <p><i>Eliminates the need for deeper excavations that are necessary for full encirclement wrapping of pipe. Previously, it was 12 inch and larger pipe that could be repaired without full encirclement wrap.</i></p> <p>Appendix B – Pipe Coating Repair – Added note that wax tape is not acceptable for coating repair.</p> <p><i>Wax tape is susceptible to being displaced during backfilling operations and pipe movement.</i></p> <p>Added links to applicable sections of Appendix I which has the application instructions in the following Appendices;</p> <p>Appendix C – Approved Hot Applied Tapes</p> <p>Appendix D – Approved Cold Applied Tapes</p> <p>Appendix F – Applied Cold Wax Tape</p> <p>Appendix G – Moisture Cured Wrap</p> <p>Appendix E – Approved Field Applied Epoxy Coatings = Corrected size of Denso Protal 7125 Kit to 825 ml.</p> <p>.</p> <p>Appendix G – Moisture Cured Wrap:</p> <p>Corrected size of Polyethylene/Stretch Wrap, 49 22 441, 5" x 200'</p> <p>Appendix H – General Wrapping Instructions</p> <p>3. Service Tee Hot Wrap Tape</p> <p>3. A. Change – Service tee or small fitting installed on 6 and larger steel pipe, hot wrap or epoxy shall cover the exposed bare steel with a 6 inch overlap beyond the bare steel.</p> <p><i>This change eliminates the need for larger excavations to wrap service tees welded on 6, 8, or 10</i></p>	October 1, 2020	April 1, 2021

UNCONTROLLED IF PRINTED

	<p>inch steel pipe. Consistent with changes in Appendix B.</p> <p>4. Service Tees Cold Applied Tape: Added instructions for wrapping service tees with cold applied tapes including wax tape. Clarifies that the cold applied tape or wax tape used to wrap the service tee can be used to cover the bare steel on the main but requires full encirclement wrap of the main.</p> <p>Appendix 1-6 & 1-7 - Wax tape application instructions – Added these are not approved for girth weld coating or pipe coating repair.</p>		
CORR 2.7	<p>Short Investigation and Clearing Shorted Pipeline</p> <p>12.0 Clearing Shorted Pipelines</p> <p>12.1 - Inserted I-Rods and Nu-Bolts as approved insulators.</p> <p>12.2 – New – For above grade applications, I-Rods spacers, Subsection 12.6, and Nu-Bolts, Subsection 12.7, should be used as the preferred method of pipe support insulation. However, if I-Rod spacer or Nu-Bolts will not work for the application, then FRP spacers may be used instead.</p> <p>12.4 Preformed FRP Spacers</p> <p>12.4.2 – Shifted wording – If a FRP insulator is installed on a pipe support</p> <p>12.6 - I-Rods – Installation instructions</p> <p>12.7 – Nu-Bolts – Installation instructions</p> <p>New product to eliminate the possibility of atmospheric corrosion by not allowing water or moisture to collect between the pipe and pipe support</p>	October 1, 2020	April 1, 2021
<u>CORR 2.8</u>	<p>Cathodic Protection Testing</p> <p>Appendix A-9 – AC Stray Current Test Station – Stelth 7 Reference Cell replaces CerAnode Reference Cell.</p> <p>Corrosion Control found Stelth 7 Reference Cell is better than CerAnode Reference Cell and has requested the Stelth 7 be stock coded.</p> <p>Appendix B-7 – Removed Stock Code for Handy Cap,</p> <p>No longer being stocked.</p>	December 1, 2020	April 1, 2021
<u>CORR 2.11</u>	<p>Records</p> <p>Appendix A Cathodic Protection Review Responsibility Table – Updated the Technician/ Specialists listing.</p>	October 1, 2020	April 1, 2021
<u>CORR 3</u>	<p>Forms and Reference Materials</p> <p>Added Borin Stelth 7 Reference Cell Instructions</p>	October 1, 2020	April 1, 2021

<u>DAMG 1</u>	<p>Requirements</p> <p>5.0 Illinois One-Call System</p> <p>5.2.4 - Difficult to Locate Facilities was added.</p> <p>Inserted this section since this section from our O&M was missed and not included Rewrite process,</p>	October 1, 2020	April 1, 2021
<u>EMER 0</u>	<p>Table of Contents</p> <p>Added EMER 2.10 Gas Control</p>	April 1, 2020	April 1 2021
<u>EMER 1</u>	<p>Requirements</p> <p>3.0 Target Audience</p> <p>Added Gas Engineering</p>	October 1, 2020	April 1, 2021
<u>EMER 2.2</u>	<p>Dispatch Center</p> <p>7.0 Cold Weather Electrical Outage and Restoring Service</p> <p>7.1.3 – Correction in customers in High and Moderate Risk systems. 300+ customers in High Risk and 500+ customers in Moderate Risk</p> <p>7.3 Table 1- Contact List for Gas Tech Services and Gas Planning Groups</p> <p>Updated contact information for GTS.</p>	October 1, 2020	April 1, 2021
<u>EMER 2.3</u>	<p>Emergency Responder</p> <p>3.0 Target Audience – Added Gas Engineering</p> <p>5.0 Dispatch to Indoor Odor or Leak</p> <p>In the NOTE, corrected name of Customer Care Center.</p> <p>7.0 Dispatch to Cut Main or Service</p> <p>7.3 – Updated reference to WIGE 2.1 Subsection 6.3</p>	October 1, 2020	April 1, 2021
<u>EMER 2.4</u>	<p>General</p> <p>3.0 Target Audience</p> <p>Added Gas Engineering</p> <p>Appendix A – Replaced 6H screen shot which shows RP for red pin the meter valve.</p>	October 1, 2020	April 1, 2021
<u>EMER 2.4.1</u>	<p>Gas Field Personnel – Dispatched to Indoor Odor or Leak</p> <p>1.13 Check for presence of alternative source of electricity, such as stand-by generator, solar panels, energy storage devices, or wind generators.</p> <p>1. If it can be safely done, disconnect these sources. This may require disconnecting at the device.</p> <p>2. Customers may be able to provide additional information regarding alternative sources of energy.</p>	October 1, 2020	April 1, 2021
<u>EMER 2.9</u>	<p>CNG Trailers</p> <p>5.0 CNG Trailer by Location and Capacity</p>	December 1, 2020	April 1, 2021

UNCONTROLLED IF PRINTED

	<p>Table 1 – Added the 4 larger CNG trailers that have 47.6 MCF @ 3600 PSIG.</p> <p>Updated contact information.</p> <p>10.0 CNG Transportation Requirements</p> <p>Updated AIC Corporate address on Ameren Shipping Paper – CNG.</p>		
EMER 2.10	<p>Gas Control</p> <p>This section was missed in the O&M Rewrite Process</p>	July 1, 2014	April 1, 2021
<u>EMER 3</u>	<p>Forms and Reference Materials</p> <p>Forms: Updated Ameren Shipping Papers - CNG</p>	October 1, 2020	April 1, 2021
<u>INCD 1</u>	<p>Requirements</p> <p>5.0 Natural Gas Incident</p> <p>5.1.3 – Estimated property damage excluding cost of gas lost:</p> <p>1. \$122,000 for incidents reported to PHMSA.</p> <p>2. \$50,000 for incidents reported to IDNR</p> <p>Added NOTE – IDNR 240.1805 – Estimate property damage is the result of a release of stored natural gas from the downhole portion of an underground natural gas storage facility.</p> <p>6.0 Potential Significant Event</p> <p>6.1.3 – A natural gas fueled fire with estimated property damage exceeding \$60,000 for potential reporting to PHMSA or \$25,000 for UNGSF potential reporting to IDNR.</p> <p>Appendix A – Gas Compliance contacted within 1 hour:</p> <p>Separated the estimated cost of property damage values: and</p> <p>Separated the estimated cost of property damage due to gas fueled fire:</p> <p>\$60,000 for potential reporting to PHMSA and ICC.</p> <p>\$25,000 for reporting to IDNR.</p> <p>Appendix B – State and Federal Reporting Matrix</p> <p>Separated the estimated property damage values:</p> <p>\$122,000 for incident reports to PHMSA and ICC.</p> <p>\$50,000 for incidents reports to IDNR.</p> <p>Added NOTE – The estimated property damage value threshold will be adjusted each July 1 beginning in 2022. The adjusted value will be reflected in the next scheduled O&M Update after July 1.</p>	October 1, 2020	April 1, 2021

	PHMSA's Regulatory Reform Rule increase the estimated property damage value to \$122,000 effective March 21, 2021. Under IDNR's regulations for underground natural gas storage facilities, this value remains at \$50,000.		
<u>LEAK 1</u>	<p>Requirements</p> <p>10.0 Leak Surveillance, Repair, and Reevaluation</p> <p>10.3 Class 1 – Revised to provide guidance on what continuous action can be taken until a hazardous condition no longer exists.</p> <p>10.3.1 – Venting may be employed but leak still remains a Class 1 leak.</p> <p>10.3.2 – Leak repairs on compression fittings must follow REPR 2.1 Section 5.0.</p> <p>10.3.3 – Additional actions may be taken to eliminate the hazardous condition with Director approval. The leak remains a Class 1 leak.</p> <p>Continuous action that can be taken to eliminate a Class 1 hazardous condition until approved repair can be made. Leak continues to be a Class 1 until repaired.</p>	October 1, 2020	April 1, 2021
<u>LEAK 2.5</u>	<p>Leak Survey Equipment</p> <p>7.0 Gas Detection Instrument</p> <p>7.9 – Added (± 10%) for 50 ppm test/bump gas.</p> <p>Test gas provider advised Training group that the specification for the test gas is ± 10% and the test gas container will show the actual ppm.</p>	October 1, 2020	April 1, 2021
<u>LEAK 3</u>	<p>Forms and Reference Materials</p> <p>Updated:</p> <p>Leak Investigation Form - Indoor Hazardous Condition of 10% and 30% for Outdoor.</p> <p>Sensit Gold CGI Instruction Manual</p> <p>Sensit Gold C2 Instruction Manual</p> <p>Sensit IRED Manual</p> <p>Added:</p> <p>GAS TRAC LZ 30 Instruction Manual</p>	October 1, 2020	April 1, 2021
<u>MAIN 0</u>	<p>Table of Contents</p> <p>MAIN 3.1 Lateral Taps</p> <p>Changed several of the Section and Appendix titles.</p>	October 1, 2020	April 1, 2021
<u>MAIN 3.1</u>	<p>Lateral Taps</p> <p>2.0 Scope – Removed Subsections in Sections 4.0, 5.0, 6.0 since they are repeated in the individual Sections.</p> <p>4.0 - Changed to PE Tees to PE Pipe</p> <p>5.0 - Changed to Steel Tees to PE Pipe</p>	October 1, 2020	April 1, 2021

	<p>6.0 - Changed to Steel Tees to Steel Pipe Appendix A - Changed PE Tees to PE Pipe Appendix B - Changed Steel Tees to PE Pipe Appendix C - Changed Steel Tees to Steel Pipe Appendix B – Added NOTES: Protective sleeve is required on fittings smaller than 2 inch and optional on fittings 2 inch and larger. Protective sleeves shall be installed as one piece and not split in half. Throughout Appendix B the following sentence was revised: If protective sleeve is installed it shall be placed over the transition fitting. Changes made to Tables and Figure descriptions.</p>		
<p><u>MAIN 3.2</u></p>	<p>End of Main Extension 2.0 Scope – Removed Subsections in Sections 4.0, 5.0, 6.0 since they are repeated in the individual Sections. 5.1 – Changed to Mueller Stopper – Steel to PE Pipe 5.4 – Changed to TDW Stopper – Steel to PE Pipe Appendix B – Added NOTES Protective sleeve is required on fittings smaller than 2 inch and optional on fittings 2 inch and larger. Protective sleeves shall be installed as one piece and not split in half. Throughout Appendix B: Changes made to the titles of Tables and Figures. The following 2 sentences revised: The final tie-in weld shall be butt or socket weld. Socket weld is approved for 2 inch and smaller pipe. If protective sleeve is install it shall be placed over the transition fitting. Appendix C – Revise sentence: The final tie-in weld shall be butt or socket weld. Socket weld is approved for 2 inch and smaller pipe. If necessary, use a transition weld fitting.</p>	<p>October 1, 2020</p>	<p>April 1, 2021</p>
<p><u>METR 1</u></p>	<p>Requirements 7.0 Installation 7.2.2 – Added the system bypass valves, Angle Valve and Brisco valve, currently stocked for 175/250 meter bars.</p>	<p>October 1, 2020</p>	<p>April 1, 2021</p>

	<p>7.4.2. Revised – All meter by-pass valves located upstream of the meter outlet shall be locked closed, when not in use, to deter unauthorized personnel from tampering with the valve.</p> <p>Clarifies bypass valve located upstream of meter outlet is the one that is to be locked closed not a bypass valve located downstream of the meter outlet.</p> <p>8.0 Regulator Vent Lines</p> <p>8.5.4 – Added – Vent lines connected to a regulator spring case or to the outlet side of a relief valve do NOT require pressure testing.</p> <p>Vent lines are to be installed using proper pipe fitting procedures. The lines are not pressure rated and therefore do not require a pressure test.</p>		
METR 2.5	<p>Gas Meter Bypass</p> <p>7.0 Using Portable CNG Tank System with the Mueller Brisco Valve</p> <p>New procedure added since AIC is stocking the Brisco Bypass valve for 175/250 Meter sets.</p>	October 1, 2020	April 1, 2021
METR 2.8	<p>Pressure Factor Metering</p> <p>6.0 Pressure Factor Metering</p> <p>6.4.1 – Added – Twist wire seals are available through Gas Meter Shop or MDF. Electric department wire seals are also acceptable.</p> <p>Regulator spring caps with eyelets can be sealed with twist wire seals</p>	October 1, 2020	April 1, 2021
METR 2.10	<p>Gas Meter Data Sheet</p> <p>1.0 Purpose</p> <p>Added – The GMDS to be compared to the account and the CSS WFM cleared within 90 days of physical transaction.</p> <p>The federal law Sarbanes-Oxley Act of 2002 language which requires companies to develop more stringent checks and balances that impact financials.</p>	October 1, 2020	April 1, 2021
METR 3.2	<p>Regulator Sizing</p> <p>Appendix A – Note (5) – Corrected the Main Spring number for Fisher CS400IR</p>	December 1, 2020	April 1, 2021
METR 3.3	<p>Diaphragm Meter Sets</p> <p>Appendix C – 175/250 Meter, 7"w.c. Delivery, 61 – 100 psig Inlet – Corrected Stock Code and orifice size for the 1" x 1" Itron B42R or American 1813C</p>	October 1, 2020	April 1, 2021
ODOR 0	<p>Table of Contents</p> <p>ODOR 1 – Removed Appendix A – Monthly Odorization Report.</p> <p>The Report form is in ODOR 3</p>	October 1, 2020	April 1, 2021
ODOR 1	<p>Requirements</p>	October 1, 2020	April 1, 2021

UNCONTROLLED IF PRINTED

	<p>2.0 Scope - Removed Appendix A – Monthly Odorization Report.</p> <p>7.0 Monthly Odorization Report</p> <p>7.1 –Link to ODOR 3 replaces link to Appendix A</p>		
<u>ODOR 2.1</u>	<p>Odorant Intensity Sampling and Testing Reference Documents</p> <p>Removed all of the Odorizer reference documents since they are not relevant to odorant intensity.</p>	December 1, 2020	April 1, 2021

<u>POLY 0</u>	<p>Table of Contents</p> <p>POLY 2.1 Section 4.0 – Design Pressure replaced Design Formula.</p>	October 1, 2020	April 1, 2021
<u>POLY 2.1</u>	<p>Design Pressure</p> <p>4.0 Design Pressure – Pressure replaced Formula</p> <p>Subsection 5.2 - Pressure replaced Formula</p> <p>5.2 Table 2 Design Temperature for HDB Value</p> <p>Added 12 inch with Design Temperature of 73 °F.</p>	October 1, 2020	April 1, 2021

Appendix A-2 – Added 8 inch and 12 inch PE 4710 to the Stock Coded pipe table.			
<p><u>POLY 2.2</u></p>	<p>Squeeze Off</p> <p>5.0 Operation</p> <p>5.2 Squeeze Off Tool Location and Operation</p> <p>5.2.2 – Removed the minimum 12 inch from any fusion joint, saddle fusion, mechanical connection or previous squeeze off location.</p> <p>Table 1 – New – Provides the minimum distance, 3 time the OD of the pipe, the squeezer shall be from a fusion joint, mechanical connection, previous squeeze point or second squeeze tool.</p> <p>5.2.5 – Removed the 12 inches.</p> <p>ASTM eliminated the 12 inch minimum so the squeeze off tool only has to be 3 pipe diameters away from joints, etc.</p> <p>6.0 Above Grade Squeeze</p> <p>6.4 – Hazardous gas environment replaces blowing gas atmosphere and updated reference to WIGE 2.1.</p>	<p>October 1, 2020</p>	<p>April 1, 2021</p>
<p><u>POLY 2.3</u></p>	<p>Installation Requirements</p> <p>6.0 Support</p> <p>6.3.3 – Revised – Protective sleeves shall be installed on the outlet of service tees in accordance with SERV 1 Appendix B and on steel-to-plastic transition fittings in accordance with MAIN 3.1 and MAIN 3.2.</p> <p>The referenced Appendices contain the new policy that; protective sleeves are required on fittings smaller than 2 inch and are optional on 2 inch and larger fittings.</p> <p>9.0 Minimum Bending Radius</p> <p>9.2 Table – Added the 12 inch PE pipe.</p> <p>10.0 Weak Link</p> <p>10.1 – Added – Weak Link is required when pulling pipe in by hand.</p> <p>10.2.1 – PE pipe size 1" CTS or smaller:</p> <p>Only acceptable weak link methods are:</p> <ol style="list-style-type: none"> 1. Cutting approximately half of the diameter of the pipe, or 2. Using a commercially manufactured weak link device. 3. Weak link is required when pulling pipe by hand. <p>Removed using larger diameter pull plug or larger bore head/back reamer.</p> <p>Using larger diameter pull plugs, drill head, back reamers are not considered weak link methods ac-</p>	<p>December 1, 2020</p>	<p>April 1, 2021</p>

	<p>ording to the ICC's interpretation and had to be removed from the O&M. In addition, a weak link is also required when pulling the pipe in by hand.</p> <p>10.3 Table 6 - Added 1/2" PE 4710 Cumberland weak link.</p>		
<u>POLY 2.4</u>	<p>Butt Fusion</p> <p>6.0 Safety – Before Starting Fusion Operation</p> <p>6.5 Checking heat iron</p> <p>6.5.2 – Temperature shall be checked replaced Temperature check readings.</p> <p>8.0 Joint Assembly</p> <p>8.1.1 – Revised - Ensure pipe ends are clean prior to placing in butt fusion machine. If needed, clean with water, alcohol solution or clean rag/towel.</p> <p>Table 1 Melt Bead Size – Added 12" fittings</p> <p>Appendix A – Butt Fusion Fittings – Added 12 " fittings</p>	December 1, 2020	April 1, 2021
<u>POLY 2.5</u>	<p>Electrofusion</p> <p>4.0 Common Requirements</p> <p>4.1.3 – Added – Electrofusion is required when joining:</p> <p>PE pipe with different wall thickness that exceeds one SDR valve, or</p> <p>PE pipe with different chemical properties (e.g. Aldyl A to MDPE)</p> <p>Added because the O&M states these pipes could not be Butt Fused but did not state how they were to be joined.</p> <p>4.2.1 – 3. All alcohol used on PE pipe shall be at least 96% isopropyl alcohol.</p> <p>Was left out in the Rewriting process.</p> <p>8.0 Pipe Surface Preparation</p> <p>8.1.3 – Maximum Gap Information from Subsection 10.1 moved to this location. Added 10 and 12 inch pipe to Table.</p> <p>Applicable to when cutting pipe ends square.</p> <p>9.0 Peeling</p> <p>9.1 Note – Hand scraping is allowed only when the use of a rotating peeler is not feasible and must be approved by the Gas Supervisor.</p> <p>Was left out in the Rewriting process.</p> <p>9.5.1 – Maximum number of passes with a peeler:</p> <p>Pipe 2" and smaller – one pass,</p> <p>Pipe 3" and larger – two passes</p>	December 1, 2020	April 1, 2021

	<p>This based on information from Central Plastics to ensure wall thickness is not reduced more than 10%.</p> <p>Appendix A – Added 12 inch electrofusion fittings.</p>		
<u>POLY 3.1</u>	<p>Transition Fittings and Protect Sleeves</p> <p>4.0 Transition Fittings</p> <p>4.3.3 - Added – Protective sleeve is required on fittings less than 2 inch.</p> <p>Protective sleeve is optional for fittings 2 inch and larger.</p> <p>Protective sleeve shall be installed as one piece and not split in half.</p> <p>Discussion with fitting manufacturer and other utilities found that only the smaller diameter service tee fittings and transition fittings need a protective sleeve to provide adequate support from shear forces.</p> <p>Appendix A – Transition Fittings – Added 12 inch PE4710 and Stock Code for the 8 inch PE 4710.</p> <p>Appendix B – Added – Protective sleeve shall be installed as one piece and not split in half.</p>		
<u>POLY 4</u>	<p>Forms and Reference Materials</p> <p>Updated Connectra 28HP Butt Fusion System Operating Manual – Sept, 2018</p>	October 1, 2020	April 1, 2021
<u>PTST 1</u>	<p>Requirements</p> <p>7.0 Test Medium</p> <p>7.1.3 – New – The test medium shall be water for:</p> <ol style="list-style-type: none"> 1. New and replaces transmission lines in an HCA. 2. Assesment for manufacturing and construction defects in an existing transmission line within a HCA. <p>New or replaced transmission lines installed within 300 feet of a building intended for human occupancy.</p> <p>7.1.4 – New – Water Is preferred test medium for all transmission lines. Other mediums may be used with engineering approval. An example of exception are included.</p> <p>NOTE: Transmission testing requirements do not apply to control lines, service lines or gas regulator stations not considered transmission.</p> <p>PHMSA's EGA Rule for transmission lines requires hydrostatic testing to ensure manufacturing and construction defects are stable. AIC has decided to hydrostatic test all transmission lines to avoid po-</p>	October 1, 2020	April 1, 2021

	tential testing if in the future the line ends up in a HCA.		
<u>PTST 1.1</u>	<p>Test Pressure and Duration</p> <p>Appendix D – Steel Main – All Steel Pipe Sizes thru 30" with Design MAOP 100 psig or Greater</p> <p>D-4 – Revised – GTE or GSE will provide hydrostatic testing plan for transmission lines. Test pressure and duration shall at least meet the minimum shown in Table D.</p> <p>D-5 – New – Facilities classified as transmission based on their function or location even though the MAOP is less than 20% SMYS, shall be hydrostatic pressure tested.</p> <p>Table D – Inserted a new category for testing: 20% SMYS or greater but less than 30% SMYS. Recording Device is Required.</p> <p>30% SMYS or greater – All tests require a Recording Device.</p> <p>Appendix E – Fabricated Unit/Assembly or Short Section of Pipe.</p> <p>E-4 – New – Transmission fabricated units and short sections of pipe, where post installation testing is impractical, a pre-installation hydrostatic pressure test shall be conducted in accordance with Table E(2).</p> <p>E-8 – New – When installing a pre-tested fabricated unit at its final location, check for damage including inlets, outlets, and lifting locations. Identify defects such as dents, gouges, bending, corrosion and cracking. If threats are found, conduct non-destructive testing, re-pressure test or repair.</p> <p>Requirements in PHMSA's Regulatory Reform Rule effective March 21, 2021.</p>	October 1, 2020	April 1, 2021
<u>PTST 2.3</u>	<p>Hydrostatic Pressure Testing</p> <p>4.0 General</p> <p>4.2 – New – Reference PTST 1 Section 7.0 Test Medium for test medium requirements.</p>	October 1, 2020	April 1, 2021
<u>PURG 2</u>	<p>Methods</p> <p>6.0 Purging of Gas with Air During Abandonment</p> <p>6.2 – Added – Do not exceed MAOP. Adhere to manufacturer's published operating pressure limits and practices, when using control fittings.</p> <p>8.0 Required Minimum Inlet Pressures</p> <p>8.1 – Added – Adhere to manufacturer's published operating pressure limits and practices, when using control fittings.</p>	December 1, 2020	April 1, 2021

	<p>Eliminates the potential over pressurizing the plugging unit causing it move allowing compressed air into the active gas system.</p>		
<p><u>REPR 1</u></p>	<p>Requirements</p> <p>4.0 General</p> <p>4.2.2 – Typo correction – Type of defect or damage.</p> <p>4.13 – Gaseous environment replaces atmosphere and updated reference to WIGE 2.1</p> <p>6.0 Common Repair Considerations Steel Pipe</p> <p>6.7 Encapsulation</p> <p>Added a NOTE: Full encirclement split sleeve and Plidco Split+Sleeve are covered in Subsection 6.3 or Subsection 6.4.</p> <p>This is to distinguish between the two methods of encapsulation.</p> <p>6.7.1 Item 2. – This is referred to as pipe/cap method.</p> <p>6.7.4. Item 1 – Removed "back welding" of steel cap. It now states "tack welding" of steel cap.</p> <p>7.6 High Pressure and Transmission Pipe Grinding Repair.</p> <p>Added a new section with grinding procedures for repair of transmission and hp distribution pipe defects.</p> <p>8.0 Steel Distribution Pipe Repair</p> <p>8.2.2. – Caution added – Half-sole sleeve must extend beyond the area of lamination and weld to sound pipe.</p> <p>8.3 – Distribution Pipe Grinding Repairs</p> <p>Added a new section with grinding procedures for repair of distribution pipe defects</p> <p>11.0 Repair Records</p> <p>11.3.1 – Non-destructive testing (NDT) replaced radiographic testing.</p> <p>Appendix A – Transmission & High Pressure Distribution Pipe Repairs</p> <p>Appendix A Notes:</p> <p>Note 3 – Revised – Grinding requirements to be specified by engineering. See Subsection 7.6.</p> <p>Note 7 – Added link to WELD 2.3 Section 10.0 for weld deposition.</p> <p>Appendix B Steel Distribution Pipe Repairs</p> <p>Appendix B Notes:</p> <p>Note 3 – Revised – The remaining wall thickness after grinding must be equal to or greater than nominal wall thickness required for the design pressure of the pipeline. See Subsection 8.3.</p>	<p>October 1, 2020</p>	<p>April 1, 2021</p>

	<p>Appendix D Mueller Tapered Screw Plug D-2.5 – Added – or encapsulated with a pressure rated cap. See Subsection 6.7 for encapsulation.</p>		
SERV 1	<p>Requirements</p> <p>4.0 Depth of Service Line</p> <p>4.1 – Revised – Service line depth for service lines smaller than 2 inch shall be a minimum of 18 inches from top of pipe to finished grade and should be a minimum of 24 inches for service lines 2 inch and larger.</p> <p>Added NOTE: Service lines 2 inch and larger, the minimum cover depth as the service line approaches the service riser will be determined by the maximum bury depth of the service riser.</p> <p>SMR team felt it prudent to install the larger service line a little deeper as added protection due to larger volume of gas in these line. The increased depth would allow for addition services to be attached which may result in the service line being classified as a main.</p> <p>Appendix B-1 through B-4 – Added link to POLY 3.1 Appendix B for protective sleeve installation.</p> <p>Appendix B-5 Note 6 – Added – Protective sleeve is optional for 2 inch and larger services. If a protective sleeve is installed, it shall be placed over the connection between the tee and the service pipe.</p>		
SERV 2.2	<p>Service Line Installation EFV and Manual Valve</p> <p>6.0 EFV Sizing</p> <p>6.1 – Changed "shall" to "should"</p> <p>6.2 – New – For existing odd size service lines such as 1-1/4", 1-1/2" or 3", Gas Engineering will evaluate the service and determine if there is a small size EFV that would meet the service specifications and load requirements at that location.</p> <p>6.2.1 Examples may include:</p> <p>1/2" CTS EFV on a 3/4" IPS PE service line.</p> <p>1" CTS EFV on a 1-1/4" IPS PE service line.</p> <p>2" IPS EFV on a 3" IPS PE service line.</p> <p>3/4" IPS EFV on a 1-1/2" IPS steel service line.</p> <p>EFVs for odd size pipe are not stocked but in most cases a small size EFV will handle the load. This also why the "shall" was changed to a "should" to allow for the mismatch between the EFV and pipe</p>	December 1, 2020	April 1, 2021
SERV 2.3	<p>Farm Tap</p> <p>Appendix A-1 through A-3 - Upgraded Schedule 40 fittings and malleable iron fittings to either</p>	December 1, 2020	April 1, 2021

CHANGE SUMMARY

December 1, 2020

Complete Change Summary			
Docu- ment	Change Summary	Previous Document Dated	Current Document Dated
<u>ABND 0</u>	Table of Contents ABND 2.1 – Added Attachment 3 – Polywater AFT Sealant	October 1, 2020	December 1, 2020
<u>ABND 2.1</u>	Abandonment of Gas Facilities Added Attachment 3 – Polywater AFT Sealant	October 1, 2020	December 1, 2020
<u>BORE 2.1</u>	Boring Operations and Pipe Installation 4.3 Prior to Beginning Operations 4.3.2 Added, in accordance with AIC Field Safety Manual provision in Section 33.4. The Field Safety Manual has been updated to reflect additional ICC re- quirements when digging within the tolerance zone. To maintain consis- tency, reference to the Safety Manual is replacing previous O&M require- ments for uncovering facilities within the tolerance zone.	October 1, 2020	December 1, 2020
<u>BORE 2.2</u>	Boring Across or Near Sewer Lines 5.0 Pre-Construction Steps Paragraph 5.2.7 Added, in accordance with BORE 2.1 Subsection 4.3 when exposing a sewer lateral. Paragraph 5.3.2 Added, in accordance with BORE 2.1 Subsection 4.3 when exposing a forced sewer main or lateral. These were added due the changes made to digging within the tolerance zone.	October 1, 2020	December 1, 2020
<u>CLAS 1</u>	Requirement 6.2.1 Correction, 660 feet and 220 yards replaces 600 feet and 200 yards. 6.2.2 Correction, 660 feet replaces 600 feet.	October 1, 2020	December 1, 2020
<u>CNTS 1</u>	Requirements 8.1.10 – Removed the Note which referenced the location of Alcohol and Illegal Drug Policy and the Employee Assistance Program.	October 1, 2020	December 1, 2020
<u>CORR 2.8</u>	Cathodic Protection Testing Appendix B Test Lead Wire Attachment 6. Welded Bolt Anode Wire or Test Lead Connection to Steel Pipe. 6. A. – Wording correction – "with MAOP or 100 psig or less" re- places "operating pressure at or below 100 psig".	October 1, 2020	December 1, 2020
<u>EMER 2.9</u>	CNG Trailers 7.0 Other Equipment 7.1.4 – Added "dry chemical (A. B. C.), 20 pound minimum" to the fire extinguisher.	October 1, 2020	December 1, 2020

UNCONTROLLED IF PRINTED

<u>EXCV 2.01</u>	<p>Prior to Excavation</p> <p>2. Job Preparation</p> <p>2. B. Added, Machine excavating may be utilized in accordance with AIC Field Safety Manual provisions in Section 33.4.</p> <p>Preferably hand or vacuum excavation is used to expose facilities within the tolerance zone but provisions are being added in the AIC Field Safety Manual to allow mechanical excavating in certain situations.</p>	January 1, 2020	December 1, 2020
<u>EXCV 2.03</u>	<p>Working in Excavation</p> <p>1. Beginning Excavation</p> <p>1. F. Added, Machine excavating may be utilized in accordance with AIC Field Safety Manual provisions in Section 33.4.</p> <p>Addition made for same reason as stated for EXCV 2.01.</p>	January 1, 2020	December 1, 2020
<u>EXCV 2.09</u>	<p>Working in Hazardous Atmosphere</p> <p>3. Entering Excavation</p> <p>3. F.: Proposed modification – A properly sized dry chemical (A. B. C.) fire extinguisher shall be at the work site. See WWBG 2.1 Sub-section 4.2.2.</p>	January 1, 2020	December 1, 2020
<u>GLOS</u>	<p>Glossary</p> <p>Tolerance Zone – (for excavating and locating purposes) Added excavating and 18 inches.</p> <p>Tolerance zone is applicable to both excavating and locating operations. Tolerance zone is commonly defined as 18 inches either side of the buried facility rather than 1-1/2 feet.</p>	October 1, 2020	December 1, 2020
<u>LOCT 1</u>	<p>Methods</p> <p>5.0 Locating Methods</p> <p>5.5 Excavate</p> <p>5.5.2 Added, Refer to AIC Field Safety Manual, Section 33.4 Work within the Tolerance Zone.</p>	October 1, 2020	December 1, 2020
<u>PMRK 2</u>	<p>Pipeline Facility Markers</p> <p>Appendix B – (B-3) – Corrected Stock Code</p>	October 1, 2020	December 1, 2020

UNCONTROLLED IF PRINTED

UNCONTROLLED IF PRINTED

Major Changes in this Update	
<p>Changes in the following sections, EMER. INCD, INVE and LEAK are a result of comments by Expert Emergency Response Consultant (EERC) and discussions between the EERC consultant and the SMR teams. EERC was asked to review AIC's O&M and make recommendations for improving AIC's emergency response procedures to ensure the safety of the general public, customers, emergency responders, AIC's employees and property are being adequately addressed.</p>	
<p>EMER 2.02</p>	<p style="text-align: center;">Dispatch Center</p> <p style="text-align: center;">1. Dispatching Gas Field Personnel to an Emergency Call</p> <p>1. C.: Revised - - If gas field personnel, emergency responder and Gas Supervisor are unavailable to respond to the call, the dispatcher shall contact the appropriate local police and/or fire department to request assistance.</p> <p style="text-align: center;">3. Cold Weather Electrical Outage and Restoring Electric Service</p> <p>3. A. (4) (a) & (b): Correction - 500+ customers on a gas system identified as High risk and 300+ customers is identified as Moderate risk.</p> <p style="text-align: center;"><i>Risk level had to be switched.</i></p>
<p>EMER 2.03</p>	<p>Emergency Responder - The following changes were made based on discussions between the EERC representative and EMER Investigation SMR team.</p> <p style="text-align: center;">2. Upon Arrival (Inside Leak)</p> <p style="text-align: center;">Added following instructions:</p> <p>2. C. (1): If volt stick alarms when riser is checked proceed with the emergency responders' procedures <u>but do not shut off meter valve.</u></p> <p>2. F.: Revised - If there is any movement of the test hand, shut the meter valve or customer valve off.</p> <p style="text-align: center;">2. J. Evacuate the structure</p> <p>2. J. (1): New - Multi-family structure or a structure containing a large number of people, such as school, hospital, nursing home, manufacturing or commercial business, responder should contact or have dispatch contact fire department to request assistance with evacuation.</p> <p style="text-align: center;">4. Upon Arrival (Cut Main or Service)</p> <p>4. B.: New - Avoid parking over manholes as they may be within the gas leak migration pattern and could possibly be venting.</p> <p>4. C.: New - Avoid parking over main valves in the event that they are required for make safe actions.</p>

These added to be consistent with Upon Arrival (Outside Leak) instructions that were added in October 1, 2019 Update at the recommendation from EERC.

**EMER
2.04**

Gas Field Personnel - The following changes were made based on discussions between the EERC representative and EMER Investigation SMR team.

2. Inside Odor Compliant - Hazardous Condition

Lowered the threshold to 10% LEL to be consistent with LEAK 2.01 Indoor Leak Investigation.

Inside Odor Complaint - Hazardous Condition

2. A. Evacuating the structure....

2. A.: Revised - Instruct them not to touch anything, operate any electrical switches or use any electronic devices as they exit.

5. Gas in a Sewer - Hazardous Condition

5. D. Check adjacent structures for gas migration

5. D. (1): Lowered the hazardous condition threshold to 10% LEL when entering a structure. When evacuating the people have them move to a safe distance.

8. Explosion and /or Fire Near Gas Pipeline Facilities

8. C.: Shall replaces should. Gas field personnel shall notify a Gas Supervisor.

8. F.: Revised - Gas field personnel should also attempt to make contact with the Fire Chief or fireman in charge at the scene and communicate AIC's concerns and pertinent information about AIC's facilities.

10. Low Pressure Situation

10. C. Low pressure may result from

10. C. (6): Revised - Unintentional shutting off or restricting gas supply to an area.

10. E. When low pressure situation is discovered, the following steps should be followed:

10. E. (3): Added lock meter valve for those customers affected.

10. E. (7): New - Identify critical customers such as hospitals, nursing homes, schools or other public facilities that may need additional support or temporary supply during an outage.

11. Over Pressure Situation

11. H.: Revised - Use valves to throttle or shut down the feed to the system until the pressure is within the normal operating range. Valves shall be constantly monitored until high pressure situation is corrected.

11. L.: New - If the MEP has been exceeded, consideration should be made to at least communicate with the local fire department and/or police in case their assistance may be needed.

12. Loss and Restoration of Service

	<p>12. D.: New - Identify critical customers such as hospitals, nursing homes, schools or other public facilities that may need additional support or temporary supply during an outage.</p> <p>12. M.: Turn-off requirement for an outage</p> <p>12. M.(1): Revised - Turn-off the meter valve or curb valve for each affected customer: The meter valve is required to be locked</p> <p><i>Requires locking the meter valve to ensure customer does not attempt to re-light during the outage,</i></p> <p>12. N.: For cases where the turn-off cannot be completed without forcible entry:</p> <p>12. N. (5) (a): New - Leave a door hanger or notice notifying the customer that due to an emergency, AIC had to make a forcible entry.</p> <p>12. N. (5) (b): New - Door hanger or notice shall contain AIC's contact number 800-755-5000.</p> <p>12. N. (6): Revised - Document damage to the premise from the forced entry along with the names of those present.</p> <p><i>Note: If police officer witnessed the forced entry, record the officer's name and badge number.</i></p> <p>12. T.: Turn-on requirements for an outage:</p> <p>Removed sentence if service is not restored the meter valve shall be left off and locked.</p> <p><i>Meter valve is locked during the turn-off process.</i></p>
<p>EMER 2.05</p>	<p>Natural Disasters or Civil Disobedience - The following changes were made based on discussions between the EERC representative and EMER Investigation SMR team.</p> <p>2. Natural Disasters</p> <p>2. D.: If AIC facilities are damaged or in danger of failing. Communicate with the appropriate fire department the potential impact on AIC's facilities.</p> <p>2. I.: In devastated areas where there is uncontrolled over pressure of release of large amounts of gas. The local fire department should be notified of the situation and the potential impact.</p> <p>3. Floods</p> <p>3. A. (3): Prior to flooding: Individual services should be shut off and locked with priority given to inside services.</p> <p>3. A. (5): If water covers pilots on interior appliances, the service should be shut off and a Warning Tag issued.</p> <p>4. Civil Disobedience</p> <p>4. B. (5): If violence or any threat to AIC personnel's safety persists, personnel and surveillance patrols should be withdrawn from the area. Law enforcement and Ameren Security shall be notified.</p>

<p>EMER 2.08</p>	<p>Investigation of Failures The following changes were made based on discussions between the EERC representative and EMER Investigation SMR team.</p> <p style="text-align: center;">2. Analysis of Failed or Defective Materials</p> <p>2. B.: Added "interim information communicated to operations" so decisions can be made concerning the need to take corrective action.</p>
<p><u>INCD 1</u></p>	<p>Incident Report Requirements: Part 191 now requires a release of gas from a natural gas underground storage be included in the reporting requirements. IDNR requires an incident resulting from release of stored gas from the downhole portion of a storage well must be reported. Therefore, gas underground storage facilities and Superintendent/Supervisor Gas Storage has been added throughout INCD 1. The incident reporting matrix has been updated. In addition, INCD 1 was reviewed by a representative of Expert Emergency Response Consultant (EERC). Some revisions were made in INCD 1 based on discussions between the EERC representative and John Bozarth. The following are the major additions to the Incident Reporting requirements:</p> <p style="text-align: center;">1. Objective</p> <p style="text-align: center;">1. B.: Added - underground natural to gas storage facilities.</p> <p style="text-align: center;">1. C.: Added - Supervisor Gas Storage</p> <p>1. C. (1): New - Gas personnel or storage field personnel shall promptly verbally notify Gas Supervisor or Supervisor Gas Storage when there is a potentially reportable incident.</p> <p style="text-align: center;">2. Natural Gas Incident</p> <p>2. A.: Added - including an underground natural gas storage facility including the downhole portion of an underground natural gas storage facility</p> <p style="text-align: center;">2. A. (2): Clarified - in-patient hospitalization means at least one overnight stay</p> <p>2. A. (5): New - Unintentional estimated gas loss from the downhole portion of an underground natural gas storage facility of 500,000 cubic feet or more that occurs within 1/8 mile of a dwelling used as a residence, place of business or place of public assembly.</p> <p style="text-align: center;">3. Potential Significant Event</p> <p style="text-align: center;">3. B.: Added - including an underground natural gas storage facility as an AIC facility where a release of gas shall be reported to Gas Compliance.</p> <p style="text-align: center;">4. Courtesy Notification</p> <p>4. A. (5): New item which may warrant a courtesy notification - Odorizer failure resulting in either over odorization or under odorization.</p> <p style="text-align: center;">6. Reporting</p> <p>6. A.: Added - Gas Superintendent and Superintendent/Supervisor Gas Storage to those who shall contact Gas Compliance within 1 hour following confirmed discovery</p>

	<p>6. A. Note: Added - Confirmed discovery - See GLOS</p> <p>6. B.: Added- Illinois Department of Natural Resources (IDNR) as another agency that Compliance must notify. 8. A. Table - Report within 1 hour of confirmed discovery:</p> <p>13.; New - Unintentional estimated gas loss from the downhole portion of an underground natural gas storage facility of 500,000 cubic feet or more that occurs within 1/8 mile of a dwelling used as a residence, place of business or place of public assembly.</p> <p>8. B. Table of agencies that Gas Compliance contact:</p> <p>Added - IDNR when the incident is the result of stored natural gas from downhole portion of gas storage facility.</p>
<p>INVE 1</p>	<p>Investigation of Incidents: Requirements - Following changes are a result of the review by Expert Emergency Response Consultant and discussions John Bozarth. The major changes are as follows:</p> <p>1. Objective - Added confidential before investigation</p> <p>2. General</p> <p>2. D. (3); New - Where gas is determined not to be a contributing factor consult with Ameren Claims to determine if any evidence needs to be retained in Ameren Illinois custody.</p> <p>2. F.: Revised - Gas facilities that may have failed or may have been impacted must be preserved and kept in a secured location until Corporate Claims specifies a location where facilities can be analyzed.</p> <p>3. NTSB Investigation of Incident</p> <p><i>This is a new section that has been added to provide instructions and guidance to gas personnel in the event NTSB launches an investigation of an incident.</i></p>
<p>INVE 2.01</p>	<p>Incident Investigation</p> <p>2. Investigation Documentation</p> <p>2. C.: New - Once Ameren Claims personnel are on the scene, they will normally be taking the photos and documenting the investigation. Only one designated person should be taking photos and documenting the investigation in order to eliminate the possibility of conflicting information if situation becomes a legal issue.</p> <p>2. I.: Added - Where applicable, include witness' agency, title and email address.</p> <p>2. J.: Added - (avoid including any speculation)</p> <p>2. K.: Word change - accessed replaces forfeited.</p> <p>Deleted reference to the 35 mm camera being used to supplement the investigation.</p> <p><i>Gas field personnel will have to provide access to photos taken of an incident with their cell phone if the photos are needed as evidence.</i></p>

	<p>2. L.: Revised - Pay special attention to areas which may include:</p> <p>2. L (9): New - Consider any other areas of interest such as sewer traps, sewer clean-outs, etc</p> <p>2. N.: Added - Interview the witnesses by asking the following questions. If witnesses are going to be available, consider waiting until Ameren Claims personnel arrive.</p> <p>2. N. (1): Revised - Describe what happened, including what was observed.</p> <p style="text-align: center;">3. Investigation of AIC Facilities</p> <p style="text-align: center;">3. D.: Check the odorant level of the gas with an odorator.</p> <p>3. D. (1): Revised - In addition to the reading performed by a qualified AIC gas personnel, request that a public official, (i.e. Police or Fire Department personnel), check the readily detectable odorant level.</p> <p style="text-align: center;">5. Analysis of the Incident</p> <p>5. D.: Revised - The report shall also contain supporting documentation as well as establishing the apparent cause of the incident.</p> <p style="text-align: center;">6. Preservation of Evidence</p> <p>6. A.: Addition - Information collected through the investigation and analysis of the gas related incident should be preserved as prescribed by AIC Gas Compliance and Ameren Legal/Claims.</p>
<p>INVE 2.02</p>	<p style="text-align: center;">Investigation of Fires</p> <p style="text-align: center;">1. General</p> <p>1. A.: Addition - This section provides instructions for investigation of the apparent cause of a gas related fire, ignition, or explosion.</p> <p style="text-align: center;">2. Fire, Ignition or Explosion Investigation</p> <p>2. A.: Addition - AIC's first and foremost concern is to respond to the scene promptly, deal with any hazardous conditions that may be present, cooperate in any investigation and to render any assistance to emergency personnel that may be requested.</p> <p style="text-align: center;">5. Communication with Fire Department</p> <p>5. A.: Revised - Once determined that natural gas is suspected or confirmed to have been involved in the incident, gas field personnel should limit discussions with the Fire Departments to a designated AIC individual while continuing to cooperate to make the scene safe for the fire department and general public.</p> <p>5. B.: Revised - Any requests for investigation results should be directed to Ameren Legal/Claims.</p> <p>5. D.: Addition - The content of the investigation should remain confidential and should not be released to anyone external to Ameren without approval from Ameren Legal/Claims.</p>
<p>LEAK 2.01</p>	<p>Indoor Leak Investigation: The major change is lower the hazardous condition threshold to 10% LEL. Research provided by EERC indicated 10% LEL is becoming the industry standard. If 10% LEL is registered at the door, there</p>

is going to be higher concentrations somewhere in the structure which could be in the explosive range. Other major changes are to provide additional protection to the public and workers.

1. D.: Hazardous conditions downgrade to 10% LEL from 30%.

3. Approaching Structure

3. B.: Revised - Before touching the gas meter, check the riser, meter and customer piping with volt stick. If voltage stick alarms refer to **METR 2.20 2.**

A. AC Voltage on Meter Set.

3. D.: New - Before entering ensure all personnel electronic devices, such as cell phones, are powered off and all intrinsically safe equipment, such as CGI and flashlight, is powered on.

Caution: The flashlight on the volt stick is not intrinsically safe and should be left off while inside.

4. Customer is Home

4. A. Upon entering the structure;

4. A. (3): New - Advise customer not to operate any switches or use any electronic devices, such as cell phone, while the investigation is being conducted.

4. A. (4): New - Continue to monitor the atmosphere while moving to the area where the odor is suspected.

4. C.: Revised - An indoor concentration at the entrance of the structure or throughout the structure of **10% LEL (0.5% Gas-In-Air)** or greater is an immediate hazard, and the structure should be evacuated and **EMER 2.04 2.** Inside Odor Compliant - Hazardous Condition implemented.

4. D. Carbon monoxide reading of 100 PPM or greater

4. D. (1): (b) New - Call 911, the fire department may assist with the evacuation and ventilation.

4. D. (2): Added - Issue a Warning Tag and advise customer to contact a qualified professional to have the system checked.

5. Customer Not Home or Can't Get Into Structure

5. A. Revised - Before touching the gas meter, check the riser, meter and customer piping with volt stick. If voltage stick alarms refer to **METR 2.20 2.**

A. AC Voltage on Meter Set.

6. Leaks on Customer Facilities

6. A. (2): Added - If simple repair cannot be made notify customer of the gas leak and advise customer they should have a qualified professional make the repairs.

LEAK 2.02

Outdoor Leak Investigation - There are a few proposed additions that EERC felt would improve these procedures.

4 Above Grade Gas Facilities

4. A. (6): New - Customer owned natural gas facilities such as; standby generators, pool heaters, barbecue, etc

	<p style="text-align: center;">7. Hazardous Conditions</p> <p style="text-align: center;">7. A. (4): New - Suspected damaged gas facility.</p> <p style="text-align: center;"><i>Added to the list of conditions that should be considered when determining if there is a hazardous condition.</i></p> <p>7. C.; Revised - If necessary, request additional resources to establish and maintain a safety zone to prevent unauthorized personnel from entering until repairs are made or the situation made safe.</p> <p style="text-align: center;">8. Leaks on Customer Owned Facilities</p> <p>8. A. (2): Revised - If simple repairs cannot be made notify customer of the gas leak and advise customer they should have a qualified professional make the repairs. Consistent language with LEAK 2.01.</p>
<p>LEAK 2.04</p>	<p>Leak Classification and Surveillance - EERC felt leak classification criteria needed to be simplified and consistent with the industry's position that any gas reading within 5 feet of a foundation would be classified a Grade 1 regardless of the volume. EERC didn't have any objections to the 2% LEL or less outside the 5 feet from the foundation. As for foreign gas. EERC felt that AIC should contact the appropriate authority when foreign gas was detected.</p> <p style="text-align: center;">7. Foreign Gas</p> <p style="text-align: center;">7. A. (5): Added - Natural gas from another supplier or utility.</p> <p>7. C.: New - Contact Dispatch to notify the appropriate authority such as; fire department, municipal sewer department or pipeline company.</p> <p style="text-align: center;">8. Leak Surveillance, Repair and Recheck Schedule</p> <p>8. A. (1): Revised - Class 1 leak requires immediate repair or continuous action until the hazardous condition no longer exists. Immediate temporary measures, such as venting may be employed to protect the public and property; however, the leak remains a Class 1 leak until approved repairs are made.</p> <p style="text-align: center;">10. Repaired Leak Recheck</p> <p style="text-align: center;">10. A. Below Grade</p> <p>10. A. (3) (b): Revised - If residual gas readings are detected within zero (0) to five (5) feet from the foundation wall:</p> <ul style="list-style-type: none"> • Daily readings shall be performed until there is a 0% LEL gas reading. • If daily readings show increased levels of gas, a check shall be made for gas migration inside the structure. <p style="text-align: center;"><i>Clarifies when checking inside for migration is required.</i></p>
	<p style="text-align: center;">The following major changes are based on proposals from SMR Teams</p>
<p>ABND 2.01</p>	<p style="text-align: center;">Abandonment of Gas Facilities</p> <p style="text-align: center;">2. Project Specific Procedures - New section</p>

A. Gas Tech Engineering or Gas Storage Engineer shall prepare written project specific procedures for abandoning facilities on projects that meet the following criteria:

- (1) Transmission facilities, or
- (2). High pressure distribution facilities with MAOP over 100 psig, or
- (3) Joint abandonment of transmission lines or high pressure distribution mains with MAOP over 100 psig with connected services.

Note: If the abandonment is a result of an emergency project or maintenance project, Division Gas Supervisor or Engineer should ensure the abandonment job packet is submitted to GTE.

B. Engineering personnel (i.e. Distribution Design Specialist or Engineer, Division Gas Engineer) shall prepare written project specific procedures for abandoning facilities on projects that meet the following criteria:

- (1) Distribution facilities with MAOP of 61 psig to an including 100 psig, and
- (2) Joint abandonment of distribution main with 10 or more connected services.

C. Procedures will include, at a minimum

- (1) Operational Checklist, refer to PRES 2.03
- (2) Written procedures along with maps should address such issues as:
- (3) Purge plan in accordance with PURG 2.01 - Purging Methods.

D. A pre-job meeting should be held to review the written procedures.

Changes were made to clarify when engineering prepared abandonment plans are required and to provide more guidance on should be included in those plans. Changes were also made in PURG 2.01 for consistency in expectations.

4. Services

4. A. (10): Revised - Service lines that are two (2) inches or larger in nominal diameter shall be purged as main when the service line is:

- (a) 500 feet or longer and operating at 100 psig or less, or
- (b) 100 feet or longer and operating above 100 psig.
- (c) See **PURG 2.01.5. Purging of Gas with Air During Abandonment.**

Expanded to be consistent with PURG 2.01 language to avoid confusions.

**METR
2.20**

Meter Header Inspection

Has been modified to one list of items to be checked whenever there is any work being performed on a meter set. Eliminated the distinction between if a meter set is disassembled or not. Thereby eliminating duplicate lists.

4. Inspection of a Meter Set

4. B. The following items should be checked:

Simplified and clarified the listing of items such as:

	<p style="text-align: center;">4. B. (6) Meter partially buried or setting on ground</p> <p style="text-align: center;">4. B. (7) Regulator relief not freely vented to the atmosphere</p> <p>4. B. (11) Change the Note to a Warning: If the regulator may contain mercury, do not replace, remove or disturb without specific instructions from Ameren Environmental. See ABND 2.08.</p> <p>4. E.: Revised - Deficiencies should be corrected immediately or documented in ClickMobile and reported to the Gas Supervisor for follow-up action.</p> <p>4. F.: If meter set is being disassembled, the following corrective action should be taken in addition to the inspection:</p>
<p>POLY 2.02</p>	<p style="text-align: center;">Squeeze Off</p> <p style="text-align: center;"><i>Procedures have been revised to meet Performance Pipe's recommended practice contained in their Technical Note PP-801-TN. The squeeze rate and release rate is based on the recommendation in ASTM 1041.</i></p> <p style="text-align: center;">2. Operation</p> <p>2. B. (1): New - Do not squeeze if there is a scratch deeper than 10% of wall thickness.</p> <p>2. G. (2): Revised - If air temperatures are near freezing or lower, closure should be slowed to approximately 2 minutes per inch of pipe's designated diameter.</p> <p>2. J.: Revised - When placing pipe back in service, slowly release the squeeze in a controlled rate at approximately 2 minutes per inch of pipe's designated diameter to allow the pipe to relax.</p>
<p>POLY 2.05</p>	<p style="text-align: center;">Electrofusion</p> <p style="text-align: center;">6. Pipe Preparation</p> <p>6. A. (4) (b): Added back in the insertion depth of 2-1/4" the Central Plastic 2 inch elbow.</p> <p>6. A. (5): Added back into the cleaning instructions. "wiping in one direction and discarding wipe or towel"</p> <p style="text-align: center;"><i>These 2 items were inadvertently left out when format of POLY 2.05 was changed to text vs chart in the October 1, 2019 Update. Wiping in one directions and discarding towel is in Central Plastic's electrofusion training instructions.</i></p>
<p>PURG 2.01</p>	<p style="text-align: center;">Purging Methods</p> <p style="text-align: center;">1. General</p> <p style="text-align: center;">1. A.: Reformatted, expanded -</p> <p>A. This section outlines the procedures to be followed when purging:</p> <ul style="list-style-type: none"> (1) Transmission lines. (2) High pressure distribution mains. (3) Distribution mains

- (4) Service lines 2 inches and larger and 500 feet or longer.
 - (5) Service lines 2 inches and larger, 100 feet or longer and operating above 100 psig.
- B. Gas Engineering, Gas Tech Engineering (GTE) or Gas Storage Engineer will provide detailed purging plans, prior to blow-down or purging operations on: (Refer to tables below)
- (1) Transmission lines 100 feet and longer.
 - (2) High pressure distribution mains 100 feet and longer.
 - (3) Service lines 2 inch and larger, and
 - (a) 100 feet or longer in length, and
 - (b) Operating at more than 100 psig.
 - (4) Projects utilizing an air mover.

Reformatted and revised to be consistent with ABND 2.01 and tables in PURG 2.01.

5. Purging of Gas with Air During Abandonment

5. F.: Word changes - The 2 tables

Service Line Smaller than 2 inch and less than 500 feet in length
and

Service Line Smaller than 2 inch but 500 feet or longer in length

Needed corrected to be consistent with ABND 2.01.

5. F. Tables: Added the following 2 items that require a Purge Plan in the Operating Pressure 100 PSIG or Less table:

Air Mover utilized to purge

Joint Abandonment of Distribution Main and Services (**ABND 2.01** 2. B.)

Added the following 2 items that require a Purge Plan in the Operating Pressure Greater than 100 PSIG table:

Air Mover utilized to purge

Joint Abandonment of Transmission Line or HP Distribution Main and Services (**ABND 2.01** 2. A.)

Joint abandonment is addressed in ABND 2.01 and the air mover is addressed in PURG 2.01 8. They were added to the table to avoid confusion as to expectations.

**SERV
2.02**

Excess Flow Valves or Manual Shut-Off Valves

8. EFV Sizing

8. E.: Added - 2 inch IPS

8. F.: Reformatted and Revised -

8. F. When selecting an EFV the following should be taken into consideration:

	<p>(1) Lowest anticipated inlet pressure - cannot drop below 10 psig.</p> <p>(2) Service line size (i.e. 1" CTS requires 1" EFV).</p> <p>(3) Length of service line must be less than maximum length in the tables below.</p> <p>(4) Maximum capacity of the meter being specified or could be specified shall not exceed maximum design flow in tables below.</p> <p style="text-align: center;">8. G. EFV Sizing Tables</p> <p style="text-align: center;">8. G. (4): Added new 2 inch UMAC Series 5500 EFV.</p> <p style="text-align: center;">8. G. (2) & (3): Update Maximum Flow and Maximum Length values.</p> <p style="text-align: center;"><i>Ran all of our UMAC EFVs through UMAC's updated sizing calculator and updated the tables for the 1 inch and 2 inch EFVs</i></p> <p style="text-align: center;">8. G. (6): Correct stock code, 39 22 635, for the 1" x 1/2" CTS reducer coupling with EFV.</p>
--	---

Complete Change Summary (current documents dated April 1, 2020 unless otherwise noted)		
Document	Change Summary	Previous Document Dated
ABND 0	<p style="text-align: center;">Table of Contents</p> <p style="text-align: center;">ABND 2.01: insert new 2. Project Specific Procedures</p> <p style="text-align: center;">Removed Joint Abandonment of Transmission Lines or Distribution Mains and Services</p> <p style="text-align: center;">ABND 4: Removed Forms section. Purge Stamp had been moved to PURG 4</p>	April 1, 2019
ABND 2.01	<p style="text-align: center;">Abandonment of Gas Facilities</p> <p style="text-align: center;">2. Project Specific Procedures - New section</p> <p>A. Gas Tech Engineering or Gas Storage Engineer shall prepare written project specific procedures for abandoning facilities on projects that meet the following criteria:</p> <p style="text-align: center;">(1) Transmission facilities, or</p> <p style="text-align: center;">(2). High pressure distribution facilities with MAOP over 100 psig, or</p> <p>(3) Joint abandonment of transmission lines or high pressure distribution mains with MAOP over 100 psig with connected services.</p> <p style="text-align: center;"><i>Note: If the abandonment is a result of an emergency project or maintenance project, Division Gas Supervisor or Engineer should ensure the abandonment job packet is submitted to GTE.</i></p> <p>B. Engineering personnel (i.e. Distribution Design Specialist or Engineer, Division Gas Engineer) shall prepare written project specific procedures for abandoning facilities on projects that meet the following criteria:</p> <p style="text-align: center;">(1) Distribution facilities with MAOP of 61 psig to an including 100 psig, and</p> <p style="text-align: center;">(2) Joint abandonment of distribution main with 10 or more connected services.</p>	October 15, 2018

UNCONTROLLED IF PRINTED

	<p>C. Procedures will include, at a minimum</p> <p>(1) Operational Checklist, refer to PRES 2.03</p> <p>(2) Written procedures along with maps should address such issues as:</p> <p>(3) Purge plan in accordance with PURG 2.01 - Purging Methods.</p> <p>D. A. Evacuating the structure....</p> <p>2. A.: Revised - Instruct them not to touch anything, operate any electrical switches or use any electronic devices as they exit.</p> <p>2. B.: Removed - if possible</p> <p>2. B. Shut off the gas from outside the structure.</p> <p>4. Major Leaks or Line Breaks</p> <p>4. B.: Removed duplicate language that is covered in 4. B. (2) and (3).</p>	<p>October 1, 2019</p>

5. Gas in a Sewer - Hazardous Condition

5. D. Check adjacent structures for gas migration

5. D. (1): Lowered the hazardous condition threshold to 10% LEL when entering a structure. When evacuating the people have them move to a safe distance.

8. Explosion and /or Fire Near Gas Pipeline Facilities

8. C.: Shall replaces should. Gas field personnel shall notify a Gas Supervisor.

8. F.: Revised - Gas field personnel should also attempt to make contact with the Fire Chief or fireman in charge at the scene and communicate AIC's concerns and pertinent information about AIC's facilities.

10. Low Pressure Situation

10. C. Low pressure may result from

10. C. (6): Revised - Unintentional shutting off or restricting gas supply to an area.

10. E. When low pressure situation is discovered, the following steps should be followed:

10. E. (3): Added - lock meter valve for those customers affected.

10. E. (7): New - Identify critical customers such as hospitals, nursing homes, schools or other public facilities that may need additional support or temporary supply during an outage.

11. Over Pressure Situation

11. D.: Shall replaces should. Gas field personnel shall immediately notify Gas Supervisor if the system's pressures are above the MAOP of the system.

11. H.: Revised - Use valves to throttle or shut down the feed to the system until the pressure is within the normal operating range. Valves shall be constantly monitored until high pressure situation is corrected.

11. K.: Revised - In the event that the system pressure has exceeded the MEP, the Gas Supervisor shall immediately contact Gas Superintendent, Supervisor Gas Tech Services and Director Pipeline Safety and Compliance. See **PRES 2.04** Overpressure Reporting for additional information.

11. L.: New - If the MEP has been exceeded, consideration should be made to at least communicate with the local fire department and/or police in case their assistance may be needed.

12. Loss and Restoration of Service

12. B.: Grammatical changes, separated 1st sentence into 2 sentences.

12. D.: New - Identify critical customers such as hospitals, nursing homes, schools or other public facilities that may need additional support or temporary supply during an outage.

12. G.: Revised - The following should be notified of the loss of service.

12. J.: Revised - Estimate manpower needs. The following should be considered when determining the appropriate staffing levels to respond to the emergency

12. G. and 12. J. removed Gas Supervisor from being the person who performs the function. These can be done by others so supervisor can concentrate operational duties.

12. M.: Turn-off requirement for an outage

12. M.(1): Revised - Turn-off the meter valve or curb valve for each affected customer: The meter valve is required to be locked

	<p><i>Requires locking the meter valve to ensure customer does not attempt to relight during the outage,</i></p> <p>12. N.: For cases where the turn-off cannot be completed without forcible entry:</p> <p>12. N. (5) (a): New - Leave a door hanger or notice notifying the customer that due to an emergency, AIC had to make a forcible entry.</p> <p>12. N. (5) (b): New - Door hanger or notice shall contain AIC's contact number 800-755-5000.</p> <p>12. N. (6): Revised - Document damage to the premise from the forced entry along with the names of those present.</p> <p><i>Note: If police officer witnessed the forced entry, record the officer's name and badge number.</i></p> <p>12. T.: Turn-on requirements for an outage:</p> <p>Removed the sentence that safety checks are not required.</p> <p>12. T. (2); "Shut in test" replaces "leak test"</p> <p>12. T. (3): "Shut in test" replaces "leak test"</p> <p>12. T. (7): Revised - AIC personnel contact an HVAC contractor to correct this type of appliance problem at AIC's expense.</p> <p>Removed sentence if service is not restored the meter valve shall be left off and locked.</p> <p><i>Meter valve is locked during the turn-off process.</i></p>	
<p>EMER 2.05</p>	<p>Natural Disaster or Civil Disobedience</p> <p>AIC replaces Ameren Illinois throughout the document.</p> <p>2. Natural Disasters</p> <p>2. B.: GTS personnel will assume responsibility for their facilities.</p> <p>2. D.: Revised - Determine if AIC facilities are damaged or in danger of failing. Communicate with the appropriate fire department the potential impact on AIC's facilities.</p> <p>2. G.: Position title change: Director Pipeline Safety & Compliance.</p> <p>2. I.: Addition - In devastated areas where uncontrolled overpressure exists or large amounts of gas are released. The local fire department should be notified of the situation and potential impact.</p> <p>3. Floods</p> <p>3. A. Prior to Flooding</p> <p>3. A.: GTS replaces the appropriate group in Gas Operations and Services.</p> <p>3. A. (3): Revised - Individual services should be shut off and locked with priority given to inside services.</p> <p>3. A. (5): Revised - If water covers pilots on interior appliances, the service should be shut off and a Warning Tag issued</p> <p>4. Civil Disobedience</p> <p>4. B. (5): Revised - If violence or any threat to AIC personnel's safety persists, personnel and surveillance patrols should be withdrawn from the area. Law enforcement and Ameren Security shall be notified.</p>	<p>January 1, 2018</p>
<p>EMER 2.08</p>	<p>Investigation of Failures</p> <p>AIC replaces Ameren Illinois throughout the document</p>	<p>April 1, 2019</p>

UNCONTROLLED IF PRINTED

	<p>2. Analysis of Failed or Defective Materials</p> <p>2. B.: Revised - By collecting and inspecting failed materials at a central location, the potential impact of the failures can be assessed, interim information communicate to operations and system-wide decisions can then be made concerning the need to take preventive measures.</p>

<p>INVE 0</p>	<p>Table of Contents</p> <p>INVE 1: Added 3. NTSB Investigation of Incident</p>	<p>January 1, 2016</p>

UNCONTROLLED IF PRINTED

	<p>INVE 4: Added Reference 1. NTSB Pipeline Investigation Guide (Wilson Elser 2019)</p>	
<p>INVE 1</p>	<p>Requirements</p> <p>1. Objective - Added confidential before investigation</p> <p>2. General</p> <p>2. C. Added a reference to INVE 2.01 3. <i>that provides more information concerning inspection of AIC gas facilities.</i></p> <p>2. D. (3); New - Where gas is determined not to be a contributing factor consult with Ameren Claims to determine if any evidence needs to be retained in Ameren Illinois custody.</p> <p>2. F.: Revised - Gas facilities that may have failed or may have been impacted must be preserved and kept in a secured location until Corporate Claims specifies a location where facilities can be analyzed.</p> <p>3. NTSB Investigation of Incident</p> <p><i>This is a new section that has been added to provide instructions and guidance to gas personnel in the event NTSB launches an investigation of an incident.</i></p>	<p>January 1, 2016</p>
<p>INVE 2.01</p>	<p>Incident Investigation</p> <p>2. Investigation Documentation</p> <p>2. C.: New - Once Ameren Claims personnel are on the scene, they will normally be taking the photos and documenting the investigation.</p> <p><i>Only one designated person should be taking photos and documenting the investigation in order to eliminate the possibility of conflicting information if situation becomes a legal issue.</i></p> <p>2. I.: Added - Where applicable, include witness' agency, title and email address.</p> <p>2. J.: Added - (avoid including any speculation)</p> <p>2. K.: Word change - accessed replaces forfeited.</p> <p>Deleted reference to the 35 mm camera being used to supplement the investigation.</p> <p><i>Gas field personnel will have to provide access to photos taken of an incident with their cell phone if the photos are needed as evidence.</i></p> <p>2. L.: Revised - Pay special attention to areas which may include:</p> <p>2. L (9): New - Consider any other areas of interest such as sewer traps, sewer clean-outs, etc</p> <p>2. N.: Added - If witnesses are going to be available, consider waiting until Ameren Claims personnel arrive.</p> <p>2. N. (1): Revised - Describe what happened, including what was observed.</p> <p>3. Investigation of AIC Facilities</p> <p>3. D.: Check the odorant level of the gas with an odorator.</p> <p>3. D. (1): Revised - In addition to the reading performed by a qualified AIC gas personnel, request that a public official, (i.e. Police or Fire Department personnel), check the readily detectable odorant level.</p>	<p>January 1, 2018</p>

	<p>5. Analysis of the Incident</p> <p>5. D.: Revised - The report shall also contain supporting documentation as well as establishing the apparent cause of the incident.</p> <p>6. Preservation of Evidence</p> <p>6. A.: Addition - Information collected through the investigation and analysis of the gas related incident should be preserved as prescribed by AIC Gas Compliance and Ameren Legal/Claims.</p>	
INVE 2.02	<p>Investigation of Fires</p> <p>1. General</p> <p>1. A.: Addition - This section provides instructions for investigation of the apparent cause of a gas related fire, ignition, or explosion.</p> <p>2. Fire, Ignition or Explosion Investigation</p> <p>2. A.: Addition - AIC's first and foremost concern is to respond to the scene promptly, deal with any hazardous conditions that may be present, cooperate in any investigation and to render any assistance to emergency personnel that may be requested.</p> <p>5. Communication with Fire Department</p> <p>5. A.: Revised - Once determined that natural gas is suspected or confirmed to have been involved in the incident, gas field personnel should limit discussions with the Fire Departments to a designated AIC individual while continuing to cooperate to make the scene safe for the fire department and general public.</p> <p>5. B.: Revised - Any requests for investigation results should be directed to Ameren Legal/Claims.</p> <p>5. D.: Addition - The content of the investigation should remain confidential and should not be released to anyone external to Ameren without approval from Ameren Legal/Claims.</p>	January 1, 2018
INVE 4	<p>Forms and Reference Materials</p> <p>Reference Materials - New</p> <p>NTSB Pipeline Investigation Guide (Wilson Elser 2019)</p>	January 1, 2016
LEAK 2.01	<p>Indoor Leak Investigation</p> <p>1. D.: Hazardous conditions downgrade to 10% LEL from 30%.</p> <p>3. Approaching Structure</p> <p>3. B.: Revised - Before touching the gas meter, check the riser, meter and customer piping with volt stick. If voltage stick alarms refer to METR 2.20 2. A. AC Voltage on Meter Set.</p> <p>3. D.: New - Before entering ensure all personnel electronic devices, such as cell phones, are powered off and all intrinsically safe equipment, such as CGI and flashlight, is powered on.</p> <p><i>Caution: The flashlight on the volt stick is not intrinsically safe and should be left off while inside.</i></p> <p>4. Customer is Home</p> <p>4. A. Upon entering the structure;</p> <p>4. A. (3): New - Advise customer not to operate any switches or use any electronic devices, such as cell phone, while the investigation is being conducted.</p>	October 1, 2019

UNCONTROLLED IF PRINTED

	<p>4. A. (4): New - Continue to monitor the atmosphere while moving to the area where the odor is suspected.</p> <p>4. C.: Revised - An indoor concentration at the entrance of the structure or throughout the structure of 10% LEL (0.5% Gas-In-Air) or greater is an immediate hazard, and the structure should be evacuated and EMER 2.04 2. Inside Odor Compliant - Hazardous Condition implemented.</p> <p>4. D. Carbon monoxide reading of 100 PPM or greater</p> <p>4. D. (1): (b) New - Call 911, the fire department may assist with the evacuation and ventilation.</p> <p>4. D. (2): Added - Issue a Warning Tag and advise customer to contact a qualified professional to have the system checked.</p> <p>5. Customer Not Home or Can't Get Into Structure</p> <p>5. A. Revised - Before touching the gas meter, check the riser, meter and customer piping with volt stick. If voltage stick alarms refer to METR 2.20 2. A. AC Voltage on Meter Set.</p> <p>6. Leaks on Customer Facilities</p> <p>6. A. (2): Added - If simple repair cannot be made notify customer of the gas leak and advise customer they should have a qualified professional make the repairs.</p>	
<p>LEAK 2.02</p>	<p>Outdoor Leak Investigation</p> <p>2. Approaching Area</p> <p>2. B.: Word change, odor replaced leak</p> <p>4 Above Grade Gas Facilities</p> <p>4. A. (1): - Revised - Meter set: Before touching the gas meter, check the riser, meter and customer piping with volt stick. If voltage stick alarms refer to METR 2.20 2. AC Voltage on Meter Set.</p> <p>4. A. (6): New - Customer owned natural gas facilities such as; standby generators, pool heaters, barbecue, etc</p> <p>7. Hazardous Conditions</p> <p>7. A. (4): New - Suspected damaged gas facility.</p> <p><i>Added to the list of conditions that should be considered when determining if there is a hazardous condition.</i></p> <p>7. C.; Revised - If necessary, request additional resources to establish and maintain a safety zone to prevent unauthorized personnel from entering until repairs are made or the situation made safe.</p> <p>8. Leaks on Customer Owned Facilities</p> <p>8. A. (2): Revised - If simple repairs cannot be made notify customer of the gas leak and advise customer they should have a qualified professional make the repairs.</p> <p><i>Consistent language with LEAK 2.01.</i></p>	<p>October 1, 2019</p>
<p>LEAK 2.04</p>	<p>Leak Classification and Surveillance</p> <p>1. General</p> <p>1. A.: Revised - This section provides the criteria for properly classifying a gas leak.</p>	<p>October 1, 2019</p>

	<p><i>Removed "defines the gas leak classifications since that is done in LEAK 1 and doesn't need repeating.</i></p> <p>3. Description of Gas Leak Classification</p> <p><i>Replaced the descriptions with Reference to LEAK 1 3.</i></p> <p>4. Leak Classification Criteria</p> <p>4. C.: Added - or other facilities at a regulator station should be reported to Gas Tech Services.</p> <p>7. Foreign Gas</p> <p>7. A. (5): Added - Natural gas from another supplier or utility.</p> <p>7. C.: New - Contact Dispatch to notify the appropriate authority such as; fire department, municipal sewer department or pipeline company.</p> <p>8. Leak Surveillance, Repair and Recheck Schedule</p> <p>8. A. (1): Revised - Class 1 leak requires immediate repair or continuous action until the hazardous condition no longer exists. Immediate temporary measures, such as venting may be employed to protect the public and property; however, the leak remains a Class 1 leak until approved repairs are made.</p> <p>8. B. (1): Revised - Surveillance - Class 2 leak is not an immediate hazard but does have the potential of becoming a hazard which requires a surveillance to be performed once every six (6) months.</p> <p>8. C. (1): Revised - Surveillance - Class 3 leak, non-hazardous but do require a surveillance shall be performed once every fifteen (15) months to ensure leak remains non-hazardous.</p> <p>10. Repaired Leak Recheck</p> <p>10. A. Below Grade</p> <p>10. A. (3) (b): Revised - If residual gas readings are detected within zero (0) to five (5) feet from the foundation wall:</p> <ul style="list-style-type: none"> • Daily readings shall be performed until there is a 0% LEL gas reading. • If daily readings show increased levels of gas, a check shall be made for gas migration inside the structure. <p><i>Clarifies when checking inside for migration is required.</i></p>	
<p>LEAK 2.12</p>	<p>Reporting Delayed Leak Response Time</p> <p>1. B: Revised - Leak response times shall be continuously monitored to ensure that AIC is in compliance with Illinois requirements.</p> <p>2. Delayed Response Time</p> <p>2. B.: Added text - A response time in excess of 60 minutes from the time of receipt of call for an indoor or outdoor leak is considered delayed and requires an explanation.</p>	<p>January 1, 2018</p>
<p>MAIN 2.02</p>	<p>Lowering or Realignment of Pipe</p> <p>3. Steel Pipe Maximum Potential Realignment Distance (Strip Back)</p> <p>3. B. Table: Correction In the 60 psig or less for 5 ft of lowering of pipe Grade A25 is 412 ft</p>	<p>April 1, 2019</p>

	<p style="text-align: center;">Updated: Ameren Public Awareness Program Emergency Responder Brochure Natural Gas Safety Flyer</p> <p style="text-align: center;">Added 11 new brochures that are distributed to various groups.</p>	
<p>PURG 0</p>	<p style="text-align: center;">Table of Contents</p> <p style="text-align: center;">Added - PURG 4 Forms and Reference Materials</p> <p style="text-align: center;">Form 1: Purge Stamp</p> <p style="text-align: center;"><i>Moved from ABND 4</i></p>	<p style="text-align: center;">October 15, 2018</p>
<p>PURG 2.01</p>	<p style="text-align: center;">Purging Methods</p> <p style="text-align: center;">1. General</p> <p style="text-align: center;">1. A.: Reformatted, expanded -</p> <p>A. This section outlines the procedures to be followed when purging:</p> <p style="padding-left: 40px;">(1) Transmission lines.</p> <p style="padding-left: 40px;">(2) High pressure distribution mains.</p> <p style="padding-left: 40px;">(3) Distribution mains</p> <p style="padding-left: 40px;">(4) Service lines 2 inches and larger and 500 feet or longer.</p> <p style="padding-left: 20px;">(5) Service lines 2 inches and larger, 100 feet or longer and operating above 100 psig.</p> <p>B. Gas Engineering, Gas Tech Engineering (GTE) or Gas Storage Engineer will provide detailed purging plans, prior to blow-down or purging operations on: (Refer to tables below)</p> <p style="padding-left: 40px;">(1) Transmission lines 100 feet and longer.</p> <p style="padding-left: 20px;">(2) High pressure distribution mains 100 feet and longer.</p> <p style="padding-left: 40px;">(3) Service lines 2 inch and larger, and</p> <p style="padding-left: 80px;">(a) 100 feet or longer in length, and</p> <p style="padding-left: 80px;">(b) Operating at more than 100 psig.</p> <p style="padding-left: 40px;">(4) Projects utilizing an air mover.</p> <p style="text-align: center;"><i>Reformatted and revised to be consistent with ABND 2.01 and tables in PURG 2.01.</i></p> <p style="text-align: center;">5. Purging of Gas with Air During Abandonment</p> <p style="text-align: center;">5. F.: Word changes - The 2 tables</p> <p style="padding-left: 40px;">Service Line Smaller than 2 inch and less than 500 feet in length</p> <p style="padding-left: 80px;">and</p> <p style="padding-left: 40px;">Service Line Smaller than 2 inch but 500 feet or longer in length</p> <p style="text-align: center;"><i>Needed corrected to be consistent with ABND 2.0.</i></p> <p>5. F. Tables: Added the following 2 items that require a Purge Plan in the Operating Pressure 100 PSIG or Less table:</p> <p style="padding-left: 40px;">Air Mover utilized to purge</p> <p style="padding-left: 20px;">Joint Abandonment of Distribution Main and Services (ABND 2.01 2. B.)</p>	<p style="text-align: center;">October 1, 2019</p>

UNCONTROLLED IF PRINTED

	<p>Added the following 2 items that require a Purge Plan in the Operating Pressure Greater than 100 PSIG table:</p> <p style="text-align: center;">Air Mover utilized to purge</p> <p style="text-align: center;">Joint Abandonment of Transmission Line or HP Distribution Main and Services (ABND 2.01 2. A.)</p> <p style="text-align: center;"><i>Joint abandonment is addressed in ABND 2.01 and the air mover is addressed in PURG 2.01 8. They were added to the table to avoid confusion as to expectations.</i></p> <p style="text-align: center;">7. Required Minimum Inlet Pressure</p> <p>7. A.: Added - Consult with Gas Tech Engineering for pipe sizes not shown in the Table 1 or Table 2.</p> <p style="text-align: center;">8. Vacuum Purge / Air Mover</p> <p>8. D.: Added engineering groups - When an air mover(s) is to be utilized to purge, Gas Engineering, GTE or Gas Storage Engineer will provide a purging plan using AGA's Purging Principals and Practice as a general basis for the plan</p>	
<p>PURG 4</p>	<p style="text-align: center;">Forms and Reference Materials - New section</p> <p style="text-align: center;">Moved Purge Stamp to PURG 4 from ABND 4.</p>	<p style="text-align: center;">New</p>
<p>REGS 2.06</p>	<p style="text-align: center;">Gas Heaters</p> <p style="text-align: center;">3. Indirect Heaters</p> <p style="text-align: center;">3. C.: Typical Spring Shut-down</p> <p style="text-align: center;">3. C. (3): Revised and reformatted</p> <p style="text-align: center;">(4) Where heater bypass provision exists:</p> <p style="text-align: center;">(a) Open bypass valve to heater.</p> <p style="text-align: center;">(b) Monitor downstream system pressure with pressure gauge.</p> <p style="text-align: center;">(c) Close inlet valve at heater so gas does not pass through heater coil.</p> <p style="text-align: center;">3. D. Typical Fall Start Up</p> <p style="text-align: center;">3. D. (16): New</p> <p style="text-align: center;">(16) Where heater bypass provisions exists:</p> <p style="text-align: center;">(a) Monitor downstream system pressure with pressure gauge.</p> <p style="text-align: center;">(b) Open inlet valve at heater so gas passes through the heater coil.</p> <p style="text-align: center;">(c) Verify heater outlet valve is in the open position and close bypass valve to heater.</p>	<p style="text-align: center;">January 1, 2018</p>
<p>REGS 3.01</p>	<p style="text-align: center;">Regulator Station Design</p> <p style="text-align: center;">GTE replaces Gas Tech Engineering throughout the document</p> <p style="text-align: center;">1. General</p> <p>1. C.: Revised - Regulator stations should be designed by Gas Tech Engineering (GTE).</p> <p style="text-align: center;">2 General Guidelines and Requirements</p> <p style="text-align: center;">2. E. Cathodic protection insulation</p> <p>2. E. (2): New - Install welded bolts and jumper wire/flange fink on one run. See CORR 3.13 Flange Fink Test Station for installation details.</p>	<p style="text-align: center;">April 1, 2019</p>

UNCONTROLLED IF PRINTED

	<p>2. E. (6): Revised - Cathodic protection design for station should be reviewed by the Corrosion Control, GTE, or Division Engineering personnel. Refer to CORR 2.01 for additional cathodic protection details.</p> <p>2. I.: Formatted into bullet points.</p> <p>3. Standardized Design Features</p> <p>3. L. Revised - Provide additional layer of protection (wrapping, FRP, rock shield, etc) on all pipe in contact with below grade pipe supports. For above grade pipe supports see CORR 2.23 3. B. (2) Preformed FRP Spacers -Type 120.</p> <p>3. 7.: Revised - 1" 289H (or equivalent)</p> <p>4. Standardized Regulator Station Drawings</p> <p>4. C.: Removed the language regarding the title block</p> <p>Updated the tables, removed: RS000 Title Block row and Outlet Flow Rate column.</p> <p>Reformatted the Notes below the table.</p> <p><i>These updates were provided by Gas Tech Engineering to improve cathodic protection monitoring, atmospheric corrosion at pipe supports.</i></p>	
<p>SERV 2.02</p>	<p>Excess Flow Valves or Manual Shut-Off Valve</p> <p>8. EFV Sizing</p> <p>8. E.: Added - 2 inch IPS</p> <p>8. F.: Reformatted and Revised -</p> <p>8. F. When selecting an EFV the following should be taken into consideration:</p> <p>(1) Lowest anticipated inlet pressure - cannot drop below 10 psig.</p> <p>(2) Service line size (i.e. 1" CTS requires 1" EFV).</p> <p>(3) Length of service line must be less than maximum length in the tables below.</p> <p>(4) Maximum capacity of the meter being specified or could be specified shall not exceed maximum design flow in tables below.</p> <p>8. G. EFV Sizing Tables</p> <p>8. G. (4): Added new 2 inch UMAC Series 5500 EFV.</p> <p>8. G. (2) & (3): Update Maximum Flow and Maximum Length values.</p> <p><i>Ran all of our UMAC EFVs through UMAC's updated sizing calculator and updated the tables for the 1 inch and 2 inch EFVs</i></p> <p>8. G. (6): Correct stock code, 39 22 635, for the 1" x 1/2" CTS reducer coupling with EFV.</p>	<p>October 1, 2019</p>
<p>TURN 2.01</p>	<p>Residential/Small Commercial Customer</p> <p>4. Existing Service Connect</p> <p>4. A.: Revised - Before touching the gas meter, check the riser, meter and customer piping with volt stick. If voltage stick alarms refer to METR 2.20 2. A. AC Voltage on Meter Set.</p> <p><i>Revised language for checking meter set with volt stick so that it is consistent throughout O&M.</i></p>	<p>October 1, 2019</p>

<p>TURN 2.03</p>	<p style="text-align: center;">Discontinuance or Transfer of Gas Service</p> <p style="text-align: center;">4. Hard Disconnect (Terminate Service)</p> <p>4. C.: Revised - Before touching the gas meter, check the riser, meter and customer piping with volt stick. If voltage stick alarms refer to METR 2.20 2. A. AC Voltage on Meter Set.</p> <p style="text-align: center;"><i>Revised language for checking meter set with volt stick so that it is consistent throughout O&M.</i></p>	<p style="text-align: center;">October 1, 2019</p>
<p>VALV 2.01</p>	<p style="text-align: center;">Valve Installation</p> <p style="text-align: center;"><i>All of the changes reflect incorporating gas storage field into these procedures.</i></p> <p>1. A.: Revised - This section provides requirements for the installation of pipeline valves, both emergency and non-emergency and storage field emergency and non-emergency master and wing valves.</p> <p>1. E.: New - Gas Storage Facility and Reservoir Engineering will provide the designation and location of emergency and non-emergency valves within gas storage field areas.</p> <p style="text-align: center;">5. Non-Emergency Valves</p> <p>5. B. Valves that could be used to sectionalize or isolate areas of a system such as:</p> <p style="text-align: center;">5. B. (4): New - Isolation of gas storage field wells</p> <p>5. C.: Revised - The location of these valves will be determined by the Gas Engineering, Gas Supervisor, Distribution Design Center, Gas Tech Engineering, Gas Storage Facility and/or Reservoir Engineers or Gas Storage Supervisor.</p> <p>5. D. As a guideline for placement of these valves ..</p> <p style="text-align: center;">5. D. (5): New - Gas storage field wells</p> <p style="text-align: center;">6. Valve Installation Operations</p> <p style="text-align: center;">6. A. Steel Valves</p> <p>6. A. (2): Revised - The valve body must be compatible with the pipeline and/or gas storage field wells on which it is being connected.</p>	<p style="text-align: center;">January 1, 2016</p>
<p>VALV 2.02</p>	<p style="text-align: center;">Valve Inspection and Maintenance</p> <p style="text-align: center;"><i>All of the changes reflect incorporating gas storage field into these procedures.</i></p> <p>1. A.: Revised - This section describes the inspection and maintenance procedures for all transmission, distribution emergency valves and gas storage field emergency and non-emergency valves.</p> <p style="text-align: center;">2. Valve Inspection</p> <p style="text-align: center;">2. A.: Valves inspected each calendar year</p> <p style="text-align: center;">2. A. (2): New - Each gas storage field emergency valve.</p> <p style="text-align: center;">2. A. (3): New - Each gas storage field master and wing valve.</p> <p style="text-align: center;">5 Records</p> <p>5. A.: Revised - The results of all emergency valve and gas storage field non-emergency valve inspections shall be recorded, by the qualified gas field personnel or gas storage field personnel performing the inspection, on the ClickMobile inspection form.</p>	<p style="text-align: center;">December 1, 2014</p>

	<p>5. B.: Revised - Any data correction or update should be reported on the Click-Mobile inspection form. Gas Supervisor, Gas Storage Field Supervisor, Gas Storage Facility/Reservoir Engineer or Gas Engineering is responsible for ensuring data corrections are made within Maximo.</p>	
WELD 0	<p>Table of Contents</p> <p>WELD 4: Updated References 10, 58, 59 & 60</p> <p>Added - 8 WPS's for Gas Storage Field Well Head Welding</p>	October 1, 2019
WELD 1	<p>Requirements</p> <p>1. D. Correction, remove "Dry" from Magnetic Particle Testing.</p>	October 1, 2019
WELD 4	<p>Updated References 10, 58, 59 & 60</p> <p>Added - WPS's for Storage Field Well Head Welding</p> <p>GS WH 01 H-40 to J-55 WPS BUTT ASME IX</p> <p>GS WH 02 J-55 to J-55 WPS BUTT ASME IX</p> <p>GS WH 03 K-55 to K-55 WPS BUTT ASME IX</p> <p>GS WH 04 K-55 to J-55 WPS BUTT ASME IX</p> <p>GS WH 05 K-55 to H-40 WPS BUTT ASME IX</p> <p>GS WH F01 K-55 to 4130 WPS Fillet ASME IX</p> <p>GS WH F02 J-55 to 4130 WPS Fillet ASME IX</p> <p>GS WH F03 H-40 to 4130 WPS Fillet ASME IX</p>	October 1, 2019
WWBG 2.01	<p>Hazardous Atmosphere</p> <p>3. Safe Zone</p> <p>3. B. Responding to a Small Diameter Cut PE Service</p> <p>3. B. (c): Revised - Squeeze off the service line from an above grade position with only an arm extended into the excavation. The head must remain out of the excavation, or</p> <p>3. B. (d): Use an above grade squeeze tool per POLY 2.02 3. Squeeze Off</p> <p><i>Made using above grade squeezer a separate point to eliminated the confusion that the above grade squeezer could only be used on small diameter PE services</i></p>	October 1, 2019

Supersedes: October 1, 2019

CHANGE SUMMARY

October 1, 2019

Change Summary October 1, 2019

Major Changes in this Update

Since there has been a regulatory ruling that only Operator Qualified people are allowed to operate our gas meter valve, the valve must be locked when the meter valve is used to shut-off the gas supply to the meter. There is one exception and that is when there is an outage an all of the meters have to be turned off, the valve does not have to be locked. Refer to EMER 2.04 10. for the details.

In the following O&M sections: EMER 2.04 6., EMER 2.04 7., LEAK 2.01 6. and LEAK 2.02 8. disconnecting and capping the meter outlet is no longer an approved method of isolating a leak. The meter valve is to be close and locked.

Leaks on customer facilities can still be isolated at the appliance control valve or at a customer valve downstream of the meter. In this case, the meter valve will be left on and unlocked.

METR 1 and TURN 2.01:

On new installation, either a System Bypass valve or a Lock Wing valve should be installed downstream of the meter outlet. It is encouraged to install one of these valve when replacing, relocating or rebuilding a meter set.

TURN 2.01;

Meter sets with System Bypass valve or customer valve, following a successful low flow test and shut-in test the meter valve can be left in the open position and the Bypass valve or customer valve closed. A Meter Relight Tag should be given to the customer.

If the low flow and shut-in test fails, the meter valve shall be closed and lock unless the leak can be isolated at the appliance control valve or customer valve.

SERV 1 10. A new service line where a meter is not installed shall have the meter valve closed and locked.

CORR 2.09 Application of the Denso 7125, 7200 and 7300 products are to be done in accordance with Denso's instructions in the Reference Materials section of CORR 4.

EMER 2.04 When responding to Outdoor Odor Complaints or Major Leaks or Line Breaks gas field personnel must first ensure that gas has not migrated into nearby structures or sewer lines before they begin to determine the extent of the migration.

LEAK 2.04 Guidelines on how to classify a leak in an area covered by or saturated with water.

METR 1 & SERV 1 Meters and risers are to be located where venting gas will not accumulate

METR 1 Effort should be made to install a system bypass valve or lock wing valve downstream of the meter outlet when installing, replacing, relocating or rebuilding a meter set.

METR 2.20	3. & 4. Inspection/Maintenance on Meter Sets: Banded regulators with corroded bolts are to be replaced not repaired
POLY 1	8. Weak Link: Smaller diameter PE pipe can no longer be used as a weak link when pulling PE pipe. Added Stock Codes for Cumberland MDPE & HDPE Weak Links.
POLY 2.11	Maintenance of Fusion Equipment is a new section that provides general requirements on maintaining electrofusion and butt fusion equipment. A with the EF Processors, all butt fusion machines will be entered in Maximo so their inspections can be recorded and tracked.
PTST 2.01	3. Leak Test Duration: The minimum required test duration for a segment of main consisting of different pipe sizes is now determined by calculating the duration for each pipe size and length and adding those durations together.
PURG 2.01	4. C. When purging air from a service line 2" and smaller, a CGI is not required to detect gas. 5. D. The riser being used as the purge point at the site of injection should be checked for zero pressure before introducing the purge medium.
REPR 1	A manufactured fitting such as Mueller or T.D.W. line stopper, shortstop, save-a-valve nipple can be used to encapsulate a leak in addition to a leaking or abandoned fitting on all steel lines; transmission, high pressure distribution and distribution. Gas Tech Engineering and Integrity Management are to be consulted to determine if encapsulation is an acceptable repair option. 4. Steel Distribution Pipe Repair: Compression couplings are no longer approved for Make Safe repairs.
SERV 2.02	11. New test requirement for a service line with an EFV prior to placing the line into operation. Once the service line and meter set riser are installed, pressure tested and purged, perform a functional flow test through the meter valve to ensure EFV will operate properly. If the EFV does not activate, it will need to be replaced with a properly size EFV.
WELD 2.04	If a tap is going through an known longitudinal seam on transmission or 4 inch and larger high pressure distribution pipe, the seam is to be ultrasonically analyzed. All transmission lines shall be UT tested for laminations prior to any in-service welding or installation of a fitting used to tap the pipe. UT testing for laminations on 4 inch and larger high pressure distribution lines with MAOP of 100 psig or greater should be performed prior to any in-service welding or installation of a fitting used to tap the pipe
WWBG 2.02	Level 2 PPE Ensemble: The Level 1 single layer coveralls are to be worn under either the Bulwark or Silver Needle Level 2 insulated coverall.

Document Change Summary		Previous Document Dated	Current Document Dated
CORR 0	<p>Table of Contents</p> <p>CORR 2.09: Protal Applications replaces Protal 7200</p> <p>Removing CORR 2.10 Protal 7125</p> <p>Removing CORR 2.17 AC Voltage</p> <p>Removing CORR 2.32 Protal 7300</p> <p>CORR 4 Forms and Reference Materials:</p> <p>Updated the Denso Protal Products Instructions</p> <p>Added Reference 40. Denso's Letter Applications Procedures</p>	April 1, 2019	October 1, 2019
CORR 1	<p>Requirements</p> <p>8. Cathodic Protection Monitoring</p> <p>8. D. Rectifiers</p> <p>8. D. (2): Added - Inspection current and voltage output will be recorded in Maximo</p> <p>8. D. (3): New - Remotely monitoring of the current and voltage output is an acceptable inspection method.</p>	April 1, 2019	October 1, 2019
CORR 2.03	<p>Coating</p> <p>1. Approved Coatings</p> <p>1. A. (1) (a) and 1. A. (2) (a):</p> <p>Update the FBE mil coating thickness to standard 16 mil with minimum of 12 mil and maximum of 28 mil for both direct bury and directional drilling installations</p> <p>1. A. (1) (c) and 1. A. (2) (c):</p> <p>Under Field Applied Liquid Epoxy removed references to Protal 7200 and Protal 7125. Replaced with reference to CORR 2.09 which is now Protal Applications.</p> <p>Application of the Protal products will be in accordance with Denso's instructions which are contained in CORR 4.</p> <p>1. E. Fittings:</p> <p>1. E. (1) Removed Coal tar epoxy (Bitumastic)</p> <p>4. Approved Field Applied Epoxy Coatings</p> <p>Correction made, these coatings are approved for both above and below ground use.</p> <p>Above grade had been left out in earlier editions.</p> <p>7. Approved Paint Specifications</p>	April 1, 2019	October 1, 2019

7. A, Approved Paints

7. A. (3): Removed "town border stations" and "with a primer"

7. A. (4): Wording change - "can be touched up" replaces "and are painted". Added "until a total repaint is necessary".

7. A. (4) (c): Added Stock Code for Red Primer, Enamel

CORR 2.09	<p>Protal Applications</p> <p>This is a new section which contains general information common to the three Denso Protal products used at AIC.</p> <p>In addition, a copy of Denso's letter stating that any size of brush, applicator pad or roller can be used to apply the three Protal products is being placed in the Reference Materials section. Letter was needed because Denso instructions states a 4" brush is to be used for application.</p> <p>This section states application of the three products is to be done in accordance with Denso's instructions contained in CORR 4 Reference Materials.</p> <p>Application of field applied liquid epoxy will be a Covered Task and individuals must be specifically qualified in the application of this material.</p>	New	October 1, 2019
CORR 2.10	<p>Protal 7125 - This section is being removed. AIC will follow Denso's Protal 7125 Instructions for application. Those instructions are in CORR 4.</p>	January 1, 2018	October 1, 2019
CORR 2.12	<p>Tapecoat TC Color Coat</p> <p>Remove the Tapecoat Profile Putty table since AIC no longer stocks this item.</p> <p>Tapecoat Profile Putty was removed from CORR 2.03 list of approved coating products because Tapecoat had added an expiration date to the profile putty.</p>	January 1, 2014	October 1, 2019
CORR 2.15	<p>Coating Inspection</p> <p>2. Inspection Requirements</p> <p>2. B. Inspection Voltage</p> <p>2. B. (2) and (3): Updated the maximum coating mil thickness for FBE only coating (28 mil) and for FBE and ARO coating (58mil)</p>	January 1, 2018	October 1, 2019
CORR 2.17	<p>AC Voltage - This section is being removed. AC voltage on gas meter has been incorporated into METR 2.20 Meter Header Inspection.</p>	January 1, 2018	October 1, 2019
CORR 2.32	<p>Protal 7300 - This section is being removed. AIC will follow Denso's Protal 7300 Procedures for application. Those procedures are in CORR 4.</p>	April 1, 2019	October 1, 2019

CORR 3.14	<p>Test Lead Wire Attachment</p> <p>1. General</p> <p>1. C.: Revised terminology - MAOP of 100 psig or less replaces distribution main operating at or below 100 psig.</p> <p>2. Cadweld Thermite Welding Process</p> <p>2. A. (2): Updated - Crimp sleeve to #12 and #14 wire. Sleeve is not required for #8 wire.</p> <p>6. Welded Bolt Anode Wire or Test Lead Connection to Steel Pipe</p> <p>6. A.: Revised terminology - "MAOP of 100 psig or less" replaces "operating at or below 100 psig"</p>	October 15, 2018	October 1, 2019
CORR 4	<p>Forms and Reference Materials</p> <p>Updated with latest version from Denso's website:</p> <p>Denso Protal 7200 Repair Cartridge Data Sheet</p> <p>Denso Protal 7125 Instructions</p> <p>Denso Protal 7200 Instructions</p> <p>Denso Protal 7300 Procedures</p> <p>Denso Protal Air Cartridge Gun 1000 Set-up</p> <p>Added: Reference 40. Denso's Letter Applications Procedures</p>	April 1, 2019	October 1, 2019
EMER 0	<p>Table of Contents</p> <p>EMER 2.10 CNG Trailer Added CNG Filling Stations and CNG Cylinders</p> <p>EMER 4 - Updated the Ameren Shipping Paper for CNG</p>	April 1, 2019	October 1, 2019
EMER 2.02	<p>Dispatch Center</p> <p>3. Cold Weather Electrical Outage and Restoring Electrical Service</p> <p>3. C.: Updated contact information for Gas Planning</p>	October 15, 2018	October 1, 2019
EMER 2.03	<p>Emergency Responder</p> <p>1. General</p> <p>1. A.: Rearranged wording</p> <p>2. Upon Arrival (Inside Leak)</p> <p>2. C. Updated reference link to METR 2.20 2. A. for the AC Voltage on Meter Set</p> <p>Upon Arrival (Outside Leak)</p> <p>3. B.: New - Avoid parking over manholes as they may be within the gas leak migration pattern and could possibly be venting.</p>	October 15, 2018	October 1, 2019

3. C.: New - Avoid parking over main valves in the event that they are required for make safe actions.

4. Upon Arrival (Cut Main or Service)

4. F.: New - Direct emergency response personnel to assist with the evacuating buildings in the immediate are for safety, if needed.

EMER
2.04

Gas Field Personnel

April
1,
2019

Octo-
ber 1,
2019

3. Outside Odor Compliant - Hazardous Condition\

3. B: Added - including surrounding buildings when monitoring gas concentrations. Evacuate as required.

4. Major Leaks or Line Breaks

4. B.: Revised - Evaluate the situation, determine where gas is migrating and if it is creating an immediate hazard to people or property.

Added:

- (1) Check for leak migration into buildings first,
- (2) If the buildings are clear then proceed with checking for migration into sewer lines, catch basins and conduits
- (3) If the leak was caused by excavation or boring damage, additional investigation is required due to the possibility of multiple leaks (i.e, service pulled out of tee)

Strengthens the importance for initially checking that gas has not migrated into structures and checking the potential migration routes into structures.

6. Fire, Ignition or Explosion - Gas Related

6. F. Contact with Fire Chief:

6. F. (2) and (3): Removed disconnect and cap from both sections.

6. F. (3): Added - when safe to approach

6. I. Control the flow of gas

6. I. (2): New - Be aware that extinguished gas ignition before the flow of gas is isolated may reignite or migrate into locations where levels can accumulate and potentially lead to an explosion.

Additional safety reminder for those working and those monitoring gas concentrations.

7. Fire, Ignition or Explosion - Non-Gas Related

7. B. Contact with Fire Chief:

7. B. (2) and (3): Removed disconnect and cap from both sections.

7. C.: Added - when safe to approach

UNCONTROLLED IF PRINTED

The meter valve will have to be locked in the closed position so that it cannot be operated by an unauthorized person. The meter must be safe to approach when verifying the valve is off and locking the valve.

12. Loss and Restoration of Service

12. S. Turn-on requirements for an outage 12. S. (9): New - If the service is not restored, the meter valve shall be left in off position and locked. Leave a door hanger advising customer call in to have their service restored.

Meter valve cannot be left unlocked in the off position since the customer is not authorized to operate AIC meter valve.

EMER 2.10	<p>CNG Trailers</p> <p>2. Trailers by Location and Capacity</p> <p>Updated the contact information</p> <p>5. CNG Filling Stations - New section</p> <p>Updated the CNG Filling Locations</p> <p>6. CNG Cylinders - New section</p> <p>6. A. CNG cylinders must be inspected and hydrostatically tested every 5 years by an approved testing facility.</p> <p>7. Requirements</p> <p>7. LEAK 4: Updated the Southern Cross manuals for the Flame Pack 400 and the All-Terrain Vehicle

LEAK
1

Requirements

Janu-
ary 1,
2013

Octo-
ber 1,
2019

2. Leak Investigations

2. D.: Revised - While performing a gas leak investigation at the customers premise, gas field personnel should use their nose to sniff test the gas to ensure the odorant is readily detectable and document it. See LEAK 2.03 3. F. or LEAK 2.03 4. D.

Revised to be consistent with the language in LEAK 2.03 and ODOR 2.03 on performing a sniff test to check if odorant is readily detectable

LEAK
2.01

Indoor Leak Investigation

April
1,
2019

Octo-
ber 1,
2019

3. Approaching Structure

3. B.: Updated reference link to METR 2.20 2. A. for the AC Voltage on Meter Set

4. Customer is Home

4. E. Investigate source of leak

4. E. (3) (f): Added - Any other points of entry into the structure. When checking openings to a structure.

Added reminder the importance of checking all possible points of entry to ensure gas has not migrated into the structure.

6. Leak on Customer Facilities

6. A. (2) (a): Isolate the gas leak upstream of leak:

Removed - "Disconnect and cap outlet of meter set or Plug and cap outlet of meter".

Since operating AIC's gas meter valve is classified as a "Covered Task", the above options for isolating a leak and leaving our meter valve unlocked are no longer applicable

7. Records

7. A.: Removed "for all leaks on company facilities".

LEAK

ber

Octo-
ber 1,
2019

4. Above Grade Gas Facilities

UNCONTROLLED IF PRINTED

4. A. .: Updated reference link to METR 2.20 2. A. for the AC Voltage on Meter Set 15, 2018

5. Below Grade Gas Facilities

5. B. (1): Added a Warning: If gas is detected at the foundation of a structure, the structure shall be immediately checked for the possible presence of gas.

When checking for gas migration, the first priority is to ensure gas has not migrated into a structure. If gas is detected at the foundation, the structure should be checked before continuing with the sampling or by another gas person present.

5. F. If gas is detected in sewer

5. F. (1): Consideration should be given for possible migration into premise bullet point was moved from the bottom of the listing to the top.

This was done to emphasize the importance of protecting the public by ensuring gas has not migrated into a structure.

7. Hazardous Condition

7. A. (5): New - Gas along a foundation when there is no access to the structure.

7. A. (6): New - Any leak, which in the judgement of qualified personnel at the scene, is regarded as potentially hazardous.

A couple of new situations a consultant recommended be included to ensure the protection of the public

8. Leaks on Customer Owned Facilities

8. A. (2) (b): Removed - "or by disconnecting the affected fuel line from the meter set".

Isolating a gas leak can only be done by turning-off a customer owned valve downstream of the meter or by turning -off and locking AIC's meter valve.

LEAK 2.04

Leak Classification and Surveillance

2. Leak Classification

2. G.: New - Procedures have been added for classifying a leak covered by water where bubbles are an indicator of a leak.

G. In an area covered or saturated by water where bubbles are the indicator of a leak the following procedures should be followed:

(1) Determine if the leak is bubbling or blowing.

(2) Blowing gas shall be classified as a Class 1 leak and handled appropriately.

October 15, 2018 October 1, 2019

(3) If gas is bubbling, assume the entire area underwater has a reading of 100% gas since a CGI cannot obtain a gas reading underwater.

(a) Zero out the gas leak in a minimum of four directions and classify accordingly.

- **Leak migration must be checked by doing a thorough leak investigation following the procedures outlined in LEAK 2.02 5. Below Grade Facilities**

(b) If the leak cannot be zeroed out in a minimum of four directions, the leak shall be classified as a Class 1 leak and handled appropriately

There is a gap in procedures that does not address gas leaks underwater where bubbling water is the indicator of the leak, management felt that this needed addressed in the O&M.

10. Repaired Leak Recheck

10. A. Below Grade

10. A. (3) (b): Expanded requirement when residual gas readings are within 0 to 5 feet of a foundation to now include an investigation of the structure to ensure gas has not migrated inside.

Important in the protection of the public to ensure gas is not present inside the structure.

<u>LEAK</u> 4	Forms and Reference Materials	April 1, 2019	Octo- ber 1, 2019
	Updated the Southern Cross manuals for the Flame Pack 400 and the All-Terrain Vehicle		
METR 0	Table of Contents	April 1, 2019	Octo- ber 1, 2019
	METR 2.20: Added AC Voltage on Meter Set and AC Voltage Action Table		
	METR 2.24: Meter Header Inspection replaces Additional Checks and Leak Checks replaces Leak Investigation		
	METR 2.27: Removed: Device Programming Verification, Device Installation Verification, and Corrector Edit Calculation		
METR 1	Requirements	Janu- ary 1, 2017	Octo- ber 1, 2019
	3. Location		
	3. E.: In addition to installing a residential meter within 3 feet of the building wall it should also be located where venting gas will not accumulate.		
	3. F. Updated reference link Section I. (1) though (10)		
	4. Installation		

4. C.: New

C. Effort should be made to install one of the following, downstream of the meter bar outlet, on new, replaced, relocated or rebuilt gas meter sets, where possible:

- (1) A system bypass valve, see METR 3.27, or
- (2) A lock wing ball valve

By installing a valve downstream of the meter bar outlet, AIC will be able to shut-off that valve and leave our gas meter valve left on. This will provide the customer with a means of shutting off their gas service without involving AIC.

5. Regulator Vent Lines

5. B. (2): Added, Street elbows shall not be used.

Street elbows restrict the flow since the main end has a reduced ID.

5. E. Vent line termination shall be located such that:

5. E. (1) Reformatted - Gas can escape freely into the atmosphere

5. E. (2) Reformatted - Water, ice or snow cannot block the opening.

5. F.: Reformatted - The vent piping shall be gas-tight and terminate with either a bug screen facing down or a rain cap.

If a hinged rain cap is used, care should be taken when painting so as not to paint the cap shut or affect its operation

METR 2.09	<p>Gas Meter Retirement</p> <p>2. Criterial for Meter Retirement</p> <p>2. B.: Added the following meters to retirement list:</p> <p>All American AL175, AL225 and AL250 meters.</p> <p>The large body Sprague 400 meters (MC01231).</p> <p>All Sprague 675 and 1000 meters</p> <p>All Rockwell R175, R200 and R250 meters</p> <p>All Rockwell 310, 315 and 415 meters</p>	<p>Janu- ary 1, 2017</p>	<p>Octo- ber 1, 2019</p>

Gas Meter Data Sheet

April
1,
2019

Octo-
ber 1,
2019

2. Gas Meter Data Sheet

2. A. (4): Clarified - GMDS is required for any meter index change on any meter regardless of metering pressure.

4. Completion Instructions

4. C. (1) (c): If there is no meter index, this can be noted by entering N/A in the meter reading field.

4. C. (1) (e): "Pressure" replaces "Press"

4. C. (2) (c) 80.: In the removal instructions: If there is no meter index, this can be noted by entering N/A in the meter reading field.

4. C. (2) (d) 82: "removed" replaces "installed"

4. C. (2) (d) 85.: Grammatical correction, added "that was"

4. C. (2) (d) 90.: Added "removed from the installation"

Meter Header Inspection

Octo-
ber
15,
2018

Octo-
ber 1,
2019

1. General

1. A.: Revised - This procedure describes the inspections and maintenance that should be done at the meter set when performing any work on the meter set.

Clarification that a meter header inspection is to be performed when any work is being done at the meter set not just daily work.

1. B: New - Procedures also addresses the potential hazards and precautions associated with the possibility of induced AC voltage on the meter set.

2. AC Voltage on Meter Set - New section,

3. AC Voltage Action Table - New section

The information previously contained in CORR 2.17 has been moved over to the METR section since it was strictly related to gas meter sets. There was no changes made in the procedures. Reference changes are required throughout the O&M where check meter set with volt stick is mentioned.

4. Inspection/Maintenance When A Meter Set is Not Disassembled.

4. A. (1): Updated the reference link to METR 2.20 A. AC Voltage on Meter Set

- 4. A. (2): Added - Reference link to CORR 1 13. C and D for disbanded coating when check riser.
- 4. A. (3): Reference link to CORR 1 13. C and E for when check for atmospheric corrosion.
- 4. A. (10): Banded regulators with corroded bolts are to be replaced not repaired.
- 5. Inspection/Maintenance When A Meter Set is Disassembled.
- 5. A. (1): Updated the reference link to METR 2.20 A. AC Voltage on Meter Set
- 5. A. (2): Reference link to CORR 1 13. C and D for disbanded coating when check riser.
- 5. A. (3): Reference link to CORR 1 13. C and E for when check for atmospheric corrosion.
- 5. A. (8): Banded regulators with corroded bolts are to be replaced not repaired.

METR 2.24	<p>Replacement of Large Volume Diaphragm Meters</p> <p>Removed 2. Safety section since it the information was all standard work practices for all work performed in AIC.</p> <p>3. Meter and Regulator Inspection</p> <p>3. A.: Updated the reference link to METR 2.20 A. AC Voltage on Meter Set</p> <p>4. Meter Header Inspection - Title change 4. A.: New - Perform a Meter Header inspection in accordance with METR 2.20</p> <p>Removed the listing of items to be checked since they area in METR 2.20</p> <p>10: Leak Check - Title change</p> <p>10. A.: Simplified - Upon completion of the meter replacement; restore gas service to the meter and check the meter set for leaks.</p> <p>Removed bar testing the riser since that is a Missouri requirement not Illinois.</p> <p>11. Painting the Meter Set 11. A.: Simplified - If the above ground piping needs painting, it shall be done in accordance with CORR 1 14. B. (2) and C. Facilities Maintenance and Painting Facilities.</p>	Janu- ary 1, 2018	Octo- ber 1, 2019
METR 2.27	<p>Electronic Corrector Installation Verification</p> <p>Reformatted this section</p> <p>3. Documentation Activities - Title change</p> <p>3. B. Meter Information</p>	Octo- ber 15, 2018	Octo- ber 1, 2019

3. B. (6): Removed "if the meter is temperature compensated", moved to a separate line.

3. B. (7): New - Temperature Compensated box - Record Yes or No.

3. C. Device Programming Verification

3. (1) (c), (d) and (e): New items - % Specific Gravity, % N2 for Supercompressibility and % CO2 for Supercompressibility

3. D. Device Installation Verification 3. D. (1): New- Confirm device is installed properly on the meter or instrument drive. 3.

D. (2): Added a word "Verify" pressure sensing line valve is Open.

3. D. (3): Clarification - Mechanical uncorrected reading should match electronic uncorrected reading.

3. E. Corrector Information

3. E. (3): New - Record corrected serial number

METR 2.29	Gas Meter Bypass 1. General 1. C.: Updated the reference link to METR 2.20 A. AC Voltage on Meter Set	April 1, 2019	October 1, 2019
METR 3.04	Regulator Sizing - 2 PSIG Delivery Pressure Corrected the part number for the spring in the 1" Fisher 289H Relief Valve and the stock code for the 289H.	January 1, 2018	October 1, 2019
METR 3.07	Regulator Sizing - Alternate Approved Corrected the part number for the spring in the 1" Fisher 289H Relief Valve and the stock code for the 289H.	January 1, 2017	October 1, 2019
METR 3.14	425 Meter, By-Pass, 2 and 5 PSIG Delivery Pressure, 5-60 PSIG Inlet In the Material List table, added the Relief Valve Set Pressures for 2 psig delivery and 5 psig delivery since the same relief valve is used. Updated some stock codes.	January 1, 2018	October 1, 2019
METR 3.17	603 Meter, By-Pass, 2, 5 and 10 PSIG Delivery Pressure, 5-60 PSIG Inlet In the Material List table, added the Relief Valve Set Pressures for 2 psig delivery, 5 psig delivery and 10 psig delivery since the same relief valve is used. Corrected the spring color of the 1" Itron CL31N and change Actaris to Itron. Updated some stock codes.	January 1, 2014	October 1, 2019

METR 3.19	15C Compact Meter, 7" W.C. Delivery Pressure In the Material List table updated some stock codes.	January 1, 2018	October 1, 2019

UNCONTROLLED IF PRINTED

POLY 0	Table of Contents New section POLY 2.11 Maintenance of Fusion Equipment	Janu- ary 1, 2019	Octo- ber 1, 2019
POLY 1	Requirements 8. Weak Link 8. B. (1) Installation options for PE pipe sizes less than or equal to 1" CTS:	Feb- ruary 1, 2019	Octo- ber 1, 2019
	<p>Eliminated using 1/2" CTS as a weak link for 1" CTS.</p> <p>Performance Pipe does not recommend using PE pipe as a weak link because it is difficult to determine if the smaller size of PE pipe is really preventing the larger PE pipe from being overstressed.</p> <p>For pipe sizes of 1" CTS or smaller the weak link options in POLY 1 8. are:</p> <ol style="list-style-type: none"> 1. Pull plug, 18" in length, at least one pipe size larger in diameter, or 2. Physically remove 50% of the pipe wall by drilling holes or cutting slots, or 3. Use back reamer/bore head 1" or more larger in diameter than pipe being installed, or 4. Commercially available manufactured weak link. <p>8. B. (2) For PE pipe sizes larger than 1" CTS:</p> <p>Eliminated using the next size smaller PE pipe as a weak link.</p> <p>A manufactured weak link is the only option for PE pipe larger than 1 inch. AIC has approved a couple, Condux which is a mechanical weak link and Cumberland which is manufactured PE pipe weak link.</p> <p>PHMSA's Plastic Pipe Rule requires a weak link method be used when installing PE pipe by trenchless excavation.</p> <p>8. C. (3): Added - listed below for the Condux swivel.</p> <p>8. D. Cumberland Products</p> <p>Added:</p> <p>AIC stock codes for the MDPE weak links, 1" to 8".</p> <p>AIC is now stocking HDPE weak links, 1" to 6"</p>		
POLY 2.02	Squeeze Off 2. Operation 2. O.: Revised - After removal of the squeeze tool, the squeeze off location shall be identified by wrapping the pipe with electrical tape and the pipe not squeezed off again at that location.	Janu- ary 1, 2016	Octo- ber 1, 2019

Combined the previous 2. P. into 2. O. regarding not squeezing the pipe in the same location. Clarified that it after the squeeze tool is removed, that the pipe is not to be squeeze at the same spot. The squeeze tool can be relaxed and re-squeezed during purging.

POLY 2.05	<p>Electrofusion</p> <p>4. Equipment, Weather and Cleanliness Guidelines</p> <p>4. G. Operating temperature ranged - Added a table with the Manufacturers' Operating Temperature Ranges.</p> <p>Reformatted Pipe Preparation, Peeling and Joint Assembly procedures with step by step procedures to replace the charts.</p> <p>Reports from the field indicated the charts were confusing particularly in the Pipe Preparation section. There are no major changes in the procedures.</p>	January 1, 2019	October 1, 2019
POLY 2.11	<p>Maintenance of Fusion Equipment</p> <p>This document prescribes the general maintenance requirements for the equipment utilized in heat fusion of PE pipe. (192.756)</p> <p>2. Electrofusion Equipment Maintenance</p> <p>A. Maintenance work required on Electrofusion processors shall be only performed by the manufacturer's authorized service personnel or service center. See POLY 4 for manufacturers' manuals.</p> <p>Caution: Under no circumstance shall the electrofusion processor enclosure be opened for service in the field by unauthorized personnel.</p> <p>B. Electrofusion processors shall be maintained at intervals that at least meet the requirements contained in Manufacturer's Instructions. Maintenance records will be maintained in Maximo.</p> <p>C. The following inspection should be performed on a regular basis on equipment that is being used:</p> <p>AIC's EF processor are inspected and calibrated by the vendor on prescribed interval that is in Maximo</p> <p>3. Butt Fusion Machine Maintenance</p> <p>A. Manufacturers' detailed maintenance procedures for the McElroy and Connectra machines can be found in POLY 4.</p> <p>B. The following are general maintenance procedures should be performed on a regular basis on equipment that is being:</p> <p>C. The butt fusion machines will have an inspection performed every other year at approximately the same time as the electrofusion processors are inspected. The inspection will be recorded and tracked in Maximo.</p>	New	October 1, 2019

Butt fusion machine manufacturers current do not have a recommended maintenance interval in their instructions. They have maintenance procedures and a checklist. The expectations is the machines should be checked on a regular basis when being used.

4. Peelers

- A. Peelers should be free of dirt and/or any substance which would contaminate the fusion area.
- B. Peeler blades should be inspected for sharpness and damage, replace if necessary.
- C. If applicable, check wheels to ensure they rotate smoothly and have not been damaged. Replace if necessary

5. Clamps

- A. Clamps should be clean.
- B. Clamps should be inspected for damage and replace if necessary.

Peelers and Clamps should be checked each time they are used. There are no plans to enter these tools in Maximo for tracking.

POLY 3.02	<p>Electrofusion Fittings</p> <p>9. Supraflow Tees - New item</p> <p>These are new style of electrofusion PE taping tees designed for side tapping a main. The outlet of the tee is either a parallel or perpendicular and come with a 90 degree elbow and 2 feet pup.</p> <p>Sizes range from 4" x 4" to 8"x 6".</p> <p>The tapping procedures are in TAPS 2.07</p>	Janu- ary 1, 2018	Octo- ber 1, 2019
PRES 2.02	<p>Electronic Recorders</p> <p>3. Calibration of Electronic Recorders</p> <p>3. C.: Maximo replaces Gas Compliance System</p>	Janu- ary 1, 2013	Octo- ber 1, 2019
PRES 2.04	<p>Overpressure Reporting</p> <p>E. The Gas Supervisor should report the following:</p> <p>E. (4): Revised to - Normal operating pressure, MAOP and MEP of system and highest pressure observed exceeding the MEP.</p> <p>Provides clarification on what is expected to be reported. There was confusion on what maximum actual operating pressure meant and the MEP was not initially listed.</p>	April 1, 2019	Octo- ber 1, 2019

PTST 2.01	<p>Leak Test</p> <p>3. Leak Test Duration</p> <p>3. C.: Revised when testing a main segment that consists of different sizes of pipe, the test duration for each size of pipe will be calculated. The total required test duration will be the sum of the calculated durations for each size. The maximum duration remains at 8 hours.</p> <p>Previously, the duration was based on the largest size of pipe for the entire length of the segment being tested. There were complaints that short sections of larger sizes of pipe in a segment was requiring much longer leak test. Example: (Previous: 10' of 4" and 2000' of 2": 20 min for 2100" = 420 Min) vs (Proposed: (20 min + (10min for 2000')) = 220 min)</p> <p>5. Leak Test Records</p> <p>E. (13): Clarification that the temperature of the pipe can be used in the Temperature Factor calculation when there is test pressure fluctuation due to temperature changes.</p> <p>Technically it is the temperature of the test medium or product in the pipe but that temperature is extremely difficult to measure. Temperature of the pipe will provide an indication of temperature change of the product inside the pipe.</p>	April 1, 2019	October 1, 2019
PTST 2.02	<p>Strength Test</p> <p>4. Strength Test Records</p> <p>B. (13) Clarification that the temperature of the pipe can be used in the Temperature Factor calculation when there is test pressure fluctuation due to temperature changes.</p> <p>Technically it is the temperature of the test medium or product in the pipe but that temperature is extremely difficult to measure. Temperature of the pipe will provide an indication of temperature change of the product inside the pipe.</p>	April 1, 2019	October 1, 2019
PUBL 2.02	<p>Liaison with Fire, Police and Public Officials</p> <p>5. Natural Gas Emergency Procedures</p> <p>5. B. (3): Revised 2nd sentence to - Do not operate any electrical switches and leave the door open after exiting as the strike plate may cause a spark. 5. B. (5): New - Check surrounding buildings for potential gas migration and evacuate as necessary. Continue to monitor gas readings as conditions may change or migration expand. Keep Ameren Illinois updated as conditions warrant.</p>	October 15, 2018	October 1, 2019
PURG 2.01	<p>Purging Methods</p> <p>4. Purging of Air with Gas</p> <p>4. C.: Correction - removed the need for a CGI when purging a 2" and smaller service line of air.</p>	April 1, 2019	October 1, 2019

The CGI was inadvertently added with the October 1, 2018 Update. Historically, when purging air from service line, once gas was detected the meter valve was closed and the line was ready to be placed in service. When the CGI was added, contractors installing services were having to purchase CGI's.

5. Purging of Gas with Air During Abandonment

5. D. New The riser being used as the purge point at the site of injection should be checked for zero pressure before introducing the purge medium.

A reminder that if a riser is being used as the injection point to purge gas from a main, that riser must be connected to the main being purged. There have been too many instances where the riser has been connected to live mains.

REGS
2.01

Regulator Station Inspections

April	October 1,
1,	2019
2019	2019

3. Operational Inspection

3. A. Visual Inspection

3. A. (2) New- Perform a visual assessment of all equipment or devices that are critical to safety, gas delivery and system reliability. Anomalies and abnormalities discovered during the visual assessment will be immediately repaired or reported.

3. C Regulator Station with Relief Valve

3. D Passive Monitor Regulator Station

3. E. Working Monitor Regulator Station

In each of the above sections, Lock-up below the gas system's MAOP or MEP(where applicable) replaces "Lock-up when in acceptable range"

Clarification that the relief valves and monitoring regulators are to lock-up below either the gas system's MAOP or MEP depending on the function of the device.

4. Primary Inspection

4. D. (2): Reference to Operational Inspection for regulator lock-up.

4. E.: Word change, identified in Maximo replaces contained in Maximo 4. F.: New - Station filters, drips, strainers and knock-out drums should be checked for reliable service. This may include opening or other techniques.

During both Operational and Primary Inspections, all of the equipment with the regulator station are expected to be checked for proper operation, condition and required maintenance performed.

5. Acoustical Inspection

5. A.: Modified word - A Station not designed to accommodate or support an Operational or Primary regulator station inspection may require Acoustical Inspection.

5. B.: Word changes - verify replaces ascertained and Lock-up replaces operating properly. Added - below the gas system's MAOP

REPR 0	<p>Table of Contents</p> <p>REPR 4 - Added</p> <p>Clock Spring Specs; Installation Manual Clock Spring Coil-Pass Method and Clock Spring Underwater Installation Guide</p>	October 15, 2018	October 1, 2019
REPR 1	<p>Requirements</p> <p>3. High Pressure Distribution and Transmission Pipe Repair</p> <p>3. F.: Expanded encapsulation to include a leak and an abandoned fitting as an approved method of repair.</p> <p>3. M: Encapsulation</p> <p>3. M. (1): Added a leak can be encapsulated with a manufactured fitting such as a line stopper, short stop, save-a-valve nipple.</p> <p>3. M. (1) (a): Requires GTE and Integrity Management to be consulted to determine if encapsulation is acceptable repair option.</p> <p>4. Steel Distribution Pipe Repair</p> <p>4. B.: Removed - Compression couplings, nut follower style, can be used for Make Safe repairs on 2" and smaller distribution pipe.</p> <p>AIC's only approved and stock compression coupling is a 3/4" IPS x 1/2"CTS, Steel x PE. Use of all other compression couplings have been discontinued in AIC operating areas since they did not carry a Category 1 rating for pullout restraint.</p> <p>4. E. (1): Expanded encapsulation to include a leak and an abandoned fitting as an approved method of repair.</p> <p>4. M. Stainless Steel Bolted Leak Clamp</p> <p>Removed - Can be used to contain leakage from minor gouges or corrosion pits.</p> <p>Removed - Consider temporarily reducing the system operating pressure prior to clamp installation.</p> <p>4. O.: Added a leak can be encapsulated with a manufactured fitting such as a line stopper, short stop, save-a-valve nipple.</p>	April 1, 2019	October 1, 2019

Encapsulating a leak with a manufactured rated fitting has historically been an acceptable practice throughout the AIC operating areas. However, for transmission line repairs, Gas Tech Engineering and Integrity Management feel they need to determine if that is an acceptable repair option.

5. PE Pipe Repair

5. A. (1): Corrected - Imperfections and damage must be repaired or removed.

5. A. (2): Removed language about gouges, scratches and other imperfections since the table addresses

REPR 4	Forms and Reference Materials Added Reference Material: Clock Spring Specs Installation Manual Clock Spring Coil-Pass Method Clock Spring Underwater Installation Guide	October 15, 2018	October 1, 2019
SERV 0	Table of Contents SERV 2.03: Added - Placing Service Line with EFV into Operation Added Right Change Bar to SERV 3.01 & SERV 3.02	October 15, 2018	October 1, 2019
SERV 1	Requirements 5. Location 5. E. Typical location to avoid 5. E. (1) (e): New- Where venting gas will not accumulate. Added as a reminder the regulator relief vents must be able to vent freely to the atmosphere. 10. New Service Lines Not In Use 10. A.: Revised- Each service line not placed in service upon completion shall have the meter valve closed and locked. 10. B.: Expanded the reference link to TURN 2.01 3. New Service Connect. Removed the ability to install a mechanical device of fitting that will prevent flow of gas. Removed disconnecting the customer's piping from the gas supply. The meter valve has to be shut-off and locked so that the customer or any other non-authorized individual cannot initiate gas service by opening the meter valve.	February 1, 2019	October 1, 2019

SERV 2.02	<p>Excess Flow Valve or Manual Shut-Off Valve</p> <p>2. Residential Service Requirements</p> <p>2. A. Single family or branch service lines:</p> <p>2. A. (5): New - If the meter capacity is greater than 1,000 SCFH and a properly sized EFV is not available and stock by AIC, a manual service line shut-off valve is required.</p> <p style="color: red;">Since AIC stocks 1" EFV's capable of handling over 2,000 SCFH and 2" EFV's capable of over 3,000 SCFH, this should not be an issue for AIC. However, our O&M Rewrite Consultants pointed out that since Part 192.365 has this requirement, they recommended including it in the O&M.</p> <p>8. G. EFV Sizing Tables</p> <p>8. G. (3): Added - 2"IPS UMAC Series 2300 EFV</p> <p>8. G. (5): New - Reduced Coupling with EF for Meter Upgrades - Friastop 1" CTS x 1/2" CTS.</p> <p style="color: red;">These EFV are primarily for use with meter upgrades where from a AC 250 to a AL 425. This EFV is based on the customer's connected load not the meter rated capacity.</p> <p>9. EFV and Manual Shut-Off Valve Identification</p> <p>9. A. (2): Removed at the residence. EFV tags are to be place on all meter sets regardless if they are a residential or commercial.</p> <p>11. Placing Service Line with EFV into Operation - New</p> <p>This sections provides the instruction for performing a functional flow test prior to placing the service line into operation.</p> <p>A. Once the service line and meter set riser are installed, pressure tested, and purged, perform a functional flow test through the meter valve to ensure EFV will operate properly:</p> <p><i>Note: If EFV is not actuated, replace the EFV and repeat functional flow test. Ensure properly sized EFV is being installed.</i></p> <p>B. Following a successful functional test, the service line is ready to be placed in service:</p> <p style="color: red;">The EFV manufacturers include a function flow test in their instructions.</p>	April 30, 2018	Octo- ber 1, 2019
SERV 2.08	<p>Insertion</p> <p>4. Dead Insertion Procedures</p> <p>4. E.: New - Remove existing service line valve in the existing steel service line.</p>	Janu- ary 1, 2018	Octo- ber 1, 2019

Since removal of existing valves was included in the main insertion procedures, the recommendation was to include it service line insertion procedures.

SERV 3.01 and	1/2" PE Service Line, Flex Riser & Rigid Riser Effective January 1, 2020, these standards will be used for insertion, repair or replacement of existing 1/2" PE services	April 1, 2013	October 1, 2019
SERV 3.02	Effective January 1, 2020, 1" PE will be the standard residential service. SERV 3.03 and 3.04		
SERV 3.07	Farm Tap, Double Cut, 451 - 1000 PSIG Inlet Pressure Updated stock codes for: Item 7 - 3/4" Street Elbow Item 12 - 3/4" x 2" Nipple, Schedule 80 Item 22 - 3/4" x 6" Nipple, Schedule 80 Items have been combined with another stock code.	January 1, 2018	October 1, 2019
SERV 3.08	Farm Tap, Double Cut, DOT Transmission B. Replaced the Assembly #3 drawings. Item numbers for the valve assembly was corrected. Updated stock codes for: Item 7 - 3/4" Street Elbow Item 12 - 3/4" x 2" Nipple, Schedule 80 Item 22 - 3/4" x 6" Nipple, Schedule 80 Items have been combined with another stock code.	April 1, 2019	October 1, 2019
STLP 2.01	Design Pressure 8. Dual Coat Steel Pipe 8. A.: Revised - Dual coated pipe shall be coated with Fusion Bonded Epoxy (FBE) with and an Abrasive Resistant Overlay (ARO) in accordance with CORR 2.03 1. A. (2) - Directional Drilling Installation Rewritten to referenced CORR 2.03 which contains the mill coating requirements for dual coated pipe rather repeat the coating thickness.	October 15, 2018	October 1, 2019
STLP 2.02	Casing Pipe Installation 1. General 1. C.: Added - PE as another carrier pipe. 3. Casing Installation	January 1, 2016	October 1, 2019

3. B.: Revised - Bare steel pipe is recommended for casing pipe but steel pipe with old coating can also be used.

3. C.: Revised - Pipe insulators for steel carrier pipe shall be spaced a minimum of every 10 feet and a maximum of 3 feet from the ends of the casing. Added "for steel carrier pipe.

STLP 3.03	<p>Weld Transition Fittings</p> <p>1. General</p> <p>1. B.: Revised - When a transition taper is required in the pipe and/or fitting, it shall be made using a mechanical end preparation machine or by manual preparation.</p> <p style="color: red;">Gas Tech Engineering pointed out inconsistency between WELD 2.03 8. F. and the previous language in STLP 3.03. The WELD section had been revised to allow for both mechanical end preparation and manual preparation. Since this Standard is for transition fittings, it was felt that the language from the WELD section should be located in the STLP section. The WELD 2.03 8. F. now has a reference link to STLP 3.03.</p>	<p>April 1, 2010</p>	<p>Octo- ber 1, 2019</p>
TAPS 0	<p>Table of Contents</p> <p>TAPS 2.04 - Added 5. Stopple Fittings</p> <p>Added - TAPS 2.07 Supraflow Tee Tapping Procedures</p> <p>TAPS 4 - Forms and Reference Materials</p> <p>Added 2 new References: GFCP Punch Tee with Transition and Style 2275 Dresser Stop Changer Manual</p>	<p>Janu- ary 1, 2016</p>	<p>Octo- ber 1, 2019</p>
TAPS 1	<p>Requirements</p> <p>1. Objective</p> <p>1. A.: Added - on steel lines.</p> <p>1. B.: Added - and contractor personnel.</p> <p>The purpose of this section is to provide necessary information to ensure personnel perform tapping and stopping procedures on steel lines in a safe and efficient manner.</p> <p>1. D.: Added (AIC)</p> <p>1. G.: Revised - A Tapping Request Form is required for each hot tap and/or stopping operation to be performed by contractor, Gas Tech Service personnel or AIC personnel from another Operating Area on all sizes of steel transmission and high pressure distribution pipelines, or 2 inch and larger distribution pipelines.</p> <p>Along with contractors and Gas Tech Services personnel, AIC personnel from outside the Operating Area can be scheduled to perform tapping and stopping operations on steel pipe, live or dead, Construction Services felt that a Tapping Request Form should be completed for taps/stops on steel pipe. This</p>	<p>April 1, 2019</p>	<p>Octo- ber 1, 2019</p>

would ensure the correct equipment and fittings were being brought to the project.

6. Fitting Placement

6. B.: A tap shall not made through any girth welds. Removed longitudinal seam from this restriction.

6. C.: New - If a tap is going through an known longitudinal seam, an analysis of the seam is to be performed in accordance with WELD 2.04 4. D. (6).

6. E. New - Checking for pipe wall lamination in Transmission lines and 4 inch and larger high pressure steel distribution mains with MAOP of 100 psig or greater is covered in WELD 2.04 6. B.

Gas Tech Engineering and Integrity Management personnel felt these additional requirement were necessary to ensure the integrity of the pipe prior to welding on a fitting and tapping the pipe.

6. D.: Revised - Transmission lines should be checked for laminations prior to installing a control fitting. Removed the 12 inch and larger requirement.

Gas Tech Engineering and Integrity Management engineers along with the Supv Gas Tech Tng - Welding felt that a check for laminations be performed on all sizes of transmission lines, not just those 12" and larger, prior to welding on a control fitting. This would be performed with an ultrasonic wall thickness (UT) gauge as specified in In-Service Welding.

7. Gauge, Blow-down, By-pass Fittings

7. B. (3): Added - leak detection instrument

TAPS
2.04

T.D. Williamson Tapping and Stopping Procedure

January 1,
2012 October 1,
2019

2. Tapping Operation

2. J.: Removed - Pressure test tapping equipment and valve.

Gas Superintendents said as far as they know or have experienced, this has never been done on TDW equipment.

5. Stopple Fitting - New

AIC now stocks Stopple fittings for 8" and 10" steel lines.

Reference added to TAPS 4 that contains TDW Hot Tapping and Stopple Pipe Plugging.

TAPS
2.07

Supraflow Tee Tapping Procedures - New Section

New October 1,
2019

Procedures were prepared by Gas Training and Gas Standards personnel based on Torre's video and practice demonstrations at the Training Center.

The bore machine drill rod actually attaches to the drill head in the tee. Tapping machine has color coded drill rods which correspond to colors on the Supraflow Tee drilling head.

TAPS 3.01	<p>Mueller Fittings</p> <p>3. Line Stopper Fittings</p> <p>Removing the 2" H-17155 (250 psig) and 2" H-17156 (1,440 psig)</p> <p>4. Mueller Bottom-Out Line Stopper Fittings</p> <p>Removing 2" H-17161 (1,440 psig)</p> <p>Gas Tech Services had requested that AIC standardize on one model of 2" line stopper fitting. Currently AIC has 2 different styles of Mueller Line Stoppers. One has a steel completion plug with an O-ring. The other is a steel completion plug without the O-ring. GTS Supt said they have been experience problems installing the completion plug on the models without the O-ring. GTS Supt checked with the Operating Areas and the preferred model was the one with the O-rings. The areas all have the equipment 2" H-17125 and H-17126 fittings. Standards & Material group agreed and the above Mueller line stoppers are being discontinued in Stores.</p>	April 1, 2019	October 1, 2019
TAPS 4	<p>Forms and Reference Materials</p> <p>Added:</p> <p>Ref 22 - GFCP Punch Tee with Transition</p> <p>Re 23 - Style 2275 Dresser Stop Changer Manual</p>	January 1, 2016	October 1, 2019
TURN 0	<p>Table of Contents</p> <p>Removed TURN 2.12 Defective Equipment</p>	January 1, 2018	October 1, 2019
TURN 2.01	<p>Residential - Small Commercial Customer</p> <p>3. New Service Connect</p> <p>3. B.: Revise- A gas meter should be installed at the same time as the service as long as the structure is framed out, the outlet of the meter bar should have:</p> <p>3. B. (1): A closed customer valve installed and the meter valve left in the on position, or</p> <p>3. B. (2): If a customer valve is not installed, the meter valve shall be locked in the off position.</p> <p>4. Existing Service Connect</p> <p>4. A.: Revised - Updated reference link to METR 2.20 2. AC Voltage on Meter Set.</p> <p>4. E. Customer Choice - Customer Relight Appliances</p>	October 15, 2018	October 1, 2019

4. E. Customer Choice - Customer Relight Appliances

(1) Customer is at home and shut-in test passes: (a) Leave meter valve in the on position

(b) Notify customer gas is on and ready for use (2) Customer is at home but shut-in test fails (a) Perform an investigation to determine location of leak

(b) Isolate the leak per LEAK 2.01 6. Leaks on Customer Facilities

(c) Notify the customer of the source of the leak and that they are responsible for repair (d) If the leak is isolated at the valve downstream of the meter outlet or at the appliance control valve, leave the meter valve in the on position, and give customer a Meter Relight Tag. (3) If customer is not at home or unavailable: (a) Perform a low flow test and 5 minute shut-in test on customer piping, if successful

- If there is a valve downstream of the meter bar, turn off the valve and leave a Meter Relight Tag, or
- If possible, install a customer valve downstream of meter bar, leave valve in off position and leave a Meter Relight Tag, or
- If valve does not exist, turn off and lock the meter valve. Leave a door hanger advising the customer to call and reschedule.

(b) If shut-in test fails, turn off and lock the meter valve. Leave a door hanger advising the customer to call and reschedule.

Procedures were revised to reflect a change in policy where the customer can no longer operate our meter valve to turn on the gas supply to their piping/appliances. If the low flow test and shut-in test are successful and there is a valve downstream of the meter outlet, that valve can be operated by the customer and AIC's meter valve can be left in the on position.

5. Low Flow and Five (5) Minute Shut-In Test

5. A.: Added - two words, verbally and immediately. If odorant is not readily detectable, verbally notify Gas Supervisor immediately for a follow-up investigation. See ODOR 2.03 6. Odorant Intensity Testing Sniff Test.

It is important that gas be readily detectable at the customer's service. If it isn't, immediate action needs to be taken to determine why.

5. E.: Revised - Check meter set fittings for leaks and repair any leaks found.

Changed language from Soap meter set fittings and repair any leaks found. Leaks can be checked with leak detection instrument. If leak detection fluid is used, it makes it more difficult to paint the meter set.

12. Gas Meter Relight Tag

12. B.: Revised - The Gas Meter Relight Tag provides the customer with instructions on how they can turn on their gas at the valve downstream of the meter outlet.

The instructions have been changed to show how to turn on the valve downstream of the meter set not the meter valve.

12. C.: Updated the Relight Tag that was revised 8/19 which provides instructions for operating the customer valve downstream of meter outlet.

TURN 2.03	<p>Discontinuance or Transfer of Gas Service</p> <p>4. Hard Disconnect (Terminate Service)</p> <p>4. C.: Updated reference link to METR 2.20 2. AC Voltage on Meter Set</p> <p>4. F.: The only option now is to close and lock the meter valve. Removed physically disconnecting the customer piping and closing the ends with a cap, plug or flange.</p>	January 1, 2018	October 1, 2019
TURN 2.10	<p>Corrugated Stainless Steel Tubing</p> <p>1. General</p> <p>1. C.: Revised - The polyethylene jacket should be left on the CSST for the length of penetration through metal, masonry or concrete to provide a sleeve to protect the integrity of the pipe.</p> <p>According to the CSST manufacturers, the polyethylene jacket is to be left on through the penetration of the foundation wall, up to the termination plate, to protect the integrity of the pipe.</p>	January 1, 2018	October 1, 2019
TURN 2.11	<p>Warning Tag</p> <p>4. Isolating an Appliance</p> <p>4. A.: Revised - Gas field personnel may isolate a hazardous condition at the at the appliance control valve, customer owned valve, or by shutting off and locking, Red Pin, the meter valve.</p> <p>4. B.: Removed - Since disconnect/cap at meter set outlet or plug/cap outlet of meter are no longer applicable.</p> <p>If the appliance cannot be isolated at the appliance control valve or customer valve, AIC's meter valve has to left in the off position and locked.</p>	January 1, 2016	October 1, 2019
TURN 2.12	<p>Defective Equipment</p> <p>Removed this section</p> <p>There is not a good method of updating defective equipment and it should be the responsibility of HVAC dealers and the media to keep customers aware of defective equipment.</p>	January 1, 2011	October 1, 2019

TURN 2.14	<p>Changing Meter Valves</p> <p>Changing of Meter Valves "On-The-Fly"</p> <p>E. (5).: Revised - Gas field personnel at the job site shall wear Level 1 PPE as a precaution due to the exposure to gas associated with changing a valve "on the fly". See WWBG 2.02 Personal Protective Equipment.</p> <p>Replaced listing the Level 1 PPE items added a reference link to WWBG 2.02 which list the approved PPE for Level 1 and Level 2.</p>	Janu- ary 1, 2016	Octo- ber 1, 2019
WELD 0	<p>Forms and Reference Materials</p> <p>WELD 4: Added - DeFelske PosiTector UTG Full Guide</p>	April 1, 2019	Octo- ber 1, 2019
WELD 1	<p>Requirements</p> <p>Throughout this document the words Examination and Inspection have been changed to Testing.</p> <p>Radiographic Testing, Dry Magnetic Particle Testing, Liquid Penetrant Testing.</p>	Janu- ary 1, 2016	Octo- ber 1, 2019
WELD 2.02	<p>Welder Performance Qualifications</p> <p>Throughout the document AIC replaces Ameren Illinois.</p> <p>Throughout the document Supv Gas Tech Tng - Welding replaced Gas Trainer - Welding</p> <p>5. Qualification Categories (Initial Test)</p> <p>5. E.: In-Service Welding Test</p> <p>5. E. (4): New - Branch-on fitting (full penetration groove weld with fillet reinforcement); 12 inch nominal diameter, 0.250 inch minimum wall thickness in 5F position, run pipe horizontal with branch out the side.</p> <p>Supv Gas Tech Tng - Welding is replacing the test sleeve and fitting places at the 45 degree position with this new procedure. This will qualify an in-service welder to weld on any size of pipe.</p> <p>8. Welder Re-Qualification</p> <p>8. C. Six month requalification test table:</p> <p>Supv Gas Tech Tng - Welding will select the pipe size to be used for the butt weld test each year. All of the welders will re-qualify on the same size pipe during that year.</p> <p>8. E.: In-Service Welders (Annual and 8 month Requalification)</p> <p>8. E. (1): Revised - The Annual and 6 month requalification test requirements will be at the discretion of the AIC Supv Gas Tech Tng - Welding and will meet the essential variables of API 1104, Appendix B.</p>	Janu- ary 1, 2016	Octo- ber 1, 2019

Supv Gas Tech Tng - Welding has requested the ability to determine the testing requirements based on the essential variables in API 1104, Appendix B. The testing will be the same for all In-Service welders for that year.

WELD 2.03	<p>Construction of Pipelines and Piping Systems</p> <p>8. Welding Requirements</p> <p>8. F. Transition Joints</p> <p>8. F. (1): Revised - Fabricated weld transition fitting replaces pre-fabricated weld transition fitting.</p> <p>8. F. (2): Moved to STLP 3.03 Weld Transition Fittings</p> <p>8. N. Weld Pass Requirements</p> <p>8. N. (4): New - . Maximum time for unfinished welds should be as soon as possible, not to exceed seventy two (72) hours.</p> <p>API 1104 requires the procedures to provide a time between welds. AIC's welding consultant recommended a maximum time of 72 hours to finish a weld.</p> <p>9. Inspection of Welds</p> <p>9. A. Recommended Non-Destructive Testing Methods (NDT)</p> <p>9. A. (2) Chart: Revised NDT method for fillet welds, Recommend method is Magnetic Particle Testing (MPT) with Liquid Penetrant Testing (LPT) as an Alternative.</p> <p>Supv Gas Tech Tng - Welding based this on industry practices.</p>	Janu- ary 1, 2018	Octo- ber 1, 2019
WELD 2.04	<p>In-Service Welding</p> <p>Throughout the document AIC replaces Ameren Illinois.</p> <p>4. Acceptable Repair Methods</p> <p>4. D. Hot Tap Fittings</p> <p>4. D. (6): Revised - If the tap is through an area containing a longitudinal seam on all transmission pipe or 4" and larger high pressure distribution pipe with MAOP of 100 psig or greater, the area shall be ultrasonically analyzed for a distance of 10 inches beyond the fillet weld at the ends of the fitting. -</p> <p>4. D. (7): Revised - All hot tap fittings and other pressure containment fittings shall be leak tested in accordance with PTST 1 5. Testing procedures after completion of the welding, but before cutting the hot tap.</p> <p>4. D. (7): Removed leak test language since it is covered in PTST 1 5. Testing.</p> <p>6. Welding Procedures</p> <p>6. B. Wall Thickness Survey</p>	Janu- ary 1, 2018	Octo- ber 1, 2019

6. B. (1): New - Prior to any in-service welding or installation of a fitting to be used to tap a transmission line, the area to be welded shall be (UT) tested for laminations, internal corrosion, inclusions. Etc. See WELD 2.09 Ultrasonic Wall Thickness Examination

6. B. (2): New - Prior to any in-service welding or installation of a fitting to be used to tap a 4 inch and larger high pressure steel distribution mains with MAOP of 100 psig or greater should be (UT) tested for laminations internal corrosion, inclusions. Etc. See WELD 2.09 Ultrasonic Wall Thickness Examination

6. B. (3): Updated - In order to weld on a 4 inch and larger pipe, the minimum wall thickness must be 0.188 inches unless approved by the Company Weld.

Gas Tech Engineering, Integrity Management and Supv Gas Tech Training - Welding agreed that the all transmission pipe must be checked for lamination prior to welding on a tapping fitting. This is a standard practice in the industry for transmission lines. It is also recommended for 4 inch and larger high pressure distribution pipe.

After discussions with industry welding experts, the Supv Gas Tech Training - Welding indicated that the minimum wall thickness of 0.188 inches applies to 4 inch and larger pipe.

6. D. Welding Sequence

Throughout this section UT survey replaces wall thickness survey.

6. D. (1): AIC designated welding supervisor replaces the company welder as the one who would have to approve welding on pipe with wall thickness less than 0.188".

6. D. (11): WELD 2.07 Magnetic Particle Testing and WELD 2.08 Liquid Penetrant Testing replaces MPT and LPT.

8. Inspection Requirements

8. A. (1): LPT replaces Liquid Penetrant and added Liquid Penetrant Testing to WELD 2.08

8. A. (2): MPT replaces Magnetic Particle Inspection and added Magnetic Particle Testing to WELD 2.07.

WELD 2.06

Radiographic Testing

Throughout this document AIC replaces Ameren Illinois.

5. Radiographic Testing Procedures

5. A. (3): New - Required radiographic testing of welds shall be performed on pipe that is uncovered, accessible and not coated with any material that would interfere with the radiographic testing.

January 17, 2018
October 1, 2019

Supv Gas Tech Training - Welding requested adding API 1104 language regarding the condition of the pipe prior to performing radiographic testing.

5. B. Procedure Qualification

5. B. (2) (b): New - Any changes in details contained in API 1104 Section 11.1.2.2 Film Radiography (20th Edition), requires a new procedure shot. Details may include: List of details included

Supv Gas Tech Training - Welding requested adding API 1104 language which stipulates when a new procedural shot is required.

WELD 2.09	<p>Ultrasonic Wall Thickness Examination</p> <p>Throughout this document AIC replaces Ameren Illinois.</p> <p>2. Equipment and Materials</p> <p>2. B.: New - AIC uses a DeFelske PosiTector UTG. See WELD 4 for the DeFelske Full Guide manual.</p>	April 1, 2012	October 1, 2019
WELD 4	<p>Forms and Reference Materials</p> <p>Added: DeFelske PostTector UTG Full Guide</p>	April 1, 2019	October 1, 2019
WWBG 2.01	<p>Hazardous Atmosphere</p> <p>4. Working in a Hazardous Outdoor Atmosphere</p> <p>4. B.: Changed "should" to "shall". Gas field personnel shall always explore all available options to control blowing gas, whenever possible, and make the repairs in a gas free atmosphere.</p>	January 1, 2018	October 1, 2019
WWBG 2.02	<p>Personal Protective Equipment</p> <p>1. E. Chart: Level 2 Silver Needle Ensemble now requires a Level 1 coverall to be worn under the Level 2 insulated coveralls.</p> <p>Silver Needle Level 1 coveralls have been added as an approved item.</p> <p>Jeff Lott, Sr. Safety Supv, presented burn test data to the WW-BG SMR Team, Tim Jacobs, facilitator. Burn test results for the Silver Needle Level 2 showed an individual would get 20% 2nd degree burns. If a second layer of protection was provide under the Level 2, there would be a significant reduction in 2nd degree burns. The SMR Team agreed from a safety standpoint there is no question that a Level 1 suit should be worn under the Silver Needle Level 2 suit.</p> <p>Jeff informed the team, that Silver Needle now has a Level 1 coverall which he recommends be added to the approved list and entered on the Chart.</p>	October 15, 2018	October 1, 2019

Supersedes: April 1, 2019

CHANGE SUMMARY
Change Summary April 1, 2019

April 1, 2019

Document	Change Summary
Major Changes in this Update	
ABND 1 ACIG 1 ACIG 2.01 REPR 1	<p>In these sections, the need to turn off rectifiers prior to welding on the steel pipe has been removed.</p> <p>However, bonding of the steel pipe prior to cutting is required and that bond shall remain in place until the pipe has been reconnected.</p> <p><i>Documentation from welding supply company and from the National Association of Corrosion Engineers (NACE) indicates that rectifiers do not have an effect on welding nor does rectifier voltage create a safety hazards.</i></p>
CORR 2.03	<p>Pipe Coating Repair and Fitting Coating Repair:</p> <p>When the coating repair is performed with the 2 part liquid epoxy, the repair shall extend a minimum of 1 inch beyond the edge of the defect. This was reduced from 6 inches.</p> <p><i>Denso Protal instructions specifies extending the repair a minimum of 1 inch beyond the defect.</i></p> <p>Soil to Air Interface Zone:</p> <p>The UV Protection coating is to extend up above final grade.</p> <p><i>A change from 12 inches above grade or to bottom of the valve whichever comes first. The O&M Approval Committee felt the UV wrap just need to come above the final grade</i></p> <p>Approved Cold Applied Tape</p> <p>Removed the TC Profile Putty from the approved list.</p> <p><i>Tapecoat has put an expiration date on this product. Since it is not used on a regular basis, this would increase the potential for using a product that is past its expiration date or increase the amount of material that has to be disposed.</i></p>
CORR 2.32	<p>Added the new Protal 7300 product that is specially formulated for application on dry, damp or wet surfaces when the pipe surface temperature is 32°F or warmer.</p>
<u>MAIN 1</u>	<p>In the Location section, main shall not be installed under buildings. This includes a new, relocated or replaced main.</p> <p><i>The SERV section included language that services were not to be installed under buildings but there wasn't a similar restriction for mains. This same restriction should apply to mains. Approval Committee agreed with that position.</i></p>
MAIN 2.02	<p>Lowering or Realignment of Pipe</p> <p>Section has been expanded to include:</p> <p>Information on which engineering group is responsible for determining the feasibility of safely lowering or realigning pipe.</p>

UNCONTROLLED IF PRINTED

What should be included in the Engineering Review.

Inspections to be performed prior to and after movement.

Minimum Strip Back Distance table has been revised. The table only applies to pipe with MAOP of 60 psig or less. Gas Tech Engineering will determine the minimum strip back distance for the higher pressure pipe.

Additional information, concerns and guidance are a result of an engineering review of API RP 1171 Manual Movement of In-Service Pipelines.

MAIN
2.04

Temporary Pipeline Support Methods

Section has been expanded to include:

Information on which engineering group is responsible for determining the temporary support method.

A couple of additional support methods are shown.

MAIN
2.06

Insertion

If there is an existing valve installed on the casing pipe that has been or being inserted, that valve shall be removed or made inoperable.

This to eliminate the possibility of someone operating the valve and potentially cutting the insert pipe creating a hazardous leak.

METR
2.29

New Section: Gas Meter Bypass

This sections contains procedures for two methods that can be used to bypassing the gas meter without interrupting the service to the customer. Bypassing the meter can be utilized for any activity that requires shutting off the gas to the service line.

Portable CNG Tank System with Angled System Bypass Valve

Portable CNG Tank with Grunsky Apparatus

PMRK
3.04

A new pipeline marker sign has been added that can be used for regulator station signage as well as for pipeline marking.

The new sign contains "No Smoking" and can be used in lieu of the Regulator Station signs in PMRK 3.03. This eliminates the need for two signs at a regulator station or farm tap.

PRES
2.03

Potential Over Pressurization or Service Interruption

Pressure monitoring is required when replacement work or regulator station maintenance work affects a low pressure distribution system.

An Operational Checklist is required with tapping/stopping on low pressure distribution mains if being performed.

A listing of AIC's low pressure systems has been added.

There is to be a pre-job meeting prior to work being performed on any activity which requires an Operational Checklist and Written procedures.

Additional precautionary steps were needed when performing any activity which could potentially affect a low pressure distribution gas system. This became ap-

parent following a review of our O&M in-light of the aftermath of Boston area explosions.

PRES
2.04

Overpressure Reporting

Additional information that must be provided to Gas Compliance when the pressure exceeds the Maximum Emergency Pressure of a system is listed.

The additional information is needed for the required notification to PHMSA and the ICC.

PTST 1

When pipe is being used for bypassing through stopping machines, the pipe has to be pre-tested to at least 1.5 times the maximum pressure encountered during the operation.

Pipe is does not carry a pressure rating as does hydraulic hoses. The Code requires pipe to be pressure tested to 1.5 times the maximum pressure.

Digital pressure gauges should be read and recorded in whole units, rounded down the nearest whole unit.

Process gauges are spring gauges in which small fluctuation in pressure would normally not be noticed. Whereas, any small fluctuation in pressure is easily notices on a digital gauge. As a result a small fizzer leak on a test tree would in all likelihood not be noticed on a spring gauge but would be on a digital gauge.

When the required pressure test for a bottom-out line stopper assembly exceeds the collapse pressure of the carrier pipe, a reference to TAPS 1 8. which has fabricating and testing procedures.

PTST
2.01

Leak Test and Strength Test

Same statement has been added to these two sections.

and

Fluctuation shall be documented in the Comments sections on the pressure test stamp. Refer to PTST 1 3. A. (2) (d) if recording device has a digital display.

PTST
2.02

Provided instructions as to where pressure fluctuation is to be documented and the reference to PTST 1 3. provides instructions that the pressure is recorded on whole units

METR
3.01

3. Standardized Design Features

3. D. (3) New, Installation of below grade control lines should be minimized whenever possible.

3. D. (4) Additional requirements for below grade control lines; control lines should be separated, Buried Gas Pipeline Caution Tape installed over the control lines and control lines should be documented on as-built prints.

These revision were added to provide additional protection against excavation damage and to ensure location of below grade control lines are recorded. Concerns for below grade control lines are a result of the recent explosions in the Boston area.

3. J. Revised, Inlet and outlet steel risers shall be coated in accordance with CORR 2.03 1. F. - Soil to Air Interface Zone.

Eliminated stating the actual height above the surface that the risers should be coated. That is covered in CORR 2.03 1. F.

3. L. & M. New, these two sections address the protection of above ground regulator stations against accidental damage by vehicular traffic. 3. M. provides factors to be taken when determining if the regulator station is a safe distance from vehicular traffic.

3. N. Expanded the issues that need to be considered for the need of security fencing around an above ground regulator station to prevent unauthorized entry.

The SMR team was requested to develop additional guidelines and procedures for addressing how to protect above ground regulator stations from vehicular damage and unauthorized entry. Steve Blunier with GTE assisted in the development of this revision. This language is necessary to clear a NOA issued by the ICC.

TAPS 1 Under 8. Testing, there are detailed fabrication and testing instructions for bottom-out line stopper assemblies when the test pressure could collapse the carrier pipe.

Gas Tech Engineering and Welding Trainer developed the plan in order to provide a standard methodology which would ensure the assembly would comply with pressure testing requirements.

2. K. Changed title, Construction & Maintenance of Distribution System (Session #2000) from Steel Mains and Services

2. K. (1) & (3) Added Plastic Pipe

2. K (10) Added Documentation

5. (OJT) Breakdown by Type of Work with Associated B31Q Covered Task

Under Steel Installation, ten (10) new work types were added.

6. Gas Apprentice Performance Appraisal

Revised the instruction for reviewing the performance appraisal. The appraisal form should be discussed with the apprentice each month. The performance appraisal form must be submitted to the union as well as the Gas Training Center staff.

7. Gas Apprentice Session Evaluation

7. C. Added, Communicate observations of apprentice's behavior and performance while in training.

Updated the example of a Gas Apprentice Session Evaluation form.

8. Home Study Guide

8. B. Revised to include Reading Assignments and Activity Sheets covering the Home Study/Home Reading Assignments.

8. C. The passing grade of 80% includes all exercises, exams and activities.

Gas Training personnel updated the Gas Journeyman training to reflect a reorganization of and changes in of topics covered in some of the sessions. Also revised some of the instructions and expectations for the performance review and Home Study Courses. The Gas Apprentice Session Evaluation Forms have been updated to reflect the change in topics. The trainers will review this updated version of APPR 2.01 with the apprentices.

There are available options for isolating a leak on customer facilities most of which do not require shutting off and locking the meter valve.</i></p>	October ber 15, 2018	April 1, 2019

<u>LEAK 4</u>	Forms and Reference Materials Added: Reference 21 - Heath Gasurveyor 700 User's Manual (10/06/2016)	Janu- ary 1, 2018	April 1, 2019
MAIN 0	Table of Contents MAIN 2.02 Title change to Lowering or Realignment of Pipe, with new sections: 2. Engineering Review 6. Inspections Required Prior to Movement 8. Inspection Required After Movement MAIN 2.04 Title change to Temporary Pipeline Support Methods, with a new section 3. Temporary Support Methods	Janu- ary. 1, 2018	April 1, 2019
<u>MAIN 1</u>	Requirements 2. Location 2. E. New, New, relocated or replaced mains shall not be installed under buildings. <i>SMR Team felt, since SERV 1 included language that services shall not be installed under buildings, that same language should apply to mains. Part 192 does not include a restriction or procedures for installing a main under a building. Part 192 does provide procedures for installing service under a building. SMR Team felt it is reasonable to assume the requirements for service would apply to a main.</i>	Feb- ruary 1, 2019	April 1, 2019
MAIN 2.02	Lowering or Realignment of Pipe 1. General 1. C. Added, Designation of responsibility for determining feasibility for safely lowering or realigning in-service pipe based on MAOP, pipe material and location. Gas Division Engineering for steel pipe with MAOP of 60 psig or less and PE pipe with MAOP of 100 psig or less. Gas Tech Engineering for steel pipe with MAOP greater than 60 psig. Gas Storage Engineer for all piping in gas storage field. 2. Engineering Review - Renamed and repositioned 2. A. This section was revised and expanded to include those groups responsible for performing this review and what should be included in the review 2. B. Minor revision to clarify that it is in-service pipe. Added that the field procedures should include pipeline support and movement methods.	Octo- ber 1, 2011	April 1, 2019

The SMR team felt it important to identify the engineering groups who should be responsible for evaluating and determining the feasibility of realigning in-service gas lines. Representatives from Gas Engineering (Kowalske) and GTE (Albrecht, McIntyre) were involved in these discussions. A check with Mike Voegele found that the DDC does not evaluate lowering projects.

3. Steel Pipe Maximum Potential Realignment Distance (Strip Back)

3. B. Added, for pipe not shown in the table, Gas Tech Engineering or Division Gas Engineer should be consulted.

Minimum Strip Back Distances table was revised based on information from API RP 1171 Manual Movement of In-Service Pipelines.

4. PE Pipe Maximum Potential Realignment Span

Adjusted the Ditch Length values.

5. Realignment Concerns

5. A. (4) Examine Types of Welds

Added that prior to realigning in-service pipe, consideration should be given to visual and nondestructive inspection of girth welds and any questionable weld should be repaired.

5. A. (5) Know the Pipe Being Moved

Expanded the material properties that should be taken into consideration; wall thickness and seam

6. Inserted new, Inspections Required Prior to Movement.

A. External corrosion - see CORR 1 6.

B. Mechanical damage- If defects are found, see REPR 1

C. Pipe coating - If defects are found, see CORR 2.15 6.

8. Inspections Required After Movement

A. Pipe coating - If defects are found, see CORR 2.15 6.

An engineer in GTE modified procedures based on information from API RP 1171 Manual Movement of In-Service Pipelines. More procedures and guidance were needed to ensure that lowering or realigning does not adversely affect the integrity of the pipe.

MAIN
2.04

Temporary Pipeline Support Methods

1. General

1. A. Revised the wording to clarify it is temporary support for in-service pipe.

1. B. Designation of responsibility for determining temporary support for in-service pipe based on MAOP. Gas Division Engineering for steel pipe with MAOP of 60 psig or less and PE

January 1,
2016 April
1,
2019

pipe with MAOP of 100 psig or less. Gas Tech Engineering for steel pipe with MAOP greater than 60 psig. Gas Storage Engineer for all piping in gas storage field.

These revisions were made to identify what groups should be responsible for determining temporary support methods in-service gas lines.

2. Support Method Table - New name

Revised the notes under the support method table.

Temporary support should remain in place until backfilled.

In backfilling, use of rock shield should be considered to protect the pipe.

Ensure pipe is flat on the trench bottom and padded well.

Added a note under maximum span table to consult with Gas Tech Engineering or Pipeline Toolbox for pipe diameters not shown in table.

3. Temporary Support Methods - added a title for depicted methods

3. E. New - Sling Method of Pipe Support

3. F. New - Side boom/Backhoe Method of Pipe Support

3. G. Other: There could be other methods but Engineering should approve these methods of temporary support

SMR Team felt there needed to be a little more guidance in these procedures. A GTE engineering confirmed the existing span lengths through the use of the Pipeline Toolbox Software Application.

MAIN
2.06

Insertion

January 1,
2016

April 1,
2019

2. Considerations

2. B. Replaced "should" with "shall" and added "or made inoperable" for existing in-line valves within the casing pipe.

This is an alternative to removing an existing valve. The main objective is make sure that the inserted pipe cannot be cut or damaged due the use of a valve in the casing pipe. This situation occurred when a water department person operated an old gas valve thinking it was a water valve.

(2) Listed 2 signs that can be used at gas regulator stations that are in a locked fence or an enclosure.</p> <p><i>A new pipeline marker sign has been added which can be used at a regulator station, farm tap or as a pipeline marker, PMRK 3.04.</i></p>	January 1, 2014	April 1, 2019
PMRK 3.04	<p>Pipeline Marker Signs</p> <p>2. Pipeline Marker Signs</p>	January 1, 2012	April 1, 2019

2. C. New Pipeline Marker sign that has "No Smoking" added which allows it to be used at Regulator Stations, Farm Taps or as a pipeline marker.

This new sign replaces the need to have a Regulator Station sign and a pipeline marker sign posted at a regulator station.

POLY 2.04	<p>Butt Fusion</p> <p>5. Joint Assembly</p> <p>5. K. Check heating iron for proper temperature</p> <p>5. K. (1): Added Note: Infrared pyrometers should have an emissivity setting of 0.95.</p> <p><i>McElroy says this is the correct setting for the proper temperature measurement of their heating iron faces. A change in the emissivity setting will significantly the temperature readings.</i></p> <p>5. M. Inserting heating iron between pipe ends</p> <p>5. M. (2): Correction, Once the pipe is closed against the heating faces, reduce the pressure to contact pressure only. Do not wait for the first indication of melt before reducing the pressure.</p> <p>The indication of melt applies to pipe 14 inches and larger per McElroy's instructions.</p> <p>5. N. Correction, deleted the hold pipe ends in contact with heater face until heating cycle is complete.</p> <p><i>The pipe ends are held in contact with the heater faces until the proper melt bead is formed. This is already in the instructions. Eliminating the heating cycle avoids confusion.</i></p>	Janu- ary 1, 2019	April 1, 2019
PRES 0	<p>Table of Contents</p> <p>Removing PRES 2.01 Mechanical Chart Recorders</p> <p>PRES 2.03 added 3. Low Pressure Systems</p>	Janu- ary 1, 2014	April 1, 2019
PRES 2.03	<p>Potential Over Pressurization or Service Interruption</p> <p>2. Pressure Monitoring While Performing Work Activities</p> <p>2. B. (7) New, Replacement work affecting a low pressure distribution gas system</p> <p>2. B. (8) New, Regulator station maintenance work on a low pressure distribution gas system</p> <p>3. Low Pressure Systems (4 inch to 14 inch water column) - New section</p> <p>Added a table listing AIC's low pressure systems:</p> <p>Belleville 5150, Alton ALR 106_LP, Jacksonville 36-64 and Peoria X436.</p>	Sep- tem- ber 1, 2016	April 1, 2019

Pressure monitoring on these system requires a designated individual to constantly observe the downstream pressure during work activities.

5 Activities Requiring an Operational Checklist

5. B. (1) Added, Tapping and stopping operations on low pressure mains.

In reviewing the O&M following the explosions near Boston in 2018, it was evident that additional precautionary steps needed to be added to address working on low pressure gas system. When working on a low pressure system, constant monitoring of the downstream pressure is critical to avoid an over-pressurization.

6. Activities Requiring an Operational Checklist and Written Procedure

6. D. New, A pre-job meeting should be held to review the written procedures

It is extremely important that everyone involve in the uprating a system fully understands the procedures and their area of responsibility. This steps was missing from the procedures.

PRES
2.04

Overpressure Reporting

1. E. Expanded the information that the Gas Supervisor will need to furnish to Gas Compliance when the MEP is exceeded.

1 E. (1): Date and times of occurrence

1. E. (2): Name, job title and phone number of person who determined the condition

1. E. (3): Pressure system ID and regulator station ID and physical address if regulator malfunction occurred

1. E. (4) Actual pressures observed during the MEP Exceedance

1. E. (6) Apparent cause of overpressure condition

1. E. (7) Corrective action taken including reduction in pressure or shutdown to date and the planned follow-up of future corrective action. Including anticipated schedule for starting and concluding such corrective action.

1. F. Added, Gas Compliance shall notify PHMSA within 5 days for the occurrence and concurrently notify the ICC Pipeline Safety Department. Provided the email link for notifying PHMSA.

Gas Compliance requested that additional information be provided when the MEP is exceeded. This will provide them with the necessary information to report to PHMSA and ICC.

PTST 1	<p>Requirements</p> <p>1. G. Added, "pre-test pipe" for by-pass through the tapping and stopping equipment. The pre-tested pipe would have to be tested at 1.5 times the maximum pressure encounter during the stopping operation.</p> <p><i>Pre-tested pipe was not originally included for by-passing through the machines. However, the use of pre-test pipe has been observed and the testing requirements needed to be specified.</i></p> <p>3. Test Recording Methods</p> <p>3. (2) Pressure Recording Device</p> <p>3. (2) (d) New; Gauges or recorders which have digital display should be read and recorded in whole units. Reading shall be rounded down to the nearest whole psig unit.</p> <p><i>The digital gauge are so sensitive they will register the smallest fluctuation in pressure. This has created problems when there has been a small fizzer leak on a test tree. The O&M states that any leak found must be repaired and the leak test started over. The team felt that recording pressure in whole unit terms would bring consistency between spring gauges and digital gauges.</i></p> <p>8. Component - Title change</p> <p>8. A. (4) New, Gauge tap type components are to be tested prior to tapping.</p> <p><i>Was added to emphasize that these fittings must be test prior to taping. This is consistent with the language in TAPS 1 7. C. which states the fitting shall be pressure tested prior to tapping.</i></p> <p>8. B. Revised to a set minimum duration of 10 minutes when checking a single component for leaks.</p> <p><i>Simplified by removing language about use of gauge or time it takes to check for leaks with detection fluid.</i></p> <p>8. D. Clarification on testing assemblies, Assemblies with nominal diameter of 2 inches and larger are to be tested in accordance with PTST 1 Table E, Fabricated Units.</p> <p>Assemblies with nominal diameter smaller than 2 inch are tested in accordance with PTST 1 Table A, Service.</p> <p><i>This revision was supposed to be in the October 15, 2018 Update but was inadvertently missed.</i></p> <p>A Note has been added which references TAPS 1 8. B. when the test pressure for a bottom-out fittings/assembly exceeds the collapse pressure of the carrier pipe. TAPS 1 8. B. provides fabricating details and testing details for the assembly.</p>	<p>October 15, 2018</p>	<p>April 1, 2019</p>
--------	--	---------------------------------	------------------------------

Gas Tech Engineering and the Sr. Trainer - Welding developed the procedures and methodology for properly testing bottom-out fittings.

PTST 1 Table E. (2)	<p>Fabricated Unit/Assembly or Short Section of Pipe with Design MAOP of ≥ 100 PSIG</p> <p>Leak Test Duration - Min. 1 Hour</p> <p>Removed the language "Check for leaks with soap or leak detection instrument or"</p> <p><i>Language was causing confusion so the decision was made to make the duration consistent with PTST 1 Table D Steel Main with Design MAOP ≥ 100 PSIG.</i></p> <p>Added Note (3) If the test pressure of the bottom out line stopper assembly exceeds the collapse pressure of the pipe, refer to TAPS 1 8. Testing.</p>	<p>October 15, 2018</p>	<p>April 1, 2019</p>
PTST 2.01	<p>Leak Test</p> <p>4. Leak Test Procedures</p> <p>4. B. (a) Added "verifying operation of the recorder" as a reason to install recording device prior to initial pressurization.</p> <p>4. F. Grammatical revision, Initiate the leak test process as indicated in 4. C. replaced restart test.</p> <p>4. G. Added, Fluctuation shall be documented in the Comments sections on the pressure test stamp. Refer to PTST 1 3. A. (2) (d) if recording device has a digital display.</p> <p><i>Provided instructions as to where pressure fluctuation is to be documented and the reference to PTST 1 3. provides instructions that the pressure is recorded on whole units</i></p> <p>5. Leak Test Records</p> <p>5. A. identified what test forms are located in PTST 4.</p> <p>5. E. (3) & (4) Added the word "leak"</p> <p>5. E (9) Added Recording device type and</p> <p>5. E. (11) Clarifies leaks and failures are documented in the Comments section of the test stamp.</p> <p>5. E. (12) Clarified that pressure fluctuations due to outside forces is recorded after the pressure has stabilized.</p>	<p>January 1, 2018</p>	<p>April 1, 2019</p>
PTST 2.02	<p>Strength Test</p> <p>3. Strength Test Procedure</p> <p>3. A. (2) Added, Air, nitrogen or natural gas is being used</p> <p>3. D. (1) Added, Verify operation of the recorder</p> <p>3. F. Added, Reestablish the strength test pressure for the required duration.</p>	<p>September 1, 2016</p>	<p>April 1, 2019</p>

- 3. G. Added, Fluctuation shall be documented in the Comments sections on the pressure test stamp. Refer to PTST 1 3. A. (2) (d) if recording device has a digital display.

Provided instructions as to where pressure fluctuation is to be documented and the reference to PTST 1 3. provides instructions that the pressure is recorded on whole units

4. Strength Test Records

- 4. A. identified what test form is located in PTST 4
- 4. B. (3) & (4) Added, strength
- 4. B. (9) Added, Recording device type
- 4. B. (11) Clarifies leaks and failures are documented in the Comments section of the test stamp.
- 4. B. (12) Clarified that pressure fluctuations due to outside forces is recorded after the pressure has stabilized.

PURG 2.01	<p>Purging Methods</p> <p>1. General</p> <p>1. D.: Removed, "This section does not apply to purging activities conducted at the Ameren Illinois gas storage fields. Gas storage fields have their own purging procedures."</p> <p>Storage fields do not have separate purging procedures. Purging is performed following the procedures in PURG.</p> <p>5. Purging of Gas with Air During Abandonment</p> <p>5. E. Table Under Documentation, added Complete Purge Stamp. Purge Stamp is in ABND 4 Form 01.</p>	October 15, 2018	April 1, 2019
REGS 1	<p>Requirements</p> <p>2. Regulator Station Inspection Schedule</p> <p>2. B. Added the word "approximately" so that stations which serve approximately 250 customers will receive a primary inspection every 10 year.</p>	January 1, 2016	April 1, 2019
REGS 2.01	<p>Regulator Station Inspections</p> <p>7. Gas Leakage</p> <p>7. E. Added, Above grade, Above grade Class 3 leaks repaired at the time of the inspection shall be documented within ClickMobile by initiating a leak investigation.</p>	January 1, 2018	April 1, 2019
REGS 3.01	<p>Regulator Station Design</p> <p>2. General Guidelines and Requirements</p> <p>2. B. Update the reference link</p> <p>2. F. Updated the reference link</p>	January 1, 2018	April 1, 2019

3. Standardized Design Features

3. D. (3) New, Installation of below grade control lines should be minimized whenever possible.

3. D. (4) Additional requirements for below grade control lines; control lines should be separated, Buried Gas Pipeline Caution Tape installed over the control lines and control lines should be documented on as-built prints.

These revision were added to provide additional protection against excavation damage and to ensure location of below grade control lines are recorded. Concerns for below grade control lines are a result of the recent explosions in the Boston area.

3. J. Revised, Inlet and outlet steel risers shall be coated in accordance with CORR 2.03 1. F. - Soil to Air Interface Zone.

Eliminated stating the actual height above the surface that the risers should be coated. That is covered in CORR 2.03 1. F.

3. L. & M. New, these two sections address the protection of above ground regulator stations against accidental damage by vehicular traffic. 3. M. provides factors to be taken when determining if the regulator station is a safe distance from vehicular traffic.

3. N. Expanded the issues that need to be considered for the need of security fencing around an above ground regulator station to prevent unauthorized entry.

The SMR team was requested to develop additional guidelines and procedures for addressing how to protect above ground regulator stations from vehicular damage and unauthorized entry. Steve Blunier with GTE assisted in the development of this revision. This language is necessary to clear a NOA issued by the ICC.

REPR 1

Requirements

2. Leak Repairs

2. H.: New, In a storage field, installing two barriers is considered a permanent repair for a leak on a storage field well. A barrier is considered installing a bridge plug, loading the well with water or other engineered barrier method.

Leak in a gas storage field well was not previously addressed in the O&M. Gas Storage personnel submitted the language that should be in the O&M.

3. High Pressure Distribution and Transmission Pipe Repair

3. C. (6): Deleted "such as turning off rectifier during repair process"

Documentation from Lincoln Welding and NACE indicate that a rectifier does not affect welding nor is it a source of acci-

October
15,
2018

April
1,
2019

dental ignition so this consideration in the planning phase is unnecessary.

3. G. (2): Deleted the reference link to ACIG 2.01 3. Welding and Other Hot Work.

3. G (3): Deleted "See ACIG 2.01 2 Tools and Equipment, if segment is being installed on a rectified system."

4. Steel Distribution Pipe Repair

4. F. (2): Deleted the reference link to ACIG 2.01 3. Welding and Other Hot Work.

4. F. (3): Deleted "See ACIG 2.01 2 Tools and Equipment, if segment is being installed on a rectified system."

The information in 3. G. (2) and 4. F. (2) is the same as in ACIG 2.01 3. so the link didn't provide additional information.

A NACE publication explained that the rectifier DC voltage is typically between 1.0 and 3.0 VDC which is not a safety hazard nor a source of ignition. Arcing across separated pipe is the potential source of ignition which is eliminated by installing a bond cable prior to cutting the pipe.

SERV 3.08	Farm Tap, Double Cut, DOT Transmission Bill of Materials Item 14 - Fisher 627- Corrected Set Point to 20 PSIG Item 30 - Fisher 1805 - Added Set Point 30 PSIG. <i>Original version at the Fisher 627 set at 30 psig. However, SERV 2.03 2. D. for the DOT farm tap, the regulator set point is 20 psig and the relief set point is 30 psig.</i>	October 15, 2018	April 1, 2019
STLP 3.01	Weld Fittings Updated listing of stocked weld fittings including stock codes.	January 1, 2016	April 1, 2019
TAPS 1	Requirements 8. Testing 8. B. New testing and fabricating procedures for bottom-out fittings when the required test pressure exceeds the collapse pressure of the carrier pipe. <i>Gas Tech Engineering and Sr. Trainer - Welding developed these step by step procedures for this specific situation. The procedures were reviewed and accepted by the Pressure Testing SMR Team.</i>	September 1, 2016	April 1, 2019
TAPS 3.01	Mueller Fittings 1. Low Pressure Line Stopper Fitting Corrected Tap Size to 3-3/4" for 19 23 148	January 1, 2018	April 1, 2019

7. Mueller Curb Stop Tee

Added the in-line curb valve tee H-17900

VALV 3.03	Kerotest Gate Valve Removed Stock Code 39 22 148 - 1" 1200 psig valve since it was a Mueller inline curb valve and not a gate valve. This was the first valve listed in the Stock Code Table.	Janu- ary 1, 2018	April 1, 2019

CHANGE SUMMARY

February 1, 2019

Change Summary February 1, 2019

Docu- ment	Change Summary	Previous Docu- ment Dated	Current Docu- ment Dated
---------------	----------------	------------------------------------	-----------------------------------

There are two primary reasons for this O&M Revision.

1. The Butt Fusion, Electrofusion, Mechanical Joining and Plastic Fusion Qualification procedures have been updated to follow the procedures of the pipe manufacturer, fitting manufacturer, electrofusion processor manufacturer and butt fusion machine manufacturer. These procedures were used and distributed during the 2019 PE Fusion Qualifications which began in early January..

2. PHMSA published the Plastic Pipe Rule on November 20, 2018 with an effective date of January 22, 2019. Revision in CORR 1, MAIN 1, POLY 1 and SERV 1 were made to comply with this new rule.

Requirements

4. Cathodic Protection of New and Replaced Pipeline Facilities

4. D. Added the words "buried and submerged"

4. D. (1) Added - "Tests, investigation or experience shows that" adequate corrosion control is provided by the alloy composition.

4. D. (3): New section which addresses isolated metal alloy fitting installed after January 22, 2019 in buried or submerged plastic pipe systems.

CORR
1

These revisions were necessary to bring the O&M into compliance with 192.455 requirements of the new Plastic Pipe Rule effective January 22, 2019.

Janu-
ary 1,
2018

Febru-
ary 1,
2019

13. Atmospheric Corrosion

13. A. Added - Facilities with light surface oxidation can be marked as "Needs Paint" within ClickMobile.

Light surface oxidation, rust, is not considered atmospheric corrosion and should not be reported as such. During an ICC field audit there was a question on how does a facility that needs painting get reported.

13. C. Added the word "new" to above grade facilities that must be coated within 1 year.

Requirements

MAIN
1

8. Underground Clearances

8. A. New, Underground clearances apply to plastic and steel pipe installed either by direct bury or trenchless methods.

Janu-
ary 1,
2018

Febru-
ary 1,
2019

8. B. Revised, At time of installation, there shall be sufficient clearance to allow for installation and maintenance activities.

8. B. (1) Combined clearance requirements for transmission lines, high pressure distribution and distribution mains since they were essentially the same, 12 inches for other existing buried structures or utilities.

Added a Note that abandoned facilities should be considered since they have a potential to provide a path for migration of leaking gas.

Note came from a GPTC guide material for Part 192.325 Underground Clearance

8. B. (2) Reformatted measures that shall be taken to protect the pipe if the minimum clearance cannot be obtained

8, B. (4) Added a reference to POLY 1 4. Clearance from Thermal Sources, for PE pipe installed near a steam pipe.

In the new Plastic Pipe Rule, 192.329, plastic pipe installed by trenchless excavation the operator is take practical steps to provide sufficient clearance for installation and maintenance activities from other existing underground facilities. In BORE 2.02, which applies to both steel and plastic pipe, it references MAIN 1 8 for clearance requirements for mains.

9. Joining

9. B. Combined a couple of sentence, Butt fusion and electrofusion should be used to join PE pipe.

9. C. Removed, Heat fusion is the principal method of joining PE Pipe.

Table of Contents

POLY 1 Requirements - Added 1 new section

POLY 2.04 Butt Fusion - Inserted 3 new sections

POLY 2.06 Electrofusion - Inserted or renamed 7 sections

POLY
0

POLY 2.07 Mechanical Joining - Added Permasert 2.0

POLY 2.09 Plastic Fusion Qualifications - Inserted 1 new section

October
15,
2018

January 1,
2019

POLY 3.05 Stab Fittings - Added 1 new section

POLY 4 - Forms and Reference Materials - Updated 12 Reference Manuals

Requirements

POLY
1

1. B. New, PE pipe shall be inspected for external damage before it is installed.

2. Handling

October
15,
2018

February 1,
2019

2. B. (3) Added "for the McElroy Line Tamer instructions.

2. E. Word changes, "if print line is not legible at time of installation the pipe shall not be installed" replaced "manufactured date cannot be determined the pipe shall not be installed".

Plastic Pipe Rule, 192.63, requires the physical markings to be legible at time of installation. The required marking on the pipe is commonly referred to as "print line".

7. Minimum Bending Radius

7. A. (2) New - Bend shall not be less than the minimum bending radius shown in the table below.

Plastic Pipe Rule, 192.313, specifies that PE pipe may not be installed with a bend radius less than that specified by the manufacturer.

7. A. (3) Word addition, "Bend shall be" free of buckles, cracks, etc.

8. Weak Link

8. A. Added "by excessive forces"

8. B. Deleted words "if the pulling load gets too high"

Plastic Pipe Rule, 192.329, uses the term "excessive forces".

By adding excessive forces in 8. A. the words in B. were not needed.

13. Metal Alloy Fittings - New section

Plastic Pipe Rule, 192.455, amended the requirements on isolated metal alloy fittings installed in a plastic pipe system. This section was added as a reminder to refer to CORR 1 4. D. which includes those requirements.

Butt Fusion

This section has been slightly revised to follow Performance Pipe's latest Heat Fusion Joining Procedures and Guidelines. There are no major procedural changes from our current butt fusion procedures. A couple of definitions were revised or added to better clarify what constitutes Cooling Time and Work Time. Some additional points were added based on Performance Pipe's procedures.

POLY
2.04

The format of this section was changed to simple stated one line bullet points. Cooling and Work Time were updated in accordance with Performance Pipe's procedures. A new section on Bead Inspection was added with updated drawings of acceptable and unacceptable fusion beads.

January 1,
2018

January 1,
2019

The procedures were reviewed and revised by the POLY SMR Team, Sr. Training Supervisor, and representatives from Operator Qualification, Quality Assurance and Gas Standards & Materials. The goal was to follow Performance Pipe's procedures which would ensure our butt fusion procedures would produce an acceptable fusion joint.

Electrofusion

This section has been reformatted and revised to reflect information from the latest Central Plastic's EF Installation Procedure Manual.

The major procedural changes in the EF process are:

1. Central Plastic now states an inverter should be 3500 watts or larger.
2. Out of Roundness requirements have been added primarily for pipe larger than 2 inch.
3. In pipe preparation, an area 3 times the length of the coupling, elbow, cap and the width of the tee saddle is to be cleaned with an alcohol solution and remain clean throughout the fusion process.
4. The area to be scraped is to be marked in a criss-cross pattern. The scraping operation must remove all of the marking to ensure the pipe has been properly scraped.
5. During the scraping process, the ribbon material should be kept off the scraped area by either breaking off the ribbon material while scraping or guiding the ribbon material away from the scraped area to avoid possible re-contamination.

January 1, 2018 January 1, 2019

POLY
2.05

Requirements that were applicable to and repeated in each of the EF processes have been combined into a new section, 3. Common Requirements. This section contains additional Information on EF fittings packaging and storing, when re-fusing is allowed and inspection of the joint after completion of the fusion cycle.

The EF procedures were reformatted into chart form. The charts were divided into sections; Pipe Preparation, Scraping and Joint Assembly.

The procedures were reviewed and revised by the POLY SMR Team, Sr. Training Supervisor, and representatives from Operator Qualification, Quality Assurance, Gas Standards & Materials and George Fischer Central Plastics. The goal was to follow Central Plastic's EF procedures which would ensure our EF procedures would produce an acceptable fusion joint.

Mechanical Joining

Major change in this section is mechanical fittings installed after January 22, 2019 shall be a Category 1 fitting.

January 1, 2018 January 1, 2019

POLY
2.06

This is a PHMSA requirement published in the Plastic Pipe Rule, 192.281 (e) (4), on November 20, 2018. AIC stocks only Category 1 compression and stab fittings.

The Continental CON-STAB section was removed since these are no longer used by AIC.

The Permasert/Permasert 2.0 procedures were formatted in chart form.

Plastic Fusion Qualification

POLY 2.09	Added the procedures for Crush Testing EF Joints made during EF qualifications. A successful Crush Test will meet the requirements of ASTM F1055 for a qualified EF joint.	Janu- ary 1, 2018	Janu- ary 1, 2019
--------------	---	-------------------------	-------------------------

Storage and Handling PE Material - NEW Section

Topics addressed in this section are:

Receipt Inspection: verification of accuracy of material, manufacture date and no damage

Handling: pipe coils and silos, unloading in relatively level area, extra care when temperatures are below freezing and damaged pipe should not be used

POLY 2.10	Unloading: procedures for unloading stick pipe, coiled pipe from truck, safety precautions, methods of protecting pipe from damage	New	Febru- ary 1, 2019
--------------	---	-----	--------------------------

Storage: shelf life of PE pipe (3years for MDPE, 10 years for HDPE), stack height for silos, prohibited storage locations, un-bundled stick pipe stacked per pipe manufacturer's instructions

PHMSA's Plastic Pipe Rule, 192.67, requires operators to have written procedures for storage and handling plastic pipe and components. Gas Standards and Materials personnel worked with Stores in developing these procedures.

Stab Fittings

POLY 3.05	Added Permasert 2.0 to all of the stab fittings and updated the information in the tables. Added Repair Couplings - Permasert 2.0 for 1/2" CTS and 1" CTS.	May 1, 2010	Janu- ary 1, 2019
--------------	---	-------------------	-------------------------

Forms and Reference Materials

Revised file name for:

Reference 02 - FRIAMAT Fusion Units Operating Instructions

Updated:

POLY 4	Reference Manuals on all of the McElroy Butt Fusion machines, Test Cap. Line Tamer. Reference Manuals for the 28EP and 28HP Connectra butt fusion machines	Janu- ary 1, 2016	Janu- ary 1, 2019
-----------	---	-------------------------	-------------------------

Performance Pipe Fusion Procedures

GF MSA 340 Operating Manual

Central Plastic EF Installation Booklet

Requirements

4. Underground Clearances

4. A. New, Underground clearances apply to plastic and steel service lines installed either by direct bury or trenchless methods.

4. B. Revised. At time of installation, there should be sufficient clearance to allow for installation and maintenance activities:

4. B. (1) A minimum of 12 inches vertically and horizontally, between service line and buried electric

Added Note: Electric lines can produce heat.

4. B. (2) A minimum of 6 inches vertically and horizontally between service lines existing underground structures or utilities.

Added a Note that abandoned facilities should be considered since they have a potential to provide a path for migration of leaking gas.

4. B. (3) Refer to POLY 1 4. Clearance from Thermal Sources, if PE service line is being installed near a steam pipe.

In the new Plastic Pipe Rule, 192.376, plastic service lines installed by trenchless excavation the operator is take practical steps to provide sufficient clearance for installation and maintenance activities from other existing underground facilities. In BORE 2.02, which applies to both steel and plastic pipe, it references SERV 1 4. for clearance requirements for service lines.

4. B. (3) Separated from and reworded original 4.A. - Refer to POLY 1 4. Clearance from Thermal Sources, if PE service line is being installed near a steam pipe.

5. Location

5. E. (1) (a) Added "crawl space opening"

Makes this bullet point consistent with the Exhibit 3.

Gas Service Card

3. Service Sketches

3. B. Service Sketch Card replaces former Gas Service Transaction Card.

3. B. (4) Added DOJM Number to information requested on Service Sketch Card.

4. Completion Instructions

4. B. Service Sketch Card replaces former Gas Service Transaction Card. Service Sketch Card Stock Code numbers were added.

Table of Contents	<p>Removed the following sections since they have been eliminated over the past years.</p> <p>ABND 2.02 - Joint Abandonment of Mains and Services (now contained in ABND 2.01)</p> <p>ABND 2.03 - Abandonment of Transmission Facilities (now contained in ABND 2.01)</p> <p>ABND 2.04 - Contaminants (now contained in ABND 2.01)</p> <p>ABND 2.07 - Discontinued Service (now contained in TURN 2.03)</p> <p>LEAK 2.14 - Leak Surveys - Special Distribution Leak Survey (this survey ended January 1, 2016)</p> <p>METR 2.21 - Pipeline Meter and Chromatograph Calibrations (no longer applicable)</p> <p>POLY 2.03 - Heat Fusion (now contained in POLY 2.04)</p> <p>REGS 2.02 - Primary Inspection - (now contained in REGS 2.01)</p> <p>REGS 2.05 - Gas Compliance System Inspection Forms - (replaced by Maximo electronic forms)</p> <p>SECR 2.01 - Communicating Security Threats (now in Corporate Gas Security Plan)</p> <p>SECR 2.02 - Critical Gas Facility Risk Control Measures (now handled by Corporate Security)</p> <p>WELD 3.01 - Post-Weld Heat Treatment (not applicable to AIU)</p>	January 1, 2018	October 15, 2018
ABND 0	<p>Table of Contents</p> <p>Removed ABND 2.02, 2.03, 2.04 and 2.07 since they were removed in the January 1, 2018 Update.</p> <p>ABND 2.01: Changed the following:</p> <p>2. Transmission Lines and Distribution Mains</p> <p>4. Joint Abandonment of Transmission Lines and Distribution Mains and Services</p>	January 1, 2018	October 15, 2018
ABND 2.01	<p>Abandonment of Gas Facilities</p> <p>Throughout the document "transmission lines and distribution mains" replaced the word "mains"</p> <p>1. General</p>	January 1, 2018	October 15, 2018

UNCONTROLLED IF PRINTED

1. D.: New: Purging of abandoned facilities shall be performed and documented in accordance with PURG 2.01 5. Purging of Gas with Air During Abandonment.

Documentation that purging of abandon gas facilities was completed is now required to address an NOPV issued by the ICC.

4. Joint Abandonment of Transmission Lines of Distribution Mains and Services

4. B. Engineering should prepare specific procedures:

4. B. (7): Revised: A sequence and procedures for abandonment and purging operations in accordance with PURG 2.01 3. Purging Transmission Lines, High Pressure Distribution Mains and PURG 2.01 5. Purging of Gas with Air During Abandonment.

In PURG 2.01 contains information on which facilities require a Purge Plan and what documentation is required.

Throughout Section 3 Services, the hyperlinks were updated to go to a specific section within the referenced document.

BORE
2.02

Boring Operations

3. Prior to Beginning Operations

3. C.: Revised: Under hard surfaces such as state highways, driveways, etc, where it may be hazardous or infeasible to expose facilities prior to boring, water line valve boxes and gravity sewer manholes can be checked to verify the depth of those lines. If the depth of an underground facility cannot be verified to be clear of the proposed bore path, the Ameren Damage Prevention team should be contacted in order to determine a course of action which best limits risk and is in compliance with JULIE requirements. The facility must be uncovered, at a minimum, on each side of the hard surface before boring begins.

Safety and Damage Prevention revised the language to bring procedures in line with the JULIE Law. The new language is the same as in AIU's Safety Manual.

2018

BORE
2.03

Pipe Installation

2. PE Pipe

2. G.: New, added POLY 1 8. C. contains the maximum allowable tensile loads for PE pipe and lists the corresponding weak links for each size of PE pipe.

Move the Max Allowable Tensile Load information to POLY 1 and incorporated it with the weak link table.

January 1,
2016

October 15,
2018

Throughout the document the hyperlinks were titles were added and the links updated to go to a specific section within the referenced document.

BORE
2.04

Boring Across or Near Sewer Lines

January 1, 2018
October 15, 2018

1. General

1. A.: Added, "to avoid installing gas line through a sewer line or sewer lateral."

1. B.: Added, "or sewer laterals that are within the proposed bore path."

4. Construction Steps

4. A.: Revised to, Before boring, conduct a final inspection along the proposed bore path looking for possible unmarked sewer facilities and ensuring the depth to the marked sewer lines have been verified not to be in conflict with proposed bore path.

Best practice from articles on cross boring recommend a final walk through before beginning boring looking for the possibility of unmarked facilities.

4. B.: Was former 4. C. and was revised to, Every effort should be made to maintain the clearances shown in MAIN 1 8. A. or SERV 1 4. B. between the gas line and the sewer line.

4. F.: Grammatical correction, verified to be clear of the bore path replaces verified not to be in close proximity of the bore path.

CONS
2.01

Construction Inspector Responsibilities

January 1, 2018
October 15, 2018

2. Job Assignment

2. E.: Grammatical revision, Contractor replaced inspector.

CORR 0

Table of Contents

January 1, 2018
October 15, 2018

CORR 4 Forms and Reference Materials

Added Reference 24 through 32.

CORR
2.03

Coatings

January 1, 2018
October 15, 2018

1. Approved Coatings

1. F. (3): Added moisture cured wrap that can be used to wrap riser at soil to air interface zone.

1. F (4): Removed the examples of approved underground coatings.

7. Approved Paint Specifications

7. A. (3): Word change, "paint" replaced "epoxy" since the approved Tnemec 2 part paint is not epoxy.

7. C.: Revised because the application temperature limitations are in the paint specification sheets and not on the containers. Points out that temperature is of the pipe not the ambient temperature.

CORR 2.09	<p>Protal 7200</p> <p>1. C.: Corrected shelf life to 2 years from manufactured date. Added, The Protal tubs and pails have a use by date which would be the last day of the month shown.</p> <p>Shelf life information in current O&M was copied from manufacturer's Protal 7200 specification sheet. A check with manufacturer found this information was incorrect and their specification sheet needed to be corrected.</p> <p>2. A. (9): Added stock code for 1 gallon jugs of MEK liquid.</p>	January 1, 2018	October 15, 2018
CORR 2.23	<p>Clearing Shorted Pipelines</p> <p>3. Preformed FRP Spacers - Type 120 - Stocked</p> <p>3. B.: Replaced the specific product names with "an approved field applied liquid/epoxy coating, CORR 2.03 5."</p>	January 1, 2016	October 15, 2018
CORR 2.29	<p>Records</p> <p>2. Construction Order Review Processes</p> <p>2. B. (1) (c): Dave Wiegand replaced Michael Lemkuhl name from table.</p>	January 1, 2018	October 15, 2018
CORR 3.02	<p>Anode Test Station</p> <p>Corrected the detector wire that is attached to the main. Added the stock codes for the 500 ft and 1500 ft spool of #12 tracer wire. Added notes on which size of anode should be installed on steel service lines and mains.</p> <p>The previous listed wire is not suitable for buried installation.</p>	January 1, 2016	October 15, 2018
CORR 3.14	<p>Test Lead Wire Attachment</p> <p>1. B.: Correction, 100 psig replaced 60 psig. This was missed in the January 1, 2018 Update.</p> <p>7. Test Lead Attachment Coating</p> <p>7. B.: Added stock code, 30 10 165, for Viscotaq Coating Patch and that Viscotaq patch is UV resistant.</p> <p>7. C.: Handy Cap is being replaced with Viscotaq Coating Patch but the Handy Cap can continue to be used until supply is depleted. Handy Cap is not UV resistant and should not be used where exposed to sunlight.</p>	January 1, 2018	October 15, 2018
CORR 4	<p>Forms and Reference Materials</p> <p>Added the following reference materials:</p>	Sep- tem-	Octo- ber

EMER 2.02	Dispatch Center	Janu-	Octo-
	2. Actions Required By the Supervisory Personnel	ary 1,	ber
	2. A.: Supervisory personnel instructions to dispatcher	2018	15,
	2. A. (1): Revised to, Continue calling qualified gas field personnel following the ARCO's protocol. During emergency situations, AIC has automated call out protocols for contacting qualified personnel from outside the affected area when there is no response from the affected area.		2018
	2. A. (3): Added meter changers and gas supervisors as examples of qualified emergency responders.		
	2. A. (1): Removed, Call qualified gas personnel from another operating center. DSOS does not call responders from outside the operating center. That is the responsibility of Duty Supervisor.		
	3. Cold Weather Electrical Outage and Restoring Electrical Service		
	3. B.: Added, GTS should be notified of scheduled maintenance outages in addition to outages involving the EOC activation.		
	If scheduled electrical maintenance outage is going to involve a large number of customers, GTS wants to be notified so they determine if electric restoration of power will have an effect on the gas system.

New (94): Supervisor Review Initials: Enter the initials of the supervisor completing the review of the completed form.

New (95): Date: Enter the date the form was reviewed.

METR 2.17	<p>Gas Meter Data verification</p> <p>2. Gas Meter Data Sheet</p> <p>2. B.: Gas field personnel are to forward the completed Gas Meter Data Sheet to their supervisor for approval. The supervisor will ensure the GMDS is forwarded to the appropriate distribution listed in METR 2.16</p> <p>3. Gas Meter Data Sheet.</p> <p>Metering SMR Team cleaned up the language to make it clearer on how the GMDS is to be routed electronically.</p>	January 1, 2017	October 15, 2018
METR 2.19	<p>Pressure Factor Verification</p> <p>New section added:</p> <p>8. AMR/AMI Reading Verification</p> <ol style="list-style-type: none"> 1. Verify AMR/AMI reads are in alignment with field meter readings. 2. AMR/AMI readings lag field readings by 24-48 hours. The 7 day history function on the AMRC screen in OAS can be used to help determine alignment. 	January 1, 2018	October 15, 2018
METR 2.20	<p>Meter Header Inspection</p> <p>2. A. (1) Added instructions if voltage is detected on a gas meter with a reference link to CORR 2.17</p> <p>2. A. AC Voltage at Customer Meter Set.</p> <p>2. A. (9): Grammatical, added the word repair so that it is consistent with 3. A. (8)</p>	January 1, 2017	October 15, 2018

3. A.: Word changes to match 2. A.

3. A. (1): Added instructions if voltage is detected on a gas meter with a reference link to CORR 2.17 2. A. AC Voltage at Customer Meter Set.

3. A. (8): Grammatical, added the word regulator to make is consistent with 2. A. (9)

Makes this section consistent with other sections where the meter set is to be checked for AC voltage.

METR 2.23	Gas Meter Exchange 10. B.: Added instructions if voltage is detected on a gas meter with a reference link to CORR 2.17 2. A. AC Voltage at Customer Meter Set Makes this section consistent with other sections where the meter set is to be checked for AC voltage.	January 1, 2017	October 15, 2018
METR 2.27	Electronic Corrector Installation Verification 7. AMR/AMI Reading Verification A. Verify AMR/AMI reads are in alignment with field meter readings. B. AMR/AMI readings lag field readings by 24-48 hours. The 7 day history function on the AMRC screen in OAS can be used to help determine alignment	January 1, 2018	October 15, 2018
METR 3.04	Regulator Sizing - 2 PSIG Delivery Pressure Typo correction, missed 1" in the description of 62 06 486 American 1813C.	January 1, 2018	January 1, 2018
METR 4	Forms and Reference Materials Updated: Form 01- Electronic Corrector Inspection Form July, 2018 Form 03 - Gas Meter Data Sheet (Rev 08-12-2018) Form 05 - Electronic Corrector Verification Form July, 2018	January 1, 2018	October 15, 2018
ODOR 0	Table of Contents ODOR 1 3. Odorization Intensity Sampling, added Intensity ODOR 2.04 Emergency Response replaces Deodorizing Agents ODOR 4 Update: Form 02 - Ameren Shipping Paper - Odorant Added: Form 03 - Odorant Event Report 8-28-2018	January 1, 2016	October 15, 2018

Reference 11 - ODOR Handy plus Manual Version August 2011

Reference 12 - Becker ACD-300 Charcoal Deodorizer

ODOR 1	<p>Requirements</p> <p>Throughout this section the word "standard" has been added to cubic feet, "standard cubic feet" and to "MMSCF".</p> <p>2. Odorization Requirement</p> <p>2. B.: Revised to address the target odorant concentration level for 80/20 and H85 odorant blends.</p> <p>2. B. (1): For the TBM 80/20 odorant blends the target level range is 0.50 to 1.25 Lbs/MMSCF.</p> <p>2. B. (2): For the H85 odorant blends the target level range is 3.0 to 6.0 LBS/MMSCF.</p> <p>2. C.: Word change, "saturation" for "concentration".</p> <p>2. C.: When using TBM 80/20 blends, the odorizers are adjusted to maintain an odorant concentration level near 1.0 Lbs/MMSCF. When using H85, the level is near 5.0 Lbs/MMSCF.</p> <p>Revised to address odorant blends used at AIC. Odorant blends have different target odorant concentration targets.</p> <p>2. E.: Supplemental odorizer would also be used for pipeline pickling or where supply sources may not provide adequate odor intensity.</p> <p>2. F.: Added the word "targeted" to injection rates.</p> <p>Odorization SMR Team is now working on pipeline pickling procedures. A supplemental odorizer may be required where long sections of new pipe is being installed.</p> <p>3. Odorization Intensity Sampling: Added Intensity</p>	<p>January 1, 2016</p> <p>October 15, 2018</p>
--------	---	--

ODOR 2.02	<p>Odorization Operations</p> <p>Throughout this section the word "standard" has been added to cubic feet, "standard cubic feet" and to "MMSCF".</p> <p>2. Odorization Location</p> <p>2. B.: Word change, odorization equipment replaced supplemental odorizer equipment.</p> <p>3. Odorizer Equipment</p> <p>3. C.: Word change, "must" replaced "should be capable of". Odorization equipment must introduce odorant into gas stream without wide variation in the level of odorant. The language closely matches 192.625.</p> <p>3. D.: Odorizer may be programmed with alarm limits, remote control and fault indications. Added "remote control".</p>	<p>January 1, 2016</p> <p>October 15, 2018</p>
-----------	---	--

4. Odorization Operations and Inspection

4. B.: Added the word verbally. When Gas Control detects an AOC they will verbally contact the appropriate Gas Tech Supervisor for consultation and instruction or may dispatch a GTS Technician.

4. B. (2): Added the word verbally. The GTS Technician will verbally contact Gas Control to notify them of the results of the investigation and follow-up action.

Due to the importance of an AOC situation, the Odorization SMR team wanted to make sure the contacts were verbal and not phone messages or email.

4. C. New: When GTS Technicians are responding to an abnormal operations on odorizer equipment that is not remotely monitored, they are expected to document the same information as required for remotely monitor equipment.

4. D.: Clarified that all in-service odorizers shall be inspected at least monthly.

Added the inspection will include checking for odorant leaks and atmospheric corrosion on the piping connected to the odorizer. Inspection is documented in ClickMobile.

4. E.(2): "intensity test" replaced "sniff test"

4. F. (4): Revised AIC's target odorization rates based on the blend of odorant being utilized. For 80/20 blend the target rate is 1 Lbs/MMSCF. For the H85 blend the target is 5 Lbs/MMSCF.

4. F. (6): If calculated usage is less than 0.50 or greater than 1.25 Lbs.MM/SCF for 80/20 blends a warning message will be displayed in Maximo.

4. F. (7): If calculated usage is less than 3.0 or greater than 6.0 Lbs.MM/SCF for H85 blends a warning message will be displayed in Maximo.

Once Maximo is unlocked it will be update to reflect this change.

4. F. (8): Added the word verbally. When the calculated odorant usage rate falls outside the compliance ranges, the GTS Technician is to verbally notify the GTS Supervisor.

4. F. (9) (e) II.: Word changes, Increase odorizer operational inspection frequency.

5. Liquid Odorant Tank to Tank Transfer

5. A. (1): Added: Mercaptan liquid than lighter than water and the vapor is heavier than air.

5. A. (6): Package group for shipping papers change to Group 1/2/3 from Group 3

5. A. (7): Identified the shipping paper template is in ODOR 4.

UNCONTROLLED IF PRINTED

5. A. (10): Expanded the PPE to include non-permeable gloves and eye goggles when working on or near pressurized odorant lines. Additional PPE that may need to be considered are respirator with organic cartridges and non-static clothing.

5. B. Procedures to be followed when transferring odorant.

5. B. (3): Added recommended hoses that should be used for the transfer.

5. B. (9): Clarified that a pressure regulated standing pilot flame should be used at the flare to ensure complete incineration of odorant vapor and possible hydrocarbons.

5. B. (11): New, a closed-loop odorant transfer methods are recommended.

5. B. (12): New: Commercial odorant delivery may incorporate compression or vacuum to transfer the odorant between target vehicle and delivery vehicle.

5. B.(17): New: Clothing may become permeated or contaminated with the odorant so personnel should avoid public areas.

6. Records

6. A.: Monthly inspection and odorization rates are maintain in Maximo for a minimum of 5 years which is a change from 3 years.

Inspection records on transmission lines must be kept for a minimum of 5 years per 192.709

Majority of the revision above were made by the Odorization SMR team to bring AIC operations in line with the new AGA Odorization Handbook. The GTS Supervisors and Technician are the only ones impacted by these revisions.

ODOR
2.03

Odorant Intensity Testing

1. Definition of odorant intensity was added to GLOS.

2. A.: Expanded reference link

3. Intensity Test Instruments and Readings

3. E.: The "sniffs the sample" was replaces with "then uses their nose to rate the intensity of the sample.

3. I.: When the intensity reading is outside the readily detectable range, it shall be verbally reported immediately to the Gas Supervisor and the GTS Supervisor.

Due to the importance of these odorant intensity tests, the Odorization SMR team wanted to make sure the contacts were verbal and not phone messages or email.

3. I. (1) and (2): Daily intensity test replaces Daily readings.

Janu-
ary 1,
2016

Octo-
ber
15,
2018

3. J. (1): Added other strong smells could contribute to olfactory fatigue.

3. K.: When the customer is available, they may be asked to perform a threshold and readily detectable test. The results of customer's test will be documented.

Replaced the word "test" with "threshold and readily detectable test" and added the documentation.

4. Employee Threshold Testing

4. B.; Word change, "attending employee" replaces "other employee".

5. Selection of Odorant Intensity Test Sites

5. B.: In addition to the size and configuration of the odorized system and the location of the delivery points, site locations will also depend on locations at end of mains.

SMR Team added end of main as another consideration for selection of intensity test site.

5. D. (3): Word changes, masking replaced dilution and disguising of gas smell replaced masking of odorant.

5. D. (5): Revised to reinforce that test sites should not be at regulators stations because the soft parts in the station equipment absorbs odorant that could may deceive of bias the intensity tests.

6. Snif Tests

6. A.: Definition of snif tests was added to GLOS

6. C.: Added, "use their nose to sniff"

6. D.: Revised; The gas field personnel shall verbally and immediately contact their Supervisor or other AIC management personnel during a suspected occurrences of either over-odorized, strong smelling gas, or under-odorized, weak smelling gas, that is not readily detectable.

6. E.: Added the word immediately, Gas Supervisor will immediately schedule odorant intensity checks to determine the actual intensity value of the gas' smell.

Odorization SMR felt the importance of odorant intensity tests needed to strengthen and that immediate verbal contact and action must be taken when there is a suspected problem.

7. Records

Odorant intensity test records shall be retained in Maximo for a minimum of 5 years which is a change from 3 years.

Test Pressure for 60 psig Design MAOP to 180 with a Note that 8" MDPE has a Max Test Pressure of 150 psig.</p> <p>Maximum test pressure is based on the design pressure of the PE pipe and 192.513 states the maximum test pressure cannot exceed 3 times the design pressure.</p>	Sep-tem-ber 1, 2016	Octo-ber 15, 2018
PTST 1 Table C	<p>Steel Main - All Steel Pipe Sizes thru 30" with Design MAOP < 100 PSIG</p> <p>Changed the Max Test Pressure for Design MAOP ≤60 PSIG to 180 psig from 120 to be consistent with PTST 1 Table B.</p>	Sep-tem-ber 1, 2016	Octo-ber 15, 2018
PTST 1 Table E	<p>Fabricated Unit/Assemblies or Short Sections of Pipe</p> <p>Removed; pressure gauge tap, blow down stacks, equalizer valve setup, pressure recording connections and by-pass connections.</p> <p>These type fittings are to be tested in accordance with PTST 1 Table A.</p> <p>Added HDPE for 60 psig Design MAOP.</p>	Sep-tem-ber 1, 2016	Octo-ber 15, 2018

Changed Max. Test Pressure for 60 psig Design MAOP to 180 with a Note that 8" MDPE has a Max Test Pressure of 150 psig.

Consistent with PTST 1 Table B

PTST 2.04	Nitrogen Pressure Testing 3. Cylinder Requirements 3. C. (1) & (2): Correction to 3 inch pipe. 12 inch pipe was erroneous entered in January 1, 2018.	January 1, 2018	October 15, 2018
PUBL 2.01	Public Notifications 6. Records 6. B.: Paradigm has replaced NIPA and SIPA	January 1, 2018	October 15, 2018
PUBL 2.02	Liaisons With Fire, Police and Public Officials 2. Periodic Contact 2. D.: Paradigm has replaced NIPA and SIPA	January 1, 2018	October 15, 2018
PURG 0	Table of Contents PURG 2.01: Changed the following: 4. Purging Transmission Lines and High Pressure Distribution Mains 5. Purging of Gas with Air During Abandonment	January 1, 2016	October 15, 2018
PURG 2.01	Purging Methods 2. Pre-Purge Activities 2. D.: Correction, services shorter than 500 feet that can be purged through the service riser. 3. Purging Transmission Lines and High Pressure Distribution Mains Transmission Lines and High Pressure Distribution Mains have been used throughout this section. 4. Purging of Air with Gas 4. C.: Clarified that when purging a service line with an EFV, the meter valve should be opened slowly to allow the air to be purged without tripping the EFV. Slowly opening the valve minimizes the gas flow thereby not exceeding the EFV's trip flow value. 4. D.: Revised: When purging from air to gas, purge is complete when CGI readings reach ninety percent (90%) Gas-in-air or greater and the smell of gas is present.	January 1, 2018	October 15, 2018

(1) Alternatively, purging may be considered complete at 90% Gas-in-Air when Engineering has prepared a pipeline conditioning (pickling) plan or

(2) Pipeline contains un-odorized gas and is not required to be odorized.

The Odorization Team wanted to provide more guidance as to when a purging the air from the pipeline is complete. This takes into account conditioning of new pipelines to ensure odorized gas is passing through the pipe and the odorant is not being absorbed into the new pipe. Engineering will evaluate projects to determine when a pipe conditioning plan will be required.

5. Purging of Gas with Air During Abandonment

5. A.: Clarification this section addresses abandonment of transmission line, distribution main or applicable service line.

5. C.: Clarification that the 2% LEL or less is measured with a CGI.

5. E.: New, Added a table that shows which gas facilities; a) require a Purge Plan, b) require purging to be documented and c) how to document the purge was completed.

Documenting that an abandoned facilities has been purged is a new requirement in most cases. This table was developed to clarify what documentation is required.

10. Monitoring Purge

10. F.: Deleted the sentence on testing gauges.

Expanded some of the reference links throughout the document.

REPR 0	Table of Contents	Janu- ary 1, 2018	Octo- ber 15, 2018
	REPR 4 Reference Materials added		
	Ref 03 - Plidco Storage and Inspection Instructions		
	Ref 04 - Plidco Installation Split + Sleeve 2016		
REPR 1	Requirements	Janu- ary 1, 2018	Octo- ber 15, 2018
	1. Objective		
	1. J.: Revision on the Make Safe Repair; Permanent repair shall be completed within 90 calendar days except for compression couplings which is 30 calendar days, see REPR 2.01. This does not apply to a Class 1 leak within 5 feet of a foundation which shall be permanently repaired at time of discovery.		
	Clarifies that permanent repair for leaking compression coupling greater than 5 feet from a foundation has to be made within 30 calendar days. Leaking compression coupling		

within 5 feet of a foundation is considered a Class 1 leak which has to be permanently repaired at time of discovery.

5. PE Pipe Repair

REPR 1 Table 3: MDPE and HDPE Pipe Repair Methods

Correction, EF Repair Saddle can be used on Pipe Defects greater than 10% wall thickness. This is consistent with language in 6. D. (1).

Updating the Table was missed with the January 1, 2018 O&M Update.

Added "leak detection equipment" where ever "testing or checking for leaks with leak detection fluid" was referred to within the document.

Expanded reference links throughout the document.

REPR
2.01

Compression Couplings

Throughout this section, below grade, has been added to clarify this O&M section addresses below grade compression couplings. In addition, calendar days was clarified throughout this section to be consistent with REPR 1 1. J.

De-
cem-
ber 1,
2014 Octo-
ber
15,
2018

2. Main Repair Methods for Below Grade Compression Couplings

2. C. Steel to Steel

New: (1) If the compression coupling is within five (5) feet of a foundation wall:

(a) Tighten and encapsulate the compression coupling with a full encirclement welded split sleeve or

(b) Remove the coupling and replace with a new section of pipe connected by an approved welding procedure.

2. C. (2): Added, If the compression coupling is greater than 5 feet from a foundation wall,

O&M did not address the situation of a leak compression coupling on a main that is within 5 feet of a foundation. The same requirements as under a service line within 5 feet should apply.

3. Service Line Repair Methods for Below Grade Compression Couplings

3. C. Steel to Steel

3. C. (4) (a): Corrected the reference to REPR 2.02 2. C. (2).

5. Testing of Repairs

5. D,: Added "leak detection instrument" and another means for check for leaks.

REPR 3.02	Dresser Reinforcing Sleeves Updated part numbers and added new Style 110 and Style 220 Reinforcing Sleeves.	January 1, 2013	October 15, 2018
REPR 4	Forms and Reference Materials Added Reference 03 - Plidco Storage and Inspection Instructions Reference 04 - Plidco Installation Split + Sleeve 2016	January 1, 2014	October 15, 2018
SERV 0	Table of Contents SERV 3.08 Farm Tap, Double-Cut, DOT Inspectable, (20% SMYS Transmission) SERV 4: Added Reference 01 - Transmission Map - 20% SMYS MAOP	April 1, 2017	October 15, 2018
SERV 2.02	Excess Flow Valves or Manual Shut-Off Valve This change was distributed on April 30, 2018. 1. General 1. D. Replaced service includes: (1) Replacement of the service tee or the fitting that connects the service line to the main, or (2) Replacement of the service line from that service tee or fitting to the service riser, or (3) Replacement of a section of the service line near the main, where an EFV is typically installed 1. E. An EFV is not required when the section of the service line being replaced is far away from the main or source of gas. Revised language closely matched Part 192.383 and removes the previous requirement for installing an EFV whenever the main is uncovered to shut-off gas on the service line. 1. H.: Grammatical change to make it clear if existing customers meet specific requirements, an EFV will be installed on their service line. 2. Residential Service Requirements 2. B. Multi-family residences shall have a properly sized EFV installed when there is one available and approved by AIC. If an EFV is not available, and manual service line shut-off valve shall be installed. In order to simplify and eliminate confusion, the 1,000 scfh criteria was removed.	April 1, 2017	April 30, 2018

2. C.: Clarified that a 3/4 inch steel EFV shall be installed on the high pressure service line of a residential farm tap if there is one available and approved by AIC.

2. D. (4): Added "approved by AIC".

3. Commercial Service Requirements

3. A. Each single service lines to a single commercial customers shall have a properly sized EFV installed when there is one available and approved by AIC. If an EFV is not available, and manual service line shut-off valve shall be installed.

3. C. Each single service lines to a multi-commercial customers shall have a properly sized EFV installed when there is one available and approved by AIC. If an EFV is not available, and manual service line shut-off valve shall be installed.

In order to simplify and eliminate confusion, the 1,000 scfh criteria was removed.

3. E.: Clarified that a 3/4 inch steel EFV shall be installed on the high pressure service line of a commercial farm tap if there is one available and approved by AIC.

3. E. (1): On all commercial farm taps, a properly sized EFV shall be installed on the primary service line if there is one available and approved by AIC.

In order to simplify and eliminate confusion, the 1,000 scfh criteria was removed.

3. G. (4): Added "approved by AIC".

8. EFV Sizing

8. F. (3): Added a higher capacity 1 inch CTS EFV, UMAC Series 2600.

SERV
2.03

Farm Tap Installation

1. General

1. B.: Added "and DOT classification" as another determining factor on which farm tap is to be installed. 1. C.: New, Double Cut DOT Transmission farm taps should be installed on all new and replaced services where the MAOP of the main is equal to or greater than 20% SMYS (DOT Transmission). A map of DOT Transmission mains is in SERV 4 -Transmission Map - 20% SMYS MAOP. 2. Standard Installation

2. A.: Added "and DOT line classification" for sizing relief valve on a farm tap.

2. B. (3): Added a Double-Cut DOT Transmission Farm Tap (Inlet MAOP up to 1000 psig) - SERV 3.08

April
1,
2017

October
15,
2018

- 2. D.: Added: On DOT Transmission farm taps the second cut regulator set point is 20 psig. The second cut 1805 relief will be set at 30 psig
- 2. E.: Added: Note: All DOT farm taps should be set as double cuts.
- 2. I.: Added SERV 3.08 Double-Cut DOT Transmission
- 3. Location
 - 3. D.: Added, Particular consideration should be given to protect DOT Transmission farm taps.

Above changes made to comply with a new PHMSA rule 192.740 requiring the pressure regulating equipment (farm tap) connected to a transmission line be inspected every three years. New farm tap design was required to allow inspection without disrupting service to the customer.
- 4. Testing
 - 4. C.: Added "leak detection instrument" as another means for checking for leaks.
- 5. Inlet Valves
 - 5. A.: Added "and DOT Transmission" to the list of farm taps.
 - 5. B. (1): Added "SERV 3.08 DOT Transmission farm tap".
- 7. Farm Tap Capacity Tables
 - 7. D. New: Double Cut DOT Transmission farm tap -2nd Cut 627, 1/8" orifice, 20 psig set point capacity at 100 psig inlet = 1810 scfh.

SERV 3.08	Farm Tap - Double-Cut, DOT inspectable (20% SMYS Transmission) Standard design for an inspectable farm tap.	New	October 15, 2018

This is per API 1104 20th Edition which has been incorporated by reference in Part 192.</p> <p>3. B.: Revised, to require trainees who are assisting Level II or Level III MT personnel to provide AIC Gas Compliance with a statement indicating satisfactory completion of their employer's training.</p> <p>Removed the language requiring a trainee to provide the same documentation as Level I, Level II and Level III since trainees are not certified.</p>	Janu- ary 1, 2018	Janu- ary 17, 2018
WELD 2.08	<p>Liquid Penetrant Testing</p> <p>3. Liquid Penetrant Testing Personnel</p> <p>3. A.: Added Level I, Level II and Level III</p> <p>3. A. (1): Revised, Level I and Level II are required to be certified every 3 years and Level III are certified every 5 years. This is per API 1104 20th Edition which has been incorporated by reference in Part 192.</p> <p>3. B.: Revised, to require trainees who are assisting Level II or Level III PT personnel to provide AIC Gas Compliance with a statement indicating satisfactory completion of their employer's training.</p> <p>Removed the language requiring a trainee to provide the same documentation as Level I, Level II and Level III since trainees are not certified.</p>	Janu- ary 1, 2018	Janu- ary 17, 2018
WWBG 0	<p>Table of Contents</p> <p>WWBG 2.02 3. Changed to PPE Equipment Specifications</p>	Janu- ary 1, 2018	Octo- ber 15, 2018
WWBG 2.02	<p>Personnel Protective Equipment</p>	Janu- ary 1, 2016	Octo- ber

1. E. Table listing the required PPE, Level 1 and Level 2. has been updated based on information from a Safety Supervisor who had done the research on the items.

2. Specialized Tools and Equipment SharePoint Site

2. A.: Added the link to the SharePoint Site

2. B.: Added, PPE items that are currently in use, that meet the specifications in this section and continue to function as designed may continue to be used until such time they are replaced.

Clarifies that existing PPE that is not listed in the table can continue to be utilized as long as it meets the required specifications.

3. PPE Equipment Specifications

3. A.: A few additional specifications were added for Level 1 Flash Suit and Goggles.

3. B.: Added Level 2 Insulated Hood should have a minimum rating to 47 cal/cm².

Safety Supervisor provided the specifications.

CHANGE SUMMARY

January 1, 2018

Change Summary January 1, 2018

Docu- ment	Change Summary	Previ- ous Docu- ment Dated	Cur- rent Docu- ment Dated
SIGNIFICANT OPERATIONAL REVISIONS			
<p>ABND 2.01</p>	<p>Abandonment of Gas Facilities</p> <p>General - Added this section</p> <p>1. A. This section applies to abandonment of transmission, high pressure distribution and distribution mains and services including regulator stations, farm taps, and inside meters.</p> <p>1. B. This section addressing abandoning main and services as a unit requiring engineering personnel to prepare a project specific procedures. This was brought over from ABND 2.02 which is being removed.</p> <p>1. C. This section addressing abandonment of transmission or high pressure distribution facilities requiring Gas Tech Engineering to prepare abandonment procedures. This was brought over from ABND 2.03 which is being removed.</p> <p>1. D. This section addresses oily hydrocarbons or PCB's that may be found in facilities being abandoned. This was brought over from ABND 2.04 which is being removed.</p> <p>1. E. This section references ABND 2.08 if mercury is encounter when abandoning a facility.</p> <p>General section incorporated the topics that were originally in ABND 2.02, 2.03, 2.04.</p> <p>2. Mains</p> <p>2. A General</p> <p>2. A. (1): New section added requiring identifying all sources of gas feeding into the section of main to be abandoned and the installation of pressure gauges to monitor upstream and downstream pressures.</p> <p>Re-enforcing the importance of monitoring pressures when abandoning sections of main to avoid an unplanned outage.</p> <p>2. A. (3): Revised, The main to be abandoned shall be purged of gas until a combustible concentration no longer exists. Refer to ABND 2.01 for purging procedures.</p> <p>2. A. (4): Prior to any cutting on steel pipe an electrical bond should be installed. See ACIG 2.01 3. Welding and Other Hot Work.</p>	<p>De- cem- ber 1, 2014</p>	<p>Janu- ary 1, 2018</p>

UNCONTROLLED IF PRINTED

Revised to ensure work is going to be performed in a combustion free environment and to prevent a source of accidental ignition.

2. C. Steel Mains

2. C. (1): Threaded cap has been approved for capping steel main smaller than 2 inch.

Gas Standards Committee agreed that threaded caps are acceptable on steel lines small than 2 inch regardless of their operating pressure.

3. Services

3. D Steel Services

3. D. (5): Threaded cap has been approved for capping steel service lines smaller than 2 inch.

Gas Standards Committee agreed that threaded caps are acceptable on steel lines small than 2 inch regardless of their operating pressure.

3. D. (6): New section that addresses using a capped pipe or properly size solid plug for capping a steel service tee with a compression outlet. If the solid plug is not restrained with a cap the outlet should be strapped to prevent movement of the capped pipe or plug.

The O&M had not addressed this style of service tee. The information was provided by personnel experienced in abandoning this style of tee.

3. D. (8): New section which contains information and stock codes for the Mueller Steel Abandonment Cap for H-17800 Curb Stop Tee.

4. Joint Abandonment of Mains and Services

New section added to ABND 2.01 that incorporated information previously on ABND 2.02. Expanded the information that should be included in the abandonment plan when main and services are abandoned as a unit.

Additional information was added to avoid an unplanned service outage.

**ABND
2.06**

Abandonment of Vaults

1. A: New, if vault/pit has a concrete/solid floor, a hole should be bust out to provide a drain.

1. B.: New, the vault/pit should be filled with soil, sand, crushed stone with the top 12 inches being compacted soil.

1. C.: New, if the vault/pit was located in a hard surface area, the hole should be capped with the appropriate hard surface material.

February 1, 2010

January 1, 2018

ACIG 2.01	<p>Work Area Protection</p> <p>2. Tools and Equipment</p> <p>2. D.: Added, Vapor extraction equipment and blowers (VEU) which may be used to move air containing natural gas should be located in a work area where the gas concentration is safe for open ignition sources and the VEU is equipped with preventative safety devices to ensure explosive levels of natural gas are not pulled through the equipment. The equipment should be operated in accordance with the manufacturer's operating instruction.</p> <p>Vapor extraction equipment (VEU) is a new piece of equipment now being used in AIC as a means of purging natural gas from the soil.</p>	<p>January 1, 2014</p>	<p>January 1, 2018</p>
<u>BORE</u> 2.02	<p>Boring Location Criteria</p> <p>3. Prior to Beginning Operations</p> <p>3. B.: Clarifies that exposing a facility within the tolerance zone means by hand digging or vacuum excavating. The pot holes should extend 18 inches either side of the locator's marks.</p> <p>JULIE requires exposing facilities by means of hand digging or vacuum excavation and these excavation should extend across the tolerance zone.</p> <p>6. Directional Drilling Operations</p> <p>6. M.: Added that if the bore hole bit does not provide a bore hole that is approximately 1.5 times the pipe diameter or greater, the hole must be back reamed to accommodate and permit free sliding of the pipe into the bore hole.</p> <p>Provides guidance as to when the bore hole has to be back reamed. Current language suggest all bore holes have to be back reamed.</p>	<p>January 1, 2016</p>	<p>January 1, 2018</p>
CNTS 2.01	<p>Surface Subsidence Areas</p> <p>4. Active Mining Operations</p> <p>4. D. (5): Added table with stock codes for Flex Braided Connectors used to connect meter set to customer piping.</p> <p>Connectors are used in areas with mine subsidence.</p>	<p>December 1, 2014</p>	<p>January 1, 2018</p>
<u>CONS</u> 1	<p>Requirements</p> <p>3. Gas Construction Work Performed by Ameren Illinois Crews or Contract Crews - Add Contract Crews</p> <p>3. Since Work Performed by Contractors was merged in with Work Performed by Ameren Illinois Crews, Construction Services Supervisor or Construction Inspector have been added</p>	<p>December 1, 2014</p>	<p>January 1, 2018</p>

throughout this section anywhere Gas Supervisor was referenced.

Ameren crews and contractor crews are required to meeting the requirements and follow the same procedures so there was no need to list separate them.

3. B.: Clarification that the Gas, Construction Services Supervisor or Construction Inspector are responsible for ensuring and verifying that all of listed requirements are being met. Ensuring and verifying that all records and maps are being documented and maintained thoroughly and accurately and that the As-Built construction packet is complete and the information is correct before forwarding the packets to the Posters was added.

Designated who is responsible for ensuring that work is being done properly and the all required documentation is being maintained in the job packet for retention.

CORR 1	<p>Requirements</p> <p>14. Pipeline Facilities That Need to Be Painted</p> <p>14. C. Painting Facilities</p> <p>14. C. (2): Added, Stainless steel control lines, fittings and valves should not be painted.</p> <p>Gas Tech Services does not want the stainless steel lines and fittings painted.</p>	<p>April 1, 2017</p>	<p>January 1, 2018</p>
CORR 2.02	<p>Anode Requirements</p> <p>1. General</p> <p>1. F.: Additional instructions when installing an anode. Pipe-to-Soil reading needs to be taken after the anode has activated. If the P/S reading does not increase immediately, water should be added and time allowed for the anode to activate.</p> <p>Anodes must be activated in order to be affective.</p> <p>1. G. New instructions if after activation, the P/S reading is below -0.950 volts, the Corrosion Control personnel should be contacted before backfilling the anode and entering the deficient reading into ClickMobile.</p> <p>This is to avoid unnecessary work orders being generated through Maximo. CP Tech may have other instructions..</p>	<p>April 1, 2017</p>	<p>January 1, 2018</p>
CORR 2.03	<p>Coatings</p> <p>1. Approved Coatings</p> <p>Replaced text with tables showing the approved coatings for girth welds on direct bury and directional drilling installation. Team felt tables would be easier to follow.</p> <p>1. A (1) Direct Bury Installation</p>	<p>July 1, 2016</p>	<p>January 1, 2018</p>

1. A. (1) (b): Approved girth weld coatings are specified for various ranges for pipe diameter; less than 2", 2" to 12" and 12" and larger.

1. A. (2) Directional Drilling Installation

Approved girth weld coatings are specified for various pipe diameter ranges; less than 2", 2" to 6" and 6" and larger

Links were added to the instructions for each of listed approved coatings.

1. C. Coating Repair

1. C. Added 2 tables, (1) Pipe Coating Repairs and (2) Fitting Coating Repairs

Provides more guidance on how to repair damage to existing pipe and fitting coatings.

1. E. Fittings

1. E. (3): New, Irregular shaped fittings and those with bolts should be coated with wax tape and that profiling material may be necessary prior to the wax tape.

Clarification on how irregular shaped fittings should be coated.

1. F Soil to Air Interface Zone

1. F. (1): Revised the wrapping instructions, terminate the wrap with a good tight seal near the bottom of the meter valve.

Previously it said to wrap to the bottom of the meter valve but comments from the field said that it was difficult to get a good seal if you wrapped to the bottom of the valve.

1. F. (4): Added a requirement that if approved below grade coating extends above grade, the coating shall be over coated with a UV resistant coating, cold applied tape, cold applied wax tape or moisture cured wrap. The UV resistant coating should extends from approximately 12" below grade to approximately 12" above grade or near the bottom of an above grade valve, whichever comes first. The UV resistant coating should be applied using a continuous application method. Paint is not an approved UV resistant coating.

Corrosion Control wants the above grade wrap to be UV resistant in order for sun's rays not to damage the coating. Pointed out paint is not UV resistant.

1. F. (5): New, Moisture cured wrap can be applies as a protective overcoat over all other coatings when there is a need to provide protection from abrasive action or mechanical damage.

Moisture cured wrap provides a relatively hard surface that is not easily damaged by abrasive action.

7. Approved Paints Specifications

UNCONTROLLED IF PRINTED

7. C.: New, Added a temperature limitation for applying paint based on manufacturer's specifications.

Quality Assurance Consultants request this be added.

CORR 2.04	<p>General Wrapping Instructions</p> <p>3. Service Tee Hot Applied Tape</p> <p>3. A.: New: Addresses service tee or a small fitting being welded on a 12 inch or larger steel pipe where only a small amount of existing pipe coating, FBE or coal tar, is removed to make the weld. Hot wrap or liquid epoxy should be used to cover the bare steel. The hot wrap or liquid epoxy should extend at least 6 inches beyond the bare area and the edges of the hot wrap sealed tightly.</p> <p>Current procedures require the hot wrap to fully encircle the pipe. This is impractical when only a small area of existing coating is removed on a large diameter steel pipe.</p> <p>3. B.: New: When service tee or fitting is being installed on steel pipe smaller than 12 inches, the hot wrap is to be installed in accordance with the current procedures in CORR 2.04</p> <p>Notes added below 3. C. (4), For 12 inch and larger pipe, see 3. A. above for wrapping instructions.</p>	<p>Janu- ary 1, 2013</p>	<p>Janu- ary 1, 2018</p>
CORR 2.11	<p>Moisture Cured Wrap - New section inserted where 3M Scotchkote Hot Melt Patch Compound had previously resided.</p> <p>Procedure for the application of moisture cured wrap on girth welds and soil air interface zone.</p> <p>Corrosion Control provided these procedures following field trials.</p>	<p>Janu- ary 1, 2013</p>	<p>Janu- ary 1, 2018</p>
CORR 2.17	<p>AC Voltage</p> <p>2. AC Voltage at Customer Meter Set</p> <p>2. A. Testing for AC at Meter Set</p> <p>2. A. (1): The meter set should be checked in 3 locations with volt stick and if voltage is indicated contact the Gas Supervisor or his designee to initiate an investigation. Volt Stick, stock code 85 36 376 is recommended for checking voltage.</p> <p>2. A. (2): Action Table - New, table replaced verbiage. If volt stick alarms, Dispatcher is to be contacted to request an Electric Service person come measure the voltage. If it is in a non-Ameren IL electric service area, Dispatcher should contact the appropriate electric provider.</p> <p>If voltage is less than 15 volts there is no action required since it is not a hazardous condition.</p>	<p>Octo- ber 1, 2011</p>	<p>Janu- ary 1, 2018</p>

If voltage is 15 volts or greater, Electric Department will investigate and take appropriate action. If the voltage is on the gas riser and Electric cannot determine the source, Corrosion Tech will investigate.

Completely revised this section to provide more guidance on how AC voltage on a meter set should be handled. Volt stick 85 36 376 is recommended because it is a non-adjustable and will alarm if voltage is over 12 volts. The red volt stick has a sensitivity adjustment which can change its alarm voltage.

**CORR
2.30**

Buried Pipe Examination

2. Buried Pipe Examination

2. A.: Clarification that Pipe Exam is to be completed when a gas carrying plastic or steel pipe is exposed by an excavation.

It is important to check the condition of existing pipe anytime it is temporarily uncovered. Atmosphere corrosion inspection is performed on pipe exposed by nature, i.e, erosion or flooding

2. E. A Buried Pipe Examination should not be performed when:

2. E. (2): Added, exposed pipe should be reported to Gas Supervisor for follow-up inspection when an exposed pipe is found during a pipeline or critical area patrol.

This to ensure an exposed pipe is contained in a critical area patrol or is being scheduled to be relocated or covered. Exposed pipe is examined for atmospheric corrosion.

2. E. (3): Reminders were added:

2. E. (3) (a): Pipe Examination should not be performed on retired pipe, retired sections of pipe or facilities.

2. E. (3) (b): Do not enter pipe to soil readings on Pie Examination for pipe classified as Unprotected Main, on rectified protected pipe when rectifier is turned off, if the pipe coating has not been disturbed or when an active replacement protect will retire the existing section of pipe within the next 12 months.

2. E. (3) (c): Do not take P/S until newly installed anode has been activated.

Corrosion Control added these reminders in an effort to reduce unnecessary work orders generated by Maximo for insufficient readings.

2. F. Common instances when Pipe Examination is required.

2. F. (1)-(4): Clarification that Pipe Exam should be completed for exposed pipe that will remain in service following the completion of the DOJM/WO project for Replacement, Relocation and Installation of service or main.

De-
cem-
ber 1,
2014

Janu-
ary 1,
2018

Clarification on when Pipe Exam is required.

3. Distribution

3. A.: Added reference to CORR 2.02 1. G. if the Pipe Exam is being completed following installation of an anode and P/S is still deficient.

Corrosion Control wants to reduce the number of unnecessary work orders generated by Maximo.

CORR 3.14	<p>Test Lead Wire Attachment</p> <p>1. General</p> <p>1. B.: Added Pin Brazing as another acceptable way to attach test lead to steel pipe.</p> <p>Pin brazing is a new approved process that is being used by contractor. Ameren IL gas personnel are not tooled up or trained for this process.</p> <p>1. C.: Welded steel bolt can now be used to connect test leads on distribution mains operating at or below 100 psig.</p> <p>Previously, a steel bolt could be welded on pipe operating at or below 60 psig.</p> <p>5. Pin Brazing - New section approved and added by Corrosion Control and Gas Standards to be utilized by contractor.</p> <p>6. Welded Bolt Anode Wire or Test Lead Connection to Steel Pipe</p> <p>6. A.: Welded steel bolt can now be used to connect test leads on distribution mains operating at or below 100 psig.</p> <p>After consultation with a welding consultant, Operation's request to allow welded bolt connections on pipe operating at 100 psig was approved.</p> <p>7. Test Lead Attachment Coating</p> <p>7. B.: Viscotaq Coating Patch - New product Approved by Corrosion Control and Gas Standards as an eventually replacement for Handy Cap.</p>	<p>Janu- ary 1, 2016</p>	<p>Janu- ary 1, 2018</p>
CORR 3.16	<p>AC Stray Current Test Station</p> <p>Updated to provide more detail instructions on where all of the test wire connection should be made. Test station configuration clearly identifies connections.</p> <p>Corrosion Control provided test station connection details</p>	<p>Janu- ary 1, 2013</p>	<p>Janu- ary 1, 2018</p>
EMER 2.02	<p>Dispatch Center</p> <p>1. General</p>	<p>Janu- ary 1, 2016</p>	<p>Janu- ary 1, 2018</p>

1. G.: Updated, Distribution Control has compiled and maintains the 911 numbers for emergency agencies through-out Ameren Illinois operating areas.

Eliminates the need for the Divisions to provide emergency numbers to Distribution Control.

**EMER
2.04**

Gas Field Personnel

Janu- Janu-
ary 1, ary 1,
2016 2018

1. General

1. B.: New, added the contact information for individuals in Gas Operations & Services, Gas Control and Distribution Control is in the Forward section.

Throughout the O&M there are references to contacting other Gas Operations & Services groups. Compliance felt contact information would be beneficial.

2. Inside Odor Compliant - Hazardous Condition

2. I.: New, Check for presence of a stand-by generator and if possible shut-off at generator's outside disconnect switch.

The stand-by generator could be a potential source of ignition if it attempts to start when the electric service is disconnected.

2. J.: Revised the disconnecting of electrical service. The electric source has to be disconnected at the power pole or transformer.

Having AMI meter shut-off remotely does not satisfy disconnecting from and external source. The switching action in the AMI meter could generate a spark.

If possible cut the telephone at a point away from the structure. If not possible, the phone line can be cut-off at the junction box on the structure as long as the junction box has been checked for possible concentration of gas.

Clarification of where telephone service can be disconnected.

3. Outside Odor Complaint - Hazardous Condition

3. F.: If leak was caused by excavation damage, investigate for the possibility of multiple leaks and migration into adjacent structures.

Emphasis on the importance of performing an investigation to ensure there are no other leaks created when an excavator has damaged our facilities.

3. G.: New, If leak could have been caused by any boring operation, immediate and continual investigation for potential gas migration into conduits, sewer lines, or structures is required.

Emphasis on the importance of performing an investigation to determine the extent of gas migration when boring operations have damaged our facilities.

3. J.: If steel pipe is squeezed to shut-off gas flow, the squeezed section of pipe has to be cut out and replaced before the pipeline is reinstated.

To avoid flow restriction and possibility of pipe failure, a squeezed section of steel pipe should not be re-activated until the squeezed section is removed and replaced.

4. Major Leaks or Line Breaks

4. A.: Added a new requirement, If leak the damage was caused by any boring operation, immediate and continual investigation for potential gas migration into conduits, sewer lines, or structures is required.

Emphasis on the importance of performing an investigation to determine the extent of gas migration when boring operations have damaged our facilities.

EMER 2.06

Emergency Personnel and Materials

April 1, 2013 January 1, 2018

2. Emergency Gas Materials

2. A.: Gas Standards Engineer will determine what emergency material will be stored in each of the designated central storeroom locations

2. B. (1): Changed the size of emergency steel pipe, 2" through 30", that will be stored at the MDF and a separate location.

3. Centralized Emergency Gas Material

3. B. (2): Stipulated that the emergency pipe will be pretested in accordance with PTST 1.

3. B. (3): Gas Tech Engineering will provide test pressure required for the emergency pipe.

3. C. (1): Storeroom personnel will arrange picking, loading and shipping of items after a request for emergency material has been made.

3. C. (2): Emergency material will be replaced with like size and kind through the automated process in EMPRV.

3. C. (4): Gas Standards Engineer will inventory emergency material at the Centralized locations on a biannual basis.

4. Non-Centralized Emergency Gas Material

4. A. Plastic Materials

4. A. (1): Emergency PE pipe will be pretested in accordance with PTST 1.

4. A. (4): Shelf life of PE pipe has been increased to 3 years from 2 years. Pipe stored for emergencies should be inspected to make sure the pipe does not exceed the shelf life.

4. B. Steel Pipe and Fittings (4" and less in diameter)

4. B. (1): Areas other than designated centralized locations should keep 100' or less of 3/4" through 4" pretested steel pipe for emergency situations.

Emergency materials sections were revised following discussions with Operations and Gas Tech Engineering on what designated material should be stored at centralized locations. Ameren Illinois now has a designated Gas Standards Engineer who will ensure the centralized locations are maintaining their emergency material inventory.

EXCV
2.03

Work in Excavation

January 1, 2014 January 1, 2018

3. Working in Excavation

3. K.: Added, Prior to leaving the jobsite, any open excavation should be secured to prevent unauthorized access, i.e. temporary fencing.

From a safety perspective, open excavations need to be delineated and secured to protect the general public from injury obtained by falling into an excavation.

EXCV
2.04

Soil Analysis and Classification

January 1, 2016 January 1, 2018

6. Excavation/Soils Checklist

6. B.: Revised, The Competent Person is required to evaluate and classify the soil prior to personnel entering the excavation.

Removed the confusing statement that requiring a completed Checklist prior to personnel entering the excavation. Personnel are required to be in the excavation probing for buried utilities during the excavation process and before all of the soils can be classified.

6. E. Removed the sample of the Excavation/Soils Checklist.

Ameren Illinois Safety maintains an electronic copy on their SharePoint Site. As the Safety Department makes changes to this Checklist the most current version will be available on the SharePoint Site.

FORW

Forward

September 1, 2016 January 1, 2018

Added and updated information on contact individuals within the various Gas Operations & Services departments or groups.

Throughout the O&M there are references to contacting other Gas Operations & Services groups. Compliance felt contact information should be provided.

GLOS

Glossary

April 1, 2017 January 1, 2018

Updated:

LEL - Changed to 5.0% gas-in-air from 4.5%

UEL - Changed to 15.0% gas-in-air from 14.5%

In the O&M 30% LEL is equated to 1.5% gas-in-air and 60% LEL is equated to 3.0% gas-in-air. In order for this to be correct the LEL needs to be 5.0% gas-in-air. The industry recognized explosive limits of natural gas is 5.0 to 15.0% gas-in-air.

INCD
1

Requirements

April 1, 2017 January 1, 2018

5. Service Interruption/Curtailment Notification

5. B. Service interruption of more than 25 customers for 8 hours or more

5. B. (1): Added contact information for ICC's Consumer Service Division and Director, Safety and Reliability Division.

6. Reporting

6. D.: New, Within 48 hours after confirmed discovery of a natural gas incident a second notification is required to revise or confirm the initial telephonic notice.

PHMSA requires a second notification

INVE
2.01

Incident Investigation

January 1, 2016 January 1, 2018

2. Investigation Documentation

2. J.: Added Only one person should be designated to take photos.

Ameren Claims wanted this emphasized because photos are evidence and we only want one set of photos. This is consistent with policy that one person should be designated to document the incident investigation. Also all cameras or cell phones that are used to take photos would be collected as evidence.

3. Investigation of Ameren Illinois Facilities

3. E.: Updated to request remote automated meter readings (AMI/AMR) as soon as practical.

Request must be made as soon as possible to ensure the readings are obtained before they are no longer available.

3. K. Documentation of transfer of custody of evidence should be done on Chain of Custody Log. See INVE 4

Clarified the Chain of Custody Log is used to document transferring evidence to another party.

LEAK
2.01

Indoor Leak Investigation

January 1, 2016 January 1, 2018

4. Customer is Home

4. G.: When there is inaccessible piping or appliance(s) that cannot be checked with leak detection instrument or leak de-

tection fluid, a minimum 5 minute shut in test shall be performed.

If piping or appliances cannot be checked for leaks, a shut in test is the only alternative.

LEAK 2.02	<p>Outdoor Leak Investigation</p> <p>5. Below Grade Gas Facilities</p> <p>5. F. New section was added to provide additional steps that should be taken when gas is detected in a sewer line. Until an ethane identifier has been used to verify the source, the investigation shall assume the source to be natural gas. If the concentration is 30% LEL of greater initiate EMER 2.04 5. Gas In a Sewer. If the concentration is less than 30% LEL expand the investigation.</p> <p>Gas Compliance felt there needed to be more guidance when our gas detection instruments detect a concentration in a sewer line.</p>	<p>Janu- ary 1, 2016</p>	<p>Janu- ary 1, 2018</p>
LEAK 2.04	<p>Leak Classification and Surveillance</p> <p>4. C.: Added reference to LEAK 2.09 1. N. (5) Walking Leak Surveys for procedures on measuring gas in a valve box.</p> <p>Measuring volume of gas in a valve box is different than in a tunnel or sewer lines manholes. In a valve box, the lid is to remain on while measuring gas concentration.</p>	<p>De- cem- ber 1, 2014</p>	<p>Janu- ary 1, 2018</p>
<u>MAIN</u> 1	<p>Requirements</p> <p>3. Cover</p> <p>3. F.: New - Added a general rule that mains should not be installed at a depth greater than 48 inches.</p> <p>SMR Team wanted to add this as a reminder to avoid additional shoring requirements whenever possible.</p> <p>19. Back-Flagging</p> <p>19. A,: Revised, Newly constructed Ameren Illinois gas facilities shall be back-flagged as stated in DAMG 1 3. D. which requires all newly installed facilities to be back-flagged.</p> <p>DAMG 1 3. D. requires newly installed facilities to be back-flagged. Damage Prevention groups have determined that back-flagging is one of the best practice to minimize 3rd party damage to newly installed facilities.</p>	<p>Janu- ary 1, 2016</p>	<p>Janu- ary 1, 2018</p>
MAIN 2.05	<p>Pipe Coating and Gasket Removal</p> <p>Section has been totally revised to provide more detailed procedures for removing coal tar pipe wrap and gaskets which may contain asbestos.</p>	<p>Janu- ary 1, 2011</p>	<p>Janu- ary 1, 2018</p>

MAIN 2.05 was used as basis for the Pipe Wrap and Gasket Removal training conducted in 2017.

METR 2.15	<p>Elevated Metering Pressure</p> <p>6. Records</p> <p>6. B.: New, The Gas Meter Data Sheet is to be distributed to the appropriate individuals/department as shown on the GMDS.</p> <p>6. C.: New, Gas Meter Data Sheets that are completed on the paper form should be transferred to the electronic form for distribution. See METR 4 for the Gas Meter Data Sheet form</p> <p>Provides information on how Gas Meter Data Sheets are to be distributed.</p>	<p>Janu- ary 1, 2017</p>	<p>Janu- ary 1, 2018</p>
METR 2.19	<p>Pressure Factor Verification</p> <p>3. Pressure Factor Verification</p> <p>3. D. The employee completing the pressure check shall record the following:</p> <p>3. D. (7): Discrepancies that require follow-up action are to be noted in the Comments.</p> <p>Comments are needed to better identify the discrepancies then the current (Y/N). Corrosion items have been moved to the Corrosion Control Inspection section.</p> <p>4. Verification Requirements Concerning Billing Constants and Pressure</p> <p>4. A.: Reduced the pressure variance to $\pm 1\frac{1}{4}$ psig from $\pm 1\frac{1}{2}$ psig. Gas Supervisor is to be notified if the physical check of the meter pressure differs from the listed metering pressure by more than $\pm 1\frac{1}{4}$ psig.</p> <p>5. Pressure Factor Verification with Recording Charts.</p> <p>5. D.: Reduced the pressure variance to $\pm 1\frac{1}{4}$ psig from $\pm 1\frac{1}{2}$ psig. Recording charts should be used if is suspected the regulator cannot maintain the metering pressure within $\pm 1\frac{1}{4}$ psig.</p> <p>In January 1, 2017 O&M Update reflecting implementation of IAC 501, the change to $1\frac{1}{4}$ psig was made in METR 2.15 but was missed in this section. IAC 501 requires a bill adjustment if the measured metering pressure differs from listed by $\pm 2\%$, a reduction from the previous $\pm 4\%$.</p> <p>7. Corrosion Control Inspections</p> <p>7. A.: Revised, Gas metering facilities shall have the below corrosion control inspection activities completed.</p> <p>(1) Atmospheric corrosion shall be documented within Click-Mobile per CORR 2.31</p>	<p>Janu- ary 1, 2017</p>	<p>Janu- ary 1, 2018</p>

(2) Disbonded coating and needs paint shall be documented within ClickMobile if follow-up is required.

Clarification on how corrosion issues are to be documented.

METR 3.01	<p>New Meter Sizing</p> <p>3. Approved Meters for New Installations</p> <p>The American AL 425 10 lb. regulator is no longer approved for 10 psig Metering Pressure.</p> <p>Current regulator options will not prevent the pressure from exceeding the meter's MEP of 15 psig.</p> <p>3. Approved Meters for New Installations</p> <p>3. Notes: Added Romet of comparable sizes.</p>	Janu- ary 1, 2016	Janu- ary 1, 2018

OQAL 1	Requirements 5. Abnormal Operating Conditions This section has been revised and lists AOCS's that are contained in Appendix E of ASME B31Q Ameren Illinois Operator Qualification program follows ASME B31Q. 7. Disqualification This is a new section which describes the steps to be taken when an employee is disqualified for a covered task. OQ section has developed a specific course of action when an employee has be disqualified from performance of a covered task.	Janu- ary 1, 2016	Janu- ary 1, 2018
POLY 2.04	Butt Fusion 1. General 1. C.: Clarification, Butt fusion joint is not allowed when joining two sections of pipe if one of the sections is Aldyl A. MDPE and HDPE pipe can be butt fused together. The melt time is different for the Yellow PE pipe than for the Aldyl due to the difference in resin used in manufacturing the pipe. Since the MDPE and HDPE are made of the same material they can be butt fused together. The bead melt may be a little different. 4. Joint Assembly 4. H.: Added a Caution, Alcohol or other solvents are not to be used to clean the pipe wall after facing. Caution was added to conform to Performance Pipe's instructions.	July 1, 2012	Janu- ary 1, 2018

4. J.: Added heating faces shall be cleaned prior to inserting the heating faces. Do Not use synthetic material to clean heater faces.

Added to conform to Performance Pipe's instructions.

4. Q. Table: Updated the melt bead size based on Performance Pipe's information.

5. Hydraulic Machine Fusion - New

Follow the operating instructions contained in the hydraulic butt fusion machine manufacturer's instructions.

Previous O&M did not include any language about hydraulic butt fusion. Since there are different hydraulic machine being used, it is simpler to state follow the manufacturer's instructions.

**POLY
2.05**

Electrofusion

January 1,
2016

January 1,
2018

Procedures have been modified by eliminating the requirement for using the fitting to mark the area to be scraped. The area can be marked by using a measurement which could be with a ruler, tape, gauge or the fitting. The majority of the pictures have also been removed.

1. General

1. D.: Added, Electrofusion fittings can be re-fused only in the event of an input power interruption.

Central Plastic's requirement

1. H.: Added, PE pipe 2 inch and larger in diameter no more than 2 passes with the scraper are allowed. PE pipe smaller than 2 inch only 1 pass with the scraper is allowed.

Prevents the removal of too much wall thickness. Based on information from Central Plastic.

1. I. Table: Revised the maximum allowable gap from square for Central Plastic fittings and for Innogaz/Friatec.

Based on information from Central Plastic and Plastic Pipe Institute.

2. Equipment, Weather and Cleanliness Guidelines

2. D.: Updated inverter requirements to a minimum of 3000 watts output from over 3000 watts.

New gas construction vehicles are coming with 3000 watt inverters

3. Electrofusion Couplings and Caps - Added caps

Eliminated the separate section on caps since their installation process is basically the same as a coupling. Cap has been added to coupling throughout this section.

3. A. Preparation Prior to Scraping

3. A. (6): Revised to allow the area to be scraped to be marked based on a measurement instead of using the bagged fitting. Does require the scraped are to be a minimum of half the length of the coupling/cap or full length whichever is applicable.

Base on field input it was agreed that measuring the area to be scraped was acceptable and in reviewing Central Plastics procedures they refer to measure and mark even though their picture shows using a coupling to mark the area.

3. B. Scraping

3. B. (1): Revised, for 1-1/4" and 2" IPS pipe may require the use of an insert stiffener.

Added a Note that SDR 7.0 and SDR 11.0 pipe will require a different scraper.

Eliminated requiring the use of an insert stiffener, Stiffener only necessary if the pipe is out of round or needs straighten to get a uniform scrape.

4. Electrofusion Service Tees, High Volume Tees or Repair Saddles - Added Repair Saddles

Throughout this section Repair Saddles has been added where ever tee is mentioned.

4. A. Preparation Prior to Scraping

4. A. (2) Added Repair saddle can be used to repair some imperfections as shown in REPR 1. 5. D.

4. D Tapping

Added If service tee is being tested with the main, the tee will be tapped before pressure testing.

4. D. (6): Added, service tees pressure tested with the main are exempted from this requirement since a successful leak test will document no leakage.

Addresses service tees being leak tested with the main. Which is covered in PTST 1.

6. Electrofusion Elbows

6. B. Scraping

6. B. (1): Revised, for 1-1/4" and 2" IPS pipe may require the use of an insert stiffener.

Eliminated requiring the use of an insert stiffener, Stiffener only necessary if the pipe is out of round or needs straighten to get a uniform scrape.

**POLY
2.06**

Mechanical Joining
2. Stab Fittings

July 1,
2012 Janu-
ary 1,
2018

UNCONTROLLED IF PRINTED

2. F.: Added, stab caps can be used to cap end of 1/2" through 1" service line and to cap the purge cap pigtail during the testing and upon completion of the test.

Allows the use of a stab cap to cap the pigtail on the PE purge cap upon completion of the pressure test.

POLY 2.09	<p>Plastic Fusion Qualifications</p> <p>2. Fusion Qualification</p> <p>2. C.: Reduced the fusion methods required for annual qualifications to:</p> <p>Butt Fusion - Manual</p> <p>Butt Fusion - Hydraulic</p> <p>Electrofusion - Coupling and Service Tee</p> <p>Code requires qualifications on the processes not the material so separate tests on the MDPE and HDPE pipe is not required.</p>	<p>Janu- ary 1, 2016</p>	<p>Janu- ary 1, 2018</p>
PTST 1	<p>Requirements</p> <p>5. Testing</p> <p>5. E. was added to address testing mains and services together.</p> <p>5. E. Revised, In order to assist in locating a leak resulting from a pressure test, main and service line(s) should be tested separately. For short main extension, repair, or emergency project(s), the Gas Supervisor or Project Engineer may approve testing main and service(s) together.</p> <p>(1) For service line(s) less than 2 inch in diameter, the minimum required test duration for the combination main and service(s) will be determined by the required test duration of the main as shown in PTST 2.01 3 Leak Test Duration. There is no need to add time for the service lines.</p> <p>(2) Service line(s) 2 inch and larger shall be tested as main with the minimum duration determined in accordance with PTST 2.01 3. C. or if applicable PTST 2.01 3. C. leak test duration when testing main of various size pipe</p> <p>(3) Service line(s) pressure test shall be recorded on the Service Card within ClickMobile with the actual test pressure and actual test duration reported for each service.</p> <p>Testing main and service is discouraged but knowing that it is happening these procedures were added to ensure the proper testing is being performed.</p>	<p>April 1, 2017</p>	<p>Janu- ary 1, 2018</p>
PTST 2.01	<p>Leak Test</p> <p>1 General</p>	<p>Sep- tember 1, 2017</p>	<p>Janu- ary 1, 2018</p>

1. G.: Revised to match language in PTST 1 5. A. above concerning testing main and services together,

**PURG
2.01**

Purging Methods

January 1, 2017
January 1, 2018

1. General

1. B.: Gas Engineering or GTE will provide a detailed purge plan prior to blow down or purging operations on transmission mains or high pressure distribution mains or service lines 2 inch and larger; that are (A) 100 feet or longer and (B) operating at more than 100 psig

Revised to eliminate the need for engineering to provide detailed plans when short sections, less than 100 feet, are being purged.

4. Purging of Air with Gas

4. C.: Revised, purge is complete when CGI reading reaches 90% Gas-in-air or greater. Changed from 95% - 100% Gas

5. Purging of Gas with Air

5. C.: Revised, purge gas from the pipeline until a combustible mixture is no longer present, 2% LEL or less. Changed from 0%

6. Using an Inert Gas Slug when Purging

6. A.: Purging mains 8 inches and larger, 100 feet or longer that operating at more than 100 psig, a slug of inert gas should be inserted between the air and gas.

A slug of inert gas does not have to be used to separate the air and gas when purging short sections of pipe.

6. E.: Removed the language regarding when a purge is complete since it discussed in earlier sections.

8. Vacuum Purge/Air Mover

8. J.: Revised, purge gas from the pipeline until a combustible mixture is no longer present, 2% LEL or less.

Percentages were revised to reflect the sensitivity of our electronic instruments and discussions with manufacturer's representative.

**REGS
3.01**

Regulator Station Design

October 1, 2011
January 1, 2018

3. Standardized Design Features

3. O.: Revised, the top of the relief stack should be a minimum of 6 feet above ground level.

Gas Tech Engineering (GTE) reduced the 7 feet minimum and removed the maximum of 8 feet above the ground level.

3. Q.: New, At differential pressures greater than 300 psig, consideration should be given to installing multiple regulator cuts per run.

3. R: New, For additional protection on boot style monitor regulator stations, the outlet token relief valve should be a 1" 289P or 1" 289H (set points less than 10 psig) to provide additional failure protection in the event of liquid build up on the flexible boot element.

Design update provided by Gas Tech Engineering.

4. Standardized Regulator Station Drawings

4. B.: Corrected link to Regulator Station drawings, Organizational Data drive "O"\GAS\Regulator Station Design Standards.

4. C. Tables: Revised the Regulator Station Design Matrix

GTE has revised the design standards for Regulator Stations.

**REGS
4**

Forms and Reference Materials

January 1,
2013

January 1,
2018

Updated all of the Standardized Regulator Designs pdf drawings

GTE has revised the design standards for Regulator Stations.

**REPR
1**

Repairs

December 1,
2014

January 1,
2018

1. Objective

1. F.: Clarification, Gas Tech Engineering should be notified before performing repairs on facilities with MAOP greater than 100 psig.

Due to the emphasis on system integrity, it is important that Gas Tech Engineering be involved in work performed on high pressure distribution and transmission facilities. However, it was felt that the Divisions should be able to properly handle repairs on facilities with MAOP 100 psig or less.

1. J.: Clarification, Make Safe repair provisions and the 90 days to complete permanent repairs does not apply to leaking compression couplings within 5 feet of a foundation.

Needs to be consistent with REPR 2.01 Compression Couplings. Leaking compression couplings within 5 feet of a foundation must be permanently repair at time of discovery.

3. High Pressure Distribution and Transmission Pipe Repair - Pipe replaced Line

Incorporated former REPR 6. Into this section and updated position titles to Pipeline Integrity, Gas Tech Engineering and Division Gas Engineer throughout this section.

3. F.: Added that encapsulation of a leaking fitting is also an approved repair method.

There was not sufficient room in the table to added encapsulation.

3. F. Table: Updated some of the defect descriptions and the Notes below the table. Weld deposition is now only approved for repair of non-leaking weld defect or a leaking weld defect if the line is taken out of service.

Notes were updated to comply with Part 192.309 and 192.711, 192.715 and 192.217. Stainless steel clamps can be used for a Make Safe repair as long as the clamp is rated for the operating pressure or the pressure is reduced to the clamp's pressure rating.

3. G. thru 3. N. are the approved repair procedures for high pressure distribution and transmission pipe.

3. K. Weld Deposition

3. K. (2): For transmission line, pressure must be below 20% SMYS to qualify as a safe level.

Part 192.715

3. L.: Plidco Split + Sleeve

3. L. (3): Permanent repair requires seal welding if the MAOP is 20% SMYS or greater.

3. L. (4): Permanent repair does not require seal welding for pipe with MAOP less than 20% SMYS.

Part 192 requires seal welding for permanent repairs on transmission pipe but not on distribution pipe.

4. Steel Distribution Pipe Repair

4. C.: Plidco Split + Sleeve does not have to be seal welded to be a permanent repair

4. E. Approved Repair Methods

4. E. (1): Added, that in addition to the methods shown in the table, tapered screw plug can be used on small non-corrosion leaks and encapsulation can be used on leaking fittings.

4. E. Table: Separated non-leaking and leaking weld defect. Updated Note on Plidco Split + Sleeve not requiring seal weld to be a permanent repair.

4. F. thru 4. N. are the approved repair procedures for steel distribution pipe.

4. F. (3): If PE pipe is being installed within an existing steel system, contact corrosion control personnel for cathodic protection requirements

Concern that an existing cathodic protected segment could be separated leaving an isolated unprotected section. ICC does not consider bonding a tracer wire to two segments of steel pipe as being continuously protected.

4. J. (2): Plidco Split + Sleeve is approved for permanent repair without being sealed welded.

5. PE Pipe Repair

5. A. General

5. A. (4): Added, Stainless steel bolted leak clamps are not designed for PE pipe and are not to be used for leak repairs.

Clamp manufacturer says these clamps are not designed for PE pipe.

5. B. Approved PE Repair Methods

Added EF Repair Saddles and Electrofusion Coupling.

5. D. Electrofusion Repair Saddles

5. D. (1) thru (5) are the requirements

5. F. Electrofusion Coupling

5. F. (1) & (2) are the requirements.

EF Repair Saddles are available in 4" and 6" and can be used for repairing pipe defects of 10% or less of the wall thickness. EF couplings can be used to repair cut PE pipe.

7. Repair Records

7. A. Pressure Test

7. A. (1) thru (4) Section was expanded to address test records for pipe and components installed for repairs. The test pressure and duration will continue to be reported in the Leak Repair form within ClickMobile. In addition, test record and pipe information will need to be recorded on the appropriate Leak Test Form (LTF) or Leak Strength Test Form (LSTF) and a copy of that record kept with DOJM/WO job packet.

7. A. (5) Tie-in connections are to be leak tested at normal operating pressure and recorded as: Repair Successfully Leak Tested on the Repair Form in ClickMobile or Tie-in Joints Tested on the appropriate Leak Test Form (LTF) or Leak & Strength Test Form (LSTF)

7. B.: The repair records should include the date, location, and description of each repair

7. B. (2): Records pertaining to non-leak repair shall be maintained in the job packet for the life of the facility.

This information is needed to document the integrity and the MAOP of the gas system.

**SERV
1**

Requirements

12 Back-Flagging

12. A.: Revised, Newly constructed Ameren Illinois gas facilities shall be back-flagged as stated in DAMG 1 3. D.

DAMG 1 3. D. requires newly installed facilities to be back-flagged. Damage Prevention groups have determined that

April 1, 2017 January 1, 2018

back-flagging is one of the best practice to minimize 3rd party damage to newly installed facilities.

SERV 2.08	<p>Insertion</p> <p>4. Dead Insertions</p> <p>4. S. (2): New, Stock Code listing for indoor service head adapters.</p> <p>A specially designed service head adapter is required when inserting a PE service line thru a foundation wall.</p>	April 1, 2017	Janu- ary 1, 2018
SERV 3.05	<p>2" PE Service Line</p> <p>10.: New, Notice added which states the manufacturer of the 2 inch anodeless riser says the threaded end of the riser cannot be removed to allow for welding.</p> <p>Manufacturer states there is insufficient space between the transition area and the weld to avoid damage to the inserted PE pipe.</p>	April 1, 2013	Janu- ary 1, 2018
STLP 1	<p>Requirements</p> <p>12. Pipe Thread Sealers</p> <p>12. C. Approved Pipe Thread Sealers</p> <p>Added Hercules Real Tuff, Hercules Megaloc and LA-CO Slic-Tite.</p> <p>Removed J.C. Whitlam Blue Magic</p> <p>Gas Standards Committee evaluated and approved the 3 additional thread sealers. Due to issues with reported leaks the Committee has removed Blue Magic as an approved sealer.</p>	Janu- ary 1, 2016	Janu- ary 1, 2018
STLP 2.01	<p>Design Pressure</p> <p>8. Dual Coated Steel Pipe</p> <p>8. B.: Correction made, a dry film coating thickness detector is to be used to measure coating thickness not an ultrasonic thickness gauge.</p> <p>Gas Tech Engineer pointed out an ultrasonic thickness gauge will only measure wall thickness not coating thickness.</p>	Janu- ary 1, 2016	Janu- ary 1, 2018
STLP 3.04	<p>Flanges</p> <p>2. Flange Assembly</p> <p>2. C.: New section added to address the proper size and length of stud bolts for the various pressure classes of flanges with a reference to the Flange Stud Bolt section of STLP 3.04.</p> <p>2. D.: New section added which states, The bolt or stud bolt shall extend completely through the nuts.</p>	Janu- ary 1, 2011	Janu- ary 1, 2018

The ICC requested language be added to provide more guidance and instructions on the proper installation of flange bolts.

TAPS 2.06	<p>TDW PE Branch Saddle-Valve</p> <p><u>3. PE Branch Saddle-Valve</u></p> <p>Added stock codes for the saddle-valves that are now available through MDF.</p> <p>No longer have to order the saddle-valve through the training center.</p>	Janu- ary 1, 2011	Janu- ary 1, 2018
UPRT 1	<p>Requirements</p> <p>2. Increasing MAOP Up to 100 PSIG</p> <p>2. K.: Clarification, Leak survey should be performed immediately after each pressure increase and should continue until the affected area has been surveyed.</p> <p>The SMR Team wanted to clarify that the leak survey should be performed immediately after the pressure increase to ensure there were no hazardous leaks.</p>	Octo- ber 1, 2011	Janu- ary 1, 2018
WELD 2.03	<p>Construction of Pipelines and Piping Systems</p> <p>8. Welding Requirements</p> <p>8. A. (1) (c): Removed "Preferred E8010 electrode is E8010-G or 70+.</p> <p>Electrodes are shown in the Welding Procedures (WPSs) in WELD 4.</p> <p>8. N. Weld Pass Requirements</p> <p>8. N. (3): New, Unfinished welds that have cooled should be heated to between 200° F and 500° F prior to completion</p> <p>8. O. (1): Revised to clarify when preheating of welds is required. A minimum 200° F maximum 500° F preheat or inter-pass temperature is required when ambient temperature is below 50° F. Heating may be required to remove moisture from the welding region, a minimum 2 inches on each side around the joint prior to welding.</p> <p>Language from API 1104 recommended welding practice code and matches what is in the welding procedures (WPSs) in WELD 4..</p> <p>8. U. Pipe Coating Protection</p> <p>8. U. (1): Specified that pipe coating on pipe 8 inch and larger should be protected from weld spatter and mechanical abrasion during welding.</p>	Janu- ary 1, 2016	Janu- ary 1, 2018

8. U. (2): New, If weld spatter is observed on smaller than 8 inch pipe, the pipe coating should be covered for protection before proceeding.

**WELD
2.04**

In-Service Welding

Janu-
ary 1,
2016 Janu-
ary 1,
2018

3. Material Requirements

Added, Backing strips should be low carbon material, example 1010, 1020 carbon mild steel.

4. Acceptable Repair Methods

4. C. Full Encirclement Sleeves

4. C. (4): New, Full encirclement sleeves that require "In-Service" welding procedures should be fitted with a low carbon steel backing strip under the longitudinal seam that contacts the carrier pipe. This is prevent arcing or welding to the carrier pipe in the hoop stress direction. Steel banding (strapping) shall not be used for backing strips.

Manufacturers of full encirclement sleeves recommend the use of backing strips along the longitudinal seam.

6. Welding Procedures

6. C. In-Service Welding Electrode Requirements

6. C. (1): Checking for high flow in pre 1975 pipe 4 inch and larger operating at above 100 psig is required which would indicate rapid cooling of the base metal.

6. C. (2): Provides guidance on how to check for rapid cooling, The welding region of the pipe should be preheated to between 400 and 500 degrees F. If the area cools to below 200 degrees F within 4 minutes, this is an indication of high flow.

6. C. (3): Clarify that a Lo Hydrogen electrode is E7018 H4R.

6. C. (9): New, Welding full encirclement fittings (Style 110, 220 or Mueller full encirclement control fittings) should utilize backing strips when using In-Service welding procedures.

Provide more guidance for In-Service welding.

7. Arc Burns

7. A.: Arc burns on pipelines operating at or above 40% SMYS shall be cut-out as a cylinder or eliminated in accordance with WELD 2.10 Arc Burn Removal.

Part 192.309 required arc burns on pipe operating or above this pressure be removed or repaired.

E. New: Evaluate the proposed work area for the ability to retrieve a co-worker in the event a rescue is necessary. If the co-worker cannot be effectively removed from the area with the use of the lifeline, worker(s) should not enter the area.</p> <p>This is a Safety issue. Before a worker enters a hazardous atmosphere, there must be means of being able to extract that worker from the area if the need arises.</p> <p>4. G. (6) (b): A minimum of 2 people per worker should be manning the lifeline</p> <p>4. G. (6) (f): There should be a designated back-up person in Level 2 PPE.</p> <p>These were both added for safety reasons to ensure there are sufficient people readily available to respond to an emergency situation.</p>	Janu- ary 1, 2016	Janu- ary 1, 2018

MINOR REVISIONS HAVE BEEN MADE TO THE FOLLOWING SECTIONS. REVISIONS ARE SHOWN IN RED TEXT IN THESE SECTIONS OF THE O&M. IF THERE IS NO RED TEXT THAT MEANS TEXT WAS REMOVED.

CHANGE SUMMARY		April 1, 2017	
Change Summary April 1, 2017			
Docu- ment	Change Summary	Previ- ous Docu- ment Dated	Current Docu- ment Dated
OPERATIONAL PROCEDURAL CHANGES			
CORR 1	<p style="text-align: center;">3. Corrective Action</p> <p>3. A.: A deficient Pipe to Soil reading has been changed to -0.950 v from -0.900 v.</p> <p style="text-align: center;">4. Cathodic Protection of New and Replacement Pipeline Facilities</p> <p>4. B.: All new and replacement steel pipeline facilities shall have a measured cathodic protection level of -0.950 volts or more within one year after completion of construction. Changed from -0.900 v.</p> <p style="text-align: center;">6. External Corrosion</p> <p>6. B.: Maximo will send Corrosion Control personnel a report where pipe to soil readings are -0.950 v or less.</p> <p>Above revisions made to be consistent with how Corrosion Control had Maximo changed in 2016 to identify deficient pipe to soil readings.</p> <p style="text-align: center;">13. Atmospheric Corrosion</p> <p style="text-align: center;">13. B. Monitoring</p> <p style="text-align: center;">13..B.(1): Added "for atmospheric corrosion"</p>	Janu- ary 1, 2016	April 1, 2017
CORR 2.02	<p style="text-align: center;">Anode Requirements</p> <p style="text-align: center;">4. Anode Requirements</p> <p style="text-align: center;">4. B. Service lines:</p> <p style="text-align: center;">4. B. Table: -0.950 v replaced -0.900 v</p> <p style="text-align: center;">4. D. Isolated services:</p> <p style="text-align: center;">4. D. Table - -0.950 v replaced -0.900 v</p> <p style="text-align: center;">Consistent with CORR 1</p> <p>Moved the PE Main Locator Wire item to POLY 1 for anode attached to tracer wire.</p>	July 1, 2014	April 1, 2017
DAMG 2.01	<p style="text-align: center;">Reporting JULIE Violations</p> <p style="text-align: center;">2. Reportable Violations</p>	Janu- ary 1, 2016	April 1, 2017

UNCONTROLLED IF PRINTED

	<p>2. A. (3): Digging prior to the dig time and date on the JULIE ticket replaces Digging prior to the 48 hour notice period on the JULIE ticket.</p> <p>The JULIE ticket shows the time and date when the 48 hour notice has been met.</p> <p>3. Investigation of Reportable Violations</p> <p>3. A.: Investigation and documentation of an incident will be performed by Damage Prevention personnel only.</p> <p>Gas Supervisors no longer have to conduct an investigation nor complete an Incident Report.</p> <p>Deleted the previous 3. B. and 3. C. Since Damage Prevention personnel will be completing the Incident Report there isn't a need to have instructions on how to access the Incident Report.</p> <p>4. Reporting a Suspected Violation</p> <p>4. A. Revised to reflect the current process, Damage Prevention personnel completes the investigation and the Incident Report. The Incident Report is reviewed by Regulatory and those Incident Reports that are identified as needing to be reported are sent the ICC</p>		
<p><u>INCD 1</u></p>	<p>2. Natural Gas Incident</p> <p>2. A. (5): Added a reference to see 3. Potential Significant Events when evaluating a Natural Gas Incident to determine if the incident should be reported.</p> <p>5. Service Interruption/Curtailment Notification</p> <p>5. B.: New section added by Gas Compliance. This section requires that Gas Compliance be notified when there is a service interruption that affects more than 25 customers for 8 hours or longer.</p> <p>5. B. (1): Gas Compliance will notify ICC where interruptions affect 50 customers or more for a period of 12 hours or longer.</p> <p>5. B. (2): Gas Compliance will prepare an annual report of gas interruptions affecting 25 or more customers for 8 hours or longer and file that report with the ICC.</p> <p>7 Gas Compliance Contact List</p> <p>If the listed Gas Compliance personnel cannot be reached, Division Operations shall report the incident by calling the numbers listed under the State & Federal Contact Numbers.</p> <p>The State & Federal Contact Numbers replaced "following steps 6 through 11" since these steps don't exist.</p>	<p>January 1, 2016</p>	<p>April 1, 2017</p>

	<p style="text-align: center;">8. Reporting Matrix</p> <p style="text-align: center;">8. A.: Gas Compliance shall be contacted:</p> <p>Insert a new item in 9. Gas service interruption of 25 of more customers for duration of 8 hours or more.</p> <p style="text-align: center;">8. B.: Gas Compliance shall make following reporting contacts:</p> <p style="text-align: center;">Added: Gas service interruption of 25 of more customers for duration of 8 hours or more.</p> <p>Consistent with the new reporting procedures in INCD 1 5. Service Interruption/Curtailment Notification</p> <p style="text-align: center;">9.State & Federal Contact Numbers</p> <p>Update on PHMSA contact via National Response Center</p> <p style="text-align: center;">10. Corporate Claims Notification (CCMI)</p> <p>Nikki Clay - Claims Administrator replaced Dennis Spencer</p> <p style="text-align: center;">14. Written Incident Report</p> <p style="text-align: center;">Clarifying and updating:</p> <p>14. A.: Gas Superintendent was added as another person responsible for collecting information for the Gas Incident Investigation Log. The Log is to be forwarded to Gas Compliance.</p> <p>14. B. Gas Compliance is the group that will review the Incident Investigation Log and actually complete the Incident Report for submittal to the appropriate agencies.</p> <p>14. C. The Incident Report is completed on the appropriate form in INCD 4.</p>		
<p>LEAK 2.07</p>	<p style="text-align: center;">Leak Surveys</p> <p style="text-align: center;">2. Leak Survey Types</p> <p style="text-align: center;">2. E. Inside Meter Sets</p> <p>Removed the requirement for Gas Supervisors to maintain a list of inside meter sets and the list maintained in Maximo.</p> <p>Gas Superintendents requested this be removed since all Operating Areas do not have Inside Meter Leak Surveys.</p> <p>2. E. (4): Corrected terminology, Service line replaced primary fuel line. The inside service line to the meter set shall be checked for leaks.</p>	<p style="text-align: center;">De- cem- ber 1, 2014</p>	<p style="text-align: center;">April 1, 2017</p>
<p><u>LEAK 2.09</u></p>	<p style="text-align: center;">Leak Surveys - Walking Leak Survey</p> <p>1. K. Fenced Gas Facilities Inspected Annually - removed Monthly.in the heading for this section and throughout the 1. K. (1) thru (4).</p>	<p style="text-align: center;">Janu- ary 1, 2016</p>	<p style="text-align: center;">April 1, 2017</p>

	<p>1. K. (2): Added: If an odorizer is located within the same fenced area as the facility being annually inspected, the odorizer piping system will be included in the Leak Survey ID and documented on Leak Survey Task within ClickMobile.</p> <p>Clarification that the leak survey should be performed on the gas facilities within the fenced area which could include an odorizer.</p> <p>1. K. (3): Correction: The first leak survey on fenced transmission facilities in Class 3 location will be performed during the annual inspection and documented within ClickMobile on the appropriate inspection task. The second leak survey will be documented in ClickMobile on their own designated Leak Survey Task.</p> <p>1. K. (4): New item addresses fenced standalone odorizers. These odorizers will have their own Leak Survey Task that is handled by Gas Tech Services personnel.</p> <p>Specifically addresses leak surveys on standalone odorizers.</p> <p>1. N. Gas Detection Instrument or FI Unit Indicates a Possible Leak</p> <p>1. N. (5): If leak surveyor detects gas from a valve box and cannot get the lid off of the valve box to complete the investigation, the leak surveyor will contact local operations supervisor or his designee for assistance.</p> <p>Contract Leak Surveyors normally do not have the necessary tools to open valve box lids.</p>		
<p>PTST 1</p>	<p>8. Component Other Than Pipe Being Replaced or Added to Pipeline</p> <p>8. A. (1): Revised testing of component on pipeline with Design MAOP of "less than 100 psig" the minimum test pressure required to check for leaks is 90 psig.</p> <p>The "less than 100 psig" is consistent with Part 192.509 language and the minimum 90 psig test pressure is a standard practice for Operations in testing our distribution pipe and facilities.</p> <p>8. A. (2): With the revision in (1), had to change Design MAOP to 100 psig or greater.</p>	<p>Sep-tem-ber 1, 2016</p>	<p>April 1, 2017</p>
<p>SERV</p>	<p>The revisions in the following SERV sections are associated with PHMSA's new EFV rules which become effective for all new or replaced services installed after April 14, 2017. Under PHMSA's new rules residential multi-family service line and all commerce service lines will require either properly sized EFV or a manual service line shut-off valve to be installed. Single family res-</p>		

	idential service line and residential branch service line will continue to require an EFV.		
SERV 1	<p style="text-align: center;">Service Line Installation Requirements</p> <p style="text-align: center;">1. Objective</p> <p>1. B.: Added reference to SERV 2.02 2. Residential Service for EFV requirements and SERV 2.02 5. Manual Service Line Shut-Off Valve requirements</p> <p>1. C.: Added reference to SERV 2.02 3. Commercial Service for EFV requirements and SERV 2.02 5. Manual Service Line Shut-Off Valve requirements.</p> <p style="text-align: center;">6. Valve Requirements</p> <p>6. C.: Manual service line shut-off valve replaces property line valve.</p> <p>6. E.: After April 14, 2017, a manual service line shut-off valve shall be installed on all new or replaced multi-family residential or commercial service lines where a properly sized EFV cannot be installed.</p> <p>6. F.: Manual service line shut-off valve replaces underground service line valve and added valve box should be located so that it can be safely accessed and is aligned to allow access for valve wrench.</p> <p style="text-align: center;">11. Excess Flow Valves</p> <p style="text-align: center;">Added references to SERV 2.02 2. and SERV 2.02 3.</p>	January 1, 2017	April 1, 2017
SERV 2.02	<p style="text-align: center;">Excess Flow Valve or Manual Shut-Off Valve - Revise title</p> <p>SERV 2.02 has basically been totally revised. SERV 2.02 2.: Addresses Residential Service Requirements 2.02 3.: Addresses Commercial Service Requirements for both EFVs and manual service line shut-off valves.</p> <p>Under the new PHMSA rules, we are still required to install EFVs on all new and replaced individual or branched residential service line and on individual commercial services with connected load of 1,000 scfh or less.</p> <p>Beginning with new or replaced service lines installed after April 14, 2017, a properly sized EFV shall be installed on multi-family residential and commercial services lines where the installed or proposed to be installed meter rate capacity is 1,000 scfh or less. If the meter rated capacity exceeds 1,000 scfh, a properly sized EFV should be installed or a manual service line shut-off valve.</p>	January 1, 2016	April 1, 2017

	<p>SERV 2.02 5.: Addresses Manual Service Line Shut-Off Valve Installation</p> <p>SERV 2.02 6.: Addresses the Inspection and Maintenance of the manual service line shut-off valves. These valves are subject to an inspection every 5 years.</p> <p>SERV 2.02 7.: Under PHMSA’s new rule all existing customers, residential and commercial, shall be notified of their right to request an EFV to be installed on their existing service line as long as their existing meter rated capacity does not exceed 1,000 scfh and the service line does not qualify for one of the exceptions for an EFV. The installation of an EFV will be at the customer’s expense.</p> <p>Ameren Communications and Public Relations will manage the notification process.</p> <p>8. EFV Sizing</p> <p>8. G.: Table for 3/4 inch steel EFV:</p> <p>Added Max Flow for Inlet Pressures 10 psig thru 50 psig for those situations where an existing customer wanted an EFV installed on existing 3/4 inch steel service line.</p> <p>9. EFV and Manual Shut-Off Valve identification</p> <p>9. B.: Added the location of manual service line shut-off valve shall be identified on the Gas Service Card Form in ClickMobile and retained in Maximo. The valve will be indicated on Ameren Illinois electronic mapping system.</p>		
<p>SERV 2.03</p>	<p>Farm Tap Installations</p> <p>2. Standard Installation</p> <p>2. G.: Added reference to SERV 2.02 2. D. Residential Service Requirement for more information.</p> <p>2. H.: Added a separate section for commercial farm taps since commercial service now require EFV or a manual service line shut-off valve. References to SERV 2.02 3. G. Commercial Service Requirements and SERV 2.02 5. Manual Service Line Shut-Off Valve requirements.</p> <p>2. I.: Added: Since the farm tap design has the outlet pressure of the regulator set at between 15 and 20 psig, the service line should be a minimum of 1 inch with an EFV of the same size as the service line.</p> <p>Consistent with SERV 2.02 3. EFV Sizing language for inlet pressure less than 20 psig.</p> <p>5. Inlet Valves</p>	<p>Sep-tem-ber 1, 2016</p>	<p>April 1, 2017</p>

	<p>5. B. (1): Added Single Cut and Double Cut to the Farm Tap standards SERV 3.06 and SERV 3.07.</p> <p>5. B. (4): Deleted the pipe classification, transmission and high pressure distribution 6 inch nominal diameter and larger as a restriction for the use of an AutoPerf tee. The use of an AutoPerf tee is limited by the 0.281 inch wall thickness of the pipe.</p> <p>Eliminated confusion on when an AutoPerf tee or a Curb Valve tee had to be used. The maximum wall thickness of 0.281 inch is the limit of the AutoPerf's punch.</p> <p>Added Single Cut and Double Cut to the Farm Tap standards SERV 3.06 and SERV 3.07</p> <p>6. Installation Notes</p> <p>6. E.: Updated reference SERV 2.02 8. Excess Flow Valves, EFV Sizing</p> <p>7. Farm Tap Capacity</p> <p>7. C. Double Cut Farm Tap</p> <p>Corrected Max Flow for Stock Code EFV 39 22 250 at Inlet Pressure of 400 psig to 7,120 C cfh. From 8,900.</p>		
<p>SERV 3.06</p>	<p>Farm Tap, Single Cut, 60 - 450 PSIG Inlet Pressure</p> <p>Revised the Note: Item 1 to: Maximum wall thickness that Mueller H-18101 can tap is 0.281 inches. If the pipe wall thickness is not known or cannot be verified through testing or experience to be less than 0.281, a Mueller valve tee, H-17656, or Mueller curb valve tee, H-17800, should be used in place of the AUTOPERF tee. See TAPS 2.05 3 Maximum Pipe Wall Thickness for AUTOPERF Tee.</p> <p>Eliminated confusion on when an AutoPerf tee or a Curb Valve tee had to be used. The maximum wall thickness of 0.281 inch is the limit of the AutoPerf's punch.</p> <p>See STLP 2.01 7 Steel Pipe Stock Code Table for wall thickness of stock coded steel pipe.</p>	<p>Sep-tem-ber 1, 2016</p>	<p>April 1, 2017</p>
<p>SERV 3.07</p>	<p>Farm Tap, Double Cut, 451 - 1000 PSIG Inlet Pressure</p> <p>Revised the Note: Item 1 to: Maximum wall thickness that Mueller H-18101 can tap is 0.281 inches. If the pipe wall thickness is not known or cannot be verified through testing or experience to be less than 0.281, a Mueller valve tee, H-17656, or Mueller curb valve tee, H-17800, should be used in place of the AUTOPERF tee. See TAPS 2.05 3 Maximum Pipe Wall Thickness for AUTOPERF Tee.</p>	<p>Janu-ary 1, 2016</p>	<p>April 1, 2017</p>

	<p>Eliminated confusion on when an AutoPerf tee or a Curb Valve tee had to be used. The maximum wall thickness of 0.281 inch is the limit of the AutoPerf's punch.</p> <p>See STLP 2.01 7 Steel Pipe Stock Code Table for wall thickness of stock coded steel pipe.</p>

Supersedes: January 1, 2017

CHANGE SUMMARY

January 1, 2017

Change Summary January 1, 2017

Docu- ment	Change Summary	Previ- ous Docu- ment Dated	Current Docu- ment Dated
---------------	----------------	---	-----------------------------------

Throughout the entire Metering section, AIC replaces Ameren Illinois in the previous O&M versions.

OPERATIONAL PROCEDURAL CHANGES

METR 1	<p>1. A.: Added two new terms that are now included in IAC 501, auxiliary and tertiary equipment which are attached to or connected to the meter. These terms have been added to the Glossary.</p> <p>Auxiliary Equipment - Means an integral device attached directly or remotely to a gas meter. The function of auxiliary equipment is to adjust gas meter usage measurements to account for changes in gas temperature or pressure (for example, correctors).</p> <p>Tertiary Equipment - means a device that electronically converts signals from a gas measurement system (meter or auxiliary equipment or both) to a useful form such as flow rate (for example, flow computers and remote monitoring devices (RMD)).</p> <p>1. B.: Added references to meter sizing and regulator sizing tables that are in the Meter Standards section.</p> <p>2. Care and Handling</p> <p>Majority of this original section has been moved to METR 2.01 Gas Meter Handling. There was no reason to duplicate the information since there is a specific section which addresses meter handling and transporting.</p> <p>3. Location</p> <p>3. A.: For new or relocated residential meters, IAC Part 501.110 IAC Part 501.110 states no meter shall be installed indoors unless an outdoor installation is not possible or would make the meter installation financially infeasible. Commercial/Industrial meters can be installed inside designated meter building which is not used for human occupancy.</p> <p>3. B.: If a new or relocated residential meter has to be installed indoors, IAC Part 501 IAC Part 501 requires that it be in a ventilated place and at least three feet from an ignition source or source of heat that could damage the meter.</p> <p>Added the regulator must be located outside of the building or in a separate metering or regulator building.</p>	Janu- ary 1, 2014	Janu- ary 1, 2017
-----------	--	-------------------------	-------------------------

3. C.: Clarified that new or relocated residential meters shall be located immediately adjacent to an outside wall.

3. F.: Clarified that new or relocated meters should be installed in area free of vehicular traffic. If this is not practical, the meter shall be protected by guard posts or railings.

3. G.: Gas meter shall not be installed:

3. G. (1): "In direct contact with soil, concrete or other surfaces that will cause corrosion unless the gas meter is designed for those condition."

Previously, it said gas meter shall not be in direct contact with ground. [IAC Part 501.110](#) IAC Part 501.110 states meter, auxiliary or tertiary equipment shall not be installed in contact with soil or concrete unless the manufacturer designed the equipment for those conditions.

3. G. (2): New, Within three feet of a source of heat which could damage the meter or expose the meter to temperatures that are outside those recommended by the manufacturer. In AIC case that is higher than 140°F or below -40 °F

[IAC Part 501.110](#) IAC Part 501.110 added these prohibited locations and our meter manufacturers provided the temperature limitations.

3. G. (3), (4), (5), (6): Not a major change only moved some wording around.

3. G (10) (a): Specified that it is the service regulator vent, not the meter, which shall not be within three feet of an ignitions source. Added examples of items that are potential sources of ignition. This is consistent with the Residential Meter Set Location Restriction, Exhibit 3 in SERV 1.

3. G. (10) (b): Specified that it is the service regulator vent, not the meter, which shall not be within twelve inches horizontally from specific openings into a house. Added examples of openings into a structure. This is consistent with the Residential Meter Set Location Restriction, Exhibit 3 in SERV 1.

3. G. (10) (c): Added the service regulator shall not be installed where it cannot vent freely to the atmosphere. This is a paraphrase of the PHMSA Part 192.355 language.

3. H. Refusal of Service is a new section based on language in [IAC Part 501.110](#) IAC Part 501.110 that is not in IAC Part 500.

Allows a utility to refuse service to a customer if the metering installation, customer piping, customer equipment is hazardous or in such condition that gas service cannot be safely provided.

Requires the Company to notify the customer of the refusal within five days of the decision to refuse service.

4. Installation

4. A.: Added regulators as part of meter set.

4. B.: Slight rewording and combined a couple of sentences from the previous METR 1. This sentence states the meter set shall be secure, upright, plumb, and level to prevent undue stress on the connecting piping and meter.

4. C.: New item added to specifically state that the residential customer's piping coming through the wall or foundation should 1 inch black iron or a CSST terminal bracket.

4. D.: New item added which states the black iron pipe should be connected to the meter bar or header. This will provide additional support which reduces the stress on the meter set.

Added an exception for areas that need to use flex braided connectors in areas with subsurface subsidence.

4. F.: Clarified that "Only qualified" personnel are authorized to install, relocate, modify, or maintain an Ameren meter set.

4. G.: Replaced "corrector" with "auxiliary and/or tertiary equipment" that are required if a non-temperature compensate meter is installed.

4. H.: New item which states all meters shall have a register or display on the meter or corrector that displays the consumption delivered to the customer and that display must be clearly visible to the customer. This is an [IAC Part 501](#) IAC Part 501 Code requirement. AIC already complies with this.

4. I.: New item, IAC Part 501 Code requires all meters, auxiliary and tertiary equipment to have security seals installed or measures taken to secure AIC equipment to deter unauthorized personnel from tampering. AIC already complies with this.

4. J.: New item, IAC Part 501 Code requires all meter bypass valves be locked closed when not in use. This is already standard practice at AIC.

4. K.: New item, IAC Part 501 Code requires regulators installed on fixed factor meter installation be sealed. Sealing of fixed regulators was already required under METR 2.15 Pressure Factor Metering.

4. N.: Simply replaces "steel pipe" with "metallic pipe/tubing"

5. Regulator Vent Lines - Added Regulator to clarify what vent lines.

5. A.: Simply replaces "steel pipe" with "metallic pipe/tubing"

6. Painting Meter Sets

6. A.: Identified the specific section in CORR 2.03 for the approved paint.

6. C.: Revised those meter set items that are not to be painted; regulator and relief valve vent openings, meter and regulator name plate badges, meter index, electronic correctors or any auxiliary equipment or remote meter reading devices or other tertiary equipment.

Remove stainless steel sensing lines since in some cases they are being painted.

8. Removed Meters

8. B.: Added the reference link to METR 2.01 2. Gas Meter Handling and Transporting.

METR
2.01

Gas Meter Handling

2. Handling and Transporting - Added Transporting

Since [IAC Part 501](#) IAC Part 501 treats auxiliary and tertiary equipment the same as gas meters in the handling and transporting, these two terms have been added where ever there was a reference to gas meters.

2. B. (1) thru (6) were previously listed in METR 1 2. Care and Handling

2. B. (1): Added language from [IAC Part 501.120](#) IAC Part 501.120 that meters that are located in a meter proofing room waiting for testing do not have to be capped nor do the meters waiting to be repaired.

2. C.: Revised to clarify that a removed meter, auxiliary or tertiary equipment must be handled so that the subsequent accuracy test of the equipment at the meter shop is representative of the meter and equipment when they were in service.

AIC Part 501.170 requires removed meters to be checked for accuracy. Removed auxiliary or tertiary equipment must be checked for proper operation and settings.

2. D.: Simply typos, capitalizing the term Sample Lot.

2. E.: New item from [IAC Part 501.120](#) IAC Part 501.120 which requires meters not in service to be stored in a secure, weather protected environment in an upright position. This does not apply to meters being transported in the trucks. This means the meters must be protected from rain and snow.

April
1,
2010

Janu-
ary 1,
2017

METR
2.03

Sample Testing

Majority of the revisions involve updating the language; AIC replaces Ameren Illinois, Administrative Code Part 501 replaces Illinois Commerce Commission, and updating the version designation for the Military Standard 105 D to (ANSI/ASQ Z1.4 2008).

6. Annual Sample Meter Scheduling

Janu-
ary 1,
2011

Janu-
ary 1,
2017

6. D.: New, [IAC Part 501.250](#) IAC Part 501.250 states that all required sample tests be completed by the end of the calendar year in which the tests are due for completion. AIC already follows this practice.

8. Rejected Sample Lots

8. A.: [IAC Part 501.250](#) IAC Part 501.250 requires all meters in a failed meter lots to be removed within 24 months after the current year’s sampling. This is a significant change since under IAC Part 500, all of the meters had to be removed within 12 months after the year’s sampling.

8. B.: Added the failed to rejected lot meters.

METR
2.04

Periodic Testing

Throughout the document AIC replaces Ameren Illinois.

Janu- Janu-
ary 1, ary 1,
2013 2017

2. Periodic Testing of Diaphragm Meters

2. A.: Revised to clearly state that all diaphragm meters that are not in the sample testing program will be tested every 10 years based on the date of the last test. AIC already complies with the 10 year requirement.

2. B.: Diaphragm meters 800 scfh and larger are included in the Periodic Testing program. AIC has moved the 630 scfh meters into the Sample Testing program.

3. Periodic Testing of Rotary Meters

[IAC Part 501.190](#) IAC Part 501.190 greatly expanded this section.

3. A.: Rotary meter must have either a differential test or a meter shop accuracy test performed at least every 60 months based on the date of the last test.

A meter shop accuracy test was added as an alternative to a field differential test. Previously, AIC was required to perform a field differential test at least every 5 years.

3. B.: If the differential test is more than 50% higher than the initial differential test or the manufacturer’s published curves [IAC Part 501.190](#) IAC Part 501.190 stipulates the steps that can be taken. If the differential cannot be returned to be within 50%, AIC has 7 days to clean and retest. If that isn’t successful, AIC has 60 days to replace the rotary meter. Where modifications to the customer’s facilities are required to remove the meter, AIC will replace the meter within 90 days unless AIC and customer agree to a longer period not to exceed 180 days.

3. C.: If AIC documents conditions that prevent AIC from obtaining a differential reading, verification may be delayed until the condition ceases to exist or up to 4 months, whichever is shorter. Documentation must be retained for 3

years of the conditions that prevented verification within the required 60 months.

4. Periodic Testing of Turbine and Ultrasonic Meters

[IAC Part 501](#) IAC Part 501 greatly expanded this section and the accuracy test requirements.

4. B.: Turbine Meter

[IAC Part 501.200](#) IAC Part 501.200 greatly expanded this section.

4. B. (1) All turbine meters, regardless of the metering pressure, must have an accuracy test performed at least every 60 months. The accuracy test pressure must be between 50% of the operating pressure up to 2 times greater than the operating pressure. Dual rotor turbine meters with an external means of verifying meter accuracy may extend the accuracy test to at least every 120 months as long as AIC verifies the meter accuracy at least every 6 months.

Previously, turbine meters operating below 100 psig required a spin test every 12 months and an accuracy test every 5 years. Turbine meters operating at 100 psig or greater required a spin test every 6 months and an accuracy test every 12 months.

4. B. (2): All single rotor turbine meters must have a spin test every 12 months. If the turbine meter is not equipped with external lubrication fittings, a spin test is required every 6 months. A spin test is not required on dual rotor turbine meters that have an external means of verifying rotor health performed at least every 6 months and can demonstrate the rotor meets manufacturer's guidelines.

4. B. (3): Added, See METR 2.13 Turbine Meter Testing for more details.

4. C. Ultrasonic Meter

[IAC Part 501.220](#) IAC Part 501.220 greatly expanded this section.

4. C. (1): Ultrasonic meters must be interrogated every 3 months. Previously, the interrogation was required twice each calendar year.

4. C. (2): The pressure and temperature transmitters shall be verified when the meter is interrogated. Previously, the transmitters had to be calibrated.

4. C. (3): AIC must flow calibrate ultrasonic meters every 120 months unless AIC can demonstrate the meter meets the manufacturing tolerances and AIC conducts an internal inspection of the meter body to ensure the meter has not accumulated deposits or incurred damage that would affect meter's accuracy.

4. C. (4): Added, See METR 2.25 Ultrasonic Meter Testing for more testing details.

5. Periodic Meter Testing Schedule

5. C.: The GTS Supervisor is now responsible for ensuring all listed rotary meters are tested prior to the test due date. Previously, it stated the Gas Metering Supervisor was responsible.

METR
2.06

Prover Accuracy Certification and Verification

Janu- Janu-
ary 1, ary 1,
2011 2017

2. Prover Certification

2. B.: [IAC Part 501.160](#) IAC Part 501.160 requires sonic nozzle provers to be calibrated and certified at least every 12 months. Previously, the provers had to be certified at within 36 months from previous certification.

2. C.: Gas meter testing contractors used to repair or test AIC meters must also provide proof their sonic nozzle prover(s) have been tested and certified at least every 12 months. Previously, the contractors had to provide proof annually that their testing equipment had been certified at within the last 36 months.

3. Reference Meter Verification Tests

3. B.: New: Reference meter verification shall be performed on each transfer prover every 3 months and an AL800 reference meter shall be utilized during the verification test.

[IAC Part 501.160](#) IAC Part 501.160 requirement for transfer provers.

4. Documentation of Reference Meter Verification Tests

4. A.: Updated, the test information is recorded in MMS for each prover and not on the "Weekly Gas Reference Meter Log".

4. B.: The Reference Meter Test Result Report is run from within MMS.

4. C.: The Reference Meter Verification Tests results are to be logged for each prover.

5. Corrective Action

5. A. (1) Grammatical change, ± 0.5% from 100%

5. B. and 5. C.: Grammatical change, Weekly Gas Reference Meter Results Report replaces Weekly Gas Reference Meter Log.

METR
2.12

Rotary Meter Differential Testing

April Janu-
1, ary 1,
2013 2017

1. B.: Grammatical change in third sentence, "can" replaced "will", added "includes" and added "/or".

3. Periodic Test

3. B.: Revised to "In-service rotary meters shall be differential tested at least every 60 months from the last test date...." Previous stated "on or before the five year anniversary from the last test date"

3. C.: Repeat of what is in METR 2.04 3. C. Periodic testing of Rotary Meters. If AIC documents conditions that prevent AIC from obtaining a differential reading, verification may be delayed until the condition ceases to exist or up to 4 months, whichever is shorter. Documentation must be retained for 3 years of the conditions that prevented verification within the required 60 months. [IAC Part 501.190](#) IAC Part 501.190 language.

3. D.: In lieu of a differential test, AIC may complete an accuracy test. The average accuracy is determined by averaging the accuracy of the check and open flow rates. [IAC Part 501.190](#) IAC Part 501.190 language.

4. Equipment

4. D.: Added "or timing device" to a clock or stop watch that are required to time the meter.

4. F.: Added "is an acceptable reference" for the manufacturer's factory differential pressure curves.

5. Differential Test

5. D.: Grammatical, added "if" to "determine if the minimum test flow requirement is met."

7. Follow-up Action

7. B. Grammatical, "receive" replaced "required", "The meter may receive corrective maintenance in the field to reduce the differential pressure to an acceptable level..."

7. C.: Repeat of what is in METR 2.04 3. B. Periodic testing of Rotary Meters. If the differential pressure can't be reduced to less than 50% increase over the original value, the meter must be replaced within 60 days. If the meter is of sufficient size that portions of the customer's structure requires modification to remove the meter, AIC will replace the meter within 90 days unless AIC and Customer agree to a longer period not to exceed 180 days.

METR
2.13

Turbine Meter Testing

[IAC Part 501](#) IAC Part 501 expanded the testing requirements

Janu- Janu-
ary 1, ary 1,
2013 2017

2. Testing Requirements

Repeat of what is in METR 2.04 4. B. (2) Periodic testing of Turbine Meters

2. A.: Turbine meters with external lubrication fittings now have to be spin tested at least every 12 months and if necessary lubricated.

Previously, a turbine could be lubricated in lieu of a spin test.

2. B.: Turbine meters without external lubrication fittings or external means of verifying the operation of the meter require a spin test every 6 months.

Previously, turbine meter operating below 100 psig had to be lubricated or spin tested each year. Turbine meter operating at 100 psig or greater had to be lubricated or spin tested every 6 months.

2. C.: A spin test is not required on dual rotor turbine meters if the meter has an external means of verifying rotor health and the rotor health is verified at least every 6 months and the rotor performance meets the manufacturer's guidelines. AIC Part 501.200 language.

2. D.: Single rotor turbine meters shall be accuracy tested at least every 60 months. This section also includes detailed testing criteria required by AIC Part 501.200.

2. E.: Dual rotor turbine meter with external means of verifying meter accuracy may extend the accuracy test to at least 120 months if the meter accuracy is verified at least every 6 months and meter's performance meets the manufacturer's guideline. AIC Part 501.200 language.

3. Test Equipment

3. A.: Added "or timing device" to a clock or stop watch that are required to time the meter.

3. C.: [IAC Part 501](#) IAC Part 501 revised the flow rate of the prover equipment to between 10% and 105% rated capacity required for the accuracy test. Previously was 20% to 80%.

7. Accuracy Test

7. A. (3): Revised flow rate requirements to between 10% and 105% rated capacity. Previously was 20% to 80%.

METR
2.14

Electronic Corrector Inspection

1. A.: Added, That an electronic corrector must be used where the elevated metering pressure is greater than 15 psig. However, Company use gas meters that operating above 15 psig on January 1, 2017 are grandfathered from requiring an electronic corrector. [IAC Part 501](#) IAC Part 501 only allows fixed factor for metering pressures 15 psig or less except for Company use meters in place on January 1, 2017.

1. C. Replaced "verify the accuracy" with "verify proper operations"

2. Electronic Corrector Inspection Schedule

2. A.: Revised, "Each electronic corrector installed at a customer meter installation shall be inspected and verified for proper operation at least every sixty (60) months. [IAC Part](#)

De-
cem-
ber 1,
2014

Janu-
ary 1,
2017

501.170 IAC Part 501.170 made corrector inspection mandatory.

2. B.: Position title update to Superintendent from Supervisor Gas Metering.

3. Pressure Verification

3. A.: The pressure transducer will be verified for proper operation by comparing the electronic corrector pressure reading to a test gauge. The difference in the readings must be within $\pm 1.0\%$ Refer to the pressure verification equation contained in the next section of this procedure that calculates the acceptable verification tolerance for each metering pressure. The pressure transducer shall be verified at zero and flowing pressure.

IAC Part 501.310 IAC Part 501.310 requires the accuracy to be within $\pm 1.0\%$ where previously there was a pressure range table with acceptable accuracy ranges. The table had to be replaced with a formula since every pressure would have a different acceptable range.

3. C.: Replaced "verify the accuracy" with "verify proper operations"

4. Pressure Verification Equation - Replaces the Allowance Variance Table. Since the verification reading has to be within $\pm 1.0\%$ each pressure value will have different \pm psig value. The metering pressure multiplied by 1.0% will give you the allowable variance.

5. Temperature Verification

5. A., 5. B. and 5. C. : Replaced "verify the accuracy" with "verified for proper operations"

5. A.: The difference between the Versitest reading the electronic corrector reading must be with ± 2.5 degrees Fahrenheit. The temperature shall be verified at 32 ° F and 75 ° F or flowing gas temperature. IAC Part 501.300IAC Part 501.300 requirements. Previously the temperature difference was ± 5 degrees.

6. Maintenance Activities

6. B.: Corrector Maintenance

6. B. (4): Corrector Date Set, excepted the Mini-P since it does not have a date feature that can be verified

6. B. (5): Corrector Time Set, excepted the Mini-P since does not have a time feature that can be verified.

7. Atmospheric Corrosion Inspection Follow-up

7. B.: Update the reference link to CORR 1 13. Atmospheric Corrosion.

8. Records

8. D.: The inspection information shall be maintained for 10 years, [IAC Part 501.300](#) IAC Part 501.300 requires 10 year where previous it was only 3 years.

METR
2.15

Elevated Metering Pressure

Octo- Janu-
ber 1, ary 1,
2011 2017

2. Elevated Metering Pressure Considerations

2. A. and 2. B.: Grammatical, AIC replaced Ameren Illinois

2. D.: New, The Division Gas Engineer should select the lowest possible metering pressure based on the customer's equipment requirements and a typical interior piping design. In addition, the meter set piping configuration should be designed to prevent excessive pressure drop or pressure variation at the meter outlet.

3. Pressure Factor Metering

3. B.: Revised to emphasize that Pressure Factor Metering can only be used where the metering pressure is 15 psig or less. Added an exception for the Company use meters that are metering above 15 psig on January 1, 2017. [IAC Part 501.150](#) IAC Part 501.150 restricts fixed factor meter to meters operating at 15 psig or less.

3. E.: The regulator selected for pressure factor metering must be capable of holding a constant outlet pressure to within $\pm 1.0\%$ of absolute billing pressure. [IAC Part 501.150](#) IAC Part 501.150 requirement for fixed factor metering. GTE says Ameren's regulators meet this requirement. Previously, the regulator had to hold the outlet pressure within $\pm 1/4$ to $1/2$ psig under anticipated load.

3. E.: Added the metal tag showing the metering pressure can be installed in a visible location near the regulator or the meter index. Previously, the tag was to be located near the meter index.

3. F. The requirement to use a calibrating gauge for setting and verifying meter pressure on all new and existing pressure factor meter sets replaced the use of Test gauges. [IAC Part 501](#) IAC Part 501 requires the use of a Portable Standard which is a calibrating gauge for setting and verifying pressures.

3. H.: New, The gas metering pressure shall be adjusted if the "As Found" pressure is found to be greater than ± 0.25 psig from the expected pressure.

Previously, this variance was ± 0.5 psig but [IAC Part 501.150](#) IAC Part 501.150 requires the regulator to hold outlet pressure to $\pm 1.0\%$ of absolute billing pressure which is less than ± 0.5 psig. The Committee agreed on ± 0.25 psig as acceptable.

5. Electronic Correctors

5. B. Added Gas Tech Engineer who along with Division Gas Engineer should coordinate with IL Metering and Projects in reviewing and specifying meter and regulating equipment when an electronic corrector is needed.

5. C.: Wording revised to emphasize that an electronic corrector shall be selected when elevated metering pressure is greater than 15 psig.

5. E.: Revised to require Gas Tech Engineering or IL Metering and Projects' approval for installation requiring elevated metering pressure greater than 15 psig. Since a corrector will be required for elevated pressures greater than 15 psig, additional approval is required.

5. F. New, Any meter with metering pressure of 175 psig or greater shall be approved by Gas Tech Engineering and by IL Metering and Projects.

Important to ensure these installations have been designed correctly and that they have no adverse effect on the gas system.

6. Records

6 B.: Replace "annual verification" with "field verification"

METR
2.16

Gas Meter Data Sheet

- 4. C. (1) (a) 2: AIC replaced Ameren Illinois
- 4. C. (1) (c) 21: "calibrating gauge" replaced "test gauge"
- 4. C. (1) (d) 28: "calibrating gauge" replaced "test gauge"
- 4. C. (2) (a) 63: AIC replaced Ameren Illinois
- 4. C. (2) (c) 75: "calibrating gauge" replaced "test gauge"
- 4. C. (2) (d) 81: "calibrating gauge" replaced "test gauge"

METR
2.19

Pressure Factor Verification

2. Verification Information

2. A.: Added GTS as another group that will be provided a list of gas meters with billing constant greater than 1.

2. D.: New, Investigation orders will be created in OAS for each premise with a factor billed elevated meter pressure.

3. Pressure Factor Verification

3. B.: [IAC Part 501](#) IAC Part 501 requires the metering pressure be verified with calibrating gauge (portable standard) rather than a test gauge. IAC 501 requires the flow rate to be less than 90% of the meter's capacity at the designated fixed factor metering pressure.

A Portable Standard (calibrating gauge) is required when setting and verifying equipment associated with correcting meter's output.

De-
cem-
ber 1,
2014 Janu-
ary 1,
2017

3. C.: [IAC Part 501.150](#) IAC Part 501.150 requires the metering pressure verification at least every 36 months. If conditions at the meter prevent this verification are documented, verification can be delayed up to 4 months.

3. E.: [IAC Part 501.150](#) IAC Part 501.150 allows residential meters that have a fixed factor meter pressure of 5 psig or less and a rated capacity under 700 cfh to be exempt from pressure factor verification process.

Previously, residential customer meters with a fixed factor of 2 psig were exempt from this verification process.

3. F.: New, [IAC Part 501](#) IAC Part 501 has added non-residential meters with a 2 psig or less metering pressure and a rated capacity under 700 cfh do not have to be included in the pressure factor verification process.

Previously these meters had to have the pressure verified.

7. Corrosion Control Inspection Follow-up

7. B.: Updated the reference link to CORR 1 13. Atmospheric Corrosion.

METR
2.20

Meter Header Inspection

2. Inspections/Maintenance When A Meter Set is Not Disassembled

2. A. (6): Added "spring cap" as another item that needs to be checked.

QA Consultant pointed out this item was not included and it is important that this cap be in place on the regulator to discourage unauthorized personnel from adjusting the pressure.

2. B.: Added discrepancies should be documented in Click-Mobile when they are not immediately repaired.

QA Consultant felt needed to indicate how to document.

3. Inspections/Maintenance When A Meter Is Installed/ Changed or Set is Disassembled

3. A. (7): Added "spring cap" as another item that needs to be checked.

3. B.: For consistency, copied 2. B. language on how discrepancies should be handled when they are not immediately repaired.

1. D.: New, Pressure gauges used during the construction and maintenance process which verifies or qualifies MAOP are addressed in PTST 1 3. Test Recording Methods.

Janu-
ary 1,
2016

Janu-
ary 1,
2017

2. Ameren Illinois Company (AIC) Pressure Gauge Definitions

Deleted the definitions for Industrial/Commercial Gauge and Process Gauge since these gauges will no longer be used in metering operations, maintenance, inspections or verifications.

2. B.: Calibrating Gauge is considered a "Portable Standard" which is used for field verification and calibrations as now required under [IAC Part 501](#) IAC Part 501.

2. C.: New, is the definition of Portable Standards - means instruments that utilities use in the field or the meter shop to test the accuracy of auxiliary and tertiary equipment, transmitters, and other equipment associated with correcting a meter's output

2. D.: New, is the definition of Reference Standard - means instruments that utilities use only for verifying the accuracy of portable standards, and whose accuracy is traceable back to the national standard maintained by the National Institute of Standards and Technology (NIST) or its successor.

Notice: Reference Standards are for use in a shop environment only and never taken to the field.

These definitions were copied from [IAC Part 501](#) IAC Part 501 and are included in the Glossary.

4. Uses of Calibrating Gauges (Portable Standard) - New Section

(1) Establishing the regulator set pressure for all new customers metered at an elevated pressure (2 psig or greater).

(2) Performing the annual metering pressure verification for all commercial customers metered at an elevated pressure.

(3) Adjusting the regulator operating pressure for all customers metered at an elevated pressure

(4) Verifying the proper operation of electronic correctors, transmitters, other auxiliary and tertiary equipment connected to a meter and other equipment associated with correcting a meter's output.

The first 3 items were previously under Uses of Test Gauges. [IAC Part 501](#) IAC Part 501 requires the use of a portable standard when setting, verifying or adjusting equipment associated with correcting meter's output.

5. Storage and Transportation of Gauges

5. A. & 5. B.: Added "calibrating gauge" that are to be handled in the same manner as test gauges.

6. Verification and Calibration

6. A. (2): Test gauge accuracy is to be verified at zero scale in addition to half scale and full scale.

6. A. (3):Grammatical only, "within it's given tolerance" replaced "within a given tolerance".

6. B. Calibrating Gauge

6. B. (1): [IAC Part 501.160](#) IAC Part 501.160 requires calibrating gauge accuracy verification at least every 12 months.

Previously these gauges were calibrated once each calendar year not to exceed 15 months. [IAC Part 501](#)IAC Part 501 does not provide a 3 month compliance window.

6. B. (2): Removed the listing of the locations where the calibrating gauge could be sent for calibration. GTS personnel will be performing the calibration and those who have calibrating gauges know where and who to send the gauges.

6. C.: New, The reference standard shall be certified at least every 36 months or by the certification due date.

[IAC Part 501.160](#) IAC Part 501.160 requires Reference Standards to be certified at least every 36 months. However, some of the certifications are only good for 1 year.

7. Recordkeeping

Added "reference standard" to the list of gauges that have to have their verification and calibration history maintained in Maximo.

METR
2.24

Replacement of Large Volume Diaphragm Meters

AIC replaced Ameren Illinois throughout the document

Janu- Janu-
ary 1, ary 1,
2014 2017

5. Additional Checks

5. A. (5): Added the reference link to METR 2.20 5. Meter Header Inspection, Banded Regulators

6. Meter Being Transported or Moved

6. A.: Added reference link to METR 2.01 2. Handling and Transporting.

8. Changing Correcting Devices

8. A.: Added, The transferred correcting device shall be inspected to verify proper operations within 60 days after the meter exchange.

[IAC Part 501.290](#) IAC Part 501.290 requires the corrector to be checked for proper operation following the transfer. The committee deemed within 60 days of the transfer as a reasonable time.

13 Reporting

13. B.: Added reference link METR 2.16 for the Gas Meter Data Sheet

METR
2.25

Ultrasonic Meter Testing

Janu-
ary 1,
2016

Janu-
ary 1,
2017

AIC replaced Ameren Illinois in the document

1. A.: Grammatical, spelled out ultrasonic meters for (USM's)

1. B.: Grammatical, added the word "utilizes"

2. Ultrasonic Meter Inspection Schedule

2. A.: In addition to meters installed at customer locations, ultrasonic meters installed at the AIC storage fields now require inspection and interrogation at least every 3 months.

Added, At least 2 of the quarterly maintenance reports in a calendar year must be with gas flowing through the meter.

This is an ICC's expectation that there be flow through the meter during 2 of the inspections.

2. C.: Added a listing of the items that are required for an inspection.

This listing came from [IAC Part 501.220](#) IAC Part 501.220.

2. G.: New item that address multi-path ultrasonic meters. These meters are to flow calibrated at least every 120 months. If the periodic inspection documentation demonstrates the meter meets the manufacturing tolerances and the AIC conducts an internal inspection of the meter body at least every 120 months to ensure there is not an accumulation of internal deposits or other damage, AIC may forego the flow calibration requirement. This [IAC Part 501.220](#) language.

4. Chromatograph Operational Check

4. A.: The gas chromatography has to be programmed such that the calibration of the unit is being performed at a minimum programmed cycle of at least once every 24 hours. [IAC Part 501.320](#) IAC Part 501.320 revised, previously this was performed once per week.

For gas chromatograph used in the gas storage field, if the field in not injecting or withdrawing, the calibration can be suspended until the facility resumes injecting or withdrawing.

4. C.: Revised to, Verify at least every three (3) months that the gas component un-normalized mole % variance is within $\pm 1.5\%$ of the gas contained within the calibration gas cylinder and that the values are being received at the meter and the on-site flow computer.

4. E.: New, The calibrated gas cylinder shall be certified or replaced at least every thirty six (36) months.

The above revisions are [IAC Part 501.320](#) IAC Part 501.320 requirements.

5. Inspection Records

UNCONTROLLED IF PRINTED

5. E.: New [IAC Part 501](#)IAC Part 501 requirement; The most recent five (5) years of inspection records shall be maintained. Documents shall also be maintained for a multi-path ultrasonic meter's most recent accuracy test, prior accuracy test and the dates of any other accuracy test that occurred during the prior ten (10) years.

METR
2.27

Electronic Corrector Installation Verification - Added the word Installation

January 1,
2016 January 1,
2017

1. A.: Clarification that an electronic corrector must be selected in instances where the elevated metering pressure is greater than 15 psig.

[IAC Part 501.150](#) IAC Part 501.150 restricts fixed factor metering to 15 psig or less.

1. C.: Grammatical, added the word "activities".

2. Electronic Corrector Inspection Schedule

2. A.: Changed the inspection schedule to 60 days from 90 days following the installation of a new or an exchanged corrector at a customer's premise.

[IAC Part 501.290](#) IAC Part 501.290 requires that following attachment of auxiliary equipment to a meter, the proper operation of the auxiliary equipment must be verified. The committee deemed within 60 days of installation as a reasonable time.

2. D.: New; All in-service electronic correctors shall be verified for proper operations at least every sixty (60) months

[IAC Part 501.300](#)IAC Part 501.300 requires corrector operation be verified following installation. The committee deemed within 60 days of installation as a reasonable time.

3. Device Programming Verification

3. A.: Grammatical, added a "s" to Codes

5. Corrector Edit Calculation

5. A.: Grammatical revisions in wording.

7. Records

7. D.: The verification records must be maintained for 10 years. [IAC Part 501.300](#)IAC Part 501.300 change previously the records were only maintained for 3 years.

METR
2.28

Customer Request Test - New Section

New January 1,
2017

This section was added in order to comply with [IAC Part 501.280](#)IAC Part 501.280

This procedure was established for processing "Customer Requested Test" on a gas meter. It outlines the process to assure proper notification of gas meter accuracy test results to all parties or their stated representatives.

2. Definition

A Customer Requested Test gas meter is any meter removed from service as a result of a customer compliant and requesting an accuracy test. The same requirements apply to an accuracy test requested by an Alternative Gas Supplier or by the ICC.

3. AIC Requirements

3. A.: The accuracy testing of a customer requested test meter shall be completed within 45 days after receiving the customer’s request.

4. Reporting Customer Requested Gas Meters

This section contains detailed procedures on how the request order is generated, how the meter is to be handled and delivered to the meter shop (within 5 days of the request), notification to the customer of the testing schedule (within 15 days of entry into MMS), possible customer cost and notifying customer of test results within 5 days after completing the test. This section also provides the procedures for a Commission Referee Test.

SERV
1

Requirements

Janu- Janu-
ary 1, ary 1,
2016 2017

5. Location

5. D.: Clarification that this applies to residential meter riser locations and that the location of the riser should take into account public safety, sources of ignition, and air intake into buildings as they relate to the meter set.

5. E.: Provides typical location to avoid and is divided into the location of the regulator vent and of the meter set. The prohibited locations are consistent with those listed in METR 1 3. H. Location

5. F.: New and is a repeat of the [IAC Part 501](#) IAC Part 501 that states gas meters shall not be installed indoors unless outdoor installation is not possible or would make the meter installation financially infeasible.

[IAC Part 501.110](#) IAC Part 501.110

5. (2): Added a reference link to SERV 2.08 4. Q. Insertion, Dead Insertion Procedures

5. G.: Added "for the appropriate meter set standard" following the reference link to SERV 3._ _.

5. I.: Updated the location of a farm tap to be consistent with SERV 2.03 3. Farm Tap Installation, Location which was revised in the January 1, 2016 Update. The farm tap is to be located above ground and on private property.

9. Pressure Testing

9. E.: Updated the reference link to PTST 1 5. Testing.

Docu- ment	Change Summary	Previ- ous Docu- ment Dated	Current Docu- ment Dated
PROCEDURAL CHANGES			
<p>PRES 2.03</p>	<p>Potential Over Pressurization or Service Interruption</p> <p>4. Activities Requiring an Operational Checklist</p> <p>4. C.: New: "When multiple tie-ins / cut-offs are required for system maintenance or replacement, Gas Engineering shall develop a written sequence of operations to ensure actions taken will not affect system supply. Gas Engineering should review the construction sequence with the Gas Supervisor and the Construction Inspector where applicable. If the scope of the field work changes, the plan should be modified and approved by Gas Engineering."</p> <p>Following an investigation of an unplanned outage during a replacement project AIC developed these new procedures to minimize the chances for unplanned service interruptions when making multiple tie-ins or cut-offs.</p>	<p>Octo- ber 1, 2011</p>	<p>Sep- tem- ber 1, 2016</p>
<p>PTST 1</p>	<p>Pressure Testing Requirements</p> <p>1. A.: Revised to match Part 192 language in that pressure testing is performed to identify "hazardous leaks".</p> <p>1. D.: New, "Pre-tested can be used for replacement, relocation or repair where post installation testing is not practical. Pre-tested pipe shall be tested, at a minimum, to meet the Design MAOP for the location it is being installed."</p> <p>Clarification that pre-tested pipe can be used in those instances where post installation testing is not practical.</p> <p>1. J.: Added a listing of the types of projects which Gas Tech Engineering is responsible for reviewing testing requirements.</p> <p>1. J. (1) All steel gas main/facility projects with Design MAOP greater than 60 psig which includes transmission or high pressure distribution lines or facilities located outside of the Gas Storage Field or compressor plants.</p> <p>1. I. (2): Steel or PE service lines that are two (2) inch and larger that have a Design MAOP greater than 60 psig.</p> <p>1. I. (3): All large meter sets with connected loads greater than 10,000 CFH and/or inlet pressure greater than 60 psig.</p> <p>1. I. (4): All regulator/flow control stations excluding service farm taps less than two (2) inch nominal diameter,</p>	<p>Janu- ary 1, 2016</p>	<p>Sep- tem- ber 1, 2016</p>

odorizer stations, valve stations and any other facility with Design MAOP greater than 60 psig.

1. K.: Added Gas Storage Engineering is responsible for reviewing the testing requirements on all gas facilities located within gas storage fields and compressor plants.

1. L. Added a listing of the types of projects DDC/PDC or Division Engineering are responsible for reviewing test requirements.

1. L. (1): PE mains with Design MAOP of 100 psig or less.

1. L. (2): Steel mains with Design MAOP 60 psig or less.

1. L. (3): PE and steel service lines with Design MAOP 100 psig or less.

1. L. (4): PE and steel service lines two (2) and larger that have a Design MAOP greater than 60 psig should also be reviewed by Gas Tech Engineering.

1. L. (5): High pressure distribution farm tap services less than two (2) inch nominal diameter.

The delineation of responsibilities is being included to eliminate the confusion on which group, GTE or DDC/PDC, handles which type of project.

1. M.: New, "Emergency project(s) or maintenance project(s) on steel main(s) and service(s) with Design MAOP 100 psig or less, testing requirements may be specified by Division Engineering."

Allows Division Engineering to handle steel projects where Design MAOP is 100 psig or less. This eliminates the need to contact Gas Tech Engineering for testing requirements for steel mains and services with Design MAOP of 100 psig or less. PE mains and service with Design MAOP of 100 psig already falls under Division Engineering.

3. Testing Recording Methods

3. C.: Revised when the verification check on process gauge(s) to "annually, not to exceed 15 months" from "annually during 1st quarter". New process gauge(s) placed into service, the accuracy does not have to be verified until the following year.

Gas Superintendents wanted more flexibility and not want to be tied down to the first quarter.

4. Design MAOP

4. B.: Added Division Gas Engineer and Gas Storage Engineering as another group besides Gas Tech Engineering that will designate specific Design MAOP for systems to be operated over 60 psig.

4. D.: Removed the need to contact Gas Tech Engineering if the maximum test pressure is exceeded on system over 60 psig.

5. Testing

5. A.: New: "The actual procedures for performing leak and strength tests along with the methods for performing these tests are contained in the appropriate section shown on PTST 0, Table of Contents.

5. B. (1) thru (7): Added a listing of the test pressure and test duration requirement tables so an individual would know which table applied to their specific project. The pressure testing tables that were previously shown under 5. B. (1) thru (7) have been removed from this section of the O&M.

Each table is in its own section which allows for printing only the testing requirements for a specific type of project.

5. F.: Inserted a new item that addresses the testing of short segments of pipe 2 inch nominal diameter and larger. These short segments of pipe are to be tested in accordance with Table PTST 1 5. E. Fabricated Unit/Assembly, Short Sections of Pipe.

5. G.: New item that addresses the testing requirement for smaller than 2 inch fittings, typically attached to pipe for use as gauge taps, pressure taps, odorant taps, purge points, control line taps. These types of fittings are to be tested in accordance with Table PTST 1 5. A Service Lines - Less than 2" Diameter, Plastic or Steel.

Address testing of small fittings attached to the pipe.

5. H.: New item "Maximum test pressure on steel pipe with Design MAOP of 100 psig or greater should not exceed that designated by Gas Tech Engineering or Gas Storage Engineering."

To avoid overstressing the pipe, GTE or GSE will specify the maximum test pressure.

5. I.: New item "Farm tap on gas pressure system with a Design MAOP greater than 1000 psig shall be designed or reviewed by Gas Tech Engineering (GTE)."

The Farm Tap Standards only go to 1000 psig and there are a few systems with Design MAOP of greater than 1000 psig. Farm Tap off of these systems must be designed by Gas Tech Engineering or Storage Engineering.

5. J.: New item "Pressure containing facilities similar to a farm tap located within gas storage fields and compressor plants shall be designed by Gas Storage Engineer (GSE)."

7. Tie-In Joints

7. B.: Added leak detection instrument can be used to check for leaks if natural gas is the test medium.

8. A Component Other Than Pipe Being Replaced or Added to Pipeline

8. A.: Expanded this item to address testing requirements for a component attached to pipe with different Design MAOP.

A. (1): Components attached to pipeline with Design MAOP 100 psig or less has a minimum test pressure of 100 psig.

A. (2): Components attached to pipeline with Design MAOP greater than 100 psig has a minimum test pressure of 100 psig with a maximum not to exceed the operating pressure of the pipeline, if that pressure is greater than 100 psig.

A. (3): If the component is similar to a cap, valve, elbow, etc., the connection will be tested at the operating pressure of the pipeline.

A. (4): Is an exception for full encirclement split sleeve installed on for a non-leak repair which only requires a visual inspection of the weld.

8. B.: Added leak detection instrument can be used to check for leaks if natural gas is the test medium.

8. C. (2) (a): Added "sav-a-valve nipple" to list of weld fitting examples.

8. E.: New item that addresses testing of instrument, control, or sampling lines. "All mechanically connected instrument, control, and sampling lines shall be rated for the maximum service pressure of the pipe or equipment to which it is attached and shall be checked for leaks at the current operating pressure."

Clarification on testing control or sampling lines which are associated with facilities such as regulator stations, meter sets, odorizers, etc.

9. Test Record

9. A. (1): Revised Gas Leak & Strength Test Stamp, added "Device Serial Number or ID" line.

This was added to meet the requirements in PTST 2.01 and 2.01 for testing information that is required to be recorded. This ties the test record to a specific recording device, gauge or recorder.

9. A. (1) (a): New, "Changes may be made to this test stamp between O&M Updates, so the test stamp on the plans may be different than the one shown above. There is currently a Records Management Committee working on a new Leak Test Record for use by the Distribution Design Centers and Field Operations. There will be a period of time in 2016

where either the above Stamp/Form or the new Leak Test Record will be acceptable."

Work is currently underway to develop new forms for recording pressure tests and as soon as these new forms have been approved, printed and distributed their use will be acceptable.

9. A. (1) (b): New, "When leak detection fluid is used to check for leaks other than Tie-In Joints. Write in "soap test" for the Actual Duration."

Provides direction on how to record soap test.

9. A. (2) Added Gas Storage Engineering as another group that will use the Leak & Strength Test Record. Revised the Leak & Strength Test Record, removed (8 Hours or Longer, Requires Chart).

A. (2) (b): New, "Changes may be made to this test record form between O&M Updates, so the test record form on or attached to plans may be different than the one shown above. There is currently a Records Management Committee working on a new Leak & Strength Test Record for use by the Gas Tech Engineering, Gas Storage Engineering and Field Operations. There will be a period of time in 2016 where either the above Test Record or the new Leak & Strength Test Record will be acceptable."

Work is currently underway to develop new forms for recording pressure tests and as soon as these new forms have been approved, printed and distributed their use will be acceptable.

9. A. (2) (c): New, "When leak detection fluid is used to check for leaks other than Tie-In Welds, write in "soap test" for the Leak Test Beginning Time."

Provides direction on how to record soap test.

9. B.: New item that addresses recording service line testing. "Gas service line test records are recorded on the Gas Service Card within ClickMobile."

Clarifies that service line test records are recorded electronically within ClickMobile and not on one of the test records shown in this section.

9. C.: New item that addresses recording test of meter set piping. "Leak testing on meter set piping shall be recorded on the meter set plans test stamp."

The service line testing in ClickMobile does not include the testing of meter sets. Recording of this testing should be recorded on one of the test records shown in this section and placed on or attached to the meter set plans.

9. D.: New item that addresses recording pre-tested pipe test. "Test record for pre-tested pipe shall be either transferred to the appropriate test stamp/test record or a copy

of the original test record placed in the As - Built construction file.

Addresses documenting the test performed on pre-tested pipe which verifies the pre-tested pipe meets or exceeds the requirement for the application.

PTST 1.01	<p>Test Pressure and Duration Requirement Tables</p> <p>Tables are shown below.</p>	(new)	Sep-tem-ber 1, 2016
PTST 1 TABLE A.	<p>SERVICE LINES - LESS THAN 2" DIAMETER; PLASTIC OR STEEL (Previously was in the PTST 1 5. Section)</p> <p>1.: Revised to clarify the table is test pressure and test duration requirements for standard construction activity.</p> <p>In Table:</p> <p>Leak Test replaced Leak/Strength Test. Note (1) was added to explain that a Leak Test satisfies both the leak test and strength test requirement in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the service line.</p> <p>The groups that have been working on this section of the O&M preferred the use of the terms Leak Tests and Strength Test and to no longer use Combination Test. Under Part 192 Code, there is no strength test requirement for service lines.</p> <p>Under Test Pressure for Steel with Design MAOP ≤ 100 psig: added 1.5 x Design MAOP (a) where (a) states "If Design MAOP is greater than 60 psig but less than 100 psig minimum test pressure is 1.5 times Design MAOP."</p> <p>Gas Superintendents wanted the ability to test steel service lines with Design MAOP between 60 psig and 100 psig at 1.5 times the MAOP rather than at a minimum of 150 psig.</p> <p>Under Test Pressure for Steel with Design MAOP >100 psig added a Note (2);</p> <p>Note (2) states If the service line is tested at a pressure that will result in the hoop stress of 20% SMYS or more it shall be tested in accordance with PTST 1 Table D.</p> <p>Note was added to meet the requirement in Part 192.511 when a service line is stressed 20% SMYS or more.</p> <p>Added a statement in the lower section of the table, "If the service has both steel and plastic pipe, then test to the Plastic Pipe Requirements"</p> <p>Eliminates the confusion on how to test service lines that contain both steel pipe and PE pipe. trolling requirements in that PE pipe is tested for a Design MAOP of either 60 psig or 100 psig.

**PTST
1 TA-
BLE B.**

PLASTIC MAIN - ALL PE PIPE SIZES THRU 8" WITH DESIGN MAOP 100 PSIG OR LESS (Previously was in the PTST 1 5. Section)

(new) Sep-tem-ber 1, 2016

1. Revised to clarify table is test pressure and test duration requirements for standard construction activity with plastic main pipe sizes thru 8 inch which includes plastic service lines 2 inch and larger.

In Table:

Leak Test replaced Leak/Strength Test. Note (1) was added to explain that a Leak Test satisfies both the leak test and strength test requirement in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the pipe.

The groups that have been working on this section of the O&M preferred the use of the terms Leak Tests and Strength Test and to no longer use Combination Test. Under Part 192 Code, there is no strength test requirement for plastic mains.

Under the Duration, replaced the reference link to PTST 2.01 with See 2. below.

2.: Duration information from PTST 2.01 3. Leak Test Duration, is summarized below:

Added duration information and table from PTST 2.01 3. so individual would not have to move back and forth between PTST 1 and PTST 2.01

**PTST
1 TA-
BLE C.**

STEEL MAIN - ALL STEEL PIPE SIZES THRU 30" WITH DESIGN MAOP LESSTHAN 100 PSIG (Previously was in the PTST 1 5. Section)

(new) Sep-tem-ber 1, 2016

1. Revised to clarify table is test pressure and test duration requirements for standard construction activity with steel main pipe sizes thru 30 inch nominal diameter and steel service lines 2 inch and larger nominal diameter with Design MAOP less than 100 psig.

In Table:

Leak Test replaced Leak/Strength Test. Note (1) was added to explain that a Leak Test satisfies both the leak test and strength test requirement in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the pipe.

The groups that have been working on this section of the O&M preferred the use of the terms Leak Tests and Strength Test and to no longer use Combination Test. Un-

der Part 192 Code, there is no strength test requirement for steel main with Design MAOP of less than 100 psig.

Under Test Pressure for Steel with Design MAOP > 60 psig to < 100 psig added 1.5.x Design MAOP (a) where (a) states "If Design MAOP is greater than 60 psig and less than 100 psig, minimum test pressure is 1.5 times Design MAOP."

Gas Superintendents wanted the ability to test steel lines with Design MAOP between 60 psig and 100 psig at 1.5 times the MAOP rather than at a minimum of 150 psig.

Under the Duration, replaced the reference link to PTST 2.01 with See 2. below.

2.: Duration information from PTST 2.01 3. Leak Test Duration, is summarized below:

Added duration information and table from PTST 2.01 3. so individual would not have to move back and forth between PTST 1 and PTST 2.01

**PTST
1 TA-
BLE D.**

STEEL MAIN - ALL STEEL PIPE SIZES THRU 30" WITH DESIGN MAOP 100 PSIG or GREATER (Previously was in the PTST 1 5. Section)

(new)

Sep-
tem-
ber 1,
2016

1. Revised to clarify table is test pressure and test duration requirements for standard construction activity with steel main pipe sizes thru 30 inch nominal diameter and steel service lines 2 inch and larger nominal diameter with Design MAOP greater than or equal to 100 psig.

This table is separated into two parts; top half is for steel pipe with Design MAOP of 100 psig or greater but less than 30% SMYS and the bottom half is for steel pipe with Design MAOP 30%SMYS or greater.

This separation is consistent with the testing requirements in Part 192 Subpart J

Steel Pipe with Design MAOP of 100 psig or greater but less than 30% SMYS

In Table:

Under the Test Pressure for the Leak Test, add Max. 20% SMYS.

This maximum leak test was added to meet a requirement in Part 192.507 when a pipeline is stressed 20% SMYS or more. The groups that have been working on this section of the O&M made a decision to require a leak test to verify no hazardous leaks were present and then a strength test to establish or validate the Design MAOP.

Under the Test Pressure for the Strength Test, added a Max. See Note (3)

Note (3) states: "Maximum test pressure on steel pipe with Design MAOP of 100 psig or greater should not exceed that

designated by Gas Tech Engineering or Gas Storage Engineering."

To avoid overstressing the pipe, GTE or GSE will specify the maximum test pressure.

Steel Pipe with Design MAOP 30% SMYS or greater

In Table:

Under Design MAOP \geq 30% SMYS added Note (2).

Note (2) states: "Refer to STLP 2.01 7. Design Pressure Steel Pipe Stock Code Table for pressure that would result in stressing pipe to 30% SMYS. If the pipe being tested is not shown in this table, contact Gas Tech Engineering or Gas Storage Engineering or local Gas Engineer for pressure determination."

This provides an easy reference for finding at what pressure the pipe is stressed to 30% SMYS.

Under the Leak Test Duration added Max. 20% SMYS.

This maximum leak test was added to be consistent with the leak test duration on pipe with Design MAOP or 100 psig or greater but less than 30% SMYS. The groups that worked on pressure testing felt that even though Part 192.505 only requires a strength test, it would be a good practice to perform a leak test at a minimum of 100 psig before increasing the test pressure to 1.5 times the Design MAOP.

Under the Strength Test Pressure added Max. Note (3)

Note (3) states: "Maximum test pressure on steel pipe with Design MAOP of 100 psig or greater should not exceed that designated by Gas Tech Engineering or Gas Storage Engineering."

To avoid overstressing the pipe, GTE or GSE will specify the maximum test pressure.

**PTST
1 TA-
BLE E.**

FABRICATED UNIT/ASSEMBLY OR SHORT SECTION OF PIPE (Previously was in the PTST 1 5. Section)

(new)

Sep-
tem-
ber 1,
2016

1. Revised to clarify the table provides test pressure and test duration requirements.

2. Added an explanation of a Fabricated Unit/Assembly.

Fabricated Unit/Assembly is sections of pipe and various fittings which are assembled together either in a shop environment or in the field and then attached to the pipe or connected to the system. Where post installation testing is impractical, the fabricate unit/assembly shall be pre-tested to at least meet the Design MAOP of the system it is being attached. Typical examples of fabricated unit/ assembly are: regulator stations, valve stations, commercial/industrial regulating/metering sets, odorizer stations, pig launcher/receivers, pipeline offset sections, valve

connections, pressure gauge tap, blow-down stacks, equalizer valve set-up, pressure recording connection, bypass facilities and etc.

When sections of pipe and/or fittings are put together and they cannot be tested to meet their Design MAOP once in place, they have to be pre-tested to establish their Design MAOP. This is required even when connecting pressure rated fittings together into a unit/assembly.

This table has now been divided into 2 sections;

PTST 1 Table E. (1) for Fabricated Unit/Assembly, or Short Section of Pipe with Design MAOP less than psig and PTST 1 Table E. (2) for Fabricated Unit/Assembly, or Short Section of Pipe with Design MAOP 100 psig and greater.

PTST 1 Table E. (1) for Fabricated Unit/Assembly, or Short Section of Pipe with Design MAOP less than psig

Leak Test Note (1) replaced Leak/Strength Test,

Note (1) states "The single Leak Test satisfies both the leak test and strength test requirement in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the unit, assembly, or pipe."

Under Duration, "See Minimum Duration Table" replaces the "Check for leaks with soap or leak detection instr. or Min. 1 Hour Leak Test.

A Minimum Leak Duration Table has been added which lists the minimum test duration based on the size of pipe/fittings being tested.

Gas Superintendents wanted the testing requirements to be consistent with the other tables. It was agreed that the minimum test duration should be based on the pipe/fitting size shown in Tables B and Table C.

Under Test Pressure for Steel with Design MAOP < 100 PSIG, revised to Min. 90 PSIG or 1.5 x Design MAOP (a) Max. 200 PSIG. Where (a) states "If Design MAOP is greater than 60 psig and less than 100 psig, minimum test pressure is 1.5 times Design MAOP."

Gas Superintendents wanted the ability to test steel lines with Design MAOP between 60 psig and 100 psig at 1.5 times the MAOP rather than at a minimum of 150 psig.

PTST 1 Table E. (2) for Fabricated Unit/Assembly, or Short Section of Pipe with Design MAOP 100 psig and greater.

Under the Strength Test Pressure in PTST 1 Table E. (2), added Max. See Note (1)

Note (1) states: "Maximum test pressure on steel pipe with Design MAOP of 100 psig or greater should not exceed that designated by Gas Tech Engineering or Gas Storage Engineering."

To avoid overstressing the pipe, GTE or GSE will specify the maximum test pressure.

Under Design MAOP \geq 30% SMYS added Note (2).

Note (2) states: "Refer to STLP 2.01 7. Design Pressure Steel Pipe Stock Code Table for pressure that would result in stressing pipe to 30% SMYS. If the pipe being tested is not shown in this table, contact Gas Tech Engineering or Gas Storage Engineering or local Gas Engineer for pressure determination."

This provides an easy reference for finding at what pressure the pipe is stressed to 30% SMYS.

**PTST
1 TA-
BLE F.**

FARM TAP - SINGLE CUT - 60 to 450 PSIG INLET PRESSURE (Previously was Table PTST 1 5. I.)

(new)

Sep-
tem-
ber 1,
2016

1. Revise to clarify the table is the test pressure and test duration requirements.

In Table:

Leak Test replaced Leak/Strength Test. Note (1) was added to explain that a Leak Test satisfies both the leak test and strength test requirement in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the service line.

The groups that have been working on this section of the O&M preferred the use of the terms Leak Tests and Strength Test and to no longer use Combination Test. Under Part 192 Code, there is no strength test requirement for service lines.

Added "Note: All of the piping from the main to the outlet of the farm tap can be tested together at the inlet service line test pressure."

Clarification that all of the farm tap piping can be tested at one time, at the same test pressure as the inlet piping from the main.

Under Outlet Service Line $<$ 2" revised the reference to PTST 1 Table A. and added See Note (4) below.

Under Outlet Service Lines \geq 2" revised the references to PTST 1 Table B if Plastic Service or PTST 1 Table C. or PTST 1 Table D. if Steel Service Lines and added See Note (4) below.

Note (4) states "If the outlet service has both steel and plastic pipe, then test to the plastic pipe requirements."

Since the Design MAOP of the PE pipe is controlling, the testing of the service line should be in accordance with the PE requirements.

PTST 1 TA- BLE G.	<p>FARM TAP - DOUBLE CUT - 451 to 1000 PSIG INLET PRES- SURE (Previously was Table PTST 1 5. J.)</p> <p>In Table:</p> <p>Leak Test replaced Leak/Strength Test. Note (1) was added to explain that a Leak Test satisfies both the leak test and strength test requirement in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the service line.</p> <p>The groups that have been working on this section of the O&M preferred the use of the terms Leak Tests and Strength Test and to no longer use Combination Test. Under Part 192 Code, there is no strength test requirement for service lines.</p> <p>Under Inlet Service Line < 2" added Note (5).</p> <p>Note (5) states "- A test pressure of 1,181 psig or greater on a 1-1/4 inch service line will stress the pipe to 20% SMYS or more. Service line shall be tested in accordance PTST 1 Table D."</p> <p>Part 192.511 requires a service line that is stressed to 20% SMYS must be tested as a pipeline that operates at or above 100 psig but less than 30% SMYS.</p> <p>Added "Note: All of the piping from the main to the outlet of the farm tap can be tested together at the inlet service line test pressure."</p> <p>Clarification that all of the farm tap piping can be tested at one time, at the same test pressure as the inlet piping from the main.</p> <p>Under Outlet Service Line < 2" revised the reference to PTST 1 Table A. and added See Note (4) below.</p> <p>Under Outlet Service Lines ≥ 2" revised the references to PTST 1 Table B if Plastic Service or PTST 1 Table C. or PTST 1 Table D. if Steel Service Lines and added See Note (4) below.</p> <p>Note (4) states "If the outlet service has both steel and plastic pipe, then test to the plastic pipe requirements."</p> <p>Since the Design MAOP of the PE pipe is controlling, the testing of the service line should be in accordance with the PE requirements.</p>	(new)	Sep- tem- ber 1, 2016
PTST 2.01	<p>Leak Test</p> <p>Revisions were made to make consistent with PTST 1.</p> <p>The items below are essentially a duplication of what is in PTST 1 Requirements.</p> <p>1. A.: Revised to match Part 192 language in that pressure testing is performed to identify "hazardous leaks".</p>	Janu- ary 1, 2016	Sep- tem- ber 1, 2016

1. C.: Revised Gas Tech Engineering's requirements to now reviewing testing requirements for transmission mains/facilities, steel high pressure mains/facilities with Design MAOP of greater than 60 psig. See PTST 1 J. for GTE responsibilities.

1. D.: New item added to address DDC/PDC or Division Engineering's requirements to now reviewing testing requirements for steel distribution mains and services with Design MAOP of 60 psig or less and PE mains and services with Design MAOP of less than 100 psig. See PTST 1 L. for DDC/PDC and Division Engineering responsibilities.

1. E.: New item added for Gas Storage Engineering requirements to include reviewing testing requirements of gas facilities in the Storage Field and Compressor Plants. See PTST 1 K. for Gas Storage Engineering responsibilities

1. F: New item added "Emergency project(s) or maintenance project(s) with Design MAOP 100 psig or less, testing requirements may be specified by Division Engineering."

Allows Division Engineering to handle steel projects where Design MAOP is 100 psig or less. This eliminates the need to contact Gas Tech Engineering for testing requirements for steel mains and services with Design MAOP of 100 psig or less. PE mains and service with Design MAOP of 100 psig already falls under Division Engineering.

1. H.: Updated the Table references.

3. Leak Test Duration

3. A.: Updated the Table reference and deleted "minimum duration of 10 minutes" since that is shown in the PTST 1 Table A.

3. B.: Updated the Table references

3. B. (1): Grammatical revision, "See table below in this section" replaces "See table in section D below".

3. E. : Updated Table reference

4. Leak Test Procedure

4. H.: Added leak detection instrument as a means of check for leaks at tie-in joints.

Since tie-in joints are tested at current operating pressure and gas is the test medium, leak detection instrument can be used.

5. Leak Test Records

5. C.: New item, Leak testing on meter set piping shall be recorded on the meter set plans test stamp."

**PTST
2.02**

Strength Test

Revisions were made to make consistent with PTST 1.

Fabricated Unit/Assembly or Short Section of Pipe - PTST 1 Table E.</p> <p>PTST 1 Table E (1) - Fabricated Unit/Assembly or Short Section of Pipe with Design MAOP <100 PSIG</p>	Janu- ary 1, 2016	Sep- tem- ber 1, 2016

PTST 1 Table E (2) - Fabricated Unit/Assembly or Short Section of Pipe with Design MAOP \geq 100 PSIG

6. Farm Tap - Single Cut - 60 to 450 PSIG Inlet Pressure - PTST 1 Table F.

7. Farm Tap - Double Cut - 451 to 1000 PSIG Inlet Pressure - PTST 1 Table G.

Forms and Reference Materials

Forms:

Updated Gas Leak & Strength Test Stamp

Updated Leak & Strength Test Record

RNST
2.01

Reinstating Mains and Services

Below revisions were made to be consistent with PTST 1, the previous references to PTST1 is being replaced by specific Table designations.

January 1,
2016

September 1,
2016

2. Reconnection of Temporarily Disconnected Services

2. A.: "See the appropriate Table under PTST 1 5. Testing, to select the appropriate test pressure and test duration table."
Replaced See PTST 1.

3 Reconnection of Temporarily Disconnected Farm Tap Services

3. B. (1): Update reference to PTST 1 Table F, "On farm tap with one regulator, the outlet piping from the regulator to the meter valve shall be pressure tested as specified in PTST 1 Table F. Farm Tap - Single Cut - 60 to 450 PSIG Inlet Pressure"

3. B. (2): Update reference to PTST 1 Table G,; "When the downstream (second cut) regulator is removed from a farm tap with two stage pressure reduction, the outlet piping from the downstream (second cut) regulator to the meter valve shall be pressure tested as specified in PTST 1 Table G. Farm Tap - Double Cut - 451 to 1000 PSIG Inlet Pressure"

3. B. (3): Update reference to PTST 1 Table G; "When the upstream (first cut) regulator is removed from a farm tap with two-stage pressure reduction, piping between the first cut regulator and inlet to the second cut regulator shall be tested as described in PTST 1 Table G. Farm Tap - Double Cut - 451 to 1000 PSIG Inlet Pressure."

4. Reconnection of Temporarily Disconnected Mains

4. C. Facilities Lifted From a Trench

4. C. (2): Update reference to PTST 1 5. "Mains which are lifted out of a trench and placed in a different location shall be pressure tested in the same manner as new lines in their final location. See PTST 1 5. Testing, to select the appropriate test pressure and test duration table."

UNCONTROLLED IF PRINTED

4. D. Facilities Cut Into Sections: Update reference to PTST 1 5. "New segments of main installed between the undisturbed sections of main shall be tested in the same manner as a new main in that location. See PTST 1 5. Testing, to select the appropriate test pressure and test duration table."

5. Reinstating Service in Abandoned Lines

5. B.: Update reference to PTST 1 5. "The facility shall be tested as though it were a new line being installed in the same location. See PTST 1 5. Testing, to select the appropriate test pressure and test duration table."

6. Records

6. A.: Revised to "All pressure test information will be maintained in Maximo or in the As Built Construction file."

SERV
2.03

Farm Tap Installation

Revisions were made to make consistent with PTST 1.

1. G.: New, "Farm tap a on gas pressure system with a Design MAOP greater than 1000 psig shall be designed or reviewed by Gas Tech Engineering (GTE).

1. H. New, "Pressure containing facilities similar to a farm tap located within gas storage fields and compressor plants shall be designed by Gas Storage Engineering (GSE)

2. Standard Installation

2. C.: Wording change, Please refer to the Farm Tap Capacity tables in Section 7 to verify flow capacity for a specific installation

4. Testing

4. A.: Updated reference to specific tables; "Farm tap piping shall be tested in accordance with the appropriate Table PTST 1 5. F. or Table PTST 1 5. G.

7. Farm Tap Capacity Tables

7. B. Single Cut Farm Tap Capacity table and

7. C. Double Cut Farm Tap Capacity table:

Maximum Flow values for the high pressure EFV's replaces the Trip Flow Rate. This is consistent with SERV 2.02 Excess Flow Valve tables.

7. C.: Added the orifice size and set pressure range for the 3/4" Fisher 627 regulator, 3/32" orifice and 70-150 psig.

UNCONTROLLED IF PRINTED

BORE 0	<p>Table of Contents</p> <p>BORE 2.04 Boring Across or Near Sewer Lines</p> <p>Inserted new section "3. Camera Inspection of High Risk Sewer Laterals</p> <p>Added BORE 4 Forms and Reference Materials</p> <p>Added reference material for the sewer listening device and accessories.</p>	<p>January 1, 2011</p>	<p>January 1, 2016</p>
BORE 2.01	<p>Boring Location Criteria</p> <p>4. Boring Site Preparation</p> <p>4. J.: Added a sentence - "Pot hole shall extend eighteen (18) inches either side of the locator's marks."</p> <p>Clarify that the hand/vacuum excavation must be done for the full width of the tolerance zone, 18 inches either side of the marks.</p> <p>4. J. (1) & (2): Removed the language that the covered material should be removed down to and below the planned bore path and the bore head and back reamer should be observed entering and leaving the pot hole.</p> <p>SMR Team didn't feel this language was necessary since 4. K. was being inserted.</p> <p>4. K.: Inserted new: "All marked buried facilities crossing the proposed bore path or are within the eighteen (18) inch tolerance zone should be exposed or verified not to be in conflict with boring, back reaming or pneumatic piercing tool operations. Pot holes should be of such depth to ensure the buried facilities will not be damaged by boring and back reaming operations."</p> <p>SMR Team inserted this language to simplify the procedures by stating that marked buried facilities should be exposed or verified not to be in conflict with the boring, back reaming, or pneumatic piercing tool and that pot holes should be of such depth to ensure buried facilities will not be damaged.</p> <p>4. M.: Changed reference for sewer listening device to "Refer to BORE 2.04 4. Construction Steps for sewer listening device requirements."</p> <p>4. O.: Revised language by adding outside of entrance trench: "For conventional boring with bore rods, the approach trench should be 1-1/2 times the length of the bore rod with no more than two (2) ten (10) feet sections of rods exposed outside of entrance pit at one time."</p> <p>SMR Team added "outside of entrance pit" This is to clarify the intent from a safety prospective of not exposing an individual or the public to more than approximately 20 feet of drill rods.</p>	<p>April 1, 2012</p>	<p>January 1, 2016</p>

4. P.: Revised language to: "As a rule of thumb, the entrance angle of the bore rod should normally be between 8 degrees and 18 degrees. However, conditions may warrant a steeper angle as long as it does not exceed minimum bending radius of the rod or pipe. A minimum of one complete length of drill rod (10 feet for smaller rigs and 30 feet for larger rigs) should be utilized before leveling out to the appropriate depth."

SMR Team revised the language slightly to allow for flexibility to exceed the normal 8 to 18 degree entrance angle provided the drill rod's manufacturer's minimum bend radius is not exceeded.

BORE
2.02

Boring Operations

Janu-
ary 1,
2012

Janu-
ary 1,
2016

1. B.: Added "Ameren Illinois Safety maintains the Job Briefing forms which are available on the Safety's SharePoint site."

Since the Safety SharePoint site maintains the most current version of the Job Briefing forms, the sample form is being removed from EXCV 4.

2. Boring Safety

2. B. (2): Grammatical only by adding reference to EXCV 2.03 for applying safe work practices at an excavation site.

2. B. (3): Added "Ensure excavations are in accordance with OSHA Standards before entering. See EXCV 1

2. C.: Inserted new item to specifically address safety around potentially energized buried cable. "Since boring operations may encounter an energized electric cable which could energize the boring machine, the following safety precautions should be followed:

2. C. (1): "The area around the boring machine should be demarcated to warn persons of the potential electrical hazard. Items such as, but not limited to, cones, tape, or barricades can be used to demarcate the area."

2. C. (2): "Other than the boring machine operator, no one should touch the machine during the boring operations".

2. C. (3): "Directional boring units should be grounded by the use of the grounding rod and cable furnished by the manufacturer or an equivalent."

2. C. (4): "Boring machine operators must remain in the operator's seat, where applicable, and not allow any part of their body to contact the ground while the boring machine is in operation."

2. C. (5): "All personnel working in the vicinity of the covered work, who may be exposed to subsurface electrical hazards, must wear boots meeting ASTM Standards F2412-05 and F2413-05 Electrical Hazard (EH) rating. These boots must be worn during the time when electrical hazards may be encountered, i.e., boring advancement, active trenching or plowing, jackhammering, etc. During work in muddy or wet conditions,

rubber insulating EH-rated boots (either overboots or safety-toed boots) must be worn."

2. C. (6): "Directional bore personnel include machine operator, locator and gas personnel working in the vicinity of the bore path from the machine to the bore head."

2. D.: Revised to read: "Only those gas personnel who through training or experience have the knowledge, skills, and abilities in the safe operation of the boring equipment are permitted to operate such equipment. A gas apprentice may operate boring equipment as part of their OJT requirements as long as an experienced operator is present, in direct observation of the apprentice, and can react immediately to AOC's. Additionally, gas field personnel who are inexperienced in the operation of boring equipment may operate the equipment if under the direct observation of an experienced operator".

Replaced Operator Qualified with "personnel who through training or experiences have the knowledge, skills, and abilities". This language is consistent with that which defines Qualified.

The SMR Team along with the Safety Specialist revised the Safety section in an effort to make it consistent with the Ameren Illinois Safety Manual.

3. Prior to Beginning Operations - New Section

3. A.:" Ensure proper job site protection and required traffic control is in place. Refer to the Ameren Utility Work Zone Traffic Control Field Manual."

3. B.: "All marked buried facilities crossing the proposed bore path or are within the eighteen (18) inch tolerance zone should be exposed or verified not to be in conflict with boring, back reaming or pneumatic piercing tool operations. Pot holes should be of such depth to ensure the buried facilities will not be damaged by boring and back reaming operations."

3. C.: "If sewer line, main or laterals, are not exposed or their depth are not verified, Gas Supervisor should refer to BORE 2.04 for available options."

3. D.: "When necessary, measures to avoid interfering with overhead electrical, telephone and cable lines should be made."

3. E.: "Determine who will be communicating with the boring machine operator during the actual boring operation and the means of communicating, hand signals or radio."

3. F.: Gas Supervisor, crew leader, or foreman should conduct an in-depth job briefing covering all of the subjects on the Job Briefing Form with entire crew.

The above items were included under each of the boring operations so the SMR Team felt they should be moved into their own section instead of repeating them.

UNCONTROLLED IF PRINTED

4. Conventional Rod Boring Operations

4. C.: Revised to read: "Assemble rods with no more than two (2) rods, approximately 10 feet each, exposed outside of the entrance pit at one time."

SMR Team added "outside of entrance pit" This is to clarify the intent from a safety prospective of not exposing an individual or the public to more than approximately 20 feet of drill rods.

4. E.: Added a sentence when boring across or near water and/or sewer lines. "Refer to BORE 2.04 if sewer line location and depth cannot be physically verified."

Reference added to address boring across or near sewer line.

4. F.: Revised to read: "If pot holes have been excavated to expose other underground facilities and the proposed bore path, workers should observe the pot hole as the drill head, back reamer and rods cross to ensure the facility has not been damaged and to check the depth of the bore. If drill head and rods are not visible in the pot hole a determination must be made if the drill path is in proper alignment or at the proper depth. Refer to Prior to Beginning Operations section above for information regarding depth of pot hole."

SMR Team added language when pot hole(s) expose the proposed bore path, the bore head, back reamer, and/or rods should be observed passing through the pot hole.

4. H.: Added a reference to Table 1 for back reamer sizes.

5. Pneumatic Piercing Tool Operations.

5. D.: Added checking "air hose connectors" to the items gas field personnel should inspect prior to beginning operations.

5. E.: Inserted new: "Air hose connections should be secured by positive means to prevent accidental disconnection. Thor self-locking connectors and Chicago fitting connectors with safety clip provide secured connections."

Safety Specialist provided information on which connectors have safety clips.

5. K.: Only grammatical change in 1st sentence to "The tail hose should be marked to provide workers with an indication of the tool's progress."

6. Directional Drilling Operations

6. G.: Revised to "It is permissible to drill the pilot hole and pre-ream/back-ream over multiple days. However, final pull-back of the pipe shall be continuous until completed."

SMR Team wanted to clarify that drilling and back reaming are a separate operation from pulling pipe. As such, they can be performed over multiply days. However, pulling pipe through the bore should be a continuous operation until complete.

6. H.: Clarification, added "whenever possible" to "Drilling should proceed downhill whenever possible to ensure that the drill mud remains in the hole."

SMR Team wanted to add some flexibility.

6. I: Revised to read: "If pot holes have been excavated to expose other underground facilities and the proposed bore path, workers should observe the pot holes as the drill head, back reamer and rods cross to ensure the facility has not been damaged and to check the depth of the bore. If drill head and rods are not visible in the pot hole a determination must be made if the drill path is in proper alignment or at the proper depth. Refer to Prior to Beginning Operations section above for information regarding depth of pot hole."

SMR Team added language when pot hole(s) expose the proposed bore path, the bore head, back reamer, and/or rods should be observed passing through the pot hole.

6. J.: Grammatical by adding "or permits" to "Check and comply with regulations or permits with specified burial depths."

6. R.: Added some additional rule of thumb language regarding the entrance angle of the bore rods. "As a rule of thumb, the entrance angle of the bore rod should normally be between 8 degrees and 18 degrees. However, conditions may warrant a steeper angle as long as it does not exceed minimum bending radius of the rod or pipe. A minimum of one complete length of drill rod (ten (10) feet for smaller rigs and thirty (30) feet for larger rigs) should be utilized before leveling out to the appropriate depth."

SMR Team felt the addition of the 8 to 18 degrees was more understandable and went along with the boring machine and rod manufacturer's recommendations.

6. W.: Removed "of 8 inch or less diameter pipe". So now reads "The diameter of the back-reamed hole should typically be greater than 1.5 times the nominal outside diameter of the pipe."

6. X.: For pipe diameters 10 inch or greater, added "minimum" to the 6 inches greater than the pipe OD for the back reamer size.

Added flexibility by not restricting the back reamer to be 6 inches larger than the pipe OD. Team members knew that in many cases the back reamer used with large diameter pipe was larger.

BORE
2.03

Pipe Installation

2. PE Pipe

2. C.: Added "The wire ends should be connected." when pulling back two tracer wires with long and/or difficult bores.

July 1,
2012

Janu-
ary 1,
2016

2. D.: Inserted a new item dealing with stainless steel tracer wire. "Consideration should also be given to using stainless steel tracer wire for long and/or difficult directional bores or plow-ins. When stainless steel wire is installed with main, a test station should be brought up at the location where the stainless wire meets the copper wire. A lead from each wire should be run up and terminated in the test station. If installation of a test box is not possible or feasible, the stainless and copper tracer wires can be connected in the same manner as copper service line tracer wire is connected to stainless steel main line tracer wire. See POLY 1"

Stainless steel wire is stronger than copper wire and less susceptible to breakage due to stresses encountered in long directional bores. Some operational areas have been successfully using the stainless steel wire so it is necessary to include it in the O&M. Corrosion Control group's recommendation is to install a test lead box where the stainless and copper wire would connect when possible.

2. T.: Added a reference to BORE 2.02 3. Prior to Beginning Operations for pot hole depth requirements

3. Steel Pipe

3. E.: Added a reference to BORE 2.02 3. Prior to Beginning Operations for pot hole depth requirements

BORE 2.04

Boring Across or Near Sewer Lines

January 1, 2013 January 1, 2016

2. Pre-Construction Steps

2. G. (3): Grammatical correction only "4. Construction Steps below replaces 3. H."

4. Construction Steps

4. G.: Added "See BORE 4 Reference Materials for instruction manuals."

Added instruction manuals for the Yellow Box sewer listening device and accessories.

BORE 4

New: Forms and Reference Materials

January 1, 2016

Reference 01 - Yellow Box WMS-1B Instructions

Reference 02 - Comtek BST-50b Manual

Reference 03 - Comtek PR-216 Operator Manual

Reference 04 - Shure VP64 User Guide

CONF 1

Requirements

January 1, 2011 January 1, 2016

1. A. New item: "Confined spaces containing gas equipment such as vaults/pits and excavations are regulated by PHMSA and those requirements are addresses in other O&M sections such as EXCV and VALT."

This was added by the Safety Specialist to clarify that working in confined spaces that contain gas equipment will not fall under this section of the O&M. They will be addressed in other sections of the O&M.

1. D.: New item, "Entry into crawl spaces or attic should be minimized and only performed when other options for lighting appliances are not available. Workers shall not enter crawl spaces or attic to investigate gas leaks. Shut-in tests should be used to investigate gas leaks on piping in crawl spaces or attics."

This language is consistent with Ameren Illinois' Field Safety Manual regarding working in crawl spaces and attics.

CORR 0	<p>Table of Contents</p> <p>Forms and Reference Materials</p> <p>Added:</p> <p>Reference 13 Dryconn 50100-56-visiLock</p> <p>Reference 14 Dairyland Over Voltage Protector Instructions</p> <p>Reference 15 Denso Protal 7200 Repair Cartridge Data Sheet</p> <p>Reference 16 Trenton EON 1000 GP Instructions</p> <p>Reference 17 Denso Protal 7125 Instructions</p> <p>Reference 18 Denso Protal 7200 Instructions</p> <p>Reference 19 Trenton Fill-Pro_PM-GP</p> <p>Reference 20 Trenton Wax Tape Systems Brochure Rev10</p> <p>Reference 21 Denso-Glass-Outerwrap</p>	De- cem- ber 1, 2014	Janu- ary 1, 2016

13. Atmospheric Corrosion

13. E. Atmospheric Corrosion

13. E. (3): Added "high pressure distribution", "Atmospheric corrosion shall be inspected to ensure that the pit depth is not greater than 10% of the original wall thickness on transmission and high pressure distribution pipeline facilities and 70% of the original wall thickness on distribution pipeline facilities. This inspection will be documented on the Corrosion and Steel Damage Evaluation form within ClickMobile. See CORR 2.31"

14. Pipeline Facilities That Need to Be Painted

14. B. (1): Added "within ClickMobile" as to where these facilities will be documents.

**CORR
2.01**

Cathodic Protection Design

July 1,
2014

Janu-
ary 1,
2016

4. Insulating Points

4. C. (2): Large Distribution Station or Town Border Station with Steel Outlet System

4. C. (2) (a): Added "Consult with Corrosion Control personnel to determine if a Lightning Arrestor needs to be installed. See CORR 2.25 3. H. for Dairyland Over Voltage Protector (Stock Code 4922423)"

4. C. (3): Delivery Station

4. C. (3) (a): Added "Consult with Corrosion Control personnel to determine if a Lightning Arrestor needs to be installed. See CORR 2.25 3. H. for Dairyland Over Voltage Protector (Stock Code 4922423)"

Sketches show a Lightning Arrestor but these are an optional item depending on if there are any high voltage overhead lines nearby. Corrosion Control personnel will determine if an ar- restor needs to be installed.

4. D. Bonding

4. D. (4) Extending New Plastic Lateral from Existing Steel

4. D. (4) (a): Added "Consideration should be taken for attach- ing and bringing a #8 wire off of the steel pipe to identify it sep- arately from the #14 tracer wire that is installed with the PE main."

4. D. (5) Extending New Plastic from End of Existing Steel

4. D. (5) (a): Added "Consideration should be taken for attaching and bringing a #8 wire off of the steel pipe to identify it separately from the #14 tracer wire that is installed with the PE main."

4. D. (6) New Plastic Installed Between Two Sections of Existing Steel

4. D. (6) (a): Added "Consideration should be taken for attaching and bringing a #8 wire off of the steel pipe to identify it separately from the #14 tracer wire that is installed with the PE main."

4. D. (7) Relocating Existing Steel with Plastic

4. D. (7) (a): Added "Consideration should be taken for attaching and bringing a #8 wire off of the steel pipe to identify it separately from the #14 tracer wire that is installed with the PE main."

Corrosion Control personnel suggested that a #8 wire be used as a test lead attached to the steel pipe. That way a person could distinguish between the test lead from the steel pipe and the #12 tracer wire with the PE pipe.

5. Insulating Materials

5. C. Weld End Insulators - Deleted the table and added reference to STLP 3.05 - Weld End Insulators where all of the stock coded weld end insulators are listed.

**CORR
2.03**

Coatings

1. Approved Coatings

1. A. New Pipe Installation

1. A. (1): Direct Bury Installation:

Revised to require girth welds on pipe 12" and larger to be coated with liquid epoxy. Girth welds on pipe smaller than 12" can still be coated with an approved hot or cold applied tape or with liquid epoxy coating.

1. A. (2) Directional Drilling Installation

1. A. (2) (a): Removed the use of a sacrificial hot wrap as an overwrap for the liquid epoxy coating on girth welds on transmission and high pressure distribution pipe. The approved overwrap is the moisture cured wrap.

1. A. (2) (b): Revised to require girth welds on distribution pipe 12" and larger to be coated with liquid epoxy and covered with either a sacrificial hot wrap or moisture cured wrap. Girth welds on distribution pipe smaller than 12" can still be coated with two layers of hot wrap or the liquid epoxy coating.

July 1, 2014 January 1, 2016

Corrosion Control feels that for the larger diameter pipe the liquid epoxy provides better protection for maintaining cathodic protection.

1. F. Soil to Air Interface Zone

1. F. (1): Added a reference to CORR 1 13. D which covers disbonded coating.

1. F. (4): New: "All approved underground coatings that extend above grade (i.e. coal tar, FBE, extruded polyethylene, hot wrap) on newly installed risers shall be over coated approximately twelve (12) inches above grade and below grade using a continuous application method of a UV resistant coating such as cold applied tape or cold applied wax tape at the soil to air interface."

For new installation of above grade facilities where the buried steel pipe is coming above grade, Gas Tech Services and Corrosion Control feels that additional coating protection is needed.

1. G. Above Grade Facilities

Added examples of approved coating materials for above grade facilities.

6. Approved Paint Specifications

6. A. (4) (b): Added Rustoleum Hunter Green aerosol spray paint

CORR 2.09

Protal 7200

2. Application

2. A.: Removed the note that Gas Tech Support has prepared kits.

2. C. Surface Preparation

2. C. (1): Revised the surface profile to 2.5 - 5 mils as recommended by the manufacturer.

2. F. Mixing and Application

2. F. (4): Increased the final thickness to 40 to 70 mil wet film thickness has recommended by the manufacturer.

2. H. inspection/Testing

2. H. (3): Revised to "Holiday testing should not exceed the maximum voltage per average mil thickness shown in the Inspection Voltage table in CORR 2.15."

January 1, 2013

January 1, 2016

CORR 2.10

Protal 7125

2. Application

2. A.: Removed the note that Gas Tech Support has prepared kits.

January 1, 2013

January 1, 2016

2. C. Surface Preparation

2. C. (1): Revised the surface profile to 2.5 - 5 mils as recommended by the manufacturer.

2. F. Mixing and Application

2. F. (4): Increased the final thickness to 40 to 70 mil wet film thickness has recommended by the manufacturer.

2. H. inspection/Testing

2. H. (3): Revised to "Holiday testing should not exceed the maximum voltage per average mil thickness shown in the Inspection Voltage table in CORR 2.15."

**CORR
2.19**

Cathodic Protection Test Points

1. Test Point

1. A.: Revised to - "Establish at least 1 test point on each cathodically protected structure (typically at least 1 test point in each quarter section).

January 1,
2014

January 1,
2016

**CORR
2.23**

Clearing Shorted Pipelines

3. Preformed FRP Spacers - Type 120 - Stocked

3. B Installation

3. B. (2): New, "Pipe support for above grade piping operating at over 60 psig and larger than four (4) inch diameter - Install insulator between pipe support(s) and the pipe. Apply Protal 7200 (CORR 2.09) or Protal 7125 (CORR 2.10) liquid epoxy coating to the FRP and to bottom of pipe as an adhesive and then press the FRP spacer against the pipe. Install pipe support under the FRP before the Protal cures."

Additional protection against corrosion is needed between pipe supports and the pipe. Pipe supports may come with a rubber pad but they often fall out. These performed spacers will provide better protection.

April
1,
2012

January 1,
2016

**CORR
2.28**

Evaluation of Corrosion

2. Distribution Piping (60 PSIG and Below)

2. A.: Added "The maximum allowable pit depth on distribution piping is 70% of the original wall thickness."

2. B. Measuring Pitted Areas (Underground or Atmospheric Corrosion

2. B. (5): Revised to "If pit depths exceed the allowable depths in Table 1, contact Division Gas Engineer or Corrosion Control Tech for further evaluation and proper corrective action."

3. Transmission or High Pressure Distribution Piping (Over 60 psig)

December 1,
2014

January 1,
2016

3. A.: Added "to less than 90% of the nominal wall thickness", "If corrosion has reduced the remaining wall thickness to less than required for the maximum allowable operating pressure or to less than 90% of the nominal wall thickness, the corroded pipe must be repaired or replaced to restore the serviceability of the piping, or the operating pressure reduced commensurate with the strength of the pipe based on actual remaining wall thickness. The maximum allowable pit depth on Transmission and High Pressure Distribution piping is 10% of the original wall thickness."

3. B. New "If corrosion has reduced the wall thickness by more than 10%, Corrosion Control shall be contacted before any corrective action is taken. Corrosion Control along with Gas Tech Engineering will determine the appropriate corrective action to be taken."

3. C. Measuring Pitted Areas (Underground or Atmospheric Corrosion)

3. C. (5): Revised to "If pit depths exceed the allowable depths in Table 2, contact Corrosion Control Tech or Gas Technical Services who will follow the Analytical Method in Figure 2 for further evaluation and proper corrective action."

4. Flow Chart for the Analytical Method

Added a note "Where the flowchart has contact Gas Technical Services this would include Corrosion Control personnel."

6. Pipe Pit Gauge

6. B.: Corrected Corrosion and Steel Damage Evaluation form.

7. Pipe Thickness Gauge

7. B.: Corrected Corrosion and Steel Damage Evaluation form.

-------------------------	---	-------------------------------	-------------------------

<u>DAMG</u> <u>0</u>	Table of Contents DAMG 1: Inserted new section: 10. Emergency Locate Request at the Site of Train Derailment	Janu- ary 1, 2014	Janu- ary 1, 2016
---------------------------------------	--	-------------------------	-------------------------

<u>DAMG</u> <u>1</u>	Requirements 2. Types of Locate Requests 2. B. (1) Normal Locate Request 2. B. (1) (a): Added language to clarify what JULIE considers a business day. "A typical locate request where the excavator must provide advance notice of an excavation to JULIE a minimum of forty eight hours / two (2) business days (exclusive of Saturdays, Sundays, and holidays) prior the start of any excavation. Business day begins at 08:00 and ends at 16:00 (exclusive of Saturdays, Sundays, and holidays recognized by the State Wide One Call Notice System). Requests for locates received after 16:00 (4:00 pm) will be processed as if received at 08:00 on the next business day." 2. B. (1) (b): Added "including the day of the call". "The excavation work must start within fourteen (14) calendar days of the day of the locate request, including the day of the call or the ticket becomes invalid." 2. B. (1) (c): Revised clarify when an extension request is required.	De- cem- ber 1, 2014	Janu- ary 1, 2016
---------------------------------------	---	-------------------------------	-------------------------

"When the excavation project extends past twenty eight (28) days from the date of the original notice, the excavator MUST request an extension of the JULIE ticket between the twentieth (20th) and twenty eighth (28th) calendar day or the ticket becomes invalid and excavation work must cease after the expiration date on the JULIE ticket."

2. B. (2) Emergency Locate Request

2. B. (2) (f): Word change "may be" replaces "is" in the sentence "The excavator may be responsible for damage to un-marked facilities if excavation is started before the 2 hour wait time."

2. B. (3): Revised heading to Joint Meet Request from Joint Meet Locate since joint meet is not a locating session.

3. JULIE Notes

3. B.: Revised last sentence to clarify how JULIE processes calls received after 4:00 PM.

"The request will be processed as if received at 8 AM on the next business day."

3. D.: Revised to clarify that all new installed facilities are to be back flagged.

"Excavation damage prevention best practices have shown back flagging is effective to prevent 3rd party damage to newly installed facilities. All Ameren Illinois and Contractor crews are required to back flag all newly installed facilities. See MAIN 1 and SERV 1.

4. JULIE Ticket Transmittal

4. A. Locate Request Tickets

4. A. (2) (c): Word change, "message" replaces "call" in "Automated message is initiated to advise the excavator that Ameren's facility is clear of the proposed dig site."

4. A. (5) Difficult to locate facilities...

4. A. (5) (d): Added "requires an Emergency Locate Request" when Ameren has to hand dig to identify the location of a difficult to locate facility.

5. Damage Prevention Notification to Excavators and the General Public

5. E. Revised to: "Ameren Illinois distributes a letter along with a copy of JULIE's Farming Brochure to known field tiling contractors."

5. F.: Changed department designation to Ameren Illinois Communications/Public Relations Department from Corporate Communications.

5. G.: Removed the sentence "The excavator's name is added to the list of known excavators."

Ameren Illinois utilizes other means of identifying known excavators.

8. Excavating Near a Transmission, High Pressure Distribution, or 8" and Larger Steel Main

8. D. (2): Revised by adding language from the JULIE law regarding exposing buried facilities within the tolerance zone.

"As stated in the Illinois Underground Utility Facilities Damage Prevention Act (section 4(b)), the Excavator is required to plan the excavation or demolition to avoid or minimize interference with underground utility facilities within the tolerance zone by utilizing such precautions that include, but are not limited to, hand excavation, vacuum excavation methods, and visually inspecting the excavation while in progress until clear of the existing marked facility."

This was added to reinforce the requirement for exposing all buried facilities within the tolerance zone and that the facilities should remain exposed until the excavation, including boring operation, has cleared the facility. This is the language from Damage Prevention Act.

8. F. : Added "electronic equivalent", " A Buried Pipe Examination form, CORR 2.30, shall be completed within ClickMobile or electronic equivalent if the facility is exposed."

Damage Prevention Standby personnel do not utilize ClickMobile but have an electronic version on their laptops.

10. Emergency Locate Request at the Site of a Train Derailment - New section that was added

A. When there is locate request at the site of a railroad train derailment, the locator shall notify Ameren Illinois Damage Prevention personnel once it is determined there is a gas line in the vicinity of the derailment. If there is a gas line in the vicinity the Damage Prevention personnel or locator will notify local Gas Supervision.

B. If there is a gas odor in the area, locator shall call the Ameren Illinois Emergency number 1.800. 755.5000 to report a leak.

C. The Damage Prevention personnel and/or local qualified gas personnel should meet with the railroad representative and emergency response personnel. See EMER 2.04 9. Train Derailment near Pipeline Facilities.

This was added due to PHMSA advisory that was issued in February, 2013 advising pipeline owners of the importance of assuring that pipeline facilities have not be damaged by a railroad accident.

11. Facility Location Information

11. B.: New item added:

"Upon completion of gas projects, updates to AIC's electronic mapping system in G/Tech will be completed within 90 days from time the completed job packet is approved. See MAIN 1"

ICC requested Ameren to specify how soon the Company's electronic mapping would be updated.

13. Records

13. D.: Revised to: "Buried Pipe Examination forms completed prior to November 1 2014 shall be retained for the life of the facility. Beginning November 1, 2014 Buried Pipe Examination information is completed within ClickMobile and shall be maintained in Maximo for the life of the facility. Information from electronic equivalent will be maintained until procedures for entering into Maximo are available."

Electronic equivalent was added to cover Damage Prevention Standby personnel documentation procedures.

DAMG 2.01	<p>Reporting JULIE Violators</p> <p>2. Reportable Violations</p> <p>2. C.: Added Damage Prevention personnel, "A contractor or utility excavator, including Ameren, that violates the JULIE law and damages Ameren's facilities which results in a gas leak on a main, shall be reported to the Gas Supervisor and/or Damage Prevention personnel at the earliest practical moment."</p> <p>3. Investigation of Reportable Violations</p> <p>3. A.: Added Damage Prevention personnel, "Once a violation is reported, the Gas Supervisor and/or Damage Prevention personnel shall investigate and document the investigation on the Illinois Underground Utility Facilities Damage Prevention Act Incident Report and submit to the Damage Prevention Group."</p> <p>3. B. (8): Corrected the E-mail address to @Gas Julie Violation since the format of the DL was revised.</p> <p>4. Reporting a Suspected Violation</p> <p>4. A.: Added "or designee", "The Gas Supervisor or designee should send the Incident Report and supporting documents to the Damage Prevention Group (Mail Code P-10) within 20 days for all main hits resulting in a gas leak."</p>	<p>Janu- ary 1, 2014</p>	<p>Janu- ary 1, 2016</p>
EMER 0	<p>Table of Contents</p> <p>EMER 2.04 added</p> <p>7. Fire, Ignition, or Explosion - Non-Gas Related</p> <p>9. Train Derailment near Pipeline Facilities</p> <p>Forms and Reference Materials added</p> <p>Reference 02 - Electric Cold Load Restoration Policy</p>	<p>July 1, 2014</p>	<p>Janu- ary 1, 2016</p>

EMER 2.01	<p>Customer Contact Center</p> <p>4. Emergency Gas Calls</p> <p>4. H. Outside Odor, Hear or See</p> <p>4. H. (2): Call taker will now tell caller that they will contact a service person who usually arrives within 1 hour.</p> <p>Call Center had earlier changed the script to 60 minutes but callers were thinking the call taker was saying 16 minutes.</p>	<p>January 1, 2014</p>	<p>January 1, 2016</p>
EMER 2.02	<p>Dispatch Center</p> <p>3. Cold Weather Electrical Outages and Restoring Electrical Service</p> <p>3. A. (1): Revised to, "Ambient temperature: Normally temperature of 32°F or less"</p> <p>3. A. (3): Revised to, "Duration of the electrical outage: In excess of 2 hours"</p> <p>3. A.(4): Number and size of gas customers affected:</p> <p>Added (a) 300+ customers on a gas system identified as High Risk</p> <p>Added (b) 500+ customers on a gas system identified as Moderate Risk.</p> <p>SMR Team added these to provide more guidance for the Dispatchers.</p> <p>3. B. Completely revised how dispatch will handle these situations.</p> <p>B. "When determined by the Distribution System Operations Supervisor (DSOS) that an electric outage will exceed the thresholds identified in the Electric Cold Load Restoration Policy, See EMER 4, the DSOS will inform the appropriate Gas Technical Services (GTS) Supervisor and Gas Control of the electric outage. Electric restoration for the affected circuits will be coordinated with GTS, based on the risk level of the affected gas system listed in the ElectricColdLoadPickup.xlsx file. GTS should also be notified of outages involving Emergency Operation Center (EOC) activations due to such events as: flooding, storms, civil unrest, etc and scheduled maintenance outages."</p> <p>Updated the table listing the Gas Technical Services Supervisors and their contact information</p> <p>Gas Tech Services developed an Electric Cold Load Restoration Policy which better defines the interaction between electric and gas following a significant electrical outage where the affected gas system could be impacted with the restoration of electrical service.</p>	<p>July 1, 2013</p>	<p>January 1, 2016</p>

**EMER
2.04**

Gas Field Personnel

July 1,
2014

Janu-
ary 1,
2016

2. Inside Odor Compliant - Hazardous Condition

2. L.: Typo correction "EMER 2.04 5."

4. Major Leaks or Line Breaks

4. C.: Added "or designee", "Gas Supervisor or designee should contact Gas Control to determine or verify if affected gas system is being remotely monitored and advise them of situation and possible actions that may be taken."

4. D.: Added "or designee", "Gas Supervisor or designee should contact Gas Tech Services if transmission or high pressure distribution facilities are involved."

In many cases it is an OSA/OSR that will make the contacts not the Gas Supervisor.

5. Gas In A Sewer - Hazardous Condition

Revised, "When gas is detected in a "sanitary sewer", a reading greater than 30% LEL (1.5% gas-in-air) is considered a hazardous condition. The following steps should be taken:"

The change to 30% LEL was missed on the last update.

5. C.: Revised to, "If the Gas Supervisor/Gas Superintendent determines there may be a potential for isolating or shutting down a section/segment of the system, Gas Control should be contacted to verify if the affected system is remotely monitored. If Gas Control verifies they do remotely monitor the affected system, establish a line of communications for the purpose of:

- (1) Keeping them updated on status of situation
- (2) Requesting their assistance in monitoring
- (3) Determining at what point Gas Control should issue a warning of potential system problem
- (4) Notifying Gas Control when situation has been corrected and system should be back to normal operation. Verify that monitored operating parameters have been restored."

SMR Team felt the need to contact Gas Control was only necessary when there was a possibility of isolating or shutting down a section of the system. Gas Control felt the line of communication process should be the same for all situation thus the reason 5.C. (1) thru (4) was added.

6. Fire, Ignition or Explosion - Gas Related

6. C.: New inserted, "If transmission or high pressure distribution facility(s) is involved, Gas Supervisor should notify Gas Tech Services Supervisor."

6. D.: New inserted, "Depending on the extent of the situation, if the Gas Supervisor/Gas Superintendent determines there may be a potential for isolating or shutting down a section/seg-

UNCONTROLLED IF PRINTED

ment of the system, Gas Control should be contacted to verify if the affected system is remotely monitored. If Gas Control verifies they do remotely monitor the affected system, establish a line of communications for the purpose of:

- (1) Keeping them updated on status of situation
- (2) Requesting their assistance in monitoring
- (3) Determining at what point Gas Control should issue a warning of potential system problem
- (4) Notifying Gas Control when situation has been corrected and system should be back to normal operation. Verify that monitored operating parameters have been restored."

SMR Team felt the need to contact Gas Control was only necessary when there was a possibility of isolating or shutting down a section of the system. Gas Control felt the line of communication process should be the same for all situation thus the reason 6.D. (1) thru (4) was added.

6. F. (2): New inserted, "If the gas meter set can be safely approached, shut off and red pin the meter valve or disconnect and cap. Complete the OAS 6H screen."

6. F. (3): Revised to, If Fire Department has shut-off the valve, visually verify the valve is off, if possible, red pin the meter valve or disconnect and cap. Complete the OAS 6H screen."

SMR Team wanted to provide gas field personnel with more guidance on how they should handle situation where the fire department is on the scene.

7. Fire, Ignition or Explosion - Non-Gas Related - New Section

"When responding to a non-gas related fire, ignition or explosion our first priorities are public safety and employee safety. The following steps will outline the appropriate actions:

A. Evaluate the situation; determine if the fire, ignition or explosion has created an immediate hazard to life or property and if a gas facility is involved, main, service, meter set, or other gas facility.

B. Make contact with the Fire Chief or fireman in charge. Remember in a fire situation, the Fire Department has jurisdiction and is in charge of the scene.

(1) Ask if they have shut-off the gas meter valve? If not ask for permission to shut-off the valve, if gas service needs to be temporarily discontinued.

(2) If the gas meter set can be safely approached, shut off and red pin the meter valve or disconnect and cap. Complete OAS 6H screen.

(3) Check components for possible damage due to the fire. If there is any indication of damage, eliminate gas service to the damaged component to ensure that no gas can leak by or through that component. See INVE 2.01.

UNCONTROLLED IF PRINTED

C. If Fire Department has shut-off the valve visually verify the valve is off, if possible, red pin the meter valve or disconnect and cap. Complete OAS 6H screen.

D. If the information received indicates that natural gas was not involved in the cause of the fire, no further investigation is required. Within one business day, the gas field personnel should notify the Gas Supervisor that they responded to a fire."

SMR Team felt there should be procedures added when it is evident that gas was not the cause but there is a potential for the gas facilities to be impacted by the fire or explosion.

8. Explosion and/or Fire Near Gas Pipeline Facilities

8. I.: Grammatical only, Gas Tech Services" replaced "Gas Operations and Services".

8. J.: Grammatical only, Gas Tech Services" replaced "Gas Operations and Services".

8. K.: New inserted, "Depending on the extent of the situation, if the Gas Supervisor/Gas Superintendent/Gas Tech Service Supervisor determines there may be a potential for isolating or shutting down a section/segment of the system, Gas Control should be contacted to verify if the affected system is remotely monitored. If Gas Control verifies they do remotely monitor the affected system, establish a line of communications for the purpose of:

(1) Keeping them updated on status of situation

(2) Requesting their assistance in monitoring

(3) Determining at what point Gas Control should issue a warning of potential system problem

(4) Notifying Gas Control when situation has been corrected and system should be back to normal operation. Verify that monitored operating parameters have been restored"

SMR Team felt the need to contact Gas Control was only necessary when there was a possibility of isolating or shutting down a section of the system. Gas Control felt the line of communication process should be the same for all situation thus the reason 8.K. (1) thru (4) was added.

9. Train Derailment near Pipeline Facilities - New section

A. When notified of a train derailment, the Gas Supervisor should verify if pipeline facilities are located within the vicinity of the derailment.

B. When the pipeline facilities are located within the vicinity, provide pertinent information to rail operators and emergency response officials. Such information would include the presence, depth and location of the pipelines so that the movement of heavy equipment and debris on the right-of-way does not

damage or rupture the pipeline or otherwise pose a hazard to people working in, and around, the derailment.

C. Gas Supervisor should notify Ameren Illinois Pipeline Integrity group of the derailment.

This was added due to PHMSA advisory that was issued in February, 2013 advising pipeline owners of the importance of assuring that pipeline facilities have not be damaged by a railroad accident.

10. Low Pressure Situation

10. F.: Revised to, "Gas Supervisor should notify Gas Control of the situation and advise them of any assistance that may be needed or could be provided with the affected system(s). If Gas Control verifies they do remotely monitor the affected system, establish a line of communications for the purpose of:

- (1) Keeping them updated on status of situation
- (2) Requesting their assistance in monitoring
- (3) Determining at what point Gas Control should issue a warning of potential system problem
- (4) Notifying Gas Control when situation has been corrected and system should be back to normal operation. Verify that monitored operating parameters have been restored"

Gas Control felt the line of communication process should be the same for all situation thus the reason 10.F. (1) thru (4) was added.

11. High Pressure Situation

11. E.: Revised to, "Gas Supervisor should notify Gas Control of the situation and advise them on any assistance that may be needed or could be provided with the affected system(s). If Gas Control verifies they do remotely monitor the affected system, establish a line of communications for the purpose of:

- (1) Keeping them updated on status of situation
- (2) Requesting their assistance in monitoring
- (3) Determining at what point Gas Control should issue a warning of potential system problem
- (4) Notifying Gas Control when situation has been corrected and system should be back to normal operation. Verify that monitored operating parameters have been restored

Gas Control felt the line of communication process should be the same for all situation thus the reason 11.E. (1) thru (4) was added.

11. F.: Grammatical only, Gas Tech Services" replaced "Gas Operations and Services".

11. K.: Grammatical only, job title update to "Manager, Gas Compliance & Training".

UNCONTROLLED IF PRINTED

12. Loss and Restoration of Service

12. B.: Revised to, "Gas Supervisor/Gas Superintendent should contact Gas Control to determine or verify if the affected system or adjacent systems are remotely monitored, notify them of the situation and discuss assistance Gas Control may be able to provide with monitoring operating parameters of the affected and adjacent systems. A line of communications should be established for the purpose of:

- (1) Keeping them updated on status of situation
- (2) Requesting their assistance in monitoring
- (3) Determining at what point Gas Control should issue a warning of potential system problem
- (4) Notifying Gas Control when situation has been corrected and system should be back to normal operation. Verify that monitored operating parameters have been restored"

Gas Control felt the line of communication process should be the same for all situation thus the reason 12.B. (1) thru (4) was added.

12. F. (3): Grammatical change only, "Gas Tech Services" replaced "Gas Operations and Services".

12. K. Organize the work force

12. K. (2): New inserted, "The Gas Supervisor or designee will maintain the customer record at the assigned headquarters."

12. K. (3): New inserted, "The Gas Supervisor or designee should utilize the customer record (obtained from the DDC/PDC) to cross reference all customer turned off and turned on from the Emergency Gas Meter Status Report form (Stock Code 37 22 247)"

12. K. (5): Revised to, "Assign 5 to 10 gas field personnel and a Gas Supervisor to each area. Each supervisor will be given maps for the affected area. Gas field personnel should be assigned designated streets/area to turn off and record the information on the Emergency Gas Meter Status Record form."

SMR Team added these to provide a little more guidance and the Gas Superintendents wanted to add the use of the Emergency Gas Meter Status Record.

12. L. Turn-off requirement for an outage

12. L. (2): Revised to, "Record the address and meter number on the Emergency Gas Meter Status Record form."

12. S. Turn-on requirements for an outage

12. S. (9): Revised to, "Gas field personnel should record, at a minimum, the customer address, meter number, times, and dates of service restoration. This information shall be added to the Emergency Gas Meter Status Record form and given to the Gas Supervisor or designee for cross reference with the

customer records to assure that all customers have been turned back on."

Revise to incorporate the use of the Emergency Gas Meter Status Record.

EMER 2.05	<p>Natural Disasters or Civil Disobedience</p> <p>2. Natural Disasters</p> <p>2. A.: Revised to, "Gas Supervisor should contact Gas Control to advise them of the situation and to determine if the affected system(s) is remotely monitored. If Gas Control verifies they do remotely monitor the affected system(s), establish a line of communications for the purpose of:</p> <p>(1) Keeping them updated on status of situation</p> <p>(2) Requesting their assistance in monitoring</p> <p>(3) Determining at what point Gas Control should issue a warning of potential system problem</p> <p>(4) Notifying Gas Control when situation has been corrected and system should be back to normal operation. Verify that monitored operating parameters have been restored."</p> <p>Gas Control felt the line of communication process should be the same for all situation thus the reason 2.A. (1) thru (4) was added.</p> <p>2. B.: Grammatical only "Gas Tech Services" replaced "Gas Operations and Services".</p>	July 1, 2014	Janu- ary 1, 2016
EMER 4	<p>Forms and Reference Materials</p> <p>Added:</p> <p>Reference 02 - Electric Cold Load Restoration Policy</p>	Janu- ary 1, 2013	Janu- ary 1, 2016

<u>INCD</u> 1	<p>Incident Reporting</p> <p>1. B.: Added "gas storage", "A natural gas incident involves the release of gas on Ameren Illinois distribution, transmission, and gas storage facilities."</p> <p>2. Natural Gas Incident</p> <p>2. A. (4): Grammatical only, "million cubic feet" replaced "MCF".</p> <p>3. Potential Significant Events</p>	<p>Janu- ary 1, 2014</p>	<p>Janu- ary 1, 2016</p>

3. D.: New inserted, "Additionally, PHMSA requests that any suspected natural gas explosion be reported even though Ameren Illinois' facilities were not involved."

4. Courtesy Notification

4. A. (1): Grammatical only added "and/or" for "and", "Fire and/or Police Emergency Response to a release of natural gas from an Ameren Illinois facility where gas migration requires any of the following:"

6. Reporting

6. A. and 6. C. The previous 2 hour call has now been reduced to 1 hour from time of confirmed discovery based on proposed PHMSA's rule change.

6. A. "The Gas Supervisor shall contact Gas Compliance (see contact list below) at the earliest practical moment, not to exceed one (1) hour, following the confirmed discovery of a natural gas incident or event that may warrant a courtesy notification."

6. C. "Any required telephone reporting must be made within one (1) hour of confirmed discovery of the natural gas incident. The telephone reporting requirement is on a twenty four (24) hours a day, seven (7) days a week basis."

PHMSA is in the process of changing the 2 hour notification time to 1 hour as mandated in the Pipeline Safety Act.

7. Gas Compliance Contact List

Added Mike Fuller and his contact information

8. Reporting Matrix

8. A. Gas Compliance shall be contacted when any of the following occurred:

8. A. Revised table heading to "Report within 1 hour of confirmed discovery".

Item 4 in table "million cubic feet" replaced "MCF"

Item 11 was added "Additionally, PHMSA requests that any suspected natural gas explosion be reported even though Ameren Illinois' facilities were not involved."

8. B. Gas Compliance shall make the following reporting contacts:

8. B. Revised table heading to "Report within 1 hour of confirmed discovery".

Grammatical only "million cubic feet" replaced "MCF"

Added ""Additionally, PHMSA requests that any suspected natural gas explosion be reported even though Ameren Illinois' facilities were not involved." This get reported to ICC and PHMSA.

11. Ameren Illinois Communication Notification

Updated Tucker Kennedy's cell phone and Media Hot Line phone number

12. Regulatory Affairs Notification

Brice Sheriff contact information replaces Jackie Voiles

13 Post-Incident Alcohol and Drug Testing

13. B. (2) Grammatical only "incident" replaced "accident"

13. C. Updated CCM contact information, "CCM at 314-963-3403 during normal work hours or 800-619-1122 after hours."

INCD
4

Forms and Reference Materials

January 1, 2014 January 1, 2016

Updated forms

Form 01- PHMSA Incident Report - Gas Distribution System (Rev 10-2014)

Form 02 - PHMSA Incident Report - Gas Transmission and Gathering Pipeline Systems (Rev 10-2014)

Form 03 - Potential Incident Report Form

INVE 0

Table of Contents

January 1, 2013 January 1, 2016

INVE 2.01 Removed Report of Investigation

INVE 1

Investigation of Incidents

May 1, 2010 January 1, 2016

2. D. Grammatical only, "unless" replaced "or".

"Every effort should be made to preserve the incident site and existing gas facilities, if at all possible, until after the investigation is complete unless:"

2. D. (1): Grammatical only added "or"

"The authorities having jurisdiction over the investigation have determined natural gas was not a contributing factor to the incident or"

2. F.: Revised to "Gas facilities that may have failed must be preserved and kept in a secured location until Corporate Claims specifies a location where facilities can be analyzed."

Added Corporate Claims who will specify who will analyze the gas equipment.

INVE
2.01

Incident Investigation

January 1, 2013 January 1, 2016

2. Investigation Documentation

2. A. : Revised to, "Limit the number of qualified gas field personnel and management required to perform the investigation. Warn all individuals not to take photos or videos of the scene."

2. B.: New inserted, "One individual should be designated to take photos and document the investigation."

2. E.: Relocated from 2. N, "Document only the facts, not opinions!"

Corporate Claims wants only one set of photos and one investigation report associated with an investigation.

3. Investigation of Ameren Illinois Facilities

"3. G.: Revised to "Test the gas service at the operating pressure if required by the State or Federal Authorities."

Clarifies testing at normal operating pressure of the service line not at the pressure a new service line would be tested.

4. Chain of Custody Documentation

4. C.: Added the stock code for the Chain of Custody Tag, 16 01 638.

INVE 2.02

Investigation of Fires

1. B. Grammatical only, Added "The", "The Fire Chief or Fireman in-charge at the scene has jurisdiction and is in charge of the scene."

2. Fire, Ignition or Explosion Investigation

"2. B.: Revised to reflect the 1 hour reporting time, "Fires and explosions involving natural gas are generally reportable within one (1) hour of the confirmed discovery of a natural gas incident to the (ICC) and to PHMSA. See the reporting matrix in INCD 1."

4. Communication with the Public

4 A.: Revised format to a list, "When investigating incidents involving natural gas, gas field personnel and supervisors:

- (1) Shall be courteous and helpful to the public
- (2) Shall not divulge information regarding the cause of the incident, or the results of our investigation.
- (3) Shall not speculate as to the cause of the incident or pass on information that they have heard or gathered from others at the scene."

Removed the section "Engagement of Outside Entities to Assist with the Investigation". Corporate Claims will be the ones that would be responsible for this function.

Removed the Employee Log

April 1, 2013 January 1, 2016

LEAK 0	<p>Table of Contents</p> <p>LEAK 2.08 Revised the following:</p> <p>2. Flame Ionization Instrument - Portable</p> <p>5. Gas-Trac</p>	De- cem- ber 1, 2014	Janu- ary 1, 2016
LEAK 2.01	<p>Indoor Leak Investigation</p> <p>5. Customer Not Home or Can't Get Into Structure</p> <p>5. F. If gas is detected inside of structure</p> <p>5. F. (1): Revised to "Shut-off gas at meter valve and Red Pin or disconnect the service line."</p> <p>SMR Team wanted to clarify that service needs either locked at the meter valve or disconnected so that the customer could not turn it back on with the leak investigation being completed.</p> <p>6. Leaks on Customer Facilities</p> <p>6. A. Inside gas leak on customer facilities</p> <p>6. A. (2) (a): Revised to, "Isolate the gas leak at the appliance control valve, customer owned valve, meter valve or outlet of meter set. If isolated at the meter valve lock the meter valve closed."</p> <p>SMR Team added other options for isolating customer's facilities.</p> <p>6. B. (1) & (2): Revised to,</p> <p>(1) "The customer can immediately call a qualified plumbing or heating professional to make the repair and the Company will turn the leak over to them once they arrive. In the case of a commercial/industrial process that has their own in-house maintenance personnel, the Company will turn the leak over to the customer if maintenance personnel are immediately on-site or</p> <p>(2) Isolate the appliance or piping, complete the OAS 6H screen and issue a Warning Tag. See TURN 2.11 Warning Tag.</p> <p>SMR Team added the word "or" at the end of (1) to emphasis the customer as an option. Added isolating the appliance or piping when the Warning Tag is issued.</p>	Janu- ary 1, 2013	Janu- ary 1, 2016
LEAK 2.02	<p>Outdoor Leak Investigation</p> <p>8. Leaks on Customer Owned Facilities</p> <p>8. A. If a gas leak is discovered on a customer-owned buried fuel line or an above ground outdoor fuel line that is of a hazardous nature.</p>	De- cem- ber 1, 2014	Janu- ary 1, 2016

8. A. (3): Revised to, "Isolate the gas leak at a customer owned valve, meter valve or outlet of meter set. If customer is not at home shut-off and "Red Pin" the outside meter valve."

SMR Team added other options for isolating customer's facilities.

8. A. (4): Revised to, "Notify customer of the gas leak and advise customer they are responsible for making the repairs. Complete the OAS 6H screen, "Red Pin", and issue a Warning Tag, See TURN 2.11 Warning Tag."

Clarify the OAS 6H screen should indicate meter valve was Red Pin.

8. B. (1) & (2): Revised to,

(1) "The customer can immediately call a qualified plumbing or heating professional to make the repair and the Company will turn the leak over to them once they arrive. In the case of a commercial/industrial process that has their own in-house maintenance personnel, the Company will turn the leak over to the customer if maintenance personnel are immediately on-site or

(2) Isolate customer piping, complete the OAS 6H screen and issue a Warning Tag. See TURN 2.11 Warning Tag.

SMR Team added the word "or" at the end of (1) to emphasize the customer as an option. Added isolating customer piping when the Warning Tag is issued.

**LEAK
2.06**

Leak Process Flow Charts

The below grade leak classification process flow chart has been revised to reflect change in leak classification when gas is detected in a valve box. If the gas reading is 80% LEL or greater in a valve box it will be classified as a Grade 2 Leak. If the gas reading is less than 80% LEL in a valve box it will be classified as a Grade 3 Leak. Valve box was separated from other below grade structures: storm sewer, water meter box, utility pedestal, pit/vault, or vent pipe.

Revision is consistent with GPTC guidelines on how to comply with the Pipeline Safety Code, PHMSA's Part 192.

ary 1,
2016

**LEAK
2.08**

Leak Surveys - Equipment

2. Flame Ionization Instrument - Portable

Former 2. D: Deleted the sentence on adjusting audible alarm since each instrument is different.

2. F.: Revised address daily operational check, "A daily operational check should be performed prior to beginning the survey in accordance with manufacturer's operating instructions or recommendations. See LEAK 4. If FI unit is being utilized on daily basis for leak survey activity, the unit should be checked

De-
cem-
ber 1,
2014

Janu-
ary 1,
2016

with the 50 ppm test/bump gas at the conclusion of the day's activity to verify the unit's sensor is responsive."

3. Gas Detection Instrument

3. B.: Add reference to GLOS for definition of Gas Detection Instrument.

3. E.: Added "CGI's sensors" to clarify what is to be inspected and calibrated. "Instrument's CGI sensors, such as LEL, Gas, and CO, shall be inspected and calibrated on a monthly basis and recorded in Maximo."

3. F.: Inserted new item:

"In the "tick" mode this instrument can be used for pin-pointing an above ground leak or providing an indication that a combustible gas may be present."

SMR team wanted to add this to clarify the instrument can be used to pin-point an above grade leak. Still would require leak detection fluid to classify the leak.

3. H.: Revised to clarify daily operational check with a 50 ppm test gas if the instrument is being used for leak surveying.

"If, according to the manufacturer, the instrument is designed to function as a leak surveying instrument, then the individual(s) performing leak surveys will follow the manufacturer's operating instructions. Daily operational check with the 50 ppm test/bump gas should be performed prior to beginning the survey in accordance with manufacturer's operating instructions or recommendations See LEAK 4 If instrument is being utilized on daily basis for leak survey activity, the unit should be checked with the 50 ppm test/bump gas at the conclusion of the day's activity to verify the unit's sensor is responsive."

5. Gas-Trac - Removed "CGI in "tick"mode"

Moved the CGI in "tick mode" up into the Gas Detection Instrument section.

5. A.: Grammatical revision by starting sentence off with "May be used for inside meter leak survey since FI unit is not to be used inside."

5. B.: Grammatical revision by starting sentence off with "Can be used in conjunction with leak detection fluid."

5. C.: Revised the monthly calibration by referencing manufacturer's instructions, deleting the 2-1/2% methane gas, and adding the calibration are recorded in Maximo

5. F.: Word correction only, "in" replaces "as".

"This instrument cannot be used in an initial gas leak investigation or in classifying a gas leak."

**LEAK
2.09**

Leak Surveys - Walking Leak Survey

De-
cem-
ber 1,
2014

Janu-
ary 1,
2016

1. Walking Leak Survey

1. D.: Revised to; "In areas with vegetative cover the leak survey should follow, as close as possible, along the route of the gas main and/or service. At a minimum, the following items should be sampled when readily observed and are within one (1) to two (2) steps either side of the route."

Training group felt there needed the leak surveyors needed some guidance on when a catch basin, manhole, or pit type facility should be checked as they walked the survey route. Training group does address this during the OQ testing for leak surveyors.

1. K. Fenced Gas Facilities Inspected Annually or Monthly

Added "or Monthly" to the title.

1. K. (2): Revised by adding "monthly", "Fenced gas facilities that are inspected annually or monthly by Gas Tech Service will have all piping, below and above grade, inside the fenced area leak surveyed during the annual or monthly inspection and documented within ClickMobile on the Regulator Station Inspection Task."

1. K. (3): Revised to clarify the documentation of leak survey of fenced facilities associated with a Transmission Leak Survey.

(1) "Fenced gas facilities associated with transmission surveys that are located in a Class 3 location will be surveyed twice each calendar year not to exceed 7-1/2 months. The first inspection will be performed during their annual inspection and will be documented within ClickMobile on the Regulator Station Inspection Task. The second inspection will be documented within ClickMobile under on their own designated Leak Survey Task. These leak surveys will be performed by Gas Tech Service personnel."

Clarification by the Compliance personnel responsible for the GCAM program.

1. L. Fenced Gas Facilities Not Inspected Annually

1. L. (2) Fenced gas facilities could include but not limited to"

(a) Valve Station

(b) Large Meter set

Deleted "odorizer" and "pipeline take point" since they are inspected either annually or monthly.

1. N. (1) (f): Deleted reference to Gas Leak Case Field Report since it was eliminated with implementation of Click Mobile.

MAIN 0	<p>Table of Contents</p> <p>MAIN 1 added</p> <p>20. Records</p> <p>Added MAIN 2.06 Insertion</p>	<p>Janu- ary 1, 2011</p>	<p>Janu- ary 1, 2016</p>
<u>MAIN 1</u>	<p>Requirements</p> <p>1. B. New, "The term "main" in this section refers to distribu- tion, high pressure distribution or transmission mains and pipelines."</p> <p>Added so the term "main" could be used interchangeable with main or pipeline.</p> <p>14. Pigging</p> <p>14. A.: Revised to:" If the internal condition of the new or re- placement pipe cannot be visually inspected for debris or cleanliness, consideration should be given to pigging the pipe segment(s) prior to tying into existing mains."</p> <p>14. B.: New "Coiled plastic pipe that has been capped or plugged prior to installation does not need to be pigged unless a condition encountered during installation resulted in contami- nates entering the pipe."</p> <p>SMR Team clarified when pigging should be considered.</p> <p>15. Pressure Testing</p> <p>15. A.: Grammatical "relocated" replaces "reinstated" and "nat- ural gas" was added as a test medium.</p> <p>15. B.: New "The pressure testing which establishes the MAOP should be performed after construction is complete with the main in its final resting location"</p> <p>There is potential of the pipe and/or joints could be over- stressed as the pipe is moved into its final location. This re- quirement is contained in ASME B31.8 Code which is the pre- decessor to Part 192 Code.</p> <p>15. C.: New: Short sections of main for repair or replacement (i.e. typically a double random length approximately 40 to 45 feet or shorter) which cannot be practically tested after installa- tion may be pretested to the appropriate MAOP prior to instal- lation. The tie-in connection shall be leak tested at normal op- erating pressure."</p> <p>Addresses pretesting short section of pipe used for repair or replacement. SMR Team defined what is considered short sec- tion of pipe.</p> <p>19. Back-Flagging</p> <p>19. A.: Word change "are" replaced "should", Newly construct- ed Ameren Illinois gas facilities are to be "back-flagged" in ar-</p>	<p>Janu- ary 1, 2014</p>	<p>Janu- ary 1, 2016</p>

eas where the additional construction activity by others could potentially damage the new facilities.

19. B.: Revised to ""Yellow" locating flags, yellow headed stakes and/or yellow marking paint should be placed over the new facilities. There should be placement of enough flags/ stakes to ensure that Ameren Illinois gas facilities are clearly identified as to route and location."

Added yellow headed stakes and yellow marking paint as other methods for back-flagging. Damage Prevention group felt all newly installed facilities should be back-flagged.

Removed the former 19. C. thru 19. E. which addressed; special areas of concern, exempted heavily paved areas and gas supervisor's determining where back-flagging is needed.

20. Records - New section

20. A.: New, relocated or replaced gas mains shall be recorded on AIC's electronic mapping system in G/Tech within ninety (90) days from the time the job has been completed and/or placed in Status 70 in DOJM.

1) Division operations or Gas Tech Engineering should review and approve the completed job packet with in thirty (30) days from the time the job is complete and/or move to Status 70 in DOJM.

2) The electronic mapping should be updated within forty five (45) days of receipt of completed job packet and/or moved to Status 80 in DOJM.

This is the commitment made in response to ICC's request that the O&M state how soon Ameren Illinois' maps are updated.

Pressure Gauges

De-
cem-
ber 1,
2014

Janu-
ary 1,
2016

1. B.: Revised to "Certain activities require a specific type of pressure gauge to be utilized to ensure an adequate degree of accuracy."

1. C.: Revised to "This procedure identifies when a test gauge or better shall be utilized and the requirements for periodically verifying the accuracy of the test gauge and a calibrating gauge.

2. Ameren Illinois Gauge Definition

2. A.: Industrial/Commercial Gauge - . The industrial/commercial gauge has accuracy less than $\pm 0.5\%$ full scale. They are not to be used to set pressures, verify pressure settings, or record pressures used to establish or validate a MAOP. These gauges can be utilized in locations or situations where only indication of the approximate pressure or presence of pressure is necessary, i.e. check for loss of pressure due to a leak, check for pressure at tapping/stopping operation, regulator station equipped with remote monitoring or at location to ensure there is not an inadvertent loss of gas service.

Definition of industrial/commercial gauge was added to clarify the difference from a process gauge. Emphasized that an industrial/commercial gauge is not to be used to set or verify set pressures nor establish or validate MAOP.

2. B. Process Gauge - A higher quality pressure gauge with an accuracy of $\pm 0.5\%$ full scale, ASME Grade 2A. These gauges are utilized for continuously monitoring gas pressure on system or used to perform a leak and/or strength test to establish system MAOP. A process gauge is typically installed at a location where an accurate pressure value is necessary, i.e. a regulator station or meter set. Process gauges used to verify the gas facilities' MAOP are addressed in PTST 1 Pressure Testing Requirements.

Added the reference to ASME Grade 2A and referred to PTST 1 for process gauges used to establish or validate MAOP.

2. C. Test Gauge - A designated pressure gauge, ASME Grade 2A or 3A, with accuracy of at least $\pm 0.5\%$ full scale that is periodically verified for accuracy and utilized for activities that require reading accuracy. A spring test gauge usually has features such as a definitive zero, mirrored scale, knife-edged pointer, and a serial number. Test Gauge is normally printed on the face of a spring test gauge. A digital gauge that meets the minimum accuracy requirement can be used in lieu of a spring test gauge. Test gauges are entered and maintained in Maximo. Spring test gauges are shown in Specialized Tools and Equipment in Gas Operations and Services SharePoint site."

Added the reference to ASME Grade 2A or 3A and that spring test gauges will have Test Gauge printed on the face and will have a serial number. Digital gauges that meet the $\pm 0.5\%$ full scale accuracy can be used as test gauge.

2. D. Calibrating Gauge - A pressure gauge with an accuracy of at least $\pm 0.10\%$ full scale, Grade 4A, utilized primarily for verifying the accuracy of a test gauge or calibrating a test gauge in a shop environment. A calibrating test gauge can also be utilized in the field to verify the accuracy of an electronic pressure correcting device, calibrating pressure transducers, or in other situations where a high degree of accuracy is required. A calibrating gauge is typically a digital gauge with a full-scale accuracy range of $\pm 0.10\%$ or better, i.e Crystal XP2i, Druck DPI 800/802

Corrected the gauge type by removing "Test" and added reference to ASME Grade 4A. Added examples of digital calibrating gauges that are used in Ameren Illinois mostly by the Gas Tech Services technicians.

3. Use of Test Gauges

3. A.: Revised to "A test gauge shall be used when performing the following activities. Gauges should be "zeroed" prior to exposing them to the gas pressure. A calibrating gauge can also be used to perform these functions."

5. Approved Test Gauges

Revised to "A list of approved spring test gauges can be found in the Specialized Tools and Equipment section of the Gas Operations and Services SharePoint site."

6. Verification and Calibration

6. A. (7): New "Digital test gauge will be calibrated in same manner as Calibrating Gauge shown below."

6. B. Calibrating Gauge

6. B. (2): Revised to "The calibrating gauge may be sent to a third party for the annual calibration or may be sent to a GTS Gas Control Technician listed below:

Replaced sending gauges to Decatur Meter Shop with sending to a Gas Control Technician. A shipping address is provide for the Gas Control Technician assigned in each Division.

METR 2.23

Gas Meter Exchanges

10 Meter Exchanges Using Portable CNG Grunsky Apparatus - Added the Grunsky Apparatus used in Springfield.

10. B.: New, "Prior to touching the gas meter set, check the meter set for voltage with a volt stick."

10. C.: New, "Exchanges should be done with little or no load present if possible, such as a furnace in operation. If furnace is

Janu-
ary 1,
2014

Janu-
ary 1,
2016

in operation, consider waiting for it to cycle off to conserve CNG tank pressure."

10. D. (1): Increased CNG tank pressure to 600 psig from 500 psig.

10. D. (2): New, "The tee must be in proper alignment for the CNG system to work."

10. D. (7): New, "Remove plug by squeezing the bag and grasping plug, loosen with fingers and let plug drop into bag."

10. D. (8): New, "Force proper size bayonet into pipe through tee locking with a twisting motion. No gas should be coming from the bag purge cap signifying a good seal."

10. D. (11): Added meter header inspection, "Follow the procedures for exchanging the meter and meter header inspection. See METR 2.20 Meter Header Inspection

10. D. (15): Revised to "Insert plug into tee and snugly tighten by hand. The bag will remain on the tee while replacing the plug into the tee."

10. D. (17): Revised to "Back off the plug in the tee, do not remove, apply pipe dope to the plug and tighten with a wrench."

10. D. (18): Added "leak detection solution", "Check for leakage with leak detection solution."

10. D. (19): Added "Clean fittings", "Clean fittings and paint meter set

10. D. (2): New, "Observe meter index movement to see if meter has returned to normal operation, when compared to beginning the meter exchange."

Personnel from the Gas Training Center and Springfield Operations reviewed and modified the instructions for using Grunsky system.

METR 2.25

Ultrasonic Meter Testing

July 1, 2014

January 1, 2016

2. Ultrasonic Meter Inspection Schedule

2. A.: Revise the testing interval to, "Each ultrasonic meter installed at a customer meter installation shall be inspected and interrogated using manufacturer's software to verify instrument overall operating condition at least every three (3) months."

This is a requirement of ICC Part 501.

3. Pressure and Temperature Transmitter Inspection

Replaced "Inspection" for Calibration"

METR 2.27

Electronic Corrector Verification

January 1, 2016

This is a totally new section that has been added by the Gas Metering Committee. Section addresses

1. General

2. Electronic Corrector Inspection Schedule
3. Device Programming Verification
4. Device Installation Verification
5. Corrector Edit Calculation
6. Documentation Activities
7. Records

METR 3.01	<p>New Meter Sizing</p> <p>1. B.: Revised to "Contact Gas Tech Engineering for selection and approval of meters larger than 7M175, delivery pressure greater than 10 psig or a connected load greater than 10,000 scfh."</p> <p>Removed Gas Engineering and Ameren Illinois Metering for those to contact.</p>	July 1, 2014	Janu- ary 1, 2016
METR 3.02	<p>Existing Meter Sizing</p> <p>1. B.: Revised to "Contact Gas Tech Engineering for selection and approval of meters larger than 7M175, delivery pressure greater than 10 psig or a connected load greater than 10,000 scfh."</p> <p>Removed Gas Engineering and Ameren Illinois Metering for those to contact.</p>	July 1, 2014	July 1, 2014
METR 3.03	<p>Regulator Sizing - 7" W.C. Delivery Pressure</p> <p>1. Heath Odorator 2 User Manual Rev A

**ODOR
1**

Requirements

Janu-
ary 1,
2013

Janu-
ary 1,
2016

2. Odorization Requirements

2. A.: Removed "10,000 P.P.M." since our instruments read in percentage of gas in air.

2. B.: Revised the odorant usage rate to 0.50 to 4.0 pounds per million cubic feet of gas. Previous usage rate was 0.65 to 1.25.

2. D.: Grammatical change only Gas Technical Services replaced Gas Operations and Services.

2. E.: Revised to reflect that a supplement odorant injection rate may be lower than 0.50 lbs/MMCF at storage fields or other location where supply sources provide odorized gas. Previous had an injection rate of 0.65.

2. F.: Grammatical only by using the terms "odorizer type and injection rates" in lieu of "injection method and actual injection rates".

SMR Team comprised primarily of Gas Tech Services personnel suggested these changes based on what they are actually experiencing in the field.

3. Odorization Sampling - New Section

This new section describes the requirements for ensuring Ameren Illinois gas system is being properly odorized by performing periodic checks. Section identifies two methods; odorant intensity checks and sniff tests performed by qualified individuals as a means ensuring the gas is readily detectable. Section states that individuals performing intensity and sniff test be periodically examined to verify that they have a normal sense of smell.

SMR Team felt that ODOR 1 should state the requirements for periodic sampling.

**ODOR
2.02**

Odorization Operation

De-
cem-
ber 1,
2014

Janu-
ary 1,
2016

2. Odorization Location

2. B,: Revised to "Where individual customer(s) are served by an unodorized line supplemental odorizer equipment shall be installed."

Previously it stated odorizer equipment would be installed if customer was between delivery point and odorizer station. This may not always be true since there are some locations where the delivered gas is odorized.

2. C.: Revised for clarification to "Odorization equipment is located to ensure that all gas supplied by the Ameren Illinois' gas system is adequately odorized so that it is readily detectable by an individual with normal sense of smell."

The normal sense of smell language was added since that is the Code, Part 192.625, requirement for adequate odorization.

3. Odorization Equipment

Former 3. B.; Removed the listing of the types of odorizers currently being used at Ameren since this is always subject to change.

3. D. Grammatical addition only by replacing 'SCADA" with "remote monitoring".

Former 3. F.: Removed the issue of using sealing compounds on threaded joints. Team felt this is a training issue and does not need to be in the O&M.

Former 3. G.: Removed the issue about designing odorzier with adequate storage. Team didn't feel this needed to be in O&M.

All of the following revisions were made by the SMR Team comprised mainly of GTS personnel. Since GTS has the primary responsibility for odorization, the team felt these revisions more closely reflected the processes and procedures being utilized throughout Ameren Illinois.

4. Odorization Operation and Inspection

4. A.: Added "odorant consumption and odorant level" and an option for Gas Control to dispatch a GTS technician when an abnormal condition is detected. "Adequate odorization requires careful monitoring of the odorizers, odorization rates, odorant consumption, odorant levels, and odorant intensity. Where applicable, Gas Control will monitor odorizer operations that have remote monitoring capability and will contact the appropriate Gas Technical Services (GTS) Supervisor for consultation, instructions or dispatch a GTS technician to investigate when abnormal operating conditions are detected."

4. A. (1): Grammatical changes only: GTS for Gas technician and odorizer station for odorizer location.

4. A. (3): Added instructions for GTS Technicians:

(3) GTS Technician will document:

- (a) As found conditions
- (b) Immediate corrective actions
- (c) As left conditions
- (d) If follow-up action is required

4. B.: Added a sentence regarding more frequent inspection of odorizer. "Bypass, drip and positive injection odorizers shall be inspected at least monthly and entered within ClickMobile.

UNCONTROLLED IF PRINTED

More frequent inspection(s) may be necessary depending on the type of odorizer, means of monitoring odorant storage level, characteristics of gas demand and time of year i.e grain drying season."

4. C.: Expanded the farm tap odorizer inspection to:

C. Farm tap odorizers:

(1) Shall be checked annually for condition, operation, usage and refilled when required.

(2) Perform an annual sniff test to verify gas is odorized

4. D.: Grammatical, replaced odorant concentration level with odorant injection/usage rate.

4. D.: Added that farm taps are exempt from monthly checks.

4 D (1): Grammatical revision in the wording to "This check shall involve calculating the average odorant usage by measuring the volume of odorant consumed during a specified period of time, normally monthly, and dividing that number by the measured corrected volume of gas during the same period."

4. D. (2): Revised to be more specific on what information is maintained in Maximo monthly. "Monthly odorization usage, Lbs/MMCF, will be calculated and maintained in Maximo."

4. D. (3): Grammatical revision only by adding a few new words ; "The Monthly Odorization Report can be utilized as a worksheet to help manually calculate odorant usage, rate of odorization, and/or odorant reserve."

4. D. (4): Inserted new item; "Ameren's average target odorization introduction rate is one pound of odorant per million cubic feet of corrected gas volume (1 Lbs/MMCF). Monthly odorizer adjustments may be necessary to maintain the target rate."

4. D. (5): Updated the acceptable range of odorant usage rate to 0.50 to 4.0 lbs/MMCF and added information about warning message in Maximo. "If the calculated usage is less than 0.50 or greater than 4.0 Lbs/MMCF, a warning message will be displayed in ClickMobile. If the warning message is displayed, corrective action shall be taken to reestablish an odorization rate at target level and then notify GTS Supervisor."

4. D. (6): Inserted new item on what corrective action can be taken as a result of the warning message.

(6) Corrective action that may be considered but are not limited to:

(a) Increase, decrease, stop or valve-off odorizer

(b) Flaring

(c) Gas system purging

(d) Site mitigation

(e) Verification:

UNCONTROLLED IF PRINTED

- I. Odorant intensity tests with odorant intensity equipment
 - II. Perform increased odorizer operation inspections
 - III. Other actions as specified by GTS Management
4. E.: Revised to clarify who does the annual review and how the odorant introduction rate is determined.
- E. "GTS Supervisor shall conduct an annual review of the average odorant injection rates, by-pass rates, and actual quantities of odorant consumed at each odorizer installation. This review will ensure adequate odorization and provide documentation that each odorizer site is configured, adjusted, operating properly and has provided the prescribed odorant-to-gas ratio specific to that site. This check shall involve calculating the odorant introduction rate by measuring the volume of odorant consumed during a specified period of time and dividing that number by the measured corrected volume of gas delivered during the same period."
5. Liquid Odorant Tank to Tank Transfer
5. A. As Safety is the first priority, the following safe practices should be observed:
5. A. (1): Added "PHMSA" in the following; "Natural gas odorant, mercaptan, is a Class 3 flammable liquid designated hazardous by PHMSA and listed in the Hazardous Material Regulation Guide (HMRG)."
5. A. (3): Grammatical only by replacing "filled out" with "completed". "Ameren Shipping Paper for Odorant must be properly completed and remain within reach of the driver during transport. Gas Technical Service should be contacted for more information. Shipping papers are required whether the tanks are empty or full. See ODOR 4"
5. A. (4): Added "or greater" to the amount of odorant being transported that requires placards on the vehicle/trailer.
- (4) "Bulk loads of 1001 pounds or 119 gallons or greater must be placarded with the identification number of 3336 and a hazard class of 3 shall be displayed on all four (4) sides of the truck or trailer and be readily visible and not obscured."
5. A. (5): Added the word "bulk" to "Placards must remain on bulk odorant trailer even when empty."
5. A. (6): Revised to "Shipping papers are required with hazmat loads that exceed the Material of Trade Exception for a Class 3, Packing Group 1 material (one pound or one pint of odorant)."
5. A. (7): Clarification that HAZMAT endorsement is required when transporting more than 119 gallons or 1001 pounds.
- (7) "HAZMAT endorsement (x) is required on CDL to transport hazardous materials in bulk, 119 gallons or more, 1001 pounds or more and some non-bulk odorant shipments."

UNCONTROLLED IF PRINTED

- 5. A. (8): Inserted "it is recommended" to provide flexibility.
(8) "Use the weather to your advantage; it is recommended to avoid low atmospheric pressures and unfavorable winds when working with odorant."
- 5. A. (10): Removed the list of required PPE and replaced with; "Wear the proper PPE, as required, rubber gloves and eye protection."
- 5. A. (11): Added the word "solution"; "An eye wash solution should be available for immediate use."
- 5. B. The following procedures should be followed when transferring liquid odorant from the delivery vehicle to the target vessel:
 - 5. B. (1): Grammatical, substituted "qualified through appropriate training and experience" instead of "knowledgeable, trained, and qualified".
(1) "Individuals shall be qualified through appropriate training and experience in handling liquid odorant."
 - 5. B. (3): Grammatical, replaces "suitable" with "compatible".
(1) "Hoses should be compatible with liquid odorant and have the correct pressure rating."
 - 5. B. (4): Revised to:
(4) "Hoses and fittings should be checked for cracks and damage prior to beginning transfer. If damage is found, hoses and fittings should be properly disposed."
 - 5. B. (5): Delete reference to ACIG 1 since it was not relevant.
 - 5. B. (6): Simple word change "should" for "must".
(6) "Pressure should be ten (10) to twenty (20) psig greater in the delivery vessel than in the target vessel to create adequate differential to move odorant into the target vessel."
 - 5. B. (9): Revised to exempt filling of wick odorizer.
(9) "Open pouring or siphoning of liquid odorant should be avoided except when filling wick odorizer(s)."
 - 5. B. (11): Simple word change "Use" for "Allow".
(11) "Use blow-back connections to clear lines of suspended liquid odorant prior to disconnecting and depressurizing."
 - 5. B. (13): Added reference to ODOR 2.04 Deodorizing Agents
(13) "Clean all tools and fittings with deodorizing agent to mitigate odors in transit. See ODOR 2.04 Deodorizing Agents"
- 6. Odorant Leakage, Spillage, Disposal
 - 6. A.: Added a warning to not mix liquid bleach with commercial neutralizing agents.

UNCONTROLLED IF PRINTED

A. "Small odorant spills that may occur when repairing odorization equipment can be neutralized with liquid bleach or commercial agents. Do not mix liquid bleach and commercial neutralizing agents."

6. C.: Revised position titles:

C. "Large odorant spills shall be reported to GTS Supervisor and Division Gas Superintendent as soon as possible to coordinate the containment and remediation of the spill."

6. D.: Specified GTS Supervisor would make notification:

D. "GTS Supervisor should notify Gas Dispatch and Gas Control of the spill."

6. F.: GTS will coordinate disposal of odorant container not Ameren Environmental Services.

F. "GTS Supervisor should notify Gas Dispatch and Gas Control of the spill."

6. G.: Simple word change "remote monitoring" for "SCADA".

G. "Following clean-up or when the odorizer is placed back into normal operation, contact Gas Control to verify remote monitoring indicates normal operation and to check out."

7. Records

7. A.: Added "minimum":

A. "Monthly odorization rates shall be maintained in Maximo for a minimum period of 3 years. Paper documents can be used as supplemental information."

**ODOR
2.03**

Odorant Intensity Testing

2. Odorant Intensity Testing

2. A.: Added reference to ODOR 1 for normal sense of smell.

3. Intensity Test Instruments and Readings

3. B. (3): Added the Heath Odorator 2

3. I.: Added Gas Supervisor will notify Gas Tech Supervisor promptly.

I. "If a reading outside this range is found, it shall be immediately reported to the Gas Supervisor by the person conducting the odorant intensity test. The GTS Supervisor shall be notified whenever an intensity reading is outside of the 0.1% to 0.8% range. Corrective actions for unacceptable odorant intensity variances are required at that time. Corrective action(s) shall be documented within ClickMobile and Maximo."

GTS Supt requested that GTS Supv be notified whenever an intensity reading is outside of the 0.1% to 0.8% range.

3. K.: Revised the position on having customer perform the intensity test by replacing "it is recommended" with "may ask".

De-
cem-
ber 1,
2014

Janu-
ary 1,
2016

K. "When a customer is available during the odorant intensity test, the gas field personnel may ask the customer if they would like to perform a test and to document the results."

Having a customer perform the test should be strictly voluntary on the customer's part with no pressure exerted by the gas field personnel.

5. Selection of Odorant Intensity Test Sites

5. A.: Added GTS Supervisor, GTS Engineer, or Gas Engineer and removed Gas Supervisor as those who would establish a schedule and locations.

A. "The GTS Supervisor, GTS Engineer or Gas Engineer shall establish a schedule and the locations for conducting odorant intensity checks. Choosing the proper test point locations is critical to the success of the odorization process."

5. B.: Simple word change "delivery points" in place of "gate stations".

B. "The number of sites selected will depend on the size and configuration of the odorized system, location of the delivery points, and locations where odorant intensity is reported to be not readily detectable."

5. C: Added Gas Engineer in addition to the Gas Supervisor who shall establish a survey plan for conducting intensity tests.

C. "The Gas Supervisor or Gas Engineer shall establish a survey plan which lists the pre-determined locations for conducting odorant intensity tests."

5. D. Contains guidelines for selecting test sites. This was formerly section 6. Guidelines for Odorant Test Locations. Majority of the items previously under 6. are now in under 5. D.

5. D. (4): Added "At the end of recently installed long gas main extension."

This was added to check to make sure odorant is recognizable at the end of new section of pipe and that the new pipe has not absorbed the odorant.

5. G.: Inserted GTS Supervisor, GTS Engineer or Gas Engineer in place of Engineering on who should annually review sample sites.

G. "Sample sites should be reviewed annually GTS Supervisor, GTS Engineer or Gas Engineer and Operations as part of the annual System Review."

The SMR Team removed the following items from previous 5. Selection of Odorant Intensity Test Sites:

5. D. Choosing the proper test point locations is critical to the success of the odorization process.

5. E. The minimum number of survey points per odorized system is determined by the following table: The Table was re-

moved that listed the minimum number of required checks per month based on the number of meters per odorized system.

The SMR Team removed the following items from previous 6. Guidelines for Odorant Test Locations.

6. G. Areas with large quantities of new steel pipelines should be considered for test sites.

6. H. In small systems (typically small towns fed by individual pipeline taps), the practice of rotating the test location on a monthly basis may be utilized. This allows small systems to be evaluated for low flow and/or dilution/fade conditions that may not be apparent using other site location methods.

6. I. Areas of rapid system growth should be considered for test sites. In these areas large amounts of main are typically installed several years before any substantial load is present, creating a potential low flow/dead end system.

6. J. In addition to predetermined location readings, random test locations should be included to monitor for any aberrations that may be present.

7. Records

Added "Odorant Intensity Test" - "Odorant Intensity Test records shall be retained in Maximo for three (3) years"

ODOR 4	Forms and Reference Materials Reference materials updates for Reference 7 - ZECK Z9000 User's Manual Rev 1 Reference 8 - ZECK Z9000 Installation and Maintenance Manual Rev 3 Added Reference 10 - Heath Odorator 2 User Manual Rev A	De- cem- ber 1, 2014	Janu- ary 1, 2016

OQAL 1	Requirements 1 B.: Removed "ASME B31Q". Ameren Illinois' OQ plan meets the federal requirements of Part 192 and Illinois Admin Code 520. 1. C.: Added ""approved equivalent" to ASME B31Q as the standard by which gas personnel and other individuals are qualified. 2. Program Implementation "Gas Compliance and Training" replaced "Safety and Training"	Janu- ary 1, 2013	Janu- ary 1, 2016

3. Definitions

3. D.: Revised to "B31Q Covered Task Manual - Contains task specific information, AOC's and O&M procedure references associated with each covered task."

3. O.: Added "On the Job Training" to define what is meant by the term OJT.

3. S.: New inserted "Proctor - An individual selected to administer a written examination."

3. X.: "Subject Matter Resource" replaced "Subject Matter Expert"

4. Covered Tasks

4. A.: "Gas Compliance and Training" replaced "Safety and Training"

4. B. (4): Deleted this item, "Difficulty, Importance Analysis"

5. Abnormal Operating Conditions

"B31Q Covered Task Manual" replaced "B31Q Covered Task Procedure Manual"

6. Evaluation Guidelines

6. B. (1): "Gas Compliance and Training Department" replaced "Gas Training Department"

6. B. (2): Revised to "Any written or computer based exams taken under the observation of an evaluator or an approved exam proctor. A list of approved proctors will be kept on file by the Gas Compliance and Training Department."

6. F.: New inserted, "Communication of Disqualification - When an employee is disqualified for a covered task, the OQ Task Disqualification Form (See OQAL 4) will be completed and promptly communicated with Gas Operations."

6. G.: "Gas Compliance and Training" replaced "Safety and Training"

6. I. (3): "Gas Compliance and Training" replaced "Safety and Training"

6. J. (2): "Gas Compliance and Training" replaced "Safety and Training"

6. K. Re-Evaluation Intervals

6. K. (1): Revised to "Ameren Illinois will utilize the ASME B31Q Covered Task list, as referenced in Appendix 5A of the ASME B31Q standard, as the basis for establishing re-evaluation intervals. Covered Tasks specific to Ameren Illinois will be evaluated independently to determine the proper re-evaluation interval."

7. Non-Qualified Individuals

7. A. (3): "Covered Task List in section 16 of this document" replaced "Covered Task List in OQAL 1."

8. Mutual Assistance

8. C. (1): Revised to clarify, "List of qualified employees with covered tasks they are qualified to perform"

10 Management of Change

10. C.: Revised to "All Management of Change records shall be maintained by the Gas Training Center or electronically in the Insight Learning Management System."

10 E.: Revised to "The appropriate Regulatory Agencies (i.e. ICC Pipeline Safety) will be notified when significant OQ written program changes are made."

11. Documentation & Record Keeping

11. A.: "all employees" replaced "all new personnel and existing", "Ameren Illinois will ensure all employees' qualification records are maintained using electronic and/or hard copy."

11. C.: New, " Ameren Illinois will maintain a listing of all employees and contractors employed on its property."

12. Contractors

"Ameren Illinois Gas Compliance and Training" replaced "Ameren Illinois Safety and Training" throughout this section

12. D. Hiring Requirements for Contractors Qualified Under the Ameren OQ Plan

12. D. (6): Revised to " Once all the requirements have been satisfied, the hiring party will be notified and the completed Checklist will be maintained with the Contractor OQ records."

13.OQ Review Meeting

13. C. (4) (a): "Ameren Illinois Gas Compliance and Training" replaced "Ameren Illinois Safety and Training"

14, Training

14. B.: "Ameren Illinois Gas Compliance and Training" replaced "Ameren Illinois Safety and Training"

15. Refresher Training

15. A.: Revised to "In addition to OQ evaluations, individuals that perform covered tasks will receive refresher training. This refresher training will focus on core areas of a specific covered task or a group of related covered tasks. Topics may be chosen by applicability to work groups or based on field performance observations, with at least one refresher training topic covered each calendar year."

15. B.: New, "In addition, refresher training on Leak Management Procedures will be conducted on an annual basis."

16. Covered Task List

UNCONTROLLED IF PRINTED

- Task numbers 0671, 0741, 0771, 0791 have been removed as AIC does not use or have procedures for these joining methods.
- Task numbers 0831, 0841, 0851 as these are related to maintenance of Cast Iron systems
- Task numbers 1631 and 1641 Launching/Receiving Pigs are being added.
- Task 1651 - Purging is being added. This was previously covered under Task A002 - Purging/Abandonment
- Task A002 is renamed as Abandonment
- Tasks 1231, 1241, 1261, 1271, 1281, and A003 are revised from a 3 Year Re-evaluation interval to a 1 Year Re-evaluation interval per Leak Management Qualification agreement with the ICC.

OQAL 4	Forms and Reference Materials Added: Form 02 - OQ Task Disqualification Notice	January 1, 2012	January 1, 2016
PMRK 1	1. E.: Removed the December 31, 2015 date and replaced with Any markers or signs identified that do not have the Ameren Illinois logo and phone number and cannot be immediately corrected, will be documented in Click Mobile as 'Pipeline Marker / Signage Issue' and shall be replaced within 30 days." Revision was submitted by Gas Compliance to address how pipeline markers, without the correct label, found after December 31, 2015 are to be handled.	January 1, 2014	January 1, 2016
POLY 0	Table of Contents Revised POLY 1 4. Clearances from Thermal Sources Added POLY 2.02 3. Above Grade Squeeze Added POLY 2.05 6. Electrofusion Elbows Added POLY 3.02 7. TDW PE Side Tap Fittings Forms and Reference Materials Added: Reference 23 Innogaz Installation Procedures Reference 24 IPEX Friatec Installation Procedures Reference 25 Central EF Installation Procedure Manual	July 1, 2014	January 1, 2016
POLY 1	Requirements 2. Handling	July 1, 2014	January 1, 2016

UNCONTROLLED IF PRINTED

2. A.: Grammatical only "may be" replaced "are"; "Coils of PE pipe may be sequence banded to permit controlled uncoiling of the pipe."

2. B. Grammatical only "run" replaced "ran" and "the pipe is" replaced "it is"; "When installing 4 inch and larger coiled PE pipe, the pipe must be run through straightening and re-rounding equipment as the pipe is removed from the pipe trailer."

2. C.: Grammatical only, rearranged text, "The straightening and re-rounding equipment instructions do not recommend installing 4 inch and larger coiled pipe when the temperature is below 32°F for an extended period. Stick pipe, 4 inch and larger, should be considered when temperatures are below 32°F. See POLY 4"

2. D.: Revised: "The shelf life of PE2406/PE2708 and PE3408/PE4710 manufactured on March 6, 2015 and earlier shall not exceed two (2) years."

2. E. New: "The shelf life of PE2708 (MDPE) manufactured on March 7, 2015 and later shall not exceed three (3) years and PE4710 (HDPE) manufactured on March 7, 2015 and later shall not exceed ten (10) years from the manufactured date stamped on the pipe."

Revised to reflect the PHMSA's incorporation by reference the latest ASTM D2513 standard into PART 192.

2. F.: Grammatical only, added the word "stated", "PE pipe stock should be rotated to prevent the pipe from exceeding the above stated shelf life."

3. Support

3. A.: New item: "For permanent installation PE pipe must be installed below ground."

This revision allows for PE pipe to be temporarily installed above ground which is allowed in Part 192.321.

3. C: Word change, "steel" replaced "metal", "Protective sleeves must be installed on the outlet of all service tees and on all steel-to-plastic transition fittings to minimize shear stresses by distributing the earth loads across the rigid connection."

3. D.: New item, "Whenever PE pipe is exposed consideration should be given to providing support to minimize stresses due to excessive sagging."

Addresses the need to recognize that excessive sagging of PE pipe could adversely affect the integrity of the pipe joints.

4. Clearance from Thermal Sources - Changed the heading title and added more information.

"PE pipe shall be installed with sufficient clearance, or insulated, from any source of heat, such as steam pipes, to avoid temperatures in excess of 100° F, impairing the serviceability

of the pipe. Typically, twelve (12) inches is considered sufficient clearance."

Clarified the need for protection from thermal sources and a guide as to what is sufficient clearance.

5. Joining

5. A.: Grammatical change, "shall only" replaced "may be".

"PE pipe shall only be joined by butt fusion, electrofusion or mechanical fittings."

5. B.: Grammatical change only by deleting reference to POLY 2.03 Heat Fusion Joining since it does not actually provide procedures.

Former 5. B. "Threaded joints are prohibited" was removed since it is no longer relevant with the revision to 5. A.

6. Thermal Expansion and Contraction

6. A.: Added "MDPE and HDPE pipe have the same expansion and contraction coefficients."

Added to clarify that medium density and high density pipe will expand and contract the same.

6. A. (2): Added a second example for expansion of a service line,

"100 feet of 1/2 or 1 inch PE pipe heated to 100°F in the sun can contract 4 inches when buried in 60°F soil. Thus, slack in the service line should be left near the service tee."

7. Minimum Bending Radius

7. B. Expanded the explanation of the information provided in the Permanent Minimum Bend Radius table and updated the bend radius for PE pipe sections that contain a fitting. The pipe manufacturers reduced the bend radius from 125 times the pipe diameter to 100 times.

Added a clarification that butt fusion joints are not considered a fitting.

8. Weak Link

8. B. Removed "but not limited to"

8. B. (c): New: "A weak link may be created by physically removing approximately 50% of the pipe wall by drilling holes or cutting slots in the pipe. Scoring is not an acceptable method for reducing the wall thickness."

SMR Team added to reflect a procedure that is currently being used in some areas of the Company.

8. B. (d): New: "Install commercially available manufactured weak link designed for the pipe size being installed."

8. B. (e): Added "back reamer", "Bore head/back reamer that are one (1) inch or more, larger in diameter than pipe being in-

stalled can take the place of a pull plug when the PE pipe is being pulled in behind the boring rods."

8. B. (f): New: "A weak link is not required when the pipe is pulled by hand."

8. B. (2) (a): Revised to make it acceptable to use a MDPE weak link when pulling HDPE pipe.

9. Tracer Wire

9. A. Table: Added a note that "#14 solid soft drawn copper tracer wire, 18 66 677, is approved for only service line insertion if there is insufficient space for #12 tracer wire."

Many times a #12 wire is too large to insert into a 3/4" steel service when a 1/2 inch PE pipe is being inserted.

9. D.: Revised to; "Consideration should also be given to using stainless steel tracer wire for long and/or difficult directional bores or plow-ins. When stainless steel wire is installed with main, a test station should be brought up at the location where the stainless wire meets the copper wire. A lead from each wire should be run up and terminated in the test station. If installation of a test box is not possible or feasible, the stainless and copper tracer wires can be connected in the same manner as copper service line tracer wire is connected to stainless steel main line tracer wire."

The preference is still to install test station where the stainless steel wire and copper wire meet but this revision does allow for the two wires to be connected if needed.

9. E.: New "When connecting PE service line copper tracer wire to the PE main stainless steel tracer wire, the wires can be connected with a stock coded split bolt connector. The connection should be coated with TL101 Corrosion Inhibitor, 31 59 733, then encapsulate in gel box."

Connecting a copper tracerCorrosion Control requested the Corrosion Inhibitor be applied with joining the stainless and copper tracer wire.

9. J.: Revised to "Considerations should be given to installing test lead box(s) or pipeline marker(s) with fink station as tracer wire access points when service line connections are not available."

Revised to provide examples of methods that can be used to provide access to tracer wire on long runs of PE pipe when there are no services.

12 Buried Pipe Examination

12. A.: Added reference to ClickMobile.

**POLY
2.02**

Squeeze Off

1. B.: Removed the sentence "However, squeezing may not provide 100% shut-off in all cases."

April
1,
2012 Janu-
ary 1,
2016

1. C. New: "When squeezing a line that has two or more feeds into the area, a pressure gauge should be installed on the live side of the squeeze and monitored throughout the stopping operations. See PRES 2.03 Potential Over Pressurization or Service Interruption."

Emphasizes the importance monitoring pressures when squeezing off a PE pipe segment to isolate an area when there are multiple leads into the area.

2. Operation

2. I.: Removed the first sentence "If squeeze-off does not provide 100% shut-off, venting may be required."

SMR Team felt in - lieu of venting, it is best to stay with practice of installing a second squeezer.

3. Above Grade Squeeze - New section was added to address the use of above grade squeeze tools.

A. PE pipe can be squeezed, without requiring gas field personnel to enter the excavation, by the use of a long handle squeeze tool.

B. Since personnel are not entering the excavation to apply the squeezer, cleaning and eliminating static charge of the pipe are not required.

C. The squeeze off tool shall be grounded.

D. If the squeeze off is to be performed in a blowing gas atmosphere, gas field personnel should follow procedures in WWBG 2.01 Hazardous Atmosphere

SMR Team added since this was not included in our O&M procedures.

POLY 2.05

Electrofusion

1. General

1. D.: New: "Electrofusion processors shall be calibrated at intervals that at least meet the requirements contained in Manufacturer's Instructions. See POLY 4 There will be a compliance period of the manufacturer's recommended interval plus ninety (90) days. Beginning no later than January 2016, calibrations records will be maintained in Maximo."

ICC issued a NOA indicating procedures need to be added to the O&M as to when and how processors were to be calibrated. The calibration intervals varied from 1, 2 and 3 years depending on the processor. The manufacturer's instructions will indicate the interval.

1. H.: New: "Some fittings utilize resistor pin technology which allows the processor to automatically read the fusion time when it is attached to the fitting. The fittings that do not utilize resistor pin technology require the barcode to be scanned to complete the fusion."

January 1, 2014

January 1, 2016

Was added to address the different control boxes that are now being used in Ameren Illinois.

1. I thru 1. N.: These are general topics that were previous repeated in each section of the procedures. They include: Use of 96% isopropyl alcohol, non-petroleum based markers, rotating scrapers, hand scraping, and replacing scraper blades.

1. O.: New: "If a square cut cannot be achieved, ensure that the resulting gap when measured with a square placed on the pipe end so that the gap between the pipe and the square is at its maximum width is equal to or less than what is shown in table below. The gap between two pipe ends should not exceed two (2) times the maximum gap shown in the table."

A picture and a table were also added.

Information that came from Central Plastics which specifies the allowable tolerance. Ameren Illinois Training personnel created the picture and table.

2. Equipment, Weather and Cleanliness Guidelines

2. B. (1): Revised to "If needed, pigtail adapter should only be used to fuse all sizes of tapping tees and 2 inch and smaller fittings (i.e. couplings, elbows, reducers, end caps)."

Clarifies on which fittings a pigtail adapter can be used.

2. B. (2): The word "fitting" replaced "coupling". "When fusing 3 inch and larger fittings the 30 amp twist lock connection is required."

2. C.: New: "For fittings larger than two (2) inches, a 3500 Watt generator or larger, or an appropriate 120 volt wall outlet must be used to power the electrofusion processors."

2. D. New: "Inverters over 3000 watts may be used to power electrofusion processors for 2" and smaller fittings.

Note: The compatibility of a specific inverter should be verified prior to using that inverter for electrofusion.

Fitting manufacturer provided these requirements.

2. E.: Revised the extension cord limitations and provided a table list the maximum cord length and size for each processor based on manufacturers' recommendations.

Processor	Extension Cord Maximum Length & Size
Central Easy Fuse & MSA 340	25 ft. - #10/3 50 ft. - #8/3
IPEX Genesis	25 ft. - #12/3 50 ft. - #10/3 100 ft. - #8/3
Friamat	100 ft. - #10/3 200 ft. - #8/3
Kerotest Diane & Charlotte	100 ft. - #10/3 200 ft. - #8/3

Current O&M specifies a minimum of #12/3 which does not meet the requirements of most processors.

3. Electrofusion Couplings (moved Elbows to its own section)

Reference to elbows was removed from this section.

3. A. Preparation Prior to Scraping

3. A. (5): Added to check for out-of-roundness that "A bar style pipe clamp may be used to assist with re-rounding the pipe if necessary."

"Note: Insert stiffeners could also be used for re-rounding for 1-1/4" and 2" pipe."

Central Plastic's procedures stress the importance of checking for out-of-roundness so it is being added to each procedure.

3. A. (6): Added a picture of a Central coupling showing the sprue that is used as a guide for marking the pipe end.

3. B. Scraping (Added this heading)

3. B. Removed the requirement to wipe the scraped area with 96% alcohol solution after scraping.

Central Plastic's procedures require cleaning the scraped area with alcohol solution only if it becomes contaminated from being handled, falling dirt or any other contaminant. This requirement is in our current O&M and is restated in 3. B. (2) of this update.

3. C. Joint Assembly

3. C. (1): Revised to "After scraping, if the insertion depth mark has been removed, remark insertion depth using an un-packaged coupling."

If the insertion depth marks are still visible, there is no reason to remark.

4. Electrofusion Service or High Volume Tees

4. A. (3): New: "Visually check pipe for out of-round condition. If the fusion area is found to be out-of-round, take appropriate steps to re-round the pipe by using an alignment or re-rounding clamp. A bar style pipe clamp may be used to assist with rerounding the pipe if necessary."

Central Plastic's procedures stress checking for and correcting out-of-roundness of the pipe, so it has been added to each fitting procedure.

4. A. (4): Revised marking the area to be scraped by replacing the instructions to mark the pipe a minimum of 1/2 inch wider than the tee on both ends with "mark the pipe on both sides of the tee slightly wider than the base so that the scraped area will be visible after the tee is fused to the pipe."

Central Plastic's procedure language.

4. A.: Removed the requirement to wipe the scraped area with 96% alcohol solution after scraping.

Central Plastic's procedures require cleaning the scraped area with alcohol solution only if it becomes contaminated from being handled, falling dirt or any other contaminant. This requirement is in our current O&M and is restated in 4. A. (6) of this update.

5. Electrofusion Caps

5. A. Preparation Prior to Scraping

5. A. (5): Added to check for out-of-roundness that "A bar style pipe clamp may be used to assist with re-rounding the pipe if necessary."

"Note: Insert stiffeners could also be used for re-rounding for 1-1/4" and 2" pipe."

Central Plastic's procedures stress checking for and correcting out-of-roundness of the pipe, so it has been added to each fitting procedure.

5. B. Scraping

5. B: Removed the requirement to wipe the scraped area with 96% alcohol solution after scraping.

Central Plastic's procedures require cleaning the scraped area with alcohol solution only if it becomes contaminated from being handled, falling dirt or any other contaminant. This requirement is in our current O&M and is restated in 5. B. (2) of this update.

5. C. Joint Assembly

5. C. (1): Revised to "After scraping, if the insertion depth mark has been removed, remark insertion depth using an unpackaged cap."

If the insertion depth marks are still visible, there is no reason to remark.

5. C. (1) (b): New "The spigot or end cap inserted into the coupling does not require scraping or cleaning and should not be removed during the process."

5. C. (2) thru (4): New

(2) Make sure that the spigot is inserted to the center of the coupling (1 below).

(3) If the spigot end cannot be restrained by the clamp, mark the spigot on the outside of the fitting so that movement can be detected during the fusion (2 below)

(4) Place the coupling or fitting kit over the scraped area, being careful not to contaminate the scraped pipe or fitting surface. Secure the fitting in place using the appropriate clamp. Standard electrofusion clamps can be used for fittings, even if the clamp does not actually clamp on the fitting surface. The

clamps should butt against the fitting end to prevent it from moving outward during the fusion process. Examples shown below:

Information came from Central Plastic's procedures

6. Electrofusion Elbows - New section that was separated from electrofusion coupling procedure.

6. A. (5): For re-rounding the pipe added A bar style pipe clamp may be used to assist with re-rounding the pipe, if necessary.

Note: Insert stiffeners could also be used for re-rounding 1-1/4" and 2" pipe.

6. A. (6): New, "Identify and mark area of the pipe to be scraped. Central Plastic electrofusion elbow has no markings on the outside of the fitting indicating the stab depth. Measurement should be taken for proper marking and scraping. For two (2) inch PE electrofusion elbow, mark pipe 2-1/4 inches from pipe end. This will indicate scraping area.

Note: If an Innogaz elbow is being used, there is a knit line on the outside of the elbow which indicates the insertion depth."

6. B. Scraping

Scraping procedures are the same as for the electrofusion coupling.

6. B. (2): As in the other procedures, the scraped area of the pipe and the inside of the elbow only require wiping with an alcohol solution if their surfaces have become contaminated after scraping.

6. C. Joint Assembly

6. C. (1): Revised to "After scraping, if the insertion depth mark has been removed, remark insertion depth. Electrofusion elbow has no markings on the outside of the fitting indicating the insertion depth. Measurements should be taken for proper insertion depth marking. For 2" PE elbow electrofusion, mark pipe 2 1/4" from pipe end This will indicate insertion depth of the pipe

Note: If an Innogaz elbow is being used, there is a knit line on the outside of the elbow which indicates the insertion depth."

6. C. (2) "Slide the elbow onto the first pipe, or tee outlet. The insertion depth mark should be visible on the pipe at the end of the elbow."

6. C. (3) "Insert the second pipe end into the elbow. The insertion depth mark should be visible on the pipe at the end of the elbow."

6. C. (4) "Improper positioning of the elbow may result in a failed joint."

6. C. (5) "Select the proper sized alignment clamp and secure pipe ends or tee outlet in the clamp with the elbow at or near the center of the clamp."

The above procedures are essentially the same as for couplings.

7. Cooling Times

7. A. Provided the cooling times for all of the Central fittings currently being stocked.

POLY 2.07	<p>Evaluating PE Pipe Damage</p> <p>1. B.: Correcting the definition of a defect to greater than 10% of the PE pipe wall thickness. Previous language had equal to or greater.</p>	January 1, 2011	January 1, 2016

PTRL 0	<p>Table of Contents</p> <p>PTRL 2.02 4. Patrol Requirements was removed in the July 1, 2014 Update</p>	March 1, 2010	Janu- ary 1, 2016
PTRL 2.01	<p>Transmission Patrols</p> <p>2. Transmission Main Patrol</p> <p>2. A.: Correction made "HCA's " replaces "HCS's"</p>	De- cem- ber 1, 2014	Janu- ary 1, 2016
PTRL 2.02	<p>Critical Area Patrols</p> <p>Critical area patrols will now include transmission pipelines as well as the high pressure distribution and distribution lines. Throughout the entire document "transmission" has been added. In addition, the word "pipeline" has replaced "main" throughout the document.</p> <p>Pipeline Integrity group feels utilizing the Critical Area Patrols process is more efficient and effective in monitoring exposed sections of transmission pipelines than attempting to do it through the mapping system.</p> <p>1. B.: Grammatical revision only, "When performing the patrol by foot, vehicle or by air, evaluate conditions which required</p>	De- cem- ber 1, 2014	Janu- ary 1, 2016

classifying the patrol as critical to verify the condition or serviceability of the pipeline have not worsened."

4. Processing Data

4. C.: New: "Notify Gas Operations and Services - Pipeline Integrity Group and Gas Tech Engineering when Critical Area Patrol(s) are needed for a transmission and high pressure distribution lines."

4. D. New: "Contact Gas Compliance for assistance in creating a Critical Area Patrol when conditions listed above are discovered and are not covered by an existing Critical Area Patrol."

Pipeline Integrity and Gas Tech Engineering will be the groups responsible for setting up the critical areas and making the evaluations of the condition of the gas line.

5. Records

5. C.: New: "For transmission lines, the patrol records shall be maintained for the life of the facility."

PTST 0	<p>Table of Contents</p> <p>PTST 1 Requirements</p> <p>Inserted 4. Design MAOP</p> <p>Revised 8. A Component Other Than Pipe Being Replaced or Added to Pipeline</p> <p>Forms and Reference Materials</p> <p>Updated</p> <p>Form 01 - Gas Leak & Strength Test Stamp</p>	<p>July 1, 2014</p>	<p>January 1, 2016</p>
PTST 1	<p>Requirements</p> <p>This document has been significantly revised and should be reviewed in its entirety. The revisions are too numerous to identify each. The major revisions within the document are:</p> <p>1. Short section of pipe has been defined as typically a double random length or approximately 40 to 45 feet or shorter. Another requirement that was added is testing a segment of pipe to establish its MAOP must be done after the is in its final location.</p> <p>2. Test recording methods was revised to list the type of gauges that can be used to record pressure tests and the table listing stock coded Process Gauges was updated. In addition, recording devices was expanded to include mechanical chart recorders, electronic pressure recorders, and calibrated dead-weight tester systems. A major change here is recording devices are only required when testing pipe that is being stressed to 30% SMYS or more. Gauges can be used for all other testing.</p>	<p>April 1, 2013</p>	<p>January 1, 2016</p>

3. Testing section was completely revised with tables replacing testing requirement verbiage. The tables are divided into the following categories:

- a. Service Lines - Less Than 2" Diameter; Plastic or Steel
- b. Plastic Main & Service with Design MAOP ≤ 100 PSIG
- c. Steel Main & Service with Design MAOP < 100 PSIG
- d. Steel Main & Service with Design MAOP ≥ 100 PSIG
- e. Fabricated Unit or Short Section of Pipe
- f. Farm Tap - Single Cut - 60 to 450 PSIG Inlet Pressure
- g. Farm Tap - Double Cut - 451 to 1000 PSIG Inlet Pressure

These tables provide the minimum required test pressure and duration. The tables also indicate when combination leak & strength test are acceptable or if separate leak and strength tests are required.

8. A Component Other Than Pipe Being Replaced or Added to Pipeline was expanded as a result of a recent PHMSA rule-making change. A component which carries a pressure rating only needs to be leak tested for approximately 10 minutes. However, once another item, pipe, fitting, or another component is attached to the component it becomes an assembly and must be tested accordingly.

SMR Teams have worked on pressure testing requirements for over year attempting to make them clearer and simpler. The concept of using a table format similar to a flowchart hopefully makes it easier to ensure the correct pressure tests are being performed.

**PTST
2.01**

Leak Test

This document has also been significantly revised to be compatible with PTST 1 and should be reviewed in its entirety. The major revisions are:

- 1. Mains and services line(s) should be tested separately.
- 3. The leak test duration section was revised to reflect a major change in determining the required leak test duration for PE pipe with MAOP of 100 psig or less and for steel pipe with MAOP less than 100 psig. The use of the original formula of 5 minutes per inch diameter per 100 feet can still be used until the calculated required duration exceeds 8 hours. Eight hours is the maximum required leak test duration regardless of the footage to be tested. The leak test can be left on for longer than 8 hours and the actual time recorded. For steel pipe with MAOP 100 psig or greater, the required leak test duration is a minimum of 1 hour as shown in the table in PTST 1. The previous 20 hour maximum leak test duration has been eliminated.
- 5. The leak test records section was expanded to include the electronic recorders and deadweight testers. A statement was

January 1,
2014

January 1,
2016

added that leak tests performed on service lines are recorded within ClickMobile. PTST 2.01 applies to leak testing of mains.

PTST 2.02	<p>Strength Test</p> <p>This document has also been significantly revised to be compatible with PTST 1 and should be reviewed in its entirety. The major revisions are:</p> <ol style="list-style-type: none"> 1. Strength test duration are shown in the tables in PTST 1. 3. The strength test procedures section now includes the electronic recorders and deadweight testers. It also allows for the test pressures to be left on the pipe until the final tie in is made. 4. The strength test records section now includes the electronic recorders and deadweight testers. The recording devices are now required only for recording the tests on mains or services with design MAOP of 30% SMYS or greater. Gauges can be used to record strength test on all other mains or services. 	<p>April 1, 2013</p>	<p>Janu- ary 1, 2016</p>
PTST 4	<p>Forms and Reference Materials Updated</p> <p>Form 01 - Gas Leak & Strength Test Stamp - Tie-in Joints Leak Test line was added.</p>	<p>July 1, 2014</p>	<p>Janu- ary 1, 2016</p>

**PURG
2.01**

Purging Methods

July 1, 2012 January 1, 2016

1. A.: Revised to "This section outlines the procedures to be followed when purging gas mains and pipelines. Service lines two (2) inch and larger and five hundred (500) feet or longer are to be purged in the same manner as mains.

1. B.: Revised to "Gas Engineering or Gas Tech Engineering (GTE) will provide detailed purging plans prior to blow-down or purging operations on transmission mains, high pressure distribution mains, or service lines two (2) inches and larger and operating at more than 60 psig."

Revised the language to clarify which gas mains and services are to be purged in accordance with these procedures.

2. Pre-Purge Activities

2. B.: Added a sentence addressing liquids and debris, "When purging, the blow off area should be kept clear to avoid property damage or injury to gas field personnel and the public. There may be a potential for liquids or debris being ejected into the blow-off gas stream and landing downwind of the blow-off. Be aware of wind direction / speed and the presence of any potential sources of ignition with special emphasis on overhead power lines."

2. D.: Revised to "When a purge pipe is used, it must be a metallic pipe of sufficient length that vented gas does not create a hazard to the public, gas field personnel, or adjacent property. The purge pipe shall be grounded to eliminate static charge. In lieu of a purge pipe, service lines smaller than two inch can be purged through the service riser."

2. E.: New, "To purge a service line smaller than two (2) inch slowly open the meter valve to allow the air to be purged. Once gas is detected close the meter valve. Service lines two (2) inch and larger will be purged the same as a main."

SMR Team wanted to caution workers that there is a potential for liquids or debris being released during a purging operations. Team decided that since situations and conditions vary it was not necessary to specify a minimum length for the purge pipe. The length will be determined by the actual conditions. They also wanted to make it clear purging out a service line does not require a separate purge pipe. Item 2. E. was added as a reminder when purging a service line, especially one with an EFV, the valve should be opened slowly so as not to trip the EFV.

3. Purging Transmission, High Pressure Distribution Pipelines

3. A.: Revised to "When transmission or high pressure distribution pipelines are taken out of service or reduced in pressure either permanently or temporarily, the effort shall be coordinated with Gas Control. See ABND 1"

Gas Control needs to be notified when either a line is being totally shut-down or when the pressure in the line is being significantly changed. The alarm settings may need to be adjusted or Gas Control needs to know why the alarm is activated.

3. B.: Grammatical only, added "When practical", "When practical, the release of large volumes of gas into the atmosphere should be minimized by transferring as much gas as possible from the pipeline to be purged to other parts of the system."

3. C.: Added use of masking agent, "When purging or blowing down a transmission or high pressure distribution line in a populated area, considerations should be given to the noise level and potential gas leak calls. The use of a masking agent may be a solution to avoid gas odor complaints."

SMR Team felt that adding a masking agent may be an option for minimizing the odor complaints.

3. D.: Grammatical only added one word "when", " Blow-down valves should be turned to fully open position as quick as possible to minimize possible erosive damage to the valve which could occur when attempting to pass a high volume of gas through a partially opened valve."

3. E.: Revised to "If flaring is utilized, GTE will include procedures in the purging plan. See PURG 2.02 Venting Gas.

4. Purging of Air with Gas

4. A.: Added reference to min. inlet pressure tables, "When a pipeline is being purged of air with gas, the gas must be released into one end of the line in a moderately rapid and continuous flow. See Tables 1 & 2 that provides the minimum inlet pressure of the gas that will ensure adequate flow."

5. Purging of Gas with Air

5. A.: Added pipeline should not be pressurized above current operating pressure, "When a pipeline is being purged of gas with air, the air must be released into one end of the line in a moderately rapid and continuous flow. The pipeline should not be pressurized above the current operating pressure of the pipeline."

5. C.: Added a caution about liquids or solids that remain in pipeline could be combustible, "When purging from gas to air, purge to 0% Gas, keep in mind that purging removes only gaseous material. Liquids and solids found in operating pipelines are typically combustible and may remain in the line after purging. Spontaneous ignition can occur if adequate air supply is available to items such as filter elements."

Safety item added to remind workers of the potential for ignition due to products that could remain in the pipeline after the gas is purged.

6. Using an Inert Gas Slug when Purging

UNCONTROLLED IF PRINTED

6. A.: Revised to "When purging mains 8" and larger, gas field personnel should separate air/gas interface with an injected slug of inert gas. To inject the inert gas hose should be connected to a fitting."

6. B.: Added reference to Volume of Inert Gas table, "The slug of inert gas must be long enough to prevent the air/gas from mixing during the purge. See VOLUME OF INERT GAS (cu ft) table below."

6. D. (2): Clarification added if there is over a 3 minute delay in purging, "In no case should the delay between the injection of inert gas and air/gas be greater than three (3) minutes. A new slug of inert gas should be injected if there is a delay."

6. F. Table: Added table heading "Volume of Inert Gas (cu ft)"

7. Required Minimum Inlet Pressures

7. A.: Revised to "Tables 1 and 2 provide minimum inlet pressure required to maintain minimum flow during purging operations. The maximum inlet pressure should not exceed the current operating pressure of the pipeline."

8. Vacuum Purge/Air Mover

This section has been completed revised and expanded significantly with input from GTE personnel.

A. An alternative method to purging gas from a pipeline is to use a vacuum purge to extract the gas from the system displacing the gas with fresh air.

B. The vacuum/air mover is normally connected to one or more locations of the system extracting by vacuum the gas out of the system while opening the other points of the system to the atmosphere allowing air to be introduced.

C. Air movers displace the gas with large volumes of fresh air when connected to one point of the system and another point opened to the atmosphere.

D. When an air mover(s) is to be utilized to purge the pipeline, Gas Tech Engineering, GTE, is to provide a purging plan. GTE will use AGA's Purging Principles and Practice as a general basis for the plan.

E. It is critical that a good seal is made between the air mover and purge stack for the air mover to work properly.

F. A ground clamp or wire from the air mover to ground is required to dissipate static electricity buildup.

G. The type of valve the air mover is mounted on can reduce the air flow by limiting effectiveness of the air mover (ex. plug valve has a 40% reduction in flow). GTE will factor this into the purge plan.

H. Typically, before an air mover/vacuum purge operation, a slug of inert gas is injected through a closed loop to separate air from gas. See VOLUME OF INERT GAS table above.

I. Once the air mover is started, ensure fresh air is being drawn into the main (i.e. verify vacuum is established at location where air is to be introduced).

J. Once a CGI indicates 0% gas is in the pipeline at the site of the first "cold" cut, the cutting operation(s) can begin (i.e wheel cutter, guillotine, etc). After the initial cut and air is being introduced via a vacuum, a torch can be used for remaining cutting operations.

K. Prior to cutting with a torch or using a grinder, reduce the air mover rate to minimize spark travel.

10. Monitoring Purge

10. A.: New, "Install gauges of the appropriate range at the inlet and outlet of the purge to continuously monitor the pressure to assure adequate flow."

10. B.: New, "Continuously monitor inlet valves and maintain constant communication, radio or telephone, with other areas of the purge operations to control and limit purge velocity."

10. D.: Revised to "Purge pipeline completely from one end to the other, especially when purging air with gas."

10. E.: Added "at defined points", "Monitor pressures at defined points using gauges during the purging to ensure the correct pressures are maintained."

10. F. Revised to "Test the gauges to ensure they are functioning properly prior to purging."

QUAL 0	Table of Contents Revised 1. 3. Action Matter Bulletin	Janu- ary 1, 2013	Janu- ary 1, 2016
QUAL 1	Requirements Gas Training, Compliance, and Quality Assurance personnel have completely rewritten the Requirements document to better reflect the current Quality Assurance program.	Janu- ary 1, 2011	Janu- ary 1, 2016
QUAL 4	Forms and Reference Materials Updated all of QA Forms and added Form 19 Excavation and Job Site Protection	Janu- ary 1, 2013	Janu- ary 1, 2016
REGS 1	Requirements 1. Objective 1. B.: New item added;" New regulator stations installed to control the flow and regulate the pressure in a downstream main segment shall comply with these requirements. This was added to clarify that new regulator stations must comply with REGS 1 in effective at the time the station is installed. These requirements are not retroactive.	De- cem- ber 1, 2014	Janu- ary 1, 2016

REPR 1	<p>Requirements</p> <p>3. Approved Repair Methods</p> <p>3. A. High Pressure Distribution and Transmission Line Repairs</p> <p>In the table under Internal Defects, added "laminations, cracks" as other example.</p> <p>4. Steel Pipe Repair Methods</p> <p>4. H. Welded Full Encirclement Split Sleeve (Dresser Style 110 of 220 Reinforcing Split Sleeve)</p> <p>4. H. (2): New: "Full encirclement split sleeves are suitable reinforcing the pipe where internal defects such as laminations or internal corrosion as long as the split sleeve will extend beyond the internal defect and sound metal is far enough away from the defect so that the localized heating will not have an adverse effect on the defect."</p> <p>Clarifies that this fitting is an acceptable repair method for internal defects.</p> <p>4. J. Composite Wrap System</p> <p>4. J. (2): Added internal defects, "These systems are a rehabilitation option for steel gas pipes with external corrosion, gouges, grooves, dents and internal defects such as laminations and corrosion."</p> <p>4. L. Encapsulation</p> <p>4. L. (2) (a): Revised to, "The steel pipe will be pretested at a pressure which qualifies the MAOP to be the same as the pipeline on which it is being attached prior to installation. See PTST 1"</p> <p>Clarifies that pipe with the weld cap is to be pretested prior to installation.</p>	<p>De- cem- ber 1, 2014</p>	<p>Janu- ary 1, 2016</p>
RNST 1	<p>Requirement</p> <p>1. B.: Revised to, "Whenever reinstating a temporarily deactivated main, only the new pipe installed within the segment of main has to be tested in accordance with PTST1 before the main can be put back in service. See RNST 2.01 for more details.</p> <p>Revised to address mains where the supply of gas is only temporarily interrupted.</p> <p>1. C.: New, "When repairing a damaged section main, if a new section of pipe is installed, the new section of pipe has to be tested in the same manner as a new main. New section of pipe can be either pretested or tested prior to installation. See REPR 1 9. Testing of Repairs"</p>	<p>June 1, 2010</p>	<p>Janu- ary 1, 2016</p>

Added to address testing requirements for pipe being installed to repair a damaged line.

1. D.: New, "As a general rule, previously abandoned gas facilities that were physically disconnected from a source of gas, purged, sealed, and no longer being maintained should not be considered for reinstatement. However, if there is consideration to reinstate, the facility shall be thoroughly evaluated for its integrity and tested the same as a new facility installed at that location."

Added as a general rule and to provide a cautionary reminder of the need to perform an in-depth evaluation of the pipe's integrity.

**RNST
2.01**

Reinstating Mains and Services

3. Reconnection of Temporarily Disconnected Farm Tap Services

3. B. (1): Grammatical by "minimum" so that the test pressure of the service line is a minimum of 90 psig.

3. B. (2): Grammatical by "minimum" so that the test pressure of the service line is a minimum of 90 psig.

4. Reconnection of Temporarily Disconnected Mains

4. D.: Facilities Cut Into Sections:

Revised to "Facilities Cut Into Sections: New segments of main installed between the undisturbed sections of main shall be tested in the same manner as a new main in that location. See PTST 1."

5. Reinstating Service in Abandoned Lines

5. A. (1): New, "An in-depth evaluation must be performed to determine if the integrity of facility is or can be made suitable for reinstatement. The evaluation should be performed by personnel from various groups such as; Gas Tech Engineering, Division Engineering, Gas Tech Services, Corrosion Control, etc."

5. A. (2): Revised to "The abandoned facility shall meet all of the requirements of a new facility being installed at that location."

5. B. Inserting new PE service pipe inside abandoned steel service line...

5. B. (1): Added reference to SERV 2.08 Tracer Wire Installation

Revised SECR 1:

1. Objective

Janu-
ary 1,
2013

Janu-
ary 1,
2016

2. Employee, Contractor and Service Vendor/Provider Responsibility

3. Direct Threats

Removed SECR 2.01 Communicating Security Threats

Removed SECR 2.02 Critical Gas Facility Security Measures

SECR 1	Requirements Totally revised this document and the entire Security Plan section of the O&M. Ameren Corporate Security now has an Ameren Gas Facilities Corporate Security Plan applicable to both Illinois and Missouri. The plan follows the Pipeline Security Guidelines as provided by Transportation Security Administration and Homeland Security. Corporate Security takes the lead in ensuring the proper risk control measures are taken Ameren Illinois' Critical Gas Facilities. They will work directly with the management personnel responsible for those facilities.	Janu- ary 1, 2013	Janu- ary 1, 2016
-------------------	---	-------------------------	-------------------------

SECR 2.01	Removed	Janu- ary 1, 2013	
----------------------	---------	-------------------------	--

SECR 2.02	Removed	Janu- ary 1, 2013	
----------------------	---------	-------------------------	--

SERV 0	Table of Contents Added: SERV 2.08 Insertion	De- cem- ber 1, 2014	Janu- ary 1, 2016
-------------------	--	-------------------------------	-------------------------

SERV 1	Requirements 5. Location 5. B.: Revised to "All new home construction residential gas meters shall be located immediately adjacent to an outside wall at a location readily accessible for emergency responders. The preferred location of the meter riser is within 2 to 5 feet of the front corner of the structure as long as the clearance requirements list below can be achieved. Alternate location would be the next closest point that meets clearance requirements. The gas meter can be installed on the front side of the home if agreed upon by Ameren Illinois and the property owner." 5. C.: New "Residential meter riser location for propane/electric conversion or an existing service line that is being replaced or relocated and/or replacement of existing service riser should be located in accordance with the following matrix:	De- cem- ber 1, 2014	Janu- ary 1, 2016
-------------------	---	-------------------------------	-------------------------

The matrix table was expanded by adding clearance requirements for Conversion from Propane and Conversion from Electric. Meter location for conversion customers do not have to meet the 2 to 5 feet from front corner preferred location.

Revisions were made to distinguish between service installed to a newly constructed home versus one installed to an existing home that is converting from electric or propane. These were reviewed and approved by the Gas Superintendents.

8. PE Service Lines

8. G.: New, "Service lines installed by plowing or boring operations should follow the procedures contained in BORE 2.03 - Pipe Installation and POLY 1."

Added to provide link to boring and pipe installation procedures.

8. I: New, "The casing pipe for the flex and rigid riser should not be shortened under any circumstances due to the potential of damaging the carrier pipe. The riser's twelve (12) inch pig-tail can be shortened but there must sufficient length remaining to allow for proper installation of the electrofusion coupling."

The casing pipe provides support and stability for the riser. The manufacturer does not recommend shorten the casing pipe.

9. Pressure Testing

9. A.: Added natural gas as an approved test medium.

9. D. Revised to "The results of the pressure test shall be recorded on the Service Card in ClickMobile."

12. Back-Flagging

12. B.: Revised to ""Yellow" locating flags, yellow headed stakes and/or yellow marking paint should be placed over the new facilities. There should be placement of enough flags/stakes to ensure that facilities are clearly identified as to route and location."

Added yellow headed stakes and yellow marking paint as other methods for back-flagging.

Removed the former 12. C. thru 12. E. which addressed; special areas of concern, exempted heavily paved areas and gas supervisor's determining where back-flagging is needed.

Damage Prevention group felt all newly installed facilities should be back-flagged.

13. Records

13. C.: Added that service should be mapped in the electronic mapping system within 90 days after submittal to Poster.

This is the commitment made in response to ICC's request that the O&M state how soon Ameren Illinois' maps are updated.

SERV 2.02	<p>Excess Flow Valves</p> <p>2. Installation</p> <p>2. A.: Revised to "On a distribution service, the EFV shall be installed as close as practical to the outlet of the service tee."</p> <p>2. B.: Revised to "An EFV shall be installed as close as practical to at the outlet of the service tee on residential high pressure distribution service line."</p> <p>Added "as close as practical" to provide flexibility where access to the service tee is impractical or not feasible, i.e. under pavement.</p> <p>2. D. Grammatical only, "above" replaced "these". "Exception to above locations must be approved by Gas Engineering personnel."</p> <p>3. EFV Sizing</p> <p>3. D.: New, "Where the inlet pressure is less than 20 psig and an existing service line is 120 feet or less with a customer's connected load is 330 cfh or less, a 1/2" PE pipe can be inserted through the existing steel service line. Upgrading to 1 inch would not be required in this case. See SERV 2.08 Insertion."</p> <p>Allows for inserting an existing service where there is confidence that the customer's current and future load can be handled by a 1/2 inch PE service line.</p>	<p>Janu- ary 1, 2014</p>	<p>Janu- ary 1, 2016</p>
SERV 2.03	<p>Farm Tap Installation</p> <p>1. C. New "A new farm tap shall only be installed within a service line that serves no more than two (2) service risers. A newly installed gas main shall not be connected to the downstream end of a newly installed farm tap."</p> <p>1. D. New "Once three (3) or more service risers are connected, the existing service line can no longer be classified as a service. The line shall either be upgraded to a main or replaced with a new main and the farm tap changed to a regulator station. An upgraded line shall meet the requirements contained in MAIN 1."</p> <p>Clarification that a farm tap is only installed on a service line. This is consistent with interpretation of the Part 192 code. Pressure regulation facility connected to a main is a pressure control station that requires annual inspection.</p> <p>3. Location</p> <p>3. A.: Inserted additional language regarding crossing adjacent property owner(s).</p>	<p>April 1, 2013</p>	<p>Janu- ary 1, 2016</p>

"Farm tap installations will normally be placed on the customer's property at or near the property line. In situations where the service installation would cross an adjacent property owner(s) an easement is normally required for the service line. If that easement allows, the farm tap can be placed on that property. The main goal is not to have a farm tap installed on public right-of-way."

3. B.: Inserted language regarding easements.

"On a long side service, the farm tap should normally be placed on the customer side of the road. However, if a private easement is obtained, the farm tap can be placed on the same side of the road as the gas main."

Reinforces the Company's position that farm taps should be on the customer's property but does provide for option if an easement can be obtained.

3. E.: Revised placement of pipeline marker, "Consideration should be given to installing pipeline marker at farm taps located in areas where vegetation growth may inhibit visibility. See PMRK 1"

In residential area or an area where the farm tap is located in a well-kept area, requiring a pipeline marker would have minimal benefit.

5. Inlet Valves

5. B.: Revised, "There are options available for installing below grade inlet valves depending on the size of the transmission or high pressure distribution supply line, location, ease of access and customer being served:

(1) For either design, an optional weld Mueller H-17900 valve can be installed in the service line. See SERV 3.06 or SERV 3.07 This valve should be installed in a location as close to the main as practical and in an area where a valve box can be maintained and easily located.

(2) A Mueller H-17800 curb valve tee can be installed as the service tap on the main in lieu of an AUTOPERF tee or H-17656 valve tee. For easy access, a valve box can be installed over this valve. See (4) below for AUTOPERF tee limitations.

(3) Similarly, a Mueller H-17656 valve tee can be installed as the service tap on the main in lieu of an AUTOPERF tee. However, as with the AUTOPERF tee, the valve tee would have to be uncovered in order to shut-off the gas flow. See (4) below for AUTOPERF tee limitations.

(4) Where the wall thickness of the pipe cannot be verified to be 0.281 inches or less, a Mueller H-17656 valve tee or Mueller H-17800 curb valve tee should be used in place of an AUTOPERF tee on transmission and high pressure distribution mains 6 inch nominal diameter and larger. See TAPS 2.05, SERV 3.06, or SERV 3.07 for more information."

5. C.: New "If there is a future possibility of upgrading the farm tap to a regulator station, consideration should be given to install either a Mueller H-17900 or a H-17800 as a station valve. The valve should be located a minimum of twenty (25) feet upstream of the farm tap inlet riser."

Revisions were made to clarify the various valves that can be installed on a main serving a farm tap and the limitations of an Autoperf tee.

SERV 2.07	<p>Gas Service GTech Mapping</p> <p>5. Farm Tap Services</p> <p>5. C.: Grammatical only, deleted since it was a duplicate to 5. A.</p>	De- cem- ber 1, 2014	Janu- ary 1, 2016
SERV 2.08	<p>Insertion</p> <p>Totally new section that was prepared by the Gas Standards Committee and reviewed by a SMR Team. This section covers:</p> <p>General</p> <p>Limitations</p> <p>Tracer Wire Installation</p> <p>Dead insertion Procedures</p> <p>Conduit or Sleeve Insertion Procedures</p>		Janu- ary 1, 2016
SERV 3.06	<p>Farm Tap - Single Cut - 60 - 450 PSIG Inlet Pressure</p> <p>Revised the Note below the Material List table.</p> <p>"Note: Item 1: Maximum wall thickness that Mueller H-18101 can tap is 0.281 inches. This limits the use of the 3/4" AUTOPERF to: (a) Schedule 40 pipe and under and pipe sizes 6 inch nominal diameter and smaller; or (b) Schedule 80 pipe and under and pipe sizes 2 inch nominal diameter and smaller. Therefore; if the pipe wall thickness is not known or cannot be verified through testing or experience to be less than 0.281, a Mueller valve tee, H-17656, or Mueller curb valve tee, H-17800, should be used in place of the AUTOPERF tee on 6 inch nominal diameter pipe and larger transmission lines and high pressure distribution lines. See TAPS 2.05 for maximum wall thickness for AutoPerf Service Tees.</p> <p>Schedule 40, 6 inch nominal diameter pipe has a design wall thickness of 0.280 inches which is why if the wall thickness of a 6 inch pipe is unknown an AUTOPERF tee should not be used. See STLP 2.01 for wall thickness of stock coded steel pipe."</p> <p>Revised in an attempt to better clarify the limitations of the Autoperf tee.</p>	Janu- ary 1, 2014	Janu- ary 1, 2016

SERV 3.07	<p>Farm Tap - Double Cut - 451 - 1000 PSIG Inlet Pressure</p> <p>Corrected the stock code for the following:</p> <p>Item 10:Tee, Pipe, 3/4" x 3/4"x 3/4", FS, Threaded, 3000 psig</p> <p>Item 12: Nipple, Pipe, 3/4"x 2", Schedule 80</p> <p>Item 23: Box, Valve, Gas (Optional)</p> <p>Revised the Note below the Material List table.</p> <p>Stock code correction for Item 10 and 12 was necessary to get the higher pressure fittings. The revised Note is the same as in SERV 3.06.</p>	Janu- ary 1, 2014	Janu- ary 1, 2016
STLP 0	<p>Table of Contents</p> <p>STLP 2.01 inserted new:</p> <p>2. Nominal Outside Diameter</p> <p>3. Nominal Wall Thickness</p> <p>STLP 2.02 added new</p> <p>5. Gel Filled Casing</p>	Janu- ary 1, 2014	Janu- ary 1, 2016
STLP 1	<p>Requirements</p> <p>12. Pipe Thread Sealers</p> <p>12. C. Approved Pipe Thread Sealers</p> <p>Removed 505 Key Tite, 8 oz, sealer from the approved list by the Gas Standards Committee due to a short shelf life.</p>	Janu- ary 1, 2013	Janu- ary 1, 2016
STLP 2.01	<p>Design Pressure</p> <p>1. Design Formula</p> <p>Removed "(actual as produced diameter)" from the Nominal outside diameter. A table has been added with Nominal Outside Diameters</p> <p>2. New: Nominal Outside Diameter</p> <p>"The nominal outside diameter (D) shown below are for commercial pipe in accordance with ASTM A53 and API 5L."</p> <p>A table was added that list the nominal outside pipe diameters for pipe sizes 3/4" thru 42"</p> <p>3. New: Nominal Wall Thickness</p> <p>(1) Nominal wall thickness (t) is shown in the Steel Pipe Stock Code Table below. Wall thickness for pipe not listed below, can be found in Pipe Fitters Handbook, ASTM A53, or API 5L.</p> <p>(2) If the wall thickness is not known, there are procedures contained in Part 192.109 that describes how to obtain the wall thickness through actual measurements.</p>	July 1, 2014	Janu- ary 1, 2016

(3) Additional wall thickness required to protect the pipe from anticipated external pressure or loads may not be included in computing design pressure.

These two items were added to provide additional information and to clarify the term "nominal".

7. Steel Pipe Stock Code Table

Gas Standards Committee and Gas Tech Engineering have updated the table to include all steel pipe that is currently stock by Ameren Illinois gas operations. Table was also updated to reflect going to all Min X52 Max X56 pipe for sizes larger than 2 inch.

8. Dual Coated Steel Pipe

Removed 8. D. that stated to contact Gas Standards and Materials personnel prior to ordering any dual coated pipe not listed in the Dual Coated Pipe table.

Removed the Dual Coated Pipe table since that pipe is now listed in the Steel Pipe Stock Code table in section 7.

STLP 2.02	<p>Casing Pipe Installation</p> <p>5. Gel Filled Casing - New</p> <p>5. A. "Gas Tech Engineering in consultation with Corrosion Control personnel will provide detailed plans and instructions on the gel filling procedures."</p> <p>A schematic of the fill operation is included.</p> <p>5. B.: "The enclosure and vent valve shown below are samples of the equipment that Gas Tech Engineering or Corrosion Control may want to be installed on the casing vent stacks."</p> <p>Picture of an enclosure for the probe and stack vent valve is included.</p>	<p>April 1, 2010</p>	<p>Janu- ary 1, 2016</p>
STLP 3.01	<p>Weld Fittings</p> <p>5. Caps</p> <p>Expanded and updated the table. Table is now divided into 3 section; Grade B, Y-52, and Y-60 caps. All the weld caps currently stocked by Ameren Illinois are listed.</p>	<p>July 1, 2014</p>	<p>Janu- ary 1, 2016</p>
STLP 3.02	<p>Reinforcing Saddles</p> <p>2. Installation</p> <p>2. A. Regular Type Reinforcing Saddle</p> <p>2. A. (4): Revised to, "Do not weld vent hole closed. Vent prevents gas build-up under the reinforcing saddle." Deleted "Plug vent hole with mastic."</p> <p>2. A. (5): New, "Coat with an approved coating material. See CORR 2.03 Coatings"</p>	<p>Janu- ary 1, 2014</p>	<p>Janu- ary 1, 2016</p>

2. B. Full Encirclement Reinforcing Saddle

2. B. (5): Revised to, "Do not weld vent hole closed. Vent prevents gas build-up under the reinforcing saddle." Deleted "Plug vent hole with mastic."

2. B. (6): "Coat with an approved coating material. See CORR 2.03 Coatings"

According to a manufacturer's information, reinforcing saddles are not designed to be a pressure containment fitting. The vent hole prevents gas build-up under the saddle.

Mastic is no longer an approved coating.

STLP 3.05	<p>Weld End Insulators</p> <p>Expanded and updated the tables to show all of the weld end insulators currently stocked by Ameren Illinois. Tables are divided into Class 300 and Class 600 rated insulators.</p>	<p>April 1, 2010</p>	<p>Janu- ary 1, 2016</p>
TAPS 0	<p>Table of Contents</p> <p>TAPS 2.02 - Updated</p> <p>5. Assemble Plugging Unit to Valve</p> <p>8. Remove Old Valve</p> <p>TAPS 2.05 - Updated</p> <p>3. Maximum Pipe Wall Thickness for AUTOPERF Tee</p> <p>TAPS 3.02 - Added</p> <p>7. Thread-O-Ring Fitting</p>	<p>Janu- ary 1, 2014</p>	<p>Janu- ary 1, 2016</p>
TAPS 1	<p>Requirements</p> <p>8 Testing</p> <p>8. B.: Revised to "A welded stopper fitting should be leak tested at the operating pressure of the line for a minimum of 10 minutes and the associated piping pressure tested in accordance with PTST 1. The final connections should be leak tested with soap solution at the operating pressure."</p> <p>Revised to be consistent with the revision in PTST 1.</p> <p>9. Tapping and Stopping/Completion</p> <p>9. E. Added "See PRES 2.03 Potential Over Pressurization or Service Interruption"</p> <p>"E. When using a bypass, or when there are two or more feeds into the area, a pressure gauge should be installed on the live side of each stopper fitting and monitored throughout the stopping operations. See PRES 2.03 Potential Over Pressurization or Service Interruption."</p> <p>When performing an operation where gas flow is being interrupted and there is a potential for an unplanned loss of service</p>	<p>July 1, 2014</p>	<p>Janu- ary 1, 2016</p>

to customers following the planning procedures in PRES 2.03 could minimize that potential.

TAPS 2.02	<p>Mueller No-Blow Valve Changer</p> <p>TAPS 2.02 was updated with the Mueller's most current instruction manual. There are some revisions in the instructions many of which provide a little more guidance. Pictures have replaced the drawing and in the pictures, the valve changer is oriented in a vertical position the same as it would be in actual operations. The instructions were revised to reflect this different orientation by using the words "up" and "down" instead of "forward" and "back". "Meter Valve" or "valve" replaces the term "stop" that was used throughout the previous instructions. Where lubrications is mentioned, added a reference to Mueller Rubber Stopper Lubricant.</p> <p>Training department already has the updated instructions.</p>	January 1, 2011	January 1, 2016
TAPS 2.05	<p>Mueller AUTOPERF Tee</p> <p>3. Maximum Pipe Wall Thickness for AUTOPERF Tee</p> <p>Revised the Notes under the table:</p> <p>1) "With the exception of the 1/2" x 1/2" H-18102, maximum wall thickness is 0.281 inches.</p> <p>2) This limits the use of the 3/4" AUTOPERF to:</p> <p>(a) Schedule 40 pipe and under and pipe sizes 6 inch nominal diameter and smaller; or</p> <p>(b) Schedule 80 pipe and under and pipe sizes 2 inch nominal diameter and smaller.</p> <p>3) Therefore; if the pipe wall thickness is not known or cannot be verified through testing or experience to be less than 0.281, a Mueller valve tee, H-17656, or Mueller curb valve tee, H-17800, should be used in place of the AUTOPERF tee on 6 inch nominal diameter pipe and larger transmission lines and high pressure distribution lines.</p> <p>4) Schedule 40, 6 inch nominal diameter pipe has a design wall thickness of 0.280 inches which is why if the wall thickness of a 6 inch pipe is unknown, an AUTOPERF tee should not be used. See STLP 2.01 for wall thickness of stock coded steel pipe."</p> <p>Attempted to better clarify the limitations of the AUTOPERF punch and the importance of knowing the pipe wall thickness before installing and AUTOPERF tee.</p>	January 1, 2013	January 1, 2016
TAPS 3.01	<p>Mueller Fittings</p> <p>3. Line Stopper Fittings</p> <p>Table for Use on Standard Wall Steel Pipe</p> <p>Removed the 4" x 3", H-17255, 275 psig, fitting.</p>	July 1, 2014	January 1, 2016

Fitting is no longer available.

Table for Use on Thin Wall Steel Pipe

Added 8", H-17275, 275 psig, Stock Code 19 33 040

TAPS 3.02	T.D. Williamson Fittings Added: 7. Thread-O-Ring Fitting A 2 inch fitting rated at 3600 psig, stock code 19 73 767	Janu- ary 1, 2011	Janu- ary 1, 2016
TAPS 4	Forms and Reference Materials Update Reference 01 - Mueller No-Blow Valve Changer Operating Instructions (Rev 01/15)	Janu- ary 1, 2014	Janu- ary 1, 2016
TURN 0	Table of Contents TURN 1: Added 2. Manufactured Homes TURN 2.01: Residential/Small Commercial Customer Revised section name 4. Existing Service Connect 6. Low Flow and Five (5) Minute Shut-in Test 8. Displacement of Air in Fuel Lines 11. Re-establishing Service After Flooding TURN 2.05 - Lighting Appliance - Water Heater Revised section name 5. Operational Check for Conventional Water Heater 6. Operational Check for High Efficiency Water Heater Added 7. Operational Check for Tankless Water Heater TURN 2.14 Changing Meter Valves New sections 3. Operating Property Line Valve 7. Installing Control Fitting Revised section headings 4. Changing of Meter Valves by Activating an EFV 5. Changing of Meter Valves by Excavating and Squeezing PE Pipe	Janu- ary 1, 2013	Janu- ary 1, 2016
TURN 1	Requirements	Janu- ary 1, 2011	Janu- ary 1, 2016

UNCONTROLLED IF PRINTED

The SMR Team rewrote this section to consolidate the information and separate out the Manufactured Homes. There are no significant changes to the requirements.

**TURN
2.01**

Residential/Small Commercial Customer

January 1,
2011

January 1,
2016

1. B. Merged the former 1. B and 1. C together

"All connected appliances shall be checked for proper installation and operation whenever the customer chooses to have Ameren Illinois relight the appliances. The installing contractor or his designee shall perform first time light-up on new or repaired appliances."

1. D. that addressed HUD Title 24 code was removed.

2. Care and Handling of Meters

2. B.: Revised to, "Meters being transported shall be in any upright secured position."

2. E.: Revised to, "Any meter that has been dropped or excessively jarred shall be tagged with an explanation and returned to the Meter Shop."

3. New Service Connect

3. A.: New inserted, "All new service connects require a check of regulator set pressure and lock-up."

3. B.: Revised to, "The gas meter should be installed at the same time as the service as long as the structure is framed out, the outlet of the meter bar should be:"

(1) Plugged or capped, and the meter valve left unlocked in the closed position or

(2) If customer piping and/or appliances have already been installed and a visual inspection of customer facilities has been performed to confirm appliance valves are closed or fuel line(s) is capped, gas meter bar may be connected to customer piping and the meter valve left unlocked in the closed position after a successful low flow and 5 minute shut-in test. Attach the Gas Meter Relight Tag."

Checking the regulator at the time installation is important to ensure the customer is getting the correct gas pressure and that the regulator is functioning properly. SMR Team provided additional guidance when a meter is installed for a new service.

4. Existing Service Connect (former Arriving at the Residence)

4. E. Customer Choice - Customer Relight Appliance

4. E. (1): Merged two previous sentences together, "When the customer chooses to relight their own appliances gas field personnel shall perform a low flow test and five (5) minute shut-in test on customer piping. See Low Flow and Five (5) Minute Shut-in Test section below."

4. E. (2): Revised to, "After the completion of a successful shut-in test, turn off the meter valve, leave meter valve unlocked and attach the Gas Meter Relight Tag."

4. E. (3): New inserted, "If customer is at home and available, the Meter Relight Tag should be given to the customer."

4. E. (4): New, "If customer is not available, leave a door hanger notifying customer their gas is ready to be turned on at the meter set."

SMR Team revised the wording to clarify the meter valve should be left unlocked and when customer is available the Meter Relight Tag should be given to the customer and not just hung on the meter set.

4. F. Customer Choice - Ameren Illinois Relight Appliances

4. F (1) (a): New, "Check to make sure access to the appliances is available. If not, leave a door tag advising customer to call to reschedule a connect."

SMR Team felt it is important to first check to make sure there are appliances available to relight before installing a meter.

4. F. (1) (b): Grammatical, added a reference to the Low Flow and 5 Minute Shut-in Test section.

4. F. (1) (c): Revised to, "If movement is detected, perform an investigation to determine source of movement." Removed "complete an inside leak investigation"

SMR Team felt there was no need to specify either an indoor or outdoor leak investigation. Gas field personnel would make the determination of what investigation was needed.

5. Low Flow and Five (5) Minute Shut-in Test

5. A.: Added "If odorant is not readily detectable, notify Gas Supervisor for a follow-up investigation."

Our insurance company representative recommended that our gas personnel check for sense of odor when they turn-on a customer's gas.

5. D. Using Gas Meter Test Hand

5. D. (1): Added "turn on gas", "Unlock meter valve, turn on gas. If fast movement on the test hand is detected turn the meter valve off and check for failed safeties and/or open fuel lines."

5. D (2): Revised to, "With the test hand on the upstroke perform the shut-in test. Refer to item (4) (a) and (b) below for meters equipped with remote meter reading modules."

According to the SMR Team members, the test hand needs to be on the upstroke.

5. D. (5), (5) (a): Just rearrange the original verbiage and put in bullet format

5. D. (5) (b): New, "If the customer is not home:

- Lock the meter valve and complete the OAS 6H screen, "Red Pin"
- Leave a door tag so the customer knows why their service is off and who to call to have service restored
- Document the finding in OAS."

SMR Team added to address situation when customer is not home.

5. D. (5) Note: Grammatical added Guidance on slight movement.

5. D. (6): New, "Soap meter set fittings and repair any leaks found."

SMR Team felt when gas field personnel leave the residence there should be no leaks on the meter set.

5. E. Using a Pressure Gauge Assembly

5. E. (7): Added "pressure gauge", "Turn the pressure gauge valve to the off position."

5. E. (9): Grammatical, "an investigation" replaced "a leak investigation", " If a slight loss in pressure is detected, ensure that the customer appliances have standing pilots and if not, perform an investigation and make any necessary repairs or issue a "Warning" tag."

5. E. (9) (a) & (b): New,

(a) If the customer is home:

- Ensure that customer appliances have standing pilots, if not
- Perform an investigation to determine source of movement
- Make simple repairs or Issue a "Warning" tag

(b) If the customer is not home:

- Lock the meter valve and complete the OAS 6H screen, "Red pin"
- Leave a door tag so the customer knows why their service is off and who to call to have service restored
- Document the finding in OAS.

SMR Team added this guidance to be consistent with the procedures under Using Gas Meter Test Hand.

6. Regulator Set Pressure and Lockup Check (Lockup replaced Shutoff)

6. A.: Revised to, "If the turn on includes a service regulator change, meter change or meter install, the turn on process will

also include a regulator set pressure and lock-up test using the following procedure."

6. A. (1) Note: Moved previous 6. C to a note under (1)

6. A. (4): Grammatical with word revisions, "The regulator should lock-up at no more than one (1) inch water column higher than the delivery set point of seven (7) inches water column."

6. A. (5): Grammatical with a couple of word changes, "Elevated delivery pressure customers will require a test gauge or better to set delivery pressure and check lockup of regulator. See METR 2.15 Elevated Meter Pressure and METR 2.22 Pressure Gauges."

7. Checking Fuel Lines

7. B.: Revised to, "If accessible, check where the fuel line enters the structure."

Previous 7. C & D. Removed checking access to appliances and verifying electric service in turned on since these are covered in other sections for TURN.

7. C. Revised tracing fuel lines to "Trace all visible fuel lines and check for code violations and hazards. See TURN 2.11 Warning Tag"

7. F.: Grammatical only, "Check each gas appliance for an accessible shut off valve or a listed gas convenience outlet installed in the same room/floor and within 6 feet of the appliance it serves. Existing appliances without a shut off valve may be lit, however a "Warning" tag should be issued."

7. G.: Grammatical only, "All water heaters and furnaces should have a sediment trap. Existing appliances without a sediment trap may be lit, however a "Warning" tag should be issued. Note: HUD does not require sediment trap (drip leg) at original appliances in Manufactured Homes."

7. H.: New, "Check for uncoated brass appliance connector(s) and replace when found. See TURN 2.15 Brass Appliance Connectors."

SMR Team revised some of the wording and merged some of the previous bullet points together. They felt that uncoated brass appliance connectors should be included.

8. Displacement of Air in Fuel Lines (replace Purging)

Throughout the section, "bleeding" replaced "purging".

8. C.: Grammatical, merged previous 8. C. & D., "The safest way to bleed a customer fuel line is at the gas stove but if not available can be bled at the water heater or furnace by holding down the pilot button to bleed the air through the pilot."

8. D.: Grammatical only added "any", "Overriding any appliance safety is an unsafe act and shall never be performed."

8. E. (4): Revised to, "When gas odor is first detected, tighten the fitting and soap test for leaks. With a gas detection instrument, check the area to ensure a hazardous atmosphere has not been created by bleeding the fuel line."

SMR Team wanted to clarify that once there is an indication of gas bleeding is when you check for leaks. The CGI should be used to check the surrounding area.

9. Lighting Appliances

9. A. Grammatical only, "When lighting a gas range complete a visual inspection and operational check of the range. See Lighting Appliance - Stove (Range) TURN 2.04."

9. B.: Grammatical only, "When lighting a water heater first verify that the water is turned on. If water does not come out of the hot and cold water faucet, do not light the water heater. Complete an inspection and operational check of the water heater. See Lighting Appliance - Water Heater TURN 2.05."

9. C.: Grammatical only, "When lighting a gas furnace complete an inspection and operational check of the furnace. See Lighting Appliance - Furnace TURN 2.06."

9. D.: Grammatical only, "Light any other existing gas appliances customer requests to be connected and complete an inspection and operational check of each appliance."

10. Crawl Spaces

10. B.: New, "If crawl space cannot be safely entered to light an appliance, notify Gas Supervisor so arrangements can be made to light the appliance or to get assistance."

SMR Team removed the list of hazardous atmospheric condition since they are contained in Confined Space section which is already reference in 10 A. and replaced the previous 10. C. and 10 D. with the new 10. B. statement.

11. Re-establishing Service After Flooding (Changed from Relighting Appliances After Flooding)

11. A.: Revised to, "If meter and/or regulator were underwater they should be checked for the presence water. If there is evidence of water, the component(s) should be replaced."

Clarified that if the meter and/or regulator had been underwater they needed to be checked and replaced if there is a presence of water.

12. Gas Meter Relight Tag

12. C.: Updated the relight tag with one that was revised in August 2015.

The SMR Team noted that previous tag did not tell the customer what to do if there was movement on the meter when the meter valve was turned on. The new tag tells the customer to turn the valve off and call Ameren Illinois.

13. Records

Revised by adding CSS, "Records associated with turning on gas service shall be recorded and maintained in Ameren Illinois CSS and OAS for at least two (2) years."

**TURN
2.02**

Large Commercial - Industrial Customer

January 1,
2013

January 1,
2016

2. Care and Handling of Meters and Correctors

2. B. Revised to be consistent with TURN 2.01, "Meters being transported shall be in an upright secured position"

5. Initiating Service

5. B.: Revised to, "Conduct a low flow test to ensure meter will register. Most large meter sets will have blow-down facilities downstream of meter that can be used to create flow through the meter. If odorant is not readily detectable, notify Gas Supervisor for a follow-up investigation."

Our insurance company representative recommended that our gas personnel check for sense of odor when they turn-on a customer's gas.

5. B.: Revised to, "Check meter set for leaks."

SMR Team removed "With customer valve closed" because in many cases there in no customer valve.

**TURN
2.04**

Lighting Appliance - Stove (Range)

January 1,
2011

January 1,
2016

2. Visual Inspection

2. A.: Revised to, "All new or replaced ranges shall have a shut off valve within 6 feet of the range and in same room."

2. B. (2): Revised to, "Existing ranges without a shut off valve may be lit, however a "Warning" tag shall be issued. See TURN 2.11 Warning Tag for list of Code Violations

Clarified the shutoff valve should be in the same room and a range without a shutoff valve is a code violation but can be lit.

3. Operational Check - Range Top Burners

Removed needing to check each burner air shutter, clean if necessary.

SMR Team indicated that accessing air shutter may not be possible or at best difficult. They felt that should be left to a qualified appliance repairman.

4. Operational Check - Oven Burner

4. B.: Revised to, "Equipment with an appliance safety, check for proper operation." Older model ovens may not have a safety.

4. B. (3): Revised to, "If you hear gas flowing through the orifice, the safety has failed. In this event, the range shall be turned off and a "Warning" tag shall be issued. See TURN 2.11

Warning Tag for Hazardous Conditions. No appliance shall be left in operation with a malfunctioning safety."

Clarification that Hazardous Condition is issued for a failed safety.

Removed needing to check oven burner air shutter, clean if necessary.

SMR Team indicated that accessing air shutter may not be possible or at best difficult. They felt that should be left to a qualified appliance repairman.

4. B (6): Revised to, "Turn on the oven burner control and check for proper ignition."

SMR Team wanted to remove all of the language regarding head position, main pilot and secondary pilot as they felt check for proper ignition was better.

4. C: Check for proper flame characteristics.

SMR Team removed the flame characteristic bullet points since they are covered in 5. Flame Characteristics.

5. Flame Characteristics

5. C. Revised to, "If the flame is lifting off of the burner or extending beyond the heating plate, there may be excessive gas pressure or combustion air."

Added "extending beyond the heating plated".

5. D.: New, "If proper flame characteristics cannot be obtained, issue a Warning Tag and isolate the appliance. See TURN 2.11 Warning Tag for Hazardous Conditions."

SMR Team added to be consistent with TURN 2.11 Warning Tag.

**TURN
2.05**

Lighting Appliance - Water Heater

July 1,
2012 Janu-
ary 1,
2016

4. Visual Inspection

4. C.: Grammatical only, removed "new or replaced water heaters" and made it simply "All water heaters". Did add that the shut-off valve should be in the same room.

C. "All water heaters must have a sediment trap before the control valve and a shut off valve within 6 feet and in the same room."

4. C. (1): Word change, "should" replaced "shall".

(1) "Existing appliances without a sediment trap or shut off valve may be lit, however a "Warning" tag should be issued."

4. E. (3): Added that high temperature flue vent tape can be used.

(3) "Single or double wall vent pipe joints are screwed or locked in place. High temperature flue vent tape can be used to secure the vent pipe joint."

4. F. (1): Added "no threads on outlet end".

(1) "The T&P Valve discharge pipe must be metal, terminates within 6 inches of the floor, and no threads on outlet end."

5. Operational Check for Conventional Water Heater - New name, Conventional Water Heater since high efficiency water heater and tankless heaters do not require the same checks.

5. A.: Simply rewording; "First, verify that the water is turned on. If water does not come out of the hot and cold water faucet, do not light the water heater."

5. C.: Added when inspecting burner assembly make sure it is suitable for operation. Removed "clean if necessary".

C. "Inspect condition of the burner assembly to ensure it is suitable for operation."

Team did not feel that our gas personnel should be responsible for cleaning the burner assembly. A qualified person should be performing that work and ensuring it is in suitable condition.

5. D: Remove the reference to Defective Equipment TURN 2.12 since it is cover in the Visual Inspection, 4. D.

D. "Check the appliance safety in the control valve for proper operation. See TURN 2.13"

5. F.: Reworded to "Verify that the pilot ignites the main burner completely. Check for proper flame characteristics."

"Caution: Position your head a safe distance away to prevent injury from possible flame rollout."

5. G.: Added "install inner door and jacket door"

G. "Turn the thermostat down to verify that the main burner shuts off, install inner door and jacket door."

Removed Former 5. L. "While the main burner is operating: Soap the fittings that connect the main burner and pilot tubes to the control valve"

5. I. (2): Revised wording to "Verify that the products of combustion are being vented outside through the use of such methods as: the hand, smoke from an extinguished match, etc."

Team revised to so other methods for verifying products are venting other than extinguished match could be used.

7. Operational Check for Tankless Water Heater - New section added.

A. "Water heaters shall be checked for operation by turning on the hot water faucet to allow the water heater to operate.

B. Then by turning the turning on the hot water faucet off to verify the water heater responds by shutting off.

C. Verify unit is venting properly."

SMR Team added procedures for tankless water heaters since they are becoming more common installations.

**TURN
2.06**

Lighting Appliance - Furnace

Janu-
ary 1,
2011

Janu-
ary 1,
2016

3. Visual Inspection

3. D.: Added "in same room", "All new or replaced furnaces shall have a sediment trap before the control valve and a shut off valve within 6 feet and in same room. Original furnaces in HUD manufactured homes may not have a sediment trap upstream of the furnace but should have a shut off valve."

Former 3. F. Removed checking model number for defective control valves

3. G.: Revised to "Inspect the furnace vent system: See Combustion and Ventilation Air TURN 2.08. See TURN 2.11 Warning Tag for Code Violation or Hazardous Conditions."

Remove 3. G. (1) thru (7) that listed venting items to inspect since they are in TURN 2.08.

4. Operational Check

4. B.: Added "if not previously done", "Turn the thermostat up as high as possible, if not previously done, and check the safety in the control valve for proper operation. See Appliance Safety and Thermocouple Tests TURN 2.13."

4. C. Revised to "Verify that the appliance valve is in the "off" position.

Note: Use the electric switch for the furnace control valve if available to control the ignition."

4. D.: Revised to "Light the pilot and turn the furnace control valve to the "on" position. Turn on the electric switch if utilized. Observe that the pilot ignites the runner tube, and that the runner tube ignites the burner(s) end to end."

4. F.: Added "characteristics", "With the blower off, continue to observe the flame characteristics from each burner."

Moved flame characteristic from 4. F.(1) & (2) to 6. Flame Characteristics

4. H.: Added "Verify that the products of combustion are being vented outside through the use of such methods as: the hand, smoke from an extinguished match, etc. If the furnace is not venting properly the furnace shall be shut off and a "Warning" tag issued."

4. L.: Deleted "combustion doors", "Re-install the furnace doors and return the thermostat to a normal setting for the season."

UNCONTROLLED IF PRINTED

4. M.: Deleted "combustion doors", "No furnace shall be left in operation without the furnace doors in place."

6. Flame Characteristics

6. C.: Revised to "If the flame is lifting off of the burner, there may be excessive gas pressure or combustion air."

Removed adjusting gas pressure at appliance or adjusting burner orifice.

6. D. & 6. E. are the flame characteristics from 4. F. (1) & (2).

6. F.: New, "If proper flame characteristics cannot be obtained, isolate the appliance and issue a Warning Tag, See TURN 2.11 Warning Tag for isolating an Appliance and Hazardous Conditions."

**TURN
2.09**

Venting

Janu- ary 1, 2011	Janu- ary 1, 2016
-------------------------	-------------------------

3. Venting Code

3. K. Gas dryers...

3. K. (1): New item: "Dryer exhaust shall not be connected into any gas vent, chimney wall, ceiling, attic, crawl space, or a concealed space of a building."

This is language is from the NFPA 54 code. NFPA 54 requires that gas clothes dryer be exhausted to the outdoors since the exhaust contains both combustion and moist air.

3. K. (2): Significantly revised to address the use of flexible metal vent material as a transition duct between the dryer and rigid exhaust duct.

(2) "Exhaust ducts shall be a rigid or UL listed flexible metal vent material. Do not use plastic or foil type vent material.

(a) Rigid metal duct material is required when vent passes through walls, ceiling or floors. The space around the duct shall be sealed with a noncombustible material.

(b) Flexible metal vent can be used as a transition from the dryer to the rigid metal duct.

(c) Flexible metal ducts are acceptable only if they are accessible for cleaning.

(d) Flexible metal vents must be fully extended and supported in the final dryer location. Remove excess to avoid sagging and kinking that could reduce airflow and poor performance.

(e) Flexible metal vents are not to be installed in or through enclosed walls, ceilings or floors."

Team added this material which comes from the NFPA 54 Code.

3. K. (3): Revised the duct assembly requirements to match NFPA 54.

(1) "Exhaust ducts shall not be assembled with screws or other fastening means that extend into the duct. External clamps or tape, such as duct tape, must be used to make connections."

Per NFPA 54, external clamps or tape must be used to make the joint connects for dryer exhaust.

**TURN
2.11**

Warning Tag

January 1,
2014

January 1,
2016

1. C.: Added "A copy of the Warning Tag is in TURN 4." This was added to eliminate the need for "See TURN 4" throughout the document.

2. Inspecting Customer Piping and Appliances

2. A.: Added "Part 3280 Manufactured Home Construction and Safety Standards" to identify where in the HUD Title 24 Code the standards are located.

4. Isolating an Appliance

4. A.: Revised to "Gas field personnel may isolate a hazardous condition at the at the appliance control valve, customer owned valve, meter valve or outlet of meter set." This is consistent with language in LEAK 2.01.

4. B.: Added "plug/cap outlet of meter", "Gas field personnel may shut-off the meter valve, disconnect/cap the meter set outlet, or plug/cap outlet of meter."

4. C.: Revised to "If the hazard is isolated at the meter valve, then the valve shall be locked, Red Pin, complete OAS 6H screen, and issue a Warning Tag". Gas field personnel should follow up to unlock the valve so customer or HVAC/plumbing contractor can relight the appliance(s)."

5. Code Violations

5. C. (2): Revised to "Advise customer to contact a qualified HVAC/plumbing contractor to have the code violation corrected."

5. C. (4): Revised to "Request that the customer sign the tag. If the customer refuses to sign the tag, turn tag into the Gas Supervisor."

5. D. Examples of Code Violations

5. D. (1): Added "damaged", "Deteriorated or damaged fuel line that does not adversely affect appliance operation."

5. D. (3): Added "improperly installed", "No sediment trap or improperly installed sediment trap on a furnace or water heater."

5. D. (6): Added "at least", "Horizontal vent pipe that is not sloped uphill at least 1/4" per foot."

5. D. (10): Added "interior wall", "Single wall vent pipe installed through floor, interior wall, exterior wall, or attic."

UNCONTROLLED IF PRINTED

5. D. (13): New, "Appliance operating properly but is located in an insufficiently sized confined space."

5. D. (15): New item that addresses CSST installation:

(a) CSST passing through furnace cabinet without protection from chafing

(b) CSST passing through masonry wall/foundation without sleeve

(c) CSST connected directly to outlet of meter set

(d) An exposed metal section of tubing outside

(e) Non pre-sleeved CSST installed underground without conduit

(f) Conduit vented inside

(g) Conduit not vented outside

(h) CSST connected directly to moveable gas appliance

The CSST SMR Team and the TURN SMR team recommended these items be added as Code Violations. CSST issues had not been previously addressed.

6. Hazardous Conditions

6. C. (3): Revised to, ""Advise customer to contact a qualified HVAC/plumbing contractor to correct the condition(s) as soon as possible."

6. C. (4): Revised to "Request that the customer sign the tag. If the customer refuses to sign the tag, turn tag into the Gas Supervisor."

6. D. Examples of Hazardous Conditions

6. D. (2): Added "valve", "A gas line/valve that is not capped or plugged."

6. D. (7): Moved from Code Violation, "Gas piping installed through air duct, gas vent, or chimney."

6. D. (8): Revised to, "Gas Appliance in a garage or in adjacent spaces opens to the garage where the burners and ignition devices are not at least 18" above the floor.

Exception: Water heater is listed as Flammable Vapor Ignition Resistant."

6. D. (9): Added broken chamber sight glass, "Missing combustion door (one or more) or broken combustion chamber sight glass."

6. D. (13): Moved from Code Violation, "Grills/louvers installed in the cold air return to the furnace in a confined space."

6. D. (15): Moved from Code Violation, "Deteriorated or damaged fuel line that prevents proper appliance operation."

- 6. D. (18): Moved for Code Violation, "Water heater with a reduced T&P valve or reduced discharge pipe."
- 6. D. (21): New, "Flexible plastic or thin foil vent tubing used to vent gas dryer."
- 6. D. (24): Revised to, "Vent pipe that is smaller than the appliance draft hood outlet or flue collar and does not meet the Vent Downsizing requirement listed in the NFPA 54 Code 13.1.2."
- 6. D. (25): Revised to, "Category 1, natural draft vent appliances sharing a common vent with Category 3 or Category 4 appliance."
- 6. D. (28): New, "Single wall vent pipe installed through unprotected combustible material(s), i.e floor, wall, ceiling, etc"
- 6. D. (30): Added "gas", "Plastic gas pipe used inside a structure or outdoors above ground."
- 6. D. (31): Added "mobile home", "An appliance installed in but not approved for mobile home or manufactured housing."
- 6. D. (33): New, "Vent-free appliance larger than 10,000 BTU in bedroom or 6,000 BTU in bathroom. NFPA 54 Code 10.23.1."
- 6. D. (35): New, "Commercial range must have a listed connector and restraint if on casters. NFPA 54 Code 10.12.6."
- 6. D. (36): New, "Inside regulator not vented properly. If designed with a vent limiter, the limiter must be facing upward."

SMR Team felt there were some previous Code Violations that should be moved to Hazardous Conditions and that there were some items that had not been previously addressed.

7. Customer Mailing

7. A.: Revised to, "If the customer refuses to sign or is not available the "Warning" tag, the Gas Supervisor or Ameren Illinois designee will send a letter with a copy of the original "Warning" tag to the customer of record addressing the code violation(s) or hazardous condition(s) encountered. In these cases, when the hazardous condition is entered on the customer's account the official letter can be printed from the Ameren Illinois CSS system. The letter is not signed by anyone at the generating location since the letter contains Ameren Illinois Customer Services contact information."

7. B.: Revised to "Sample of the CSS generated letter to customer:"

8. Records

- 8. A.: Replace "should" for "shall", "All Warning tag originals should be maintained by each Division for a period of 3 years."
- 8. B.: Added "Warning tag(s)", "Customer mailings should be filled with the original Warning tag(s) for future reference."

**TURN
2.14**

Changing Meter Valves

July 1,
2012

Janu-
ary 1,
2016

1. A.: Increased options for changing meter valves from five to seven methods. "This procedure identifies seven approved methods for changing meter valves while the service line is under pressure."

Moved the approved methods into a list format:

1. B.: The approved methods are:

- (1) Using meter valve changer, No-Blo
- (2) Operating property line valve
- (3) Activating an excess flow valve (EFV)
- (4) Excavating and squeeze polyethylene pipe
- (5) Excavating the service tee and closing the punch
- (6) Installing a control fitting
- (7) Changing a meter valve "on-the-fly" under specified pressure conditions.

Added Operating property line valve and installing a control fitting.

3. Operating Property Line Valve - New

A. Access and turn off the valve.

B. Verify the gas has been shut-off by slightly opening the meter valve.

4. Changing of Meter Valve by Activating an EFV - Added "Activating"

4. A. (5): New inserted, "Install vent piping to point the flow of gas away from the structure."

4. C.: New, "If the EFV fails to trip, notify Gas Supervisor for follow up investigation and corrective action if required. Utilize one of the other procedures to shut-off gas."

Removed the requirement for gas field personnel to wear their flash suit when performing this procedure.

SMR Team felt these two items needed to be added to provide additional guidance. The team also felt since the by-pass flow of gas is minimal there was no need for a flash suit.

5. Changing of Meter Valves by Excavating and Squeezing PE Pipe - Added "Excavating"

5. B.: Revised to, "In this situation or where this option is desired, the PE service line may be excavated and squeezed off. See POLY 2.02 Squeeze Off

7. Installing Control Fitting - New

A. Install fitting in accordance with procedures in TAPS 1

- B. Tap and stop fitting in accordance with manufacturer's instructions.
- C. Verify the gas has been shut-off by slightly opening the meter valve.

8. Changing of Meter Valves "On-The-Fly"

8. A.: Revised to "Changing a meter valve "on-the-fly" may be performed as outlined in the procedure below if conditions do not permit the use of a NO-BLO meter valve changer, utilizing an EFV, squeezing a polyethylene pipe, operating service tee or installing a control fitting."

SMR Team wanted to reinforce that utilizing "On-The-Fly" method is a last resort procedures when none of the others are possible.

**TURN
2.15**

Brass Appliance Connectors

Janu-
ary 1,
2011 Janu-
ary 1,
2016

3. Uncoated Brass Connectors Found In Service

3. B.: Revised to "Uncoated brass connectors found should be replaced by the gas field personnel with a stainless steel connector supplied by Ameren Illinois. The gas field personnel should explain to the customer why the replacement is necessary."

It is important that the customer be told of the potential hazard associated with these connectors and that is why the connector needs to be replaced.

3. C.: Replaced "will be" with "should be", "An approved appliance valve should also be supplied and installed with the stainless steel connector if such a valve is not already in place."

3. E." Replaced "completed" with "issued", "If the customer should refuse to have the uncoated brass connector replaced, a "Warning" tag shall be issued informing the customer the uncoated brass connector may be dangerous and that they refused to have the connector replaced free of charge."

3. G.: Revised to "The gas field personnel should properly discard the uncoated brass connector at their local headquarters or other Ameren Illinois facility."

**VALT
0**

Table of Contents

Janu-
ary 1,
2011 Janu-
ary 1,
2016

VALT 1 2.: Change the section name to Vault Inspection Requirements from Maintenance Requirements

VALT 2.01 2.: New section Vault/Pit Hazard Assessment and General Entry Requirements

**VALT
1**

Requirements

Janu-
ary 1,
2011 Janu-
ary 1,
2016

1. A.: Added "containing gas equipment".

A. "This section addresses the requirements for inspecting vaults or pits along with work to be performed in vaults or pits containing gas equipment."

By specifying the vault/pit contains gas equipment, PHMSA becomes the regulating agency not OSHA.

1. B.: Moved definition of Vault from VALT 2.01

B. "Vault is a subsurface structure housing piping and piping components that has a volumetric internal content of 200 cubic feet or more and constructed in such a manner that would allow gas to accumulate."

1. C.: Moved definition of Pit from VALT 2.01

C. Pit is a subsurface structure housing piping and piping components that has a volumetric internal content of less than 200 cubic feet and constructed in such a manner that would allow gas to accumulate

2. Change section name to Vault Inspection Requirements

Former 2. E.: Removed the statement regarding OSHA agreeing that PHMSA would regulate hazards associated with natural gas.

In CONF 1 there is already statement that PHMSA will regulate vaults/pits containing gas equipment.

**VALT
2.01**

Inspecting Vaults and Pits

1. B.: Revised to: "Refer to VALT 1 for distinction between a vault and pit.

Move the definitions that were originally in this section to VALT 1.

2. Vault/Pit Hazard Assessment and General Entry Requirements - This is new section that was added. It contains many of the items in the previous VALT 2.01 just rearranged.

2. A. (3): Added "Gas field personnel shall use only intrinsically safe equipment, or tools while in a vault or pit if a hazardous atmosphere, gas-in-air concentration of 30%LEL or greater, is present."

Added these safety items based on GTPC guidelines for Part 192.749 vault maintenance.

2. A. (5): Added "Compressed gas cylinders should not be brought into vault or pit"

These were safety items added by the Safety Specialists.

2. B. Air Testing - New section added

2. B. (1) The atmosphere of each vault or pit shall be tested 2.

B (1) (c): Added "Check the vault atmosphere at all levels of the vault or pit, using an extension hose connected to the gas

De-
cem-
ber 1,
2014

Janu-
ary 1,
2016

detection equipment. Allow the instrument readings to stabilize at each level before lowering the probe further."

Added these safety items based on GTPC guidelines for Part 192.749 vault maintenance.

2. B. (2): Added "If there is a possible source or indication of toxic gasses such as carbon monoxide or hydrogen sulfide, the atmosphere should be tested for the specific gas(s) prior to allowing anyone to enter."

Normally, the vault/pit atmosphere only needs to be tested for combustible gas and oxygen deficiency unless there is an indication the presence of other gases. However, current language implies checking all vaults/pits for CO.

2. B. (3): Added "Acceptable entry atmospheric concentrations, without additional PPE required, are as follows:

(a) Oxygen content between 19.5% and 21.5%.

(b) Gas-in-air concentration < 30% LEL.

(c) Carbon monoxide concentration < 30 ppm.

(d) Other toxic gas concentrations, below established threshold levels. Contact Safety Specialist for threshold level if necessary.

2. B. (4): Added "If acceptable entry conditions are not met the space should be ventilated. Forced air ventilation is generally preferred over exhaust ventilation."

2. B. (5): Added "Re-test the vault or pit atmosphere after ventilation to determine if it was adequate to bring concentration to within acceptable entry conditions"

Clarification on what is an acceptable entry atmosphere and a corrective measure that should be taken.

2. C.: Totally new section: Space Classification

C. "Space Classification

(1) Each vault or pit must be classified as either a Permit-Required Confined Space (PRCS) or non-PRCS, based upon the visual inspection and air testing results.

(2) If serious safety or health risks other than natural gas are present in the space (engulfment, entrapment, atmospheric other than natural gas, mechanical, electrical, etc.), and cannot be eliminated through ventilation or other means, the space must be considered a PRCS, and all entry must be in full compliance with the OSHA PRCS standard (29 CFR 1910.146), especially in regards to PPE, standby personnel, and retrieval/rescue procedures.

(3) If the vault or pit is classified as a PRCS contact a Safety Supervisor."

This section addresses whether a vault/pit is either a Permit-Required Confined Space (PRCS) or a Non-PRCS. The determi-

UNCONTROLLED IF PRINTED

nation is based on visual inspection and air testing results. If natural gas is the only hazard or risk based on the air testing, then the vault/pit would not be classified as a PRCS.

2. D. Totally new section: Entry Requirements Based on Air Testing

D. "Entry Requirements Based on Air Testing

(1) If, after ventilation, gas-in-air concentration < 30% LEL, but oxygen is not between 19.5% to 21.5% or the CO is more than 30 ppm, or toxic gas concentrations are above established threshold concentrations, then entry will not be performed until further measures are taken to improve air quality to acceptable concentrations.

(2) If, after ventilation, the only atmospheric hazard in the space is natural gas, then entry procedures must be in accordance with the VALT 2.01 2. B.(3) of this section.

(3) While employee(s) is in the vault or pit, the vault or pit atmosphere will be continuously monitored"

If there are other hazards; oxygen deficiency, excessive CO, or other toxic gases, additional corrective measures must be taken to bring the atmosphere into acceptable range.

3. Working in Gaseous Atmosphere

3. A.: " Revised to "For atmospheres where natural gas is the only atmospheric hazard, the following procedures will be followed:

(1) If gas-in-air concentration is 30% LEL or more but less than 60% LEL, then entry may be made with Level 1 PPE. See WWBG 2.01

(2) If gas-in-air concentration is more than 60% LEL, and the facility cannot be taken out of service, entry may be made only with Level 2 PPE: a Level 2 suit, supplied-air respiratory protection, and a full-body harness and retrieval device. See WWBG 2.01"

This section was completely revised by the SMR team. In order to eliminate confusion the team felt we should reference WWBG section of the O&M and use the same language from that section. The important point is these procedures only apply when natural gas is the only atmospheric hazard.

4. General Vault and Pit Inspection Items

4. A.: Added "through monitoring with CGI"

A. "If gas is found in the vault or pit through monitoring with a CGI, piping and equipment should be checked for leakage. Any leaks found should be repaired."

Reinforces that the vault/pit atmosphere is to be checked with CGI.

4. F. Added "ClickMobile"

F. "Report all deficiencies found on the Regulator Station or Valve Inspection forms within ClickMobile."

5. Vault Inspection Items

5. I.: Added "ClickMobile"

I. "All deficiencies found during the inspection shall be reported on the appropriate Regulator Station or Valve Inspection forms within ClickMobile."

The above two items were missed in the December 1, 2014 update that was devoted to the GCAM process.

VALV 0	Table of Contents	Janu- ary 1, 2011	Janu- ary 1, 2016
	Reference Materials Added		
	Reference 05 - Cameron Type 31 Install, Operate, Maintenance Manual		
	Reference 06 - Grove B5, 4B, 4C Installation, Maintenance Manual		
	Reference 07 - Cameron B5 Installation, Maintenance Manual		

VALV 2.01	Valve Installation	De- cem- ber 1, 2014	Janu- ary 1, 2016
	1. D.: Added "Distribution Design Center", "Gas Engineering or Distribution Design Center will provide the designation and location of emergency and non-emergency valves within the distribution system."		
	5. Non-Emergency Valves		
	5. C.: Revised to : "The location of these valves will be determined by the Gas Engineering, Gas Supervisor, Distribution Design Center or Gas Tech Engineering." Added the Distribution Design Center.		
	5. D.: New inserted, "As a guideline for placement of these valves, serious consideration should be taken for placement of a valve(s) in the following locations:		
	(1) An entrance to a subdivision where a distribution main being installed.		
	(2) Entrance to a dead end street with a cul-de-sac that is not part of a subdivision.		
	(3) Entrance to a subdivision cul-de-sac that has more than thirty (30) houses.		
	(4) Within a main segment such that no more than three hundred (300) customers would be isolated by a set of valves."		
	Gas Standards Committee developed consideration guidelines on where valves should be located when designing a project that involves installation of new or replacement gas main/ pipelines.		

VALV 2.03	<p>Plug Valve Maintenance</p> <p>9. Plug Valve Lubrication Extension</p> <p>9. H.: Revised to "Protect rod and all exposed threads with a cold applied tape, i.e. cold applied wax tape." These new or updated procedures will be published in the next O&M update."</p> <p>The welders, Company and contract, are required to follow approved welding procedures (WPSs). It is not necessary for them to have the qualifying procedures (WPQRs) thus the reason for separating the two. During the course of the year, situ-</p>	January 1, 2014	January 1, 2016

ations/conditions arise that may require development of new procedures for a specific project. The use of these new procedures may not correspond to O&M update schedule. When a new procedure is approved by Gas Standards & Procedures personnel, that procedure may be utilized.

3. E.: New "Contractor(s) or fabrication shop(s) may have their welding procedures reviewed and approved by the Gas Standards and Procedures group. See WELD 2.03 Construction of Pipelines and Piping Systems."

Approved contractor or fab shop welding procedures will not be included in WELD 4 but will be kept by the Gas Training section and Gas Standards & Procedures section.

**WELD
2.01**

Safe Welding Practices

Janu- Janu-
ary 1, ary 1,
2014 2016

5. Supervisor's Role

5. A. (5): Added reference to CONF 1; "Determine whether the work will be conducted in a confined space in accordance with Company procedures. See CONF 1"

8. Protection of Personnel

8. A. (3): New "Welding in Excavations: When welding in an excavation/trench, all requirements on the Excavation Safety (EXCV) section shall be followed to protect workers from excavation related hazards, including cave-ins. Welders working in excavations will also be protected from accumulation of welding fumes as specified in the ventilation section below."

Added to address welders working in an excavation.

9. Ventilation

9. A.: Remove "brazing"; "Adequate ventilation (natural or mechanical) must be provided for all welding and cutting related operations".

9. C.: Revised to: "The atmosphere of the area where welding or cutting is to be performed should be checked with a gas detection instrument, as necessary, to ensure the atmosphere is non-hazardous and is not oxygen deficient. The check must always be conducted when performing these operations in confined spaces."

Added checking the atmosphere when welding in a confined space. Remove brazing since Ameren Illinois gas operations does not do brazing.

9. E. Mechanical Ventilation

(1) Ameren Illinois Safety Specialist should be contacted when a question arises regarding the requirements for mechanical ventilation.

(2) Mechanical ventilation must be used when welding and cutting indoors or in confined spaces and must be used as

necessary in excavations in order to maintain adequate air quality.

(3) Mechanical ventilation consists of general room ventilation or local exhaust ventilation.

(4) Local exhaust ventilation is preferred, with the following precautions taken:

(a) The system shall be of sufficient capacity and so arranged as to remove fumes and smoke at the source and keep the concentration of them in the breathing zone within safe limits.

(b) Local exhaust ventilation shall consist of freely movable hoods intended to be placed by the welder as close as practical to the work.

(c) The exhaust from the system must be situated to insure that the welding fumes and smoke are not dispersed to other work areas or re-entrained into the make-up air of the building.

(5) If general mechanical (general room) ventilation is used, the following conditions must be met:

(a) Space of more than 10,000 cubic feet, per welder in an enclosed area (i.e., a building).

(b) Ceiling height is more than sixteen (16) feet.

(c) Welding is not done in confined space such as tanks, etc.

(d) Welding space does not contain partitions, balconies, or other structural barriers that significantly obstruct cross ventilation.

(e) The welding area is maintained generally clear of visible welding fume and the welding area is sufficiently separated from adjoining areas of the building to prevent welding fumes from moving into those areas

Expanded this section to provide more requirement details for mechanical ventilation. Safety Specialist provided this information based on OSHA requirements.

10. Equipment

10. C. Hoses

10 C. (5): Added "Cutting and welding torches should be fitted with an anti-flashback check valve."

Safety item added.

10. E. Electrode Holder

10. E. (3): Added a single word "electrode"

(3) The Ameren welding inspector may require the use of insulated electrode holders for specific applications.

WELD 2.02	<p>Welder Performance Qualifications</p> <p>5. Qualification Categories (Initial Test)</p> <p>5. B. (3): IN-SERVICE replaced MAINTENANCE</p> <p>5. C. Welding Procedure Qualification Report (WPQR). Ameren Illinois' welding procedures' (WPS's) are included in WELD 4. However, new or updated WPS's may be approved subsequent to this publication, see WELD 1."

Between O&M updates, new welding procedures may need to be qualified or updated and implemented before the next update.

4. F.: New: "A contractor or fabrication shop may submit their own procedures for review by Ameren Illinois' welding instructor and approval by the Gas Standards and Procedures personnel. The approved welding procedure shall be adhered to at all times while the contractor or fabrication shop is performing welding operations for Ameren Illinois. A copy of the approved welding procedure(s) will be maintained by Ameren Illinois' welding instructor and the Gas Standards and Procedures group."

Ameren Illinois can approve a contractor's or fab shop's welding procedure for use on an Ameren project. These procedures will be maintained separately and not included WELD 4.

5. Welder Qualification

5. D.: Replaced "section 6 of API 1104" with "Qualification of Welders" in API 1104 and "maintenance welding" with "In-Service Welding".

6. Welding Process and Controls

6. C. New, "The pipe and/or fitting(s) must be free of moisture prior to and during welding operation."

7. Pre-alignment Inspection

7. B. Pipe Wall Discontinuities

7. B. (4) (a): Added "For API 5L wall thickness tolerances see Table 9 and Table 11 in WELD 2.10 Arc Burn Removal."

(4) Gouges, Grooves, Scratches and Notches

(a) "All gouges, grooves, scratches and notches that exceed the requirements of API 5L shall be eliminated by grinding, providing the wall thickness is not reduced to below the minimum requirements. For API 5L wall thickness tolerances see Table 9 and Table 11 in WELD 2.10 Arc Burn Removal."

8. Welding Requirements

8. B. Line-Up and Fit-Up of Butt Welds, majority of this section was rewritten.

B. Line-Up and Fit-Up of Butt Welds

(1) External line-up or internal clamps should be used to assure proper alignment for butt welds greater than two (2) inch nominal diameter, unless it is impractical due to dimensional differences such as flange or fittings to pipe, fitting to flange,

(etc.) then the pipe will be firmly supported to prevent movement.

(2) External line-up clamps (for butt welds) may be removed before the complete root bead is applied, provided the line pipe is not unduly stressed and it is securely supported and tack welded.

(3) Root bead segments shall be approximately equal length segments spaced around the circumference of the joint.

(4) When conditions make it difficult to prevent movement of the line pipe, or if the line pipe weld will be unduly stressed, then approximately fifty percent (50%) of the root bead should be uniformly spaced around the circumference of the pipe before the line-up clamp is released or removed.

(5) The clamps shall remove out-of-roundness and shall provide a uniform joint fit-up. High-low conditions on equal wall thickness pipe should not exceed three-thirty seconds (3/32) of an inch.

(6) When an internal alignment clamp is used for achieving alignment it shall be held firmly in position until the root pass is approximately ninety percent (90%) completed and the line pipe has been properly supported.

(7) Root Opening shall have a uniform spacing throughout the circumference of the joint. The spacing shall be in accordance with the approved welding procedure. Minor root opening adjustments are permitted after installation of a root bead segment to maintain root opening tolerances. Adjustments to the root gap greater than 1/8th inch on weld assemblies is not allowed unless the root bead segment is replaced.

The welding trainer and welding SMR team revised this section in response to issues regarding when line-up clamps can be removed raised by an ICC inspector.

8. F. Transition Joints

8. F.(1): Added "not less than 12 inches minimum"

(1) "The transition between pipe ends of unequal thickness shall be by mechanical tapering, or by welding in accordance with ASME B31.8 or by means of a prefabricated weld transition fitting not less than twelve (12) inches minimum or one and one-half (1 1/2) pipe diameters in length. See STLP 3.03 Weld Transition Fittings"

(1) New: "When a transition taper is required in the pipe and/or fitting, it shall be made using a mechanical end preparation machine or by manual preparation. Taper shall meet the requirements contained in unequal wall thickness section below."

Added to be in compliance with API 1104.

8. P. Filler and Finished Beads

8. P. (4): Added "and inspected", The completed weld shall be thoroughly brushed, cleaned and inspected."

8. Q. Inter-pass Cleaning and Removal of Visual Defects

8. Q. (1): Replaced "buffer wheels" with "wire wheels:.

(1) "Each pass of the weld metal shall be cleaned of slag or remaining flux using hand or power tools with wire wheels before a further pass is applied."

8. R. Arc Burns (DOT 192.309)

8. R. (1): Added reference to WELD 2.10 Arc Burn Removal.

(1) "Arc burns shall be eliminated in accordance with the approved arc burn removal procedure. DOT 192.309 (c). See WELD 2.10 Arc Burn Removal"

8. R. (2): Removed Tables 9 and 11 and referenced their location in WELD 2.10.

(2) In the event that the remaining wall thickness is less than the minimum specified in API 5L, 43rd edition Table 9, (for pipe manufactured before 2009) or 44th edition Table 11 (for pipe manufactured in 2009 and after) shown herein, the pipe shall be cut-out as a cylinder. See WELD 2.10 for Table 9 and Table 11.

8. U. Pipe Coating Protection, replaces "shall" with 'should"

"The pipe coating (if any) should be protected from weld spatter and mechanical abrasion during welding."

8. W. Identification of Welders, changed from Identification of Multiple Welders. Replaced "shall" with "should".

"Each welder should mark the weld or section of weld for which he has been responsible with the identification assigned to him by the welding inspector using a weatherproof permanent ink or paint marker."

8. X. Weld Repairs

8. X. (1); Replaced "radiographic" with "non-destructive" and removed "welding inspector may require".

(1) "Depending on the extent of defective weld areas found during nondestructive examination, the weld may be cut-out as a cylinder of pipe or be repaired in accordance with the following limits:"

8. X. (2): Deleted "in a manner acceptable to the welding inspector".

(2) Before the above repairs are made, the defective area shall be entirely removed to clean metal by grinding."

8. X. (4): Revised to:

(4) "All repair cavities shall be not less than 2 inches in length and repaired with a minimum of two passes."

UNCONTROLLED IF PRINTED

8. X. (8): Removed Section 9 of API 1104. Latest Edition"

(8) "All repairs shall meet the Acceptance Standards for Non-destructive Testing of API 1104."

8. Z Revised to "When welding on pipe diameters greater than or equal to 16 inches two welders should be used to complete the root bead and hot pass. One (1) welder can then complete the fill and cap passes."

8. AA.: "On pipe diameters less than 16 inches one welder may be used."

Welding SMR team made this revision since it is allowed in API 1104.

9. Inspection of Welds

9. B. Visual Weld Inspection, replaced "Section 9.0, API 1104, Latest Editions".

"Visual inspection of welds will be conducted to insure that the welding is performed in accordance with the approved welding procedure (WPS) and the welding meets the requirements of this specification including Acceptance Standards for Nondestructive Testing of API 1104. See WELD 2.05 Visual Inspection"

9. D. Standard of Acceptability, replaced Section 9.0 API 1104 (Latest Edition).

"Unless specified otherwise, the standard of acceptability for the radiographic film interpretation of all regulated pipeline or piping system welds shall be Acceptance Standards for Non-destructive Testing of API 1104."

**WELD
2.04**

In-Service Welding (formerly Maintenance Welding)

Throughout this section the term "maintenance welding" has been replaced with "in-service welding".

Janu-
ary 1,
2013

Janu-
ary 1,
2016

6. Welding Procedures

6. (3): Revised by adding reference to WELD 4, "The in-service welding procedure (WPS) to be used will be those contained in WELD 4 and designated with the "IS" prefix, unless specified otherwise."

**WELD
2.06**

Radiographic Examination

2. Codes and Standards

2. B.: Added "accepted by PHMSA"

B. "American Petroleum Institute (API), Standard 1104, Latest Edition accepted by PHMSA, "Standard for Welding Pipelines and Related Facilities."

2. C.: Added "accepted by PHMSA"

Janu-
ary 1,
2012

Janu-
ary 1,
2016

C. "American Society of Nondestructive Testing (ASNT), Recommended Practice No. SNT-TC-1A, Supplement A, Radiographic Testing Methods, Latest Edition accepted by PHMSA."

2. D.: Added "accepted by PHMSA"

D. "American Society for Testing Materials (ASTM), E-E94-04 - Radiographic Testing, Latest Edition accepted by PHMSA."

3. Radiographic Inspection Personnel

3. A. Personnel Qualification

3. A. (1): Added " shall be qualified and certified to Level 1, II, or III of ASNT SNT-TC-1A, Latest Edition accepted by PHMSA"

"All regularly assigned radiographic personnel shall meet the requirements as defined in ASNT Recommended Practice; and shall be qualified and certified to Level 1, II or III of ASNT SNT-TC-1A, Latest Edition accepted by PHMSA, Supplement A and NRC and/or State Regulations for radiation safety."

3. A. (4) Records of certification for radiographers and interpreters

(d) 3. A. (4)(d): Revised to "A current vision acuity records administered by an approved source of the Radiographer's Jaeger J-2 and color discrimination eye examination.

3. A. (6): Revised to "In addition, film interpreters may be required to review this document and demonstrate their knowledge and understanding of this procedure prior to production film interpretation."

3. A. (7): Revised to "Radiographers may be required to demonstrate their ability to produce acceptable radiographs with each radiographic procedure they use prior to performing production radiographs."

3. B. Training Requirements

3. B. (1): "Moved some wording around "Prior to assignment, the Contractor shall train radiographic trainees to Level I in the use of radiation monitoring equipment."

3. C. Certification

3. C. (5); Employee Number replaced Social Security Number

4. Radiographic Procedures

4. B. Level of Quality

4. B. (1): Revised to "Image Quality Indicators (IQI), penetrameter, shall be placed on the weld prior to radiography and various attributes must be visible when viewing the resulting film."

4. B. (2): Revised to "The procedures shall produce radiographs of sufficient density, clarity, etc to provide the image of the essential wire diameter and ASTM set letter."

UNCONTROLLED IF PRINTED

4. B. (3): New "Ameren Illinois utilizes the ASTM Image Quality Indicator"

4. C. Radiographic Procedure Details

4. C. (4): Film Density

4. C. (4)(a): Changed film density 2.0 to 4.0 from 1.8 to 3.0.

(a) "Film shall be exposed so that the H & D density shall not be less than 2.0, or more than 4.0 through the thickest portion of the weld."

4. C. (6): New "Film Limitations

(6) Film Limitations

(a) "When radiographic source is outside but not more than a half (1/2) inch from the weld surface at least three exposures separated by one hundred twenty (120) degrees shall be made for radiographic inspection of the completed weld.

(b) When the radiographic source is outside and more than half (1/2) inch from the weld surface at least four (4) exposures separated by ninety (90) degrees shall be made for radiographic inspection of the completed weld."

4. C. (7) Penetrameters

4. C. (7)(a): Spelling and typo corrections, "API penetrameters made of radiographically similar material to the weld being inspected shall be used."

4. C. (7)(b): Revised to "The thickness and location of the penetrameters shall be in accordance with API 1104, Latest Edition shown the following table.(Table 5 of the 20th edition)"

Added a Table for Weld Thickness Versus Diameter of ASTM E747 Wire Type IQI from API 1104.

4. C. (8) Shims, completely revised

(a) "When penetrameters are not placed directly on the weld reinforcement due to restricted areas or if required to be placed off the weld so as not to mask relevant discontinuities the wire shims of radiographically similar material will be utilized to simulate the average reinforcement (build-up). The film density through the shim and the penetrometer must meet the density and essential wire requirements stated in API 1104, Latest Edition accepted by PHMSA."

4. D. Qualification Procedures

4. D. (5): Revised to "Ameren Illinois representative may review all procedure details and the test results prior to beginning testing."

4. D. (6); Changed "approved" to "accepted"; "Qualification Form provided by the Radiographic Contractor and accepted by Ameren Illinois.

5. Production Radiography

UNCONTROLLED IF PRINTED

5. C. Equipment for Interpretation

5. C. (b). Change film density to 4.0 from 3.5.

(b) "The viewer shall produce a sufficient illumination to view a maximum film density of 4.0."

5. D. Standards of Acceptability

5. D. (1) Film Interpretation

5. D. (1)(a): Added "porosity charts from API 1104, 20 edition shown below"

(a) "The standard of acceptability for radiographic film interpretation shall be API 1104 and the porosity charts from API 1104, 20th edition shown below."

5. D. (1)(b): Added " Maximum Distribution of Gas Pockets: Wall Thickness Less Than or Equal to 0.500 in. (AP1104)"

5. D. (1)(c); Added "Maximum Distribution of Gas Pockets: Wall Thicknesses Greater than 0.500 in (API1104)"

5. E. Daily Radiographic Reports

5. E. (3) The daily radiographic report

5. E. (3)(j): Inserted new, "Type of Exposure; Single Wall Exposure/Single Wall Viewing (SWE/SWV) or Double Wall Exposure/Single Wall Viewing (DWE/SWV)"

WELD
2.07

Dry Magnetic Particle Inspection

1. General

1. A.: Revised to "This section defines the requirements for performing a Visible Dry Magnetic Particle Inspection (Yoke/ Prod Methods) for Pipeline and Related Facilities Weld (hereafter referred to as "VDMPT") of pipe groove and fillet welds for detection of cracks and other discontinuities open to the surface using the dry powder method. The continuous test method should be utilized."

Provided the actual name of the inspection method versus the generic term magnetic particle.

1. D.: Inserted new; "Ameren Illinois does not allow magnetic particle examination on surface areas that are coated or painted."

2. Inspection Personnel: Revised to include certified:

"All personnel performing and interpreting the results of the magnetic particle examination shall be qualified and certified in accordance with the American Society of Nondestructive Testing (ASNT), "Recommended Practice No. SNT-TC-1A Latest Edition accepted by PHMSA," Level II (MPT),"

3. Equipment

3. A. General

January 1,
2012

January 1,
2016

3. A. (1): Added the code to which the power must comply.

(1) Commercial grade, dry magnetic particle powder complying with the requirements of ASTM E709-08 and have the properties required by AMS 3040 shall be used, red or grey in color, whichever provides the maximum contrast with the surface being examined.

3. A. (4): Insert new: "Visible light intensity for visible magnetic particle examination shall be one hundred (100) foot candles minimum at the surface of the test area.

3. B. Yoke Method

3. B. (1): Changed lifting force to 50 lbs. from 40 lbs.

(1) "A portable D.C. magnetic yoke capable of a lifting force of 50 Lbs. at a 6" spacing shall be used."

3. B. (2): Inserted new, "Dead weight checks should be performed at a minimum every six (6) months.

4. Inspection Procedures

4. B.: Inserted new, "Examination temperature of the test area shall not exceed 600° F during final inspection."

5. Standards of Acceptability

5. A.: Revised to "All relevant indications shall be evaluated in accordance with API 1104, Acceptance Standards for Nondestructive Testing, Latest Edition accepted by PHMSA, and the porosity charts from API 1104 20th edition, except that no crack regardless of length is acceptable."

5. B.: Inserted new "Porosity charts from API 1104 are shown below.

5. B. (1): New porosity chart, "Maximum Distribution of Gas Pockets: Wall Thickness Less Than or Equal to 0.500 in.(API 1104)"

5. B. (2): New porosity chart: "Maximum Distribution of Gas Pockets: Wall Thicknesses Greater than 0.500 in (API1104)"

6. Reports

6. A.: Significantly expanded to include a list of 12 items that should be included in the report. List is too long to show here.

**WELD
2.08**

Liquid Penetrant Inspection

1. General

1. A.: "Minor change in title of process, This section covers the recommended procedures for the Visible, Solvent Removable Inspection for Pipeline and Related Facilities Welds of pipeline maintenance groove and fillet welds, hereafter, referred to as Liquid Penetrant Testing (LPT)."

2. Codes and Standards

Janu-
ary 1,
2012

Janu-
ary 1,
2016

2. A.: Correct in code designation, "This specification meets the requirements of ASTM E165/E165M-12,"Standard Recommended Practice for Liquid Penetrant Inspection Methods."

2. B.: inserted new, "This standard is used for the preparation of process specifications and procedures dealing with the liquid penetrant testing of parts and materials."

3. Inspection Personnel, revised to include certified,

"All personnel conducting liquid penetrant testing shall be qualified and certified in accordance with the requirements of ASNT SNT-TC-1A - Level III for Penetrant Testing, Latest Edition accepted by PHMSA."

5. Inspection Procedures

5. D. Penetrant Application

5. D. (1): Expanded to allow brushing, blotting, or immersion for applying penetrant.

(1) "With the pipe and penetrant temperature between 60 degrees F. and 125 degrees F. and the surface cleaned, the penetrant shall be applied to the area to be inspected using aerosol spray cans, spraying, brushing, blotting or immersion and applied in such manner as to provide complete coverage over the area being tested."

5. E. Penetrant Removal

5. E. (1): Added the word "excess" and method for removal, After the desired dwell (soak) time has elapsed, the excess penetrant shall be removed in the following manner:

(a) "First use a clean lint free rag or towel to wipe the area.

(b) Once this is completed, use a clean lint free cloth or towel lightly moistened with solvent to remove the remaining traces of surface penetrant."

5. F. Developer Application

5. F. (1): Added the word "wet" and stipulation that the wet developer be non-aqueous.

"Once all visible penetrant has been removed, and the weld surface is dry (by normal evaporation), the wet developer shall be sprayed directly on the weld and adjacent area. The wet developer should be a non-aqueous developer."

5. F. (3): Increased the time the developer is to remain on area to 10 minutes from 7 minutes.

(3) "The wet developer shall remain on the area for a minimum time of ten (10) minutes prior to inspection."

5. F. (4): Added new:

(4) "The development time does not start until the developer has completely dried."

5. G. Inspection

5. G. (1): Added the required illumination,

(1) With proper illumination, minimum light intensity of 100 foot candles, inspect the developer for bleed-out of penetrant from discontinuities.

5. H. Acceptance Criteria

5. H. (1): Revised to;

(1) "The standard of acceptability shall be API 1104, Acceptance Standards for Nondestructive Testing, Latest Edition accepted by PHMSA, except that cracks of any length are not allowed. Acceptance criterion will include porosity charts directly from API 1104, 20th edition shown below."

5. H. (2): Added, "Maximum Distribution of Gas Pockets: Wall Thickness Less Than or Equal to 0.500 in.(API 1104)"

5. H. (3): Added, "Maximum Distribution of Gas Pockets: Wall Thicknesses Greater than 0.500 in (API1104)"

6. Inspection Equipment

6. C.: New item specifies the code which the liquid penetrant must comply.

C. "Liquid penetrant material utilized shall meet the requirements of AMS2644 and intermixing of penetrants from different manufacturers is prohibited."

7. Reports

7. A.: Significantly expanded to include a list of 12 items that should be included in the report. List is too long to show here.

**WELD
2.10**

Arc Burn Removal

January 1, 2012 January 1, 2016

1. General

1. C.: Revised to: "For these reasons arc burns shall be removed on transmission pipeline and should be removed on high pressure distribution pipeline or at the welding inspector's option cut out."

Allows for arc burns to be removed in accordance with the procedures. Removal is required on transmission pipe and should be done on high pressure distribution pipe.

1. B.: New, "A welder who repeatedly makes arc burns may be subject to disqualification or other disciplinary action."

Former 1. B and 1. C. has been removed.

2. Removal Sequence

2. A. (6): Revised to "Upon removal of all evidence, swab the ground area using "a" tip or cotton ball with an appropriate

American Welding Society (AWS) approved etching solution such as a 20 percent solution of ammonium persulfate (20% ammonium persulfate crystals and 80% water). If a blackened spot appears, the metallurgical notch (arc burn) has not been completely removed and additional grinding/filing should be performed and the application the approved etching solution repeated."

Expanded to include reference to AWS approved etching solution. There may be other approved etching solutions available than the 20% solution of ammonium persulfate.

2. A. (8): Revised to "If the resulting wall thickness is less than required, the portion of the pipe that contained the arc burn should be removed as a cylinder or repaired with an approved procedure listed in REPR 1."

Added or repair with an approved procedure.

WELD 3.01	<p>Post-Weld Heat Treatment</p> <p>Removed this section from the O&M. Ameren Illinois does not utilize this process and it is not contained in Part 192 code.</p>	January 1, 2012	
WELD 3.02	<p>Useful Information</p> <p>3. Pipe Properties</p> <p>Former 3.B. Tolerances for Wall Thickness, Table 9: for pipe manufactured before 2009 and Table 11 for pipe manufactured in 2009 and after were removed.</p> <p>Those tables are in WELD 2.10 Arc Burn Removal. Throughout WELD and REPR sections these tables are reference as being in WELD 2.10.</p>	January 1, 2012	January 1, 2016
WELD 4	<p>Forms and Reference Materials</p> <p>Reference Materials:</p> <p>All 51 welding procedures have been updated so that only the actual welding procedure, WPS, is in this section. There are 4 new SMAW fixed position procedures; 2 new GMAW fixed position procedures, 2 new SMAW rolled position procedures and 1 new GMAW rolled position procedure.</p> <p>The WPQRs' for each WPS has been separated out and will be kept by the Gas Training section.</p>	January 1, 2013	January 1, 2016

Changed to Specialized Tools and Equipment Share-Point Site</p> <p>2.02 3: New; Personal Protective Equipment (PPE) Acquisition</p> <p>2.02 4: Changed to Level 1 PPE Availability, Care and Storage</p>	January 1, 2011	January 1, 2016

2.02 5. Changed to Level 2 PPE Availability, Care and Storage

2.02 6. New, Inspection

WW- BG 1	<p>Requirements</p> <p>2. Definitions</p> <p>Deleted definition of blowing gas</p> <p>2. D. Level 2 PPE - removed "in addition to Level 1 PPE". Level 2 PPE is specified in WWBG 2.02</p>	<p>October 1, 2011</p>	<p>January 1, 2016</p>
WW- BG 2.01	<p>Hazardous Atmosphere</p> <p>2. Identifying a Hazardous Outdoor Atmosphere</p> <p>2. B. (1): Added "without an EFV" to service line.</p> <p>2. B. (2): Added "with blowing gas" to damage to regulator station, farm tap, meter set, riser, or other gas facility.</p> <p>3. Secure Area</p> <p>3. A. (1): Added reference to EMER 2.03 Emergency Responder for non-gas field personnel that are dispatched to make area safe until qualified personnel arrive.</p> <p>3. B.: New item 'Responding to a Small Diameter Cut PE Service (1/2" thru 1-1/4")</p> <p>(1) "Gas field personnel wearing Level 1 PPE may approach a small diameter, 1-1/4 inch or less, cut PE service line to control the flow of gas utilizing the following procedures:</p> <p>(a) Approach from an upwind position</p> <p>(b) Monitor the gas concentration and maintain a level of less than 30% LEL</p> <p>(c) Squeeze off the service line with an above grade squeeze tool or from an above grade position with only an arm extended into the excavation. The head must remain out of the excavation"</p> <p>This was added to allow responding gas field personnel to squeeze of PE service lines without establishing a safe zone.</p> <p>3. C.: Changed heading to "Establishing a Safe Zone</p> <p>3. C. (1): Revised to "After the extent of the gas migration is determined or additional gas personnel have arrived to assist, a safe zone will be established if the blowing gas is the result of damaged gas facilities other than a small diameter PE service line."</p> <p>Revision made to emphasize the importance of first determining the extent of the migration of gas when responding to a blowing gas call.</p> <p>3. C. (4): Grammatical addition of "outside of the safe zone", "As long as there is blowing gas, gas field personnel will moni-</p>	<p>October 1, 2011</p>	<p>January 1, 2016</p>

tor the perimeter of the safe zone to ensure the atmosphere outside the safe zone remains non-hazardous."

3. C. (5): Revised to "If the area is readily accessible to the general public the perimeter of the Safe Zone should be visually marked by such means as barricade(s), sign(s), cone(s), fencing, marking paint or tape."

Revised to clarify that a safe zone only needs to be marked if it is readily accessible to the general public. When the blowing gas is in a remote or rural area where the general public is not present, marking of the safe zone is not necessary since only gas personnel or emergency responders should be present.

3. C. (8): Added "should be visually marked" when referring to the perimeter of a hazardous area with gas concentration of 60% LEL or greater where Level 2 PPE is required.

4. Working in a Hazardous Outdoor Atmosphere

4. C.: New inserted "If working in an excavation is required, the procedure in EXCV 2.09 - Working in Hazardous Atmosphere should be reviewed and utilized in conjunction with these procedures."

4. F. (2): Grammatical "less than 30% LEL" replaces "up to 30% LEL".

4. F. (3): Grammatical only "Be suited up in Level 1 PPE if a CGI reading of 30% LEL (1.5% gas-in-air) to 60 % LEL (3.0% gas-in-air) is measured in the atmosphere where the work is to be performed."

4. F. (4): Grammatical only "Be suited up in Level 2 PPE if a CGI reading of 60% LEL (3.0% gas-in-air) or greater is measured in the atmosphere where the work is to be performed."

4. F. (5): New inserted: "Have a dry chemical (A, B, C) fire extinguisher present near the worksite at all times while work is being performed in a gaseous atmosphere."

4. F. (6) (a): Added that the Manned fire extinguisher should be a minimum of 20 pound and shall be discharged tested prior to work being performed.

6. PPE Requirements

6. A.: Grammatical only by adding "Level 1 is designed to provide protection against a flash fire."

6. B.: Grammatical only by adding "Level 2 is designed to provide protection against a sustained fire."

**WW-
BG
2.02**

Personal Protective Equipment

1. B.: New: "Ameren Illinois continues to evaluate PPE products. Once a product is approved by the Gas Standards and Procedures group in conjunction with Ameren Illinois Safety Department, the product will be added to the Specialized Tools and Equipment on the Gas Operations and Services Share-

October 1,
2011

January 1,
2016

Point Site. Therefore, not all approved PPE items may not be contained in this edition of the Gas O&M."

1. E.: New, added a table that lists the PPE required for Level 1 and Level 2 and shows the ensembles for Level 2 with the Bulwark Insulated Coveralls and Silver Needle Insulated Coveralls.

2. Renamed "Specialized Tools and Equipment SharePoint Site"

Removed the vendor information since it will be on the Specialized Tools and Equipment SharePoint Site in the future.

This section was revised to list only the basic specifications or requirements for the various items of PPE.

3. Personal Protective Equipment (PPE) Acquisition - This was put in its own section and the procedures were updated to reference the SharePoint site.

4. Renamed "Level 1 PPE Availability, Care and Storage" from "Level 1 PPE". Information is basically the same.

5. Renamed "Level 2 PPE Availability, Care and Storage" from "Level 2 PPE". Information is basically the same.

6. Inspection

6. A.: Revise to list equipment that is included in the monthly inspection, supplied air equipment including air supply, filtration system, carbon monoxide alarm, regulator/manifold system, hoses, and airline units. The inspections are document in Maximo.

6. B.: New, "Escape bottles must be inspected annually and hydrostatically tested every 5 years by a qualified person.

Supersedes: December 1, 2014

CHANGE SUMMARY

Change Summary December 1, 2014

Docu- ment	Change Summary	Previ- ous Docu- ment Dated	Current Docu- ment Dated
	<p>The main focus of the following O&M changes is to reflect the implementation of the new gas code compliance systems; Maximo, ClickSchedule, and ClickMobile. References to Gas Compliance System (GCS) has been replaced with one or more of these new systems throughout the O&M.</p>		
ABND 1	<p>3. Records</p> <p>3. B.: Information on abandoned facilities will now be maintained in Maximo. The information will be entered in ClickMobile then uploaded to Maximo.</p> <p>There will no longer be a paper record for abandoned facilities that has to be filed.</p>	Janu- ary 1, 2014	De- cem- ber 1, 2014
ABND 2.01	<p>Abandonment of Gas Facilities</p> <p>5. Records</p> <p>5. B. (2): "In ClickMobile the service record should indicate a full retirement, but the stub greater than 18 inches box should be checked."</p> <p>5. C.: "Service record card (Service Transaction Form/Card) should be updated within ClickMobile to document the retirement and leak test performed to check the capping of the pressurized stub."</p> <p>5. D.: "Buried Pipe Examination Form should be completed within ClickMobile to report condition of the remaining pressurized main(s) and/or service line(s). See CORR 2.30"</p> <p>5. E.: "If there is evidence for internal corrosion it shall be documented on the Corrosion and Steel Damage Evaluation form within ClickMobile. See CORR 2.31"</p> <p>All abandonment records will now be electronic and entered within ClickMobile.</p>	Janu- ary 1, 2014	De- cem- ber 1, 2014
CNTS 1	<p>4. Reporting of Gas Leaks</p> <p>4. A.: Added the Ameren Emergency phone number, 1.800.755.5000. Non-gas field personnel who detect an odor of gas should call the Emergency phone number to report the odor.</p> <p>Instead of Non-gas field representative attempting to contact the Gas Supervisor, SMR Team felt it would be best and quicker to call of the Contact Center to report a leak.</p>	Janu- ary 1, 2012	De- cem- ber 1, 2014

7. System Review Report

7. D.: Updated the title of the individual to whom the System Review Report is to be sent, Manager, Gas Compliance & Training, PWN-427 (MC for Pawnee Gas Training Center)

CNTS 2.01	<p>Surface Subsidence Areas</p> <p>3. Active Surface Subsidence Area</p> <p>3. C.: "A special leak survey shall be set up for subsidence area within Maximo. Contact Compliance Specialist for assistance in setting up the survey in Maximo."</p> <p>3. D.: All leak survey activity will be completed within ClickMobile and recorded in Maximo.</p> <p>3. E.: "After two (2) years without any further indication of new subsidence in the affected area a final leak survey can be conducted and the special leak survey retired in Maximo."</p> <p>7. Records</p> <p>7. A.: "Gas Supervisor should ensure that activities, leak surveys, patrol, repairs, temporary provisions made or taken are documented in ClickMobile." 7. C.: "Written report(s) describing activities performed, dates performed, employees performing activities, findings, and corrective action taken should be retained by the Gas Supervisor, Gas Superintendent, or the Engineer/Supervisor of the group overseeing the activities."</p> <p>Expanded to specify the Gas Supervisor, Gas Supt, or Engineer/Supervisor of group overseeing the activities should retain the written reports.</p>	Janu- ary 1, 2014	De- cem- ber 1, 2014
<u>CONS</u> <u>1</u>	<p>2. Construction Records, Maps, and Operating History</p> <p>2. B.: Replaced "Ameren Illinois gas compliance system" with "Maximo" as the location where much of the operating history is maintained.</p>	July 1, 2014	De- cem- ber 1, 2014
CORR 0	<p>CORR 2.30 - Pipe Examination Form</p> <p>Deleted:</p> <p>Stock Number for Form</p> <p>Flowchart Buried Pipe Examination Form</p> <p>CORR 2.31 - Corrosion and Steel Damage Evaluation Form</p> <p>Deleted:</p> <p>Stock Number for Form</p> <p>Flowchart Buried Pipe Examination Corrosion and Steel Damage Evaluation</p> <p>CORR 4 Forms and Reference Materials</p>	July 1, 2014	De- cem- ber 1, 2014

Deleted Forms:

Buried Pipe Examination Form

Corrosion and Steel Damage Evaluation Form

Deleted Reference Material:

Corrosion Tracking in DOJM and GCS

CORR
1

3. Corrective Action

3. C. (2)(a): Replaced "GCS" with "Maximo". When P/S readings on an unmonitored pipe is less negative than -0.900 volts, an integrity leak survey shall be created in Maximo.

July 1, 2014
December 1, 2014

6. External Corrosion

6. A.: Revised to: "When any portion of a buried steel main or service is exposed, an examination of the exposed portion must be conducted and recorded on the Buried Pipe Examination form within ClickMobile with the information retained in Maximo."

Deleted 6. A. Note and the 3 bullet points that address entry in Pipe Exam Database and distribution of the Buried Pipe Examination Form.

Information no longer valid since the form is being completed and maintained electronically.

6. B.: Revised to: "Reports from Maximo are sent to Corrosion Control personnel listing the locations where pipe to soil readings were -0.900 volts or less. Corrosion Control personnel will then perform follow-up investigation. The required corrective measures will be identified, performed and entered in ClickMobile or scheduled."

Deleted reference to Pipe Exam Database, PEET. This database will no longer be utilized since all records will now be maintained in Maximo.

7. Internal Corrosion

7. A.: Added ClickMobile - "All tapping coupons are to be inspected for evidence of internal corrosion and documented on the Buried Pipe Examination form within ClickMobile. See CORR 2.30."

7. D.: Added ClickMobile - "Corrosion Control person or qualified Gas Engineer will complete a Corrosion and Steel Damage Evaluation form within ClickMobile, CORR 2.31"

10. Test Lead Connections;

10. A.: Added a second reference CORR 3.13 as another method for attaching test leads to pipe. 13. Atmospheric Corrosion

13. C. (2): Corrective action or disbonded coating reported during compliance inspection shall be tracked in Maximo.

13. E. (3): Revised to indicate the Corrosion and Steel Damage Evaluation form is completed within ClickMobile.

14. Pipeline Facilities That Need to Be Painted

14. B. (1): Revised to: "Maximo will maintain a list of facilities that need paint and will track corrective action by specific address or location. Gas Supervisors can continue to use spreadsheets that list locations where deficiencies were discovered prior to December 1, 2014."

14. B. (2): Second sentence revised to: "Whenever gas field personnel are on site for other activities and identify disbonded coating, atmospheric corrosion, or pipeline facilities that need to be painted, corrective action shall be taken while on site or documented within ClickMobile."

16. Records

16. C.: "All information shall be maintained in Maximo and the electronic mapping system." Maximo replaces Gas Compliance System.

CORR 2.02	<p>Anode Requirements</p> <p>The July 1, 2014 Web and Local Viewer version of CORR 2.02 did not include one of the revised instructions that had been made in one of the tables, 4. B. The published July 1, 2014 version did include the correct instructions.</p> <p>4. Anode Requirements</p> <p>4. B.: Service lines and repairs steel main and services, install anodes as shown in table.</p> <p>Revised the instructions if the P/S reading is less negative than -0.900 VDC. Install an anode as long as it is not a transmission main.</p> <p>Corrosion Control SMR team felt the logical course of action would be to install an anode rather than contacting a corrosion control person, who in most cases advise installing an anode when it is not a transmission main. Example of a more negative and a less negative reading was added to provide clarification and eliminate confusion.</p>	October 1, 2011	July 1, 2014
CORR 2.28	<p>Evaluation of Corrosion</p> <p>2. Distribution Piping (60 psig and Below)</p> <p>2. B. Measuring Pitted Areas (Underground or Atmospheric Corrosion)</p> <p>2. B. (6): Revised to: "Document on the Corrosion and Steel Damage Evaluation form within ClickMobile."</p> <p>3. Transmission or High Pressure Distribution Piping (Over 60 psig)</p>	April 1, 2013	December 1, 2014

3. B. Measuring Pitted Areas (Underground or Atmospheric Corrosion)

3. B. (6): Revised to: Document on the Corrosion and Steel Damage Evaluation form within ClickMobile."

6. Pipe Pit Gauge

6. B. Instructions

6. B. (7): Record data on Corrosion and Steel Damage Evaluation form within ClickMobile.

7. Pipe Thickness Gauge

7. B. Instructions

7. B. (6): Record data on Corrosion and Steel Damage Evaluation form within ClickMobile.

CORR
2.29

Records

1. C.: Deleted instructions for tracking corrective action utilizing the Gas Compliance System's Cathodic Protection Module that was in CORR 4 Reference Materials.

Maximo will track corrective action so there is no need to provide instructions.

2. Construction Order Review Processes

2. B. Belleville Design Center/Peoria Design Center

2. B. (1) (c): Updated the Corrosion Techs in the table showing areas of responsibility.

3. Additional Detail Information for Test Points

3. A.: Revised to: "Each test point detail sketch may be attached to the asset in Maximo."

3. B. Pipeline Crossing Sketches: On the form "Readings recorded in ClickMobile" Replaced GCS.

4. Other Cathodic Protection Record Activities

4. A. Pipe Exam Review Process 4. A. (1): Revised to: "Transmission, high pressure distribution and distribution pipe Buried Pipe Examinations are completed within ClickMobile and stored in Maximo. See CORR 2.30"

Buried Pipe Examination is required for all classes of pipe and sending copies to other groups is no longer needed since the Examination is now completed in ClickMobile and information is maintained in Maximo. Maximo will send out messages when corrective action is needed.

4. A. (4): Deleted reference to CP Deficiency Tracking in Cathodic Protection Sharepoint site.

Replaced with: "Corrective orders for deficient pipe-to-soil potentials not related to annual test points can be tracked in Maximo." 4. B. Annual Tasks

July 1, 2014
December 1, 2014

4. B. (2)(i): Revised to: " As needed, review casing drawings or permits for casing details to be added as test point detail sketches in Maximo."

CORR
2.30

Buried Pipe Examination

July 1,
2014 De-
cem-
ber 1,
2014

The Buried Pipe Examination will now be entered within Click-Mobile and the paper form is being eliminated.

2. Buried Pipe Examination

2. A.: Revised to "The Buried Pipe Examination shall be completed by gas field personnel or Damage Prevention's Watch and Protect personnel, construction inspectors, engineering personnel, or others any time existing buried plastic or steel gas carrying pipe is exposed. An examination of the exposed portion must be conducted and recorded on the Buried Pipe Examination form within ClickMobile."

2. B.: Revised to "A Buried Pipe Examination form shall be completed within ClickMobile any time existing main or service pipe, plastic or steel, is exposed and the existing pipe is planned to remain in service."

2. C.: Revised to "A Buried Pipe Examination form is required for each pipe segment and should be completed on ClickMobile."

Removed the ability to report the condition of all pipe exposed in one excavation.

2. D.: Revised to "If the examination of the pipe indicates the presence of corrosion or damage to the pipe then a Corrosion and Steel Damage Form should be completed within ClickMobile. See CORR 2.31."

2. E.: Revised to "A Buried Pipe Examination form is not required when:"

2. E. (1) "New pipe being installed."

2. E. (2) "When an existing section of pipe is planned to be retired and will not remain in service."

2. E. (3) "The exposed pipe is found during a pipeline or critical area patrol."

2. E. (4) "When pipe is not going to be buried"

This was revised to better clarify when a Buried Pipe Examination is not required.

2. G.: Revised to "The internal surface of the abandoned pipe must be inspected for evidence of corrosion as stated in CORR 1. A corrosion control person for the area should be notified if there is an indication of internal corrosion. Any internal corrosion found will be documented on a Corrosion and Steel Damage Evaluation within ClickMobile, CORR 2.31, stating where the internal corrosion was found; on the pipe remaining in service or the abandoned pipe."

UNCONTROLLED IF PRINTED

2. H.: Revised to "Information from Buried Pipe Examination forms is maintained in Maximo."

PEET database has been eliminated.

2. I.: Revised to "Information will be used by Corrosion, Operations, Engineering, Corrosion Control, DIMP, and TIMP personnel for evaluation, maintenance and risk analysis."

Former 2. D.: Deleted the requirement for a Buried Pipe Examination for each excavation. Now a separate examination form must be completed for each pipe segment.

3. Distribution

3. A.: Revised to "Buried Pipe Examination will be completed within ClickMobile. The information will be transferred and maintained in Maximo."

3. B.: Revised to "Maximo will generate a Task and send it to Corrosion Control, Gas Tech Engineering or the Pipeline Integrity Group. When corrective action is required. Maximo will track and maintain corrective action taken."

Since the examination form is being completed electronically in ClickMobile and the data is uploaded into Maximo, there is no need to physically distribute information to other groups.

4. Completion Instructions

4. A.: New "The Buried Pipe Examination Form will be completed within ClickMobile."

4. B.: New "The required information field are indicated in Red. However, it is good practice to record all information that is known"

4. C.: New "It is important that accurate pipe information be entered in ClickMobile."

Removed the instructions on completing the paper form since the information will now be enter on the form in ClickMobile. Deleted copy of the examination form.

Former 6 Flowchart of processing the Buried Pipe Examination Form has been removed since much of it is no longer applicable with implementation of Maximo and ClickMobile.

Former 4. Stock Number for Form has been removed since the form is no longer going to be used.

5. Records

5. A.: New "Information from Buried Pipe Examination forms is maintained in Maximo."

5. B.: New "Maximo tracks and maintains corrective action taken and reported within ClickMobile."

5. C.: New "Tasks and queries can be generated and submitted to the appropriate work groups."

Records will be maintained electronically in Maximo so there will no longer be physical records to file or maintain.

CORR
2.31

Corrosion and Steel Damage Evaluation

April
1,
2013

De-
cem-
ber 1,
2014

The Corrosion and Steel Damage Evaluation will now be entered within ClickMobile and the paper form is being eliminated.

2. Distribution

2. A.: Revised to "Corrosion and Steel Damage Evaluation form will be completed within ClickMobile. The information will be transferred and maintained in Maximo."

2. B.: Revised to "Maximo will generate a Task and send it to Corrosion Control when corrective action is required. Maximo will track and maintain corrective action taken."

Since the evaluation form is being completed electronically in ClickMobile and the data is uploaded into Maximo, there is no need to physically distribute information to other groups. Maximo will create corrective action orders when needed and send them to the appropriate parties.

3. Completion Instructions

3. A.: New "The Corrosion and Steel Damage Evaluation Form will be completed within ClickMobile."

3. B.: New "The required information field are indicated in Red. However, it is good practice to record all information that is known"

3. C.: New "It is important that accurate pipe information be entered in ClickMobile."

4. Records

4. A.: New "Information from Corrosion and Steel Damage Evaluation forms is maintained in Maximo."

4. B.: New "Maximo tracks and maintains corrective action taken and reported within ClickMobile."

4. C.: New "Tasks and queries can be generated and submitted to the appropriate work groups."

Records will be maintained electronically in Maximo so there will no longer be physical records to file or maintain.

Former 3. Stock Number for Form has been removed since the form is no longer going to be used.

Former 4 Removed the instructions on completing the paper form since the information will now be enter on the form in ClickMobile. Deleted copy of the evaluation form.

Former 5 Flowchart Buried Pipe Examination - Corrosion and Steel Damage Evaluation has been removed since much of it is no longer applicable with implementation of Maximo and Click-Mobile.

CORR 4	<p>Forms and Reference Materials</p> <p>Updated Pipeline Crossing Sketch - Changed GCS to ClickMobile Deleted Forms:</p> <p>Buried Pipe Examination Form</p> <p>Corrosion and Steel Damage Evaluation Form</p> <p>Deleted Reference Material: Corrosion Tracking in DOJM and GCS</p>	Janu- ary 1, 2013	De- cem- ber 1, 2014
<u>DAMG</u> 1	<p>4. JULIE Ticket Transmittal</p> <p>4. A. Locate Request Tickets</p> <p>4. A. (6): Added "Gas field personnel can put dimensions on their ClickMobile maps, take a screenshot, attach it to a GIS discrepancy, and incomplete it within ClickMobile. This will get sent to the DDC so the measurements may be mapped. The can also put the measurements in the comment section of the service card."</p> <p>Provides instructions on how field personnel can make sketch in ClickMobile with measurements when they are standing by on difficult to locate gas facilities.</p> <p>7. Protection of Excavated Facilities</p> <p>7. A. (1): Replaced the 2" and 4" Safety Wraps with one Safety Wrap that covers both 2" and 4" diameter pipe.</p> <p>Manufacturer combined the two separate wraps into one.</p> <p>8. Excavating Near a Transmission, High Pressure Distribution, or 8" and Larger Steel Main</p> <p>8. E. (1): Revised to indicate the Buried Pipe Examination is completed within ClickMobile.</p> <p>8. F.: Revised to indicate the Buried Pipe Examination is completed within ClickMobile.</p> <p>12. Records</p> <p>12. D.: Added "Buried Pipe Examination forms completed prior to November 1 2014 shall be retained for the life of the facility. Beginning November 1, 2014 information shall be maintained in Maximo for the life of the facility."</p>	Janu- ary 1, 2014	De- cem- ber 1, 2014
FORW	<p>Forward</p> <p>5. Contacts</p> <p>Replaced Gas Compliance System (GCS) with Maximo, Click-Mobile, ClickSchedule</p>	Janu- ary 1, 2014	De- cem- ber 1, 2014
<u>GLOS</u>	<p>Glossary</p> <p>Modified: Gas Compliance System (GCS) - Company system utilized to manage and document various gas operating and</p>	Janu- ary 1, 2014	De- cem-

maintenance activities. Beginning December 1, 2014, GCS was replaced with a suite of compliance products; Maximo, ClickMobile, and ClickSchedule

ber 1,
2014

Added New Definitions:

ClickMobile - Mobile Workforce Management system used to document Gas Compliance activities electronically.

ClickSchedule - Mobile Workforce Management system used to schedule and dispatch Gas Compliance activities to field technicians

Maximo - Asset Management System utilized for Gas Compliance activities

Natural Gas Reading - A reading of 2.0% LEL or less is considered 0% gas for leak classification/documentation purposes and is not a reportable reading if the reading is greater than five (5) feet from a foundation wall.

LEAK
0

LEAK 2.04 Leak Classification and Surveillance

Janu-
ary 1,
2014

De-
cem-
ber 1,
2014

Deleted the following:

Venting a Leak

Downgrading a Leak

Ameren Illinois Leak Classification Guidelines

LEAK 2.05 Gas Leak Case Field Report

Removed the instructions for completing the GLCFR and Mechanical Fitting Leak form since they are now completed in ClickMobile.

LEAK 4 Forms

Removed:

GCS Leak Case Field Report

Leak Survey Daily Report Form

Mechanical Fitting Leak Data Form

LEAK
2.02

Outdoor Leak Investigation

Janu-
ary 1,
2013

De-
cem-
ber 1,
2014

5. Below Grade Gas Facilities

5. I. (2): Revised to "Bar hole locations and % Gas readings taken with a CGI should be recorded on the leak sketch within ClickMobile"

7. Hazardous Condition

7. A. (2): Changed to: "A reading in a sanitary sewer of 30% LEL (1.5% gas-in-air) or greater."

Significant reduction from the previous 80% LEL reading. This was changed to be consistent with other sections in the O&M

where hazardous condition exists when the reading is 30% LEL or greater.

7. B.: Eliminated reclassifying a hazardous leak to a Class 2. This now reads "Gas field personnel shall remain at the site of a hazardous leak until the leak is repaired. A safety perimeter should be established to prevent unauthorized personnel from entering until repairs are made or the situation made safe."

Reclassifying a Class 1 leak to a Class 2 leak by venting the leak has been eliminated as an option under the new gas compliance system.

8. Leaks on Customer Owned Facilities

8. B.: Removed "soap bubble holds" as an example of a non-hazardous leak on customer facilities.

Soap bubble holds is no longer used in the new compliance system.

9. Records

9. C.: Revised to "If the leak is discovered on Ameren Illinois facilities, leak investigation shall be initiated within ClickMobile."

All leaks found on Ameren facilities will be reported in ClickMobile by initiating a leak investigation task. Even if leak is repaired when found, it still requires entry in ClickMobile along with the repair information.

9. D.: New "If an existing leak exists at the address/location, a leak surveillance shall be performed and documented within ClickMobile."

Existing leaks will show on the ClickMobile Map, so instead of creating a new leak, a surveillance will be performed and documented in ClickMobile.

9. D. thru F.: Deleted the instructions on how and when to report: Class 1 Above Grade leaks, Class 3 Above Grade leaks found during compliance inspections, and Above & Below Grade leaks found during compliance inspections.

No longer valid since all leaks and their status will now be documented within ClickMobile and maintained in Maximo.

LEAK
2.03

Leak Investigation Form

2. Top Block - General Information

2. A. (7): GCS No. - Deleted - No longer applicable

2. A. (8): Deleted the instructions for recording OAS number on GLCFR since that form has been eliminated.

4. Outdoor Investigation Documentation

4. A. Check Outside Area

April	De-
1,	cem-
2013	ber 1,
	2014

4. A. (11)(b): Revised to require documenting findings on the OAS 6F screen and completing the leak and surveillance information within ClickMobile.

4. B. Perform Subsurface Sampling - Utilizing a CGI & Probe Rod

4. B. (2)(d): Revised to require documenting the leak and surveillance information within ClickMobile.

4. C. Bar Test Riser

4. C. (3)(c): Revised to require documenting the leak and surveillance information within ClickMobile which replaces the Gas Leak Case Field Report.

5. Back Page Information

5. C. Follow-up Action - In this area

5. C. (3)(c): Revised to "Leak repair order will be available for completion by crew in ClickMobile." Eliminated the need to provide Gas Supervisor with copy of GLCFR.

6. Records

All leak records are now documented in ClickMobile and maintained in Maximo.

6. B.: Deleted Refer to LEAK 2.05 since the Gas Leak Case Field Report has been eliminated.

All references to Gas Leak Case Field Report have been removed since that form is no longer utilized in the new compliance system.

LEAK
2.04

Leak Classification and Surveillance

2. Leak Classification

2. C.: Added reference to LEAK 2.06 which has the flow charts for the leak classification process for both below grade and above grade gas leaks

2. F.: Added reference to LEAK 2.06 which has the flow chart for the process to classify an above grade gas leak.

4. Leak Classification Criteria

4. E.: Deleted reference to Ameren Illinois Gas Leak Classification Guideline card since the card has been eliminated. Click-Mobile will classify leaks based on information provided.

4. F.: New: "LEAK 2.06 provides qualified gas field personnel with criteria utilized for accurate classification of both below grade and above grade gas leaks."

8. Leak Surveillance, Repair, and Recheck Schedule

8. A. Class 1

January 1,
2014

December 1,
2014

8. A. (1): Revised to: "Class 1 leak requires immediate repair or continuous action until the hazardous condition no longer exists. Immediate temporary measures, such as venting, may be employed to protect the public and property, however, the leak remains a Class 1 leak until permanent repairs are made."

Although venting as a means for downgrading a Class 1 leak to a Class 2 leak has been eliminated, venting can be used as a temporary measure but the leak will remain a Class 1 leak and will require continuous monitoring until it is repaired.

8. B. Class 2

8. B. (1) Surveillance

8. B. (1) Removed the exception to the surveillance interval when a Class 1 leak has been downgraded to Class 2 by venting when gas was initially detected entering a building. Venting is no longer an option for downgrading.

8. B. (2) Repair

8. B. (2): Removed the exception to the repair interval when a Class 1 leak has been downgraded to Class 2 by venting when gas was initially detected entering a building. Venting is no longer an option for downgrading.

10. Repaired Leak Recheck

10. A. Below Grade

10 A. (3) Where residual gas is detected in the soil,

10. A. (3)(a): Changed to "The presence of residual gas shall be documented on the ClickMobile Repair Form."

10. A. (3)(b): Changed to "If the residual gas readings are detected within zero (0) to five (5) feet from the foundation wall, daily monitor tasks will also have to be performed."

10. A. (4): New - "Leak recheck must be performed within thirty (30) days of repair. If natural gas readings are detected during the recheck, the leak recheck should be completed noting the readings and classifying the leak accordingly."

11. Records 11. D.: Revised to "Leak investigation, repair, monitor, and recheck information shall be recorded in ClickMobile. Records pertaining to leak classification and leak surveillance shall be maintained for six (6) years." 11. F.: Revised to "The information and associated sketches shall be recorded within ClickMobile and retained within Maximo"

Former 7. Venting a Leak - This section has been deleted since venting a leak is no longer an option for reclassifying a Class 1 leak to a Class 2.

Former 8. Downgrading a Leak - This section had been deleted because ClickMobile will classify the leak.

Former 10.: Deleted the Ameren Illinois Leak Classification Guidelines

Former 13. A. (3): Removed "This recheck may be performed immediately after repair of a gas leak, where no residual gas is detected in the soil." since all below grade repaired leaks require a recheck with a CGI.

LEAK 2.05	<p>Gas Leak Case Field Report</p> <p>Gas Leak Case Field Report has been eliminated. Leak investigation information is now documented in ClickMobile and maintained in Maximo.</p> <p>The Mechanical Fitting Leak Data Form is now completed within ClickMobile and the use of the paper form has been discontinued.</p>	January 1, 2014	December 1, 2014
LEAK 2.06	<p>Leak Process Flow Charts</p> <p>Flow charts were revised to show the leak classification process based the gas field personnel's responses to leak investigation questions within ClickMobile.</p>	January 1, 2013	December 1, 2014
LEAK 2.07	<p>Leak Surveys</p> <p>2. Leak Survey Types</p> <p>2. A. Transmission Mains</p> <p>2. A. (5)(c): Added a note "Ameren Illinois does not have facilities in Class 4 areas."</p> <p>2. A. (6)(b): Clarified if gas meter with an underground fuel line is more than three (3) feet from the residential structure surveyor will notify Gas Supervisor. Supervisor will add the location to appropriate yardline survey.</p> <p>Added with underground fuel line to clarify yardline survey applies only to buried lines.</p> <p>2. A. (9)(f) & (g): Added See METR 2.20 for pictures of banded regulators and substandard regulators</p> <p>2. A.(10): Revised to "If any of the above deficiencies are noted, they will be repaired immediately or reported within Click-Mobile for follow-up action."</p> <p>Eliminated notifying Gas Supervisor since Maximo will schedule and track follow-up action.</p> <p>2. B. Distribution and High Pressure Distribution Mains and Services</p> <p>2. B.(4): Clarified if gas meter with an underground fuel line is more than three (3) feet from the residential structure surveyor will notify Gas Supervisor. Supervisor will add the location to appropriate yardline survey.</p> <p>Added with underground fuel line to clarify yardline survey applies only to buried lines.</p>	April 1, 2012	December 1, 2014

2. B. (7)(f) & (g): Added See METR 2.20 for pictures of banded regulators and substandard regulators

2. B. (8): Revised to "If any of the above deficiencies are noted, they will be repaired immediately or reported within ClickMobile for follow-up action."

Eliminated notifying Gas Supervisor since Maximo will schedule and track follow-up action.

2. C.: Business Districts

2. C. (7): New "Division engineering and gas supervision should review Business District area periodically not to exceed five (5) years commencing in 2015."

SMR team felt that the Business District areas should be periodically reviewed by Division engineer and gas supervision to ensure the correct areas are being leak surveyed. The O&M is currently silent on this issue.

2. C. (13)(h) & (i): Added See METR 2.20 for pictures of banded regulators and substandard regulators

2. C. (14): Revised to "If any of the above deficiencies are noted, they will be repaired immediately or reported within ClickMobile for follow-up action."

Eliminated notifying Gas Supervisor since Maximo will schedule and track follow-up action.

2. D. Yardlines

2. D. (3): Revised to "Gas Supervisor will maintain list of all residential yardlines in Maximo."

2. D. (8) Leak found on yardlines must be made safe.

2. D. (8)(a): Revised to "A contract surveyor will call the Ameren Illinois emergency phone number 1.800.755.5000 to report the leak. Ameren Illinois gas field personnel will contact the Gas Supervisor or an Ameren Illinois' designee."

2. D. (8)(b): Revised to "An OAS EMGL will be created and a qualified gas field person dispatched to respond to the leak." Removed Gas Supervisor as the one to create the order since this can be done by different individuals.

2. E. inside Meter Sets

2. E. (2): Revised to "Gas Supervisor is to maintain records of all inside meter sets. List of locations with inside meters will be maintained in Maximo."

2. E. (8)(g) & (h): Added See METR 2.20 for pictures of banded regulators and substandard regulators

2. E. (9): Revised to "If any of the above deficiencies are noted, they will be repaired immediately or reported within ClickMobile for follow-up action."

Eliminated notifying Gas Supervisor since Maximo will schedule and track follow-up action.

LEAK 2.08	<p>Leak Survey - Equipment</p> <p>2. Flame Ionization Instrument - Portable</p> <p>2. (E): Revised to "Ameren Illinois' FI Instrument shall be inspected and calibrated on a monthly basis and recorded in Maximo. Instrument inspection and calibration shall be performed in accordance with manufacturer's operating manual for the FI unit being used. See LEAK 4"</p> <p>3. Gas Detection Equipment</p> <p>3. F.: Revised to "Instrument shall be inspected and calibrated on a monthly basis and recorded in Maximo."</p> <p>4. Combustible Gas Indicator (CGI)</p> <p>4. --------------	---	----------------------------	-----------------------------

<u>LEAK 2.09</u>	<p>Walking Leak Survey</p> <p>1. J. Regulator Station, Farm Taps, Outside Meter Sets</p> <p>1. J. (9): Revised to "Surveyor will initiate a Leak Investigation task within ClickMobile."</p> <p>1. K. Fenced Gas Facilities Inspected Annually</p> <p>1. K. (2): Changed to state inspection is documented in Click-Mobile on Leak Survey Inspection Task.</p> <p>1. K. (2)(b) & (c): Deleted these two leak survey map items since they are no longer applicable with the implementation of Maximo.</p> <p>1. M. Inaccessible Facilities</p> <p>1. M. (1): Revised to "Facilities that cannot be accessed during the leak survey shall be reported as a status Inaccessible within ClickMobile."</p> <p>1. N. Gas Detection Instrument or FI Unit Indicates a Possible Leak</p> <p>1. N. (1)(a): Added the Bascom Turner Gas Rover as another survey instrument that has capabilities of classifying a leak.</p> <p>1. N. (1)(c): Added the Ameren Illinois emergency phone number 1.800.755.5000 for the contract leak surveyor to call to report a leak.</p> <p>Instead of the contract leak surveyor attempting to contact the Gas Supervisor, SMR Team felt it would be best and quicker to call of the Contact Center to report a leak.</p> <p>1. N. (1)(e): Revised to "Surveyor will initiate an Leak Investigation task in ClickMobile."</p>	<p>January 1, 2014</p>	<p>December 1, 2014</p>
--------------------------------------	---	----------------------------	-----------------------------

1. N. (2) If leak surveyor detects gas entering a building, Class 1 leak:

1. N. (2)(a): Added the Ameren Illinois emergency phone number 1.800.755.5000 for the contract leak surveyor to call to report a leak.

Instead of the contract leak surveyor attempting to contact the Gas Supervisor, SMR Team felt it would be best and quicker to call of the Contact Center to report a leak.

1. N. (2)(f): Revised to "Surveyor will initiate an Leak Investigation task in ClickMobile."

1. N. (3): Added "appears to be" so now reads "If leak surveyor detects a gas leak that appears to be non-hazardous, Class 2 or Class 3:"

1. N.(3)(c): Revised to "Surveyor will initiate an Leak Investigation task in ClickMobile or a leak surveillance within ClickMobile if the leak is already known."

1. N. (4) If the leak surveyor detects gas on customer piping.

1. N. (4)(a): Added the Ameren Illinois emergency phone number 1.800.755.5000 for the contract leak surveyor to call to report a leak.

Instead of the contract leak surveyor attempting to contact the Gas Supervisor, SMR Team felt it would be best and quicker to call of the Contact Center to report a leak.

1. N. (4)(d): Revised to "Leaks on customer facilities shall be documented within ClickMobile by selecting the Additional Work - Leak on Customer Facilities task."

1. N. (5) If leak surveyor detects an indication of gas from a valve box or pit which contains a gas facility:

1. N. (5)(c): Revised to "Leak will be classified and documented within ClickMobile."

1. O. Weather Limitations

1. O. (g): Changed to " Gas Supervisor and Leak Technician are responsible for determining if weather is unacceptable for surveying."

LEAK
2.10

Leak Surveys - Mobile Leak Survey

1. Mobile Flame Ionization Leak Survey

1. F. (1): Added the Ameren Illinois emergency phone number 1.800.755.5000 for the contract leak surveyor to call to report a leak.

1. F. (3): Revised to "Surveyor will complete a Leak Investigation task within ClickMobile."

1. G. If leak appears non-hazardous, Class 2 or Class 3 1. G. (1): New - "Surveyor may continue with the survey until it is

October 1,
2011

December 1,
2014

UNCONTROLLED IF PRINTED

convenient to access their vehicle to return with the CGI and probe rod to do a full investigation and classification."

1. G. (2): New - "Surveyor shall follow the procedures contained in LEAK 2.04, Leak Classification and Surveillance in the O&M Manual."

1.G. (3): New - "Surveyor will initiate a Leak investigation task within ClickMobile, or a Leak Surveillance task if the leak has already been identified on the ClickMobile Map."

SMR Team added these to be consistent with the Walking Leak survey procedures. 3. Optical Methane Detector (OMD) Survey

3. G. (1): Added the Ameren Illinois emergency phone number 1.800.755.5000 for the contract leak surveyor to call to report a leak.

3. G. (3): Revised to "Surveyor will initiate a Leak Investigation Task within ClickMobile."

3. H. If leak appears to be non-hazardous, Class 2 or Class 3
3. H. (1): New - "Surveyor may continue with the survey until it is convenient to access their vehicle to return with the CGI and probe rod to do a full investigation and classification."

3. H. (2): New - "Surveyor shall follow the procedures contained in LEAK 2.04, Leak Classification and Surveillance in the O&M Manual."

3. H. (3): New - Surveyor will initiate a Leak investigation task within ClickMobile, or a Leak Surveillance task if the leak has already been identified on the ClickMobile Map."

SMR Team added these to be consistent with the Walking Leak survey procedures.

LEAK
2.11

Leak Surveys - Records and Maps

1. Additional Survey Checks

1. A.: Added - "Deficiencies are documented within ClickMobile and are tracked in Maximo." 1. C.: Revised to "Deficiencies and leaks found on Ameren Illinois facilities are to be reported each day within ClickMobile "

1. D.: Revised to "Deficiencies that are reported are tracked in Maximo." 2. Maps and Records 2. A.: Revised to "Electronic maps in ClickMobile will be utilized for all transmission, high pressure distribution, and distribution leak surveys."

2. C.: Revised to "Leak Surveyor(s) will record each day's survey by lassoing section(s) of the pipeline and facilities that were leak surveyed within ClickMobile."

Deleted the practice of color highlighting on leak survey maps daily surveys since maps are now electronic.

2. E.: Changed to "Transmission Leak Survey maps and records will be maintained in Maximo for life of facility" 2. F.

January 1,
2014

December 1,
2014

Changed to "Maps and records for all distribution leak surveys will be maintained in Maximo for six (6) years."

2. G. Residential Yard Line and Inside Meter Set Survey Records

2. G. (1): Revised to "Gas Engineer or Gas Supervisor maintains the location of each Yard Line to be surveyed within Maximo." 2. G. (1)(d): New - "When the entire survey is complete, the surveyor will complete the task in ClickMobile for the yardline survey." 2. G. (2); Revised to "Gas Engineer or Gas Supervisor maintains the location of each Inside Gas Meter outside the Business District within Maximo." 2. G.(2)(c):) : New - "When the entire survey is complete, the surveyor will complete the task in ClickMobile for the yardline survey." 2. G. (3): Revised to "Completed surveys and associated records will be maintained in Maximo."

LEAK 2.13	<p>Calibration of Gas Detection Instruments</p> <p>7. Records</p> <p>7. A.: Revised to "The monthly calibration information for the CGI and FI units is required and shall be maintained for six (6) years in Maximo."</p>	<p>January 1, 2013</p> <p>December 1, 2014</p>
LEAK 2.14	<p>Special Distribution Leak Survey</p> <p>3. Survey</p> <p>3. D. (3): Revised to "Extension of a gas service" from Relocation</p> <p>Revision made to match categories in ClickMobile.</p> <p>2. D.: Added Corrosion Control to the groups that may use the service information.</p> <p>3. Inserted New - Service Sketches</p> <p>3. A.: New "Service Sketch should be completed within ClickMobile for all new installations, modifications, retirements and repairs to record and/or clarify work performed."</p> <p>3. B.: New "ClickMobile Sketch tool should be used but if for some reason a service sketch cannot be completed in ClickMobile, the sketch can be made on a copy of the former Gas Service Transaction Card then scanned and attached to the Work Order task assigned. The following information should be provided with the sketch."</p> <p>3. B. (1) Address of the service</p>	Janu- ary 1, 2014	De- cem- ber 1, 2014

- 3. B. (2) City or town
- 3. B. (3) Premise Number - if available
- 3. B. (4) Name of the person responsible for performing the work
- 3. B. (5) Employee Number of the responsible person performing the work
- 3. B. (6) Contractor Company if an outside contractor performed the work
- 3. B. (7) Date the work was performed
- 3. B. (8) Remarks

4. Completion Instructions

4. A.: New "The ClickMobile Gas Service Form contains required fields that must be accurately completed. However, it is good practice to record all information that is known about the service."

4. B. New "If the Gas Service Transaction Card/Sheet is being used for the service sketch, only the information listed under Service Sketches, above, should be included with the sketch. Service attributes should not be entered on the Transaction Card."

4. C.: New "Sample of a Gas Service Transaction Card used for Service Sketch"

Lines that are to be completed are indicated with the number associated with the information shown under Service Sketch. None of the service attribute information is to be entered on this card. A separate Sketch Card may be developed in the future if the need arises.

5. Distribution

5. A.: New "Gas Service Card Form shall be completed within ClickMobile."

5. B.: New "An email will be sent the appropriate poster who will access Maximo and retrieve the Service Request task and Service Sketch. The poster will post a service in G/Tech when necessary and maintain the Maximo Service Asset number for the service in G/Tech."

5. C.: New "The Gas Service Card Form information will be maintained in Maximo."

Removed:

Former 4 Service Transaction Card section

Former 5 Completion Instructions section for the Gas Service Transaction Card

These were removed since the Gas Service Transaction Card/ Sheets have been replaced with the electronic Gas Service Card contained in ClickMobile.

SERV
2.07

Gas Service G/Tech Mapping

Janu-
ary 1,
2014
De-
cem-
ber 1,
2014

1. B.: Revised to "Service attributes are collected on a Gas Service Card Form within ClickMobile and retained in Maximo. Maximo maintains the official service attributes record. The official gas service drawing is retained in Maximo as well."

1. C.: Revised to "G/Tech will maintain the relationship between the CSS Service Drop number and the Maximo Asset number."

2. Map a Premise

2. A." Revised to "The premise symbol represents a gas premise. When premise symbol is placed, the peak of the house will point north. It is not necessary to rotate the symbol. The Gas Service Card Form drawing will portray the premise's actual location and direction."

4. Map a Gas Service

4. A.: Revised to "Gas service attributes are maintained in Maximo."

4. D.: Revised to "The graphical line represents a service not the physical path to the premise. The physical path, dimensions, material, and other service attributes are captured on the Gas Service Card Form."

4. H.: Revised to "For service lines being mapped, the correct CSS service drop number and the correct Maximo service asset number should be associated to the service."

4. I.: Inserted new "The CSS Service Drop number will be associated to the Maximo Asset number in G/Tech."

4. J.: Revised to "Excess flow valves, curb valves, valve tees, and other fittings should not be mapped in G/Tech. The fitting information is maintained in Maximo." 5. Farm Tap Services

5. A.: Revised to "The entire service line from the main to the premise will be posted as one graphic service line and follow gas service mapping practice. The physical path, dimensions, material, and other service attributes are captured on the Gas Service Sketch within Click Mobile."

5. C.: Revised to "The entire service line from the main to the premise will be posted as one graphic service line and follow gas service mapping practice. The physical path, dimensions, material, and other service attributes are captured on the Gas Service Sketch within Click Mobile."

6. Branch Service

6. C.: Revised to "Care should be taken to assign the proper Service Drop number and Maximo Service Asset number to the correct service segment."

8. Retired Service

8. B.: Revised to "Maximo will maintain the retired material and date."

8. C.: Revised to "The Service Drop number and Maximo Asset number should stay with the retired service to maintain relationship to the service attribute record in Maximo."

9. Stub Service

9. B.: Revised to "An existing service drop number and Maximo Service Asset number should remain associated with the stub service. This will allow for reference for tapping information, location dimensions and material records."

SERV 4	Forms and Reference Materials Removed all of the Gas Service Transaction Card/Sheets These Cards/Sheets are no longer to be used. Service information will now be entered on the Gas Service Card contained within ClickMobile.	October 1, 2011	December 1, 2014
VALT 2.01	Inspecting Vaults and Pits 5. Vault Inspection Schedule 5. B.: Revised to "Inspection and deficiencies will be recorded within ClickMobile on the appropriate Regulator Station or Valve Inspection forms." 6. Inspection Records 6. A.: Revised to "All inspections of vaults with an internal volume of two hundred (200) cubic feet or more shall be maintained in Maximo."	January 1, 2011	December 1, 2014
VALV 1	4. Emergency Valve Inspections 4. B.: Revised to "Inspections will be recorded in ClickMobile and maintained for the life of the valve in Maximo."	January 1, 2014	December 1, 2014
VALV 2.01	Valve Installation 2. Valve Identification 2. B.: Revised to "Valve numbering is to be maintained and recorded in Maximo." 5. Non-Emergency Valves 5. E.: Revised to "Valve can be entered in Maximo and designated as Non-Emergency Valve." 5. E. (1): Revised to "Be cautious when entering a valve in Maximo that the correct Designation is denoted and an Emergency Valve is not erroneously entered as Non-Emergency. Some areas initially enter a valve as Non-Emergency until the valve is initially inspected, then the valve designation must be changed to Emergency when the inspection is entered in order for annual inspection to be scheduled."	January 1, 2014	December 1, 2014

5. E. (3): "Revised to Maximo will maintain a listing, location, and attributes of Non-Emergency valves."

5. E. (4) thru (6): These items were deleted since they referred to GCS instructions which are no longer valid.

5. F.: Revised to "If a below grade non-emergency valve is used to isolate or sectionalize gas main segments of a gas distribution system or transmission system during an emergency situation, the valve will be designated as an Emergency Valve after the emergency situation has been resolved. An Emergency Valve ID shall be assigned. The valve shall be entered into Maximo and on the electronic gas system map. In the comments section of the ClickMobile valve inspection form, enter "valve was used during an emergency situation". This does not include a below grade service line valve used to shut down a service line."

VALV
2.02

Valve Inspection and Maintenance

July 1, 2012
December 1, 2014

2. Valve Inspections 2. C.: Revised to "Review, verify, correct or furnish missing data on the ClickMobile map and inspection form."

2. K.: Revised to "Unknown or inaccurate valve description and installation data that can be accessed without excavation or disruption of service shall be verified and entered onto the ClickMobile inspection form." 3. Valve Maintenance 3. B.: Revised to "Verify that the valves are properly shown on the reference maps such that they can be easily located. Measurements associated with the sketch in ClickMobile should be checked to ensure they are reasonably correct." 4. Follow-up Maintenance 4. D.: Revised to "Gas Supervisor should review the inspection sheets and other maintenance work listed in Maximo. Maintenance work that can be reported during valve inspection includes: replacement of valve number tags, miscellaneous work, mechanical maintenance, lubricate valve, new insulator needed, new gasket needed, data correction, clear vegetation, clear valve box, clean internal (flush), clean external, bond wire, and align valve box."

5. Records

5. A.: Revised to "The results of the emergency valve inspection shall be recorded, by the qualified gas field personnel performing the inspection, on the ClickMobile inspection form."

Former 5. B. Deleted information regarding entering inspection results on hand-held, lap top, MDT or PDA that has access to GCS Valve Inspection module. This is no longer applicable.

5. B.: Revised to "Any data correction or update should be reported on the ClickMobile inspection form. Gas Supervisor or Gas Engineering is responsible for ensuring data corrections are made within Maximo."

5. C.: Revised to "The results of the emergency valve inspection shall be entered into ClickMobile and maintained within Maximo."

5. D.: Revised to "The results of the inspection shall be maintained for the life of the facility."

Supersedes: July 1, 2014

CHANGE SUMMARY

July 1, 2014

Change Summary July 1, 2014

Docu- ment	Change Summary	Previous Docu- ment Dated	Current Docu- ment Dated
<u>CONS</u> <u>0</u>	Table of Contents Added CORR 1 2. Construction Records, Maps, and Operating History	Janu- ary 1, 2013	July 1, 2014
<u>CONS</u> <u>1</u>	Requirements Inserted new section: 2. Construction Records, Maps, and Operating History A. Construction records, maps and operating history are available to gas field personnel assigned to safely operate the pipeline facilities and respond to emergencies. B. Construction records and operating history are typically located based on the type of facility and the area of operations responsible for the construction and/or maintenance of the facility. Much of the operating history is maintained in the Ameren Illinois gas compliance system. Gas field personnel can request the information through their Supervisor. C. Gas system maps are available electronically through the Ameren Illinois electronic mapping system. Gas field personnel have access to these maps via truck mounted mobile data terminals, lap top computers, or office based computers. This section was added to comply with requirements in Part 192.605. Language had not been included in the O&M that stated construction records, maps, and operating history are available to the operating personnel. 5. Construction Inspector B.: Added Gas Field Personnel and Management Employees to those that need to attend Gas Construction Training prior to inspecting gas construction work. C. Added new: "Construction Inspector Training will consist of a review of O&M Plan procedures for construction tasks, Gas Construction Oversight procedures, related forms and documentation requirements, and a review of Quality Assurance Field Inspection forms. An exam will be administered after the completion of training." These additions were made by the Gas Training group in response to a Notice of Amendment (NOA) issued by the ICC stating the O&M didn't include who should attend Gas Construction Inspector Training and what is included in the training,	Janu- ary 1, 2014	July 1, 2014

CORR 0	<p>Table of Contents</p> <p>CORR 1</p> <p>Inserted a new item 3. Corrective Action</p>	Janu- ary 1, 2014	July 1, 2014
CORR 1	<p>Requirements</p> <p>2. Cathodic Protection Measurements</p> <p>2. A.: Grammatical: Combined the two sentences to specify reference cell is a copper-copper sulfate.</p> <p>3. Corrective Action: Inserted a New Section: Moved CORR 1 7. I. language moved into its own section.</p> <p>Corrosion SMR group felt Corrective Action should be its own section.</p> <p>4. Cathodic Protection of New and Replacement Pipeline Facilities</p> <p>4. B.: Changed the required protection level to -0.900 volts from -0.850 volts to be consistent with the threshold at which corrosion control personnel are to be notified.</p> <p>6. External Corrosion</p> <p>6. B.: Revised to reflect it is no longer necessary to send copies of the Buried Pipe Examination form to Corrosion Control personnel when there is a reading of -0.900 volts or less. Corrosion control personnel receive daily reports list locations with readings less negative than -0.900.</p> <p>Corrosion SMR team felt sending copies of the Buried Pipe Examination form was an unnecessary waste of time and resources.</p> <p>13. Atmospheric Corrosion</p> <p>13. B. Monitoring</p> <p>13. B.(1): Listed those gas facilities that have annual compliance inspections which include checking for atmospheric corrosion.</p> <p>13. B.(2): Listed those gas facilities that are inspected on a 4 year cycle for atmospheric corrosion.</p> <p>This revision merely identifies at which interval atmospheric corrosion is performed. Ameren Illinois has a four year atmospheric corrosion inspection waiver for its gas facilities. However, there are gas facilities that have annual inspection requirements such as transmission leak surveys, regulator station inspections, emergency valve inspections, etc. Distribution and high pressure distribution facilities are leak surveyed on a 4 year cycle. Inspecting for atmospheric corrosion is part of all of these required inspections.</p> <p>13 B.(5): Deleted having meter readers checking for and reporting atmospheric corrosion on meter sets.</p>	Janu- ary 1, 2014	July 1, 2014

Since Company performs distribution leak surveys on a 4 year cycle and checking for atmospheric corrosion on meter sets is part of the leak survey process, it is no longer necessary for meter readers to perform that function. Leak surveyors are better trained in identifying atmospheric corrosion.

CORR 2.01	<p>Cathodic Protection Design</p> <p>5. Insulating Materials</p> <p>5. B. Flange Insulation</p> <p>Table for Class 600 Flange, Insulated: updated the stock codes for bolts used in 8 inch, 10 inch, and 12 inch flanges. For the 8 inch flange, 1-1/8" x 8-1/2" bolt is 21 96 234; for a 10 inch flange, 1-1/4" x 9" bolt is 21 96 233, and for a 12 inch flange, 1-1/4" x 9-1/2" bolt is 21 93 235. These bolts are stocked at the MDF and do have minimum quantity established.</p> <p>Gas Engineering requested these bolts be stock coded and a supply maintained at the MDF. These bolts are not readily available at local vendors.</p>	Janu- ary 1, 2013	July 1, 2014
CORR 2.02	<p>Anode Requirements</p> <p>1. General</p> <p>1. D.: Deleted "Anode shall not be installed at or within 10 feet of a test station attachment to steel pipe."</p> <p>1. D.: Inserted a new item to provide additional instructions for anode installation.</p> <p>"1. D.: Anode can be placed vertically or horizontally and a minimum of six (6) inches below the bottom of the steel pipe. Anodes may be installed in multiple groupings. No more than 2 anodes shall be installed in an excavation unless 10 feet of spacing can be maintained between the anodes. If multiple connections are made on the pipe, the connections should be at least six (6) inches apart.</p> <p>1. E.: "Anode should be placed as far away from the pipe as the excavation safely allows up to the length of the anode lead wire."</p> <p>To avoid issue of meeting specific measurements, Corrosion Control SMR team removed specifying minimum distance away from the pipe an anode should be placed. They felt the size of the excavation would detect the placement of the anode was more realistic.</p> <p>1. F.: Simplified instructions on activating anode(s) to be consistent with CORR 1 language. "If the pipe to soil reading does not change after installation of anode(s), add water to activate."</p> <p>Corrosion SMR group felt there needed to be additional instructions added to ensure that anodes were being correctly in-</p>	Octo- ber 1, 2011	July 1, 2014

stalled and to reinforce the necessity of the anode being activated after installation.

4. Anode Requirements

4. B.: Service lines and repairs steel main and services, install anodes as shown in table.

Changed the Pipe to Soil reading criteria to -0.900 VDC from -1.000 VDC to be consistent throughout the O&M.

Revised the instructions if the P/S reading is less negative than -0.900 VDC. Install an anode as long as it is not a transmission main.

In the table headings added examples as to what is a more negative reading and a less negative reading.

Corrosion Control SMR team felt the logical course of action would be to install an anode rather than contacting a corrosion control person, who in most cases advise installing an anode when it is not a transmission main. Example of a more negative and a less negative reading was added to provide clarification and eliminate confusion.

4. D.: Isolated services, install anodes as shown in table.

Changed the Pipe to Soil reading criteria to -0.900 VDC from -1.000 VDC to be consistent throughout the O&M.

Revised the instructions if the P/S reading is less negative than -0.900 VDC on an existing isolated service line to go ahead and install an anode.

Corrosion SMR group agreed the Pipe to Soil reading threshold should be the same throughout the O&M. Corrosion Control SMR team felt the logical course of action would be to install an anode rather than contacting a corrosion control person, who in most cases advise installing an anode.

5. Anode Bank Installation

5. C.: Added a reference to CORR 3.04 Perpendicular Anode Bank and to CORR 3.03 Parallel Anode Bank.

5. E.: Added a reference to CORR 3.14 Test Lead Wire Attachment for instruction on attaching collector wire to the main and coating the connection.

Links to the Corrosion Standards were added as an improvement to the O&M.

CORR
2.03

Coatings

5. Approved Cold Applied Wax Tapes

5. D.: Trenton Items - Added Trenton Fill-Pro PM-GP as an approved profiling mastic to be used on irregular surfaces to create a smooth surface prior to applying wax tape.

January 1,
2014

July 1,
2014

Based on field trials, Corrosion Control found the Trenton Fill-Pro to be more moldable than the Trenton Profiling Material and easier to fill in irregular surfaces.

CORR 2.16	<p>Measuring Cathodic Protection Potentials</p> <p>4. Equipment</p> <p>4. B. Copper Sulfate Reference Electrode</p> <p>4. B.(6)(b): Revised language regarding cleaning and refilling the Reference Electrode based on information provided by a manufacturer.</p> <p>(6) Maintenance</p> <p>(6)(b): After prolonged use, the copper sulfate solution may become contaminated, which causes measurement errors.</p> <ul style="list-style-type: none"> · Half-cells used sporadically throughout the year should be cleaned and refilled annually. · Half-cells used daily should be cleaned and refilled quarterly or when needed. · The copper sulfate solution may become cloudy with use. This does not mean the solution has become seriously contaminated. <p>(6)(c) & (6)(d) have been deleted</p> <p>Corrosion SMR group felt the current language regarding maintenance of the half cells was too difficult to follow and the manufacturer's recommendations were straight forward and easier to understand and follow.</p>	Janu- ary 1, 2013	July 1, 2014
CORR 2.29	<p>Records</p> <p>2. Construction Order Review Process</p> <p>2. A. General</p> <p>2. A.(3): Grammatical only, updated job titles: Field Engineering Representatives, and Gas Tech Engineering</p> <p>2. B. Belleville Design Center/Peoria Design Center</p> <p>2. B.(2): Revise work group to "Gas Engineering Work (Work designed by Gas Tech Engineering or Consultant)</p> <p>2. B.(2)(b): Revised language in the Corrosion Technician review of final design to state the review will be documented on the Cathodic Protection Review stamp. A revised Cathodic Protection Review stamp has been added.</p> <p>2. B.(2)(c): In Post Construction - As Builts section changed "Designer" to "DDC/PDC Poster". Posters will give copy of "as built" to the Corrosion Tech if field changes are made.</p> <p>2. B.(2)(c): Added PDC. "Corrosion Technician will send mapping changes to the DDC/PDC for posting as needed."</p>	Janu- ary 1, 2013	July 1, 2014

Revisions were made to reflect current position titles and updated review process by Corrosion Techs,

CORR
2.30

Buried Pipe Examination
2. Buried Pipe Examination

April
1,
2013

July 1,
2014

2. F.: Added the word "section" to the sentence, "A Buried Pipe Examination form is not required on the new pipe being installed or when an existing section of pipe is planned to be retired and will not remain in service.

2. G. (5): Merely a format change by dividing earlier language into bullet points.

2. H.: Inserted a new item: The internal surface of the abandoned pipe must be inspected for evidence of corrosion as stated in CORR 1. A corrosion control person for the area should be notified if there is an indication of internal corrosion. Any internal corrosion found will be documented on a Corrosion and Steel Damage Evaluation, CORR 2.31, stating where the internal corrosion was found; on the pipe remaining in service or the abandoned pipe.

Note: If a corrosion control person or qualified gas engineer is not available at time of discovery, a representative section of the pipe with internal corrosion can be removed and retained for evaluation.

This was added as an emphasis that an internal inspection for evidence of atmospheric corrosion is required, by Part 192 Code, for any steel pipe being removed from service for any reason. If evidence is found then a Corrosion and Steel Damage Evaluation is required to document the internal inspection.

5. Completion Instructions

5, C. Steel Pipe Information

5. C. 20.: Revised the wording by eliminating the language regarding Corrosion Control monitoring PEET database.

20. Pipe to Soil Reading: Required - Select Not Required or select P/S and enter the pipe to soil reading. Pipe to Soil readings are not required if bare steel is not exposed, coating is not removed, or if the exam is on a rectifier-protected pipe and the rectifier is turned off. If a magnesium anode is installed, record the anode installation in the Remarks section of the form or on the job order created for the anode installation. Do not install galvanic anodes on transmission pipelines unless recommended by Corrosion Control Personnel.

Corrosion Control SMR team removed the PEET monitoring language since it had no bearing on how to complete the Buried Pipe Examination form.

CORR 3.01	<p>Anode Installation - Direct Connection</p> <p>Additional installation procedures have been added by the Corrosion SMR team to ensure anodes are being correctly installed.</p> <p>Inserted new: "3. Anode can be placed vertically or horizontally and a minimum of six (6) inches below the bottom of the steel pipe. Anodes may be installed in multiple groupings. No more than 2 anodes shall be installed in an excavation unless 10 feet of spacing can be maintained between the anodes. If multiple connections are made on the pipe, the connections should be at least six (6) inches apart.</p> <p>4.: "Anode should be placed as far away from the pipe as the excavation safely allows up to the length of the anode lead wire."</p> <p>Revised language: "6. If the Pipe to Soil reading does not change after installation of anode(s), add water to activate. See CORR 2.02."</p> <p>Added to 8: "Do not attach wire within two (2) inches of longitudinal seam or nearest girth weld."</p> <p>Added Reference to CORR 3.14: "10. Attach wire, as described in CORR 3.14, to clean (no coating, grease, moisture, dirt, or rust) pipe after looping wire around pipe as shown.</p> <p>Inserted New: "11. Steel pipe operating at or below 60 psig, a welded 5/16" bolt may be used to attach test lead to the pipe as shown in CORR 3.14."</p>	Febru- ary 1, 2010	July 1, 2014
CORR 3.02	<p>Anode Test Station</p> <p>Additional installation procedures have been added by the Corrosion SMR team to ensure anodes and test stations are being correctly installed. Language is basically a repeat of CORR 3.01.</p> <p>Inserted new: "3. Anode can be placed vertically or horizontally and a minimum of six (6) inches below the bottom of the steel pipe. Anodes may be installed in multiple groupings. No more than 2 anodes shall be installed in an excavation unless 10 feet of spacing can be maintained between the anodes. If multiple connections are made on the pipe, the connections should be at least six (6) inches apart.</p> <p>4.: "Anode should be placed as far away from the pipe as the excavation safely allows up to the length of the anode lead wire."</p> <p>Revised language: "6. If the Pipe to Soil reading does not change after installation of anode(s), add water to activate. See CORR 2.02."</p> <p>Added to 8.; "Do not attach wire within two (2) inches of longitudinal seam or girth weld."</p>	Febru- ary 1, 2010	July 1, 2014

Added Reference to CORR 3.14: "10. Attach wire, as described in CORR 3.14, to clean (no coating, grease, moisture, dirt, or rust) pipe after looping wire around pipe as shown.

Inserted new: "11. Steel pipe operating at or below 60 psig, a welded 5/16" bolt may be used to attach test lead to the pipe as shown in CORR 3.14."

Material List:

Updated the description of the CP Test Box to reflect a change in buried test boxes now being stocked in the storerooms. "Box, CP Test, 4 in ID x 18 in Lgh, Plastic w/Cast Iron Lockable Lid, 5 terminals, Marked Gas Test."

CORR
3.03

Parallel Anode Bank

February 1,
2010

July 1,
2014

Corrosion SMR team significantly expanded the installation instructions to ensure for proper installation. The following procedures were added or expanded.

Inserted new: "2. Install anode in convenient location, as near as practical to that shown on construction drawing, and record installation. See CORR 2.02"

Inserted new: "3. Anode can be placed vertically or horizontally and a minimum of six (6) inches below the bottom of the steel pipe. See CORR 2.02"

Inserted new: "4. Carefully lower or place anode in the hole or excavation and center it. Do not lower anode using lead wire."

Revision: 5. Specified a #8 split bolt and added the stock code 17 54 002 for the split bolt.

Inserted new: "7. If Pipe to Soil readings do not change after installation of anode(s), add water to activate. See CORR 2.02"

Inserted new: "8. Backfill with fine earth (not sandy or rocky soil) around anode to about 4" above top of bag. Complete backfill with tamped earth."

Inserted new: "9. Leave sufficient slack in wire to avoid damage when back-filling."

Inserted new: "10. Attach wire, as described in CORR 3.14, to clean (no coating, grease, moisture, dirt, or rust) pipe. Do not attach wire within two (2) inches of longitudinal seam or nearest girth weld."

Inserted new: "11. Coat connection according to the methods described in CORR 3.14."

Material List:

Updated the description of the CP Test Box to reflect a change in buried test boxes now being stocked in the storerooms. "Box, CP Test, 4 in ID x 18 in Lgh, Plastic w/Cast Iron Lockable Lid, 5 terminals, Marked Gas Test."

UNCONTROLLED IF PRINTED

Added the Splice box, 49 62 001, as an option to the vinyl tape at the instructions from the Corrosion SMR team.

CORR 3.04	<p>Perpendicular Anode Bank</p> <p>Corrosion SMR team significantly expanded the installation instructions to ensure for proper installation. The following procedures were added or expanded.</p> <p>Inserted new: "2. Install anode in convenient location, as near as practical to that shown on construction drawing, and record installation. See CORR 2.02"</p> <p>Inserted new: "3. Anode can be placed vertically or horizontally and a minimum of six (6) inches below the bottom of the steel pipe. See CORR 2.02"</p> <p>Inserted new: "4. Carefully lower or place anode in the hole or excavation and center it. Do not lower anode using lead wire."</p> <p>Revised: 5. Specified a #8 split bolt and added the stock code 17 54 002 for the split bolt.</p> <p>Inserted new: "7. If Pipe to Soil readings do not change after installation of anode(s), add water to activate. See CORR 2.02"</p> <p>Inserted new: "8. Backfill with fine earth (not sandy or rocky soil) around anode to about 4" above top of bag. Complete backfill with tamped earth."</p> <p>Inserted new: "9. Coat connection according to the methods described in CORR 3.14."</p> <p>Material List:</p> <p>Updated the description of the CP Test Box to reflect a change in buried test boxes now being stocked in the storerooms. "Box, CP Test, 4 in ID x 18 in Lgh, Plastic w/Cast Iron Lockable Lid, 5 terminals, Marked Gas Test."</p> <p>Added the Splice box, 49 62 001, as an option to the vinyl tape at the instructions from the Corrosion SMR team.</p>	February 1, 2010	July 1, 2014
CORR 3.05	<p>Drive-In Anode</p> <p>Additional installation procedures have been added by the Corrosion SMR team to ensure drive-in anodes are being correctly installed.</p> <p>Inserted new: "5. A grounding clamp can be used in place of the clamp that comes with the drive-in anode. The riser will</p>	February 1, 2010	July 1, 2014

have to be cleaned down to bare metal where the grounding clamp makes contact.

Grounding clamp for 1/2" and 1" risers is Stock Code 40 59 319

Grounding clamp for 1-1/4" and 2" risers is Stock Code 40 59 318"

Revised 7. To require applying only one layer of was tape, over the wire. Deleted applying two layers of wax tape, one under the anode wire and one over the anode wire.

Revised 9. "Typically place anode approximately 12 inches to 18 inches from the riser and drive with hammer until head is below grade."

Inserted new: "10. If the Pipe to Soil reading does not change after installation of anode, add water to activate. See CORR 2.02

CORR 3.06	<p>Anode Installation - Isolated Steel Service Line</p> <p>Additional installation procedures have been added by the Corrosion SMR team to ensure anodes are being correctly installed.</p> <p>Inserted new: "5. Attach wire, as described in CORR 3.14, to clean (no coating, grease, moisture, dirt, or rust) pipe.</p> <p>Inserted new: "7. If Pipe to Soil reading does not change after installation of anode, add water to activate. See CORR 2.02</p>	February 1, 2010	July 1, 2014
CORR 3.07	<p>Single Test Lead - Flush Grade Test Station</p> <p>Additional installation procedures have been added by the Corrosion SMR team to ensure test lead is being correctly installed.</p> <p>Inserted new: "2. Attach wire, as described in CORR 3.14, to clean (no coating, grease, moisture, dirt, or rust) pipe after looping wire around pipe as shown. Do not attach wire within two (2) inches of longitudinal seam or nearest girth weld".</p> <p>Inserted new: "3. Steel pipe operating at or below 60 psig, a welded 5/16" bolt may be used to attach test lead to the pipe. See CORR 3.14 for material list."</p> <p>Inserted new: "6. Terminate the test lead wire on a terminal in the test station."</p> <p>Material List</p> <p>Updated the description of the CP Test Box to reflect a change in buried test boxes now being stocked in the storerooms. "Box, CP Test, 4 in ID x 18 in Lgh, Plastic w/Cast Iron Lockable Lid, 5 terminals, Marked Gas Test."</p>	February 1, 2010	July 1, 2014

CORR 3.08	<p>Single Test Lead - Above Grade Test Station</p> <p>Additional installation procedures have been added by the Corrosion SMR team to ensure test lead is being correctly installed.</p> <p>Inserted new: "3. Attach wire, as described in CORR 3.14, to clean (no coating, grease, moisture, dirt, or rust) pipe after looping wire around pipe as shown. Do not attach wire within two (2) inches of longitudinal seam or nearest girth weld."</p> <p>Inserted new: "4. Steel pipe operating at or below 60 psig, a welded 5/16" bolt may be used to attach test lead to the pipe as shown in CORR 3.14."</p> <p>Inserted new: "7. Terminate the test wire on a terminal in the test station."</p>	February 1, 2010	July 1, 2014
CORR 3.09	<p>Foreign Pipeline Crossing Test Station</p> <p>Corrosion SMR group added the following to ensure test stations were being properly installed.</p> <p>Inserted new: "3. Attach wires, as described in CORR 3.14, to clean (no coating, grease, moisture, dirt, or rust) Ameren Illinois pipe after looping wires around pipe as shown. Do not attach wires within two (2) inches of longitudinal seam or nearest girth weld. Multiple connections to the pipe should be at least six (6) inches apart."</p> <p>Revised: "5. Terminate test wires on terminals in the test station." Deleted "as shown in construction drawing or neatly in test station."</p>	February 1, 2010	July 1, 2014
CORR 3.10	<p>Inline Insulator - Above Grade Test Station</p> <p>Corrosion SMR group added the following to ensure test stations were being properly installed.</p> <p>Inserted new: "1. Attach wire, as described in CORR 3.14, to cleaned (no coating, grease, moisture, dirt, or rust) pipe after looping wire around pipe as shown. Do not attach wire within two (2) inches of longitudinal seam or nearest girth weld."</p> <p>Inserted new: "2. Steel pipe operating at or below 60 psig, a welded 5/16" bolt may be used to attach test lead to the pipe as shown in CORR 3.14."</p> <p>Inserted new: "6. Terminate the test lead wire on a terminal in the test station."</p>	February 1, 2010	July 1, 2014
CORR 3.11	<p>Inline Insulator - Flush to Grade Test Station</p> <p>Corrosion SMR group added the following to ensure test stations were being properly installed.</p> <p>Inserted new: "1. Attach wire, as described in CORR 3.14, to clean (no coating, grease, moisture, dirt, or rust) pipe after</p>	February 1, 2010	July 1, 2014

looping wire around pipe as shown. Do not attach wire within two (2) inches of a longitudinal seam or nearest girth weld"

Inserted new: "2. Steel pipe operating at or below 60 psig, a welded 5/16" bolt may be used to attach test lead to the pipe as shown in CORR 3.14."

Revised "5. Terminate the test wires on the terminals in the test station." Deleted "as shown in construction drawing or neatly in test station."

Material List

Updated the description of the CP Test Box to reflect a change in buried test boxes now being stocked in the storerooms. "Box, CP Test, 4 in ID x 18 in Lgh, Plastic w/Cast Iron Lockable Lid, 5 terminals, Marked Gas Test."

CORR 3.12	<p>Insulated Valve - Underground</p> <p>Corrosion SMR group added the following to ensure test station in a valve box was being properly installed.</p> <p>Inserted new: "1. Attach wire, as described in CORR 3.14, to cleaned (no coating, grease, moisture, dirt, or rust) pipe after looping wire around pipe as shown. Do not attach wire within two (2) inches of a longitudinal seam or nearest girth weld."</p> <p>Inserted new: "2. Steel pipe operating at or below 60 psig, a welded 5/16" bolt may be used to attach test lead to the pipe as shown in CORR 3.14."</p>	February 1, 2010	July 1, 2014
CORR 3.13	<p>Flange Fink Station</p> <p>Corrosion SMR added instructions on attaching wires to the pipe or to the edge of the flanges.</p> <p>Test Leads Attached to Pipe:</p> <p>Added installation instructions:</p> <p>Installation</p> <p>"1. Attach wire, as described in CORR 3.14, to clean (no coating, grease, moisture, dirt, or rust) pipe after looping wire around pipe as shown. Do not attach wire within two (2) inches of a longitudinal seam or nearest girth weld."</p> <p>"2. Steel pipe operating at or below 60 psig, a welded 5/16" bolt may be used to attach test lead to the pipe as shown in CORR 3.14."</p> <p>"3. Coat each connection according to the methods described in CORR 3.14".</p> <p>"4. Terminate the test leads on the terminals in the test station."</p> <p>Test Leads Attached to Flanges:</p> <p>Installation</p>	April 1, 2012	July 1, 2014

"1. Attach wire to the outside edge of the flanges with either thermite weld or welded 5/16" bolt as described in CORR 3.14. A 5/16" bolt can be welded on the edge of flange that is operating at any pressure."

"2. Cover or protect the flange gasket from slag resulting from either the thermite weld or welding on a bolt."

"3. Coat each connection according to the methods described in CORR 3.14."

"4. Terminate the test leads on the terminals in the test station."

Material List

Added stock codes for the material necessary to install 5/16" bolt.

CORR
3.14

Test Lead Wire Attachment

Corrosion SMR group added these to provide more guidance on attaching test leads to pipe.

October 1,
2011

July 1,
2014

1. D.: New: "If multiple connections are made on the pipe, the connections should be at least six (6) inches apart.

1. E.: New: "Do not attach wire within two (2) inches of longitudinal seam or nearest girth weld."

2. Cadweld Thermite Welding Process

2. A. Installation

2. A.(1): Moved checking atmosphere for the presence of natural gas up to the first thing that should be done before proceeding.

Ensuring the work location is gas free is the first priority before beginning any work.

2. A.(4): Expanded instructions on pipe preparation: "Use a file, wire wheel, scraper, power brushes or grinder, or commercial blasting on the pipe until the bare metal is bright and shiny in the attachment location. If commercial blasting is used clean the grit or shot off the pipe after blasting."

2. A.(5): Added "dry pipe" in addition to cleaning the pipe thoroughly before starting the weld.

2. A.(6): Added precautionary language when using a torch to heat the pipe prior to thermit weld.

(a) "Be cautious not to damage the existing pipe coating during this step by keeping the torch moving."

(b) "If there is PE pipe is connected to the steel pipe, keep the torch flame away from the PE pipe or protect the PE pipe from the torch flame. Protection methods can be such as; covering PE pipe with backfill material, covering with noncombustible material, or placing a shield between the torch and PE Pipe, etc."

2. A.(10): Inserted a new item: "Place metal disk in mold prior to pouring in powder."

3. Cadweld Plus Process

3. A. Installation

The same revisions were made to the Cadweld Plus Process that was added to the Cadweld Thermit Welding Process.

3. A.(4): Expanded instructions on pipe preparation: "Use a file, wire wheel, scraper, power brushes or grinder, or commercial blasting on the pipe until the bare metal is bright and shiny in the attachment location. If commercial blasting is used clean the grit or shot off the pipe after blasting."

3. A.(5): Added "dry pipe" in addition to cleaning the pipe thoroughly before starting the weld.

3. A.(6): Added precautionary language when using a torch to heat the pipe prior to thermit weld.

(a) "Be cautious not to damage the existing pipe coating during this step by keeping the torch moving."

(b) "If there is PE pipe is connected to the steel pipe, keep the torch flame away from the PE pipe or protect the PE pipe from the torch flame. Protection methods can be such as; covering PE pipe with backfill material, covering with noncombustible material, or placing a shield between the torch and PE Pipe, etc."

6. Test Lead Attachment Coating

6. B. Handy Cap (19 62 336)

The instructions for using the Handy Cap have been significantly expanded to follow manufacturer's instructions for; Installation, Inspection and Testing and Backfilling.

6. B.(1) Installation:

6. B.(2) Inspection and Testing

6. B.(3) Backfilling

CORR
3.15

Rectifier Installation

3. Rectifier Ground Bed Anode Installation

3. B.(2): Added "Loose coke breeze is an optional backfill material."

4. Rectifier Ground Bed Header Connections

4. B.(1) Description for Dryconn Visilock:

4. B.(1)(d), (e), (g), (i): Deleted these previous instructions to be consistent with manufacturer's procedures.

5. Connection of Rectifier Lead to Transmission Main

5. B.: Installation

January 1,
2014

July 1,
2014

5. B.(2): Inserted new "The connections should be at least six (6) inches apart."

Corrosion SMR group added the loose coke breeze as an optional backfill material for the anode bed and cleaned up the installation instruction.

EMER 0	Table of Contents Added EMER 2.11 Gas Control	Janu- ary 1, 2014	July 1, 2014
EMER 2.04	Gas Field Personnel 4. Major Leaks or Line Breaks 4. H.: Corrected reference EMER 2.04 10. Loss and Restoration of Service. January version had 2.04 9. 10. Loss and Restoration of Service 10. E: Revision made to how customer list can be obtained. Added Contacting Gas Engineer, DDC/PDC, or Gas Tech Engineering, who can assist in obtain a list. After checking with Operations, some areas are going through the DDC/PDC or Gas Tech Engineering- Planning group to acquire a customer list instead of using the Gas Emergency Re-light User's Guide.	Janu- ary 1, 2014	July 1, 2014
EMER 2.05	Natural Disasters or Civil Disobedience 2. Natural Disasters 2. H.: Updated position title, Manager, Gas Compliance & Training, who Gas Supervisor is to notify and kept updated on situation. 3. Floods 3. C. Following the Flood 3. C.(6): Inserted a new item, "Create pipeline patrols in the Gas Compliance System for any pipeline segments that become exposed, undermined, or at risk due to reduced cover. See PTRL 1. This item was added in response to a Notice of Amendment issued by the ICC. Additional measures needed to be added to address inspection of pipelines subjected to flooding. Additional procedures are also contained in PTRL 1 and PTRL 2.02 - Critical Area Patrols.	April 1, 2013	July 1, 2014
EMER 2.11	New: Gas Control New section was added to provide general information regarding Gas Control's interaction with gas operating personnel. Gas Control remotely monitors numerous gas facilities and operations. This section addresses steps taken when Gas Control: a) loses communications with devices they are remotely	N/A	July 1, 2014

monitoring and b) responses to alarms indicating possible abnormal operation, malfunction of a component or safety device.

These procedures were added in response to a Notice of Amendment issued by the ICC which requested information contained in Gas Controls' Control Room Management Plan regarding response to abnormal operations be included in the Gas O&M Plan.

MAIN 3.15	<p>End of Main Extension Steel to PE, Mueller Stopper</p> <p>Stock Code for the 4 inch Line Stopper updated to match what GTECH construction units, 19 23 148 for the thin wall fittings.</p> <p>DDC representative sent a message that Construction Unit in GTECH for the 4 inch Class 150 Mueller Line Stopper did not match what is in the O&M Main Standards. All of the following Standards have the same correction,</p>	January 1, 2011	July 1, 2014
MAIN 3.16	<p>End of Main Extension Steel to PE, Increasing, Mueller Stopper</p> <p>Stock Code for the 4 inch Line Stopper updated to match what GTECH construction units, 19 23 148 for the thin wall fittings.</p>	January 1, 2011	July 1, 2014
MAIN 3.17	<p>End of Main Extension Steel to PE, Decreasing, Mueller Stopper</p> <p>Stock Code for the 4 inch Line Stopper updated to match what GTECH construction units, 19 23 148 for the thin wall fittings.</p>	January 1, 2011	July 1, 2014

MAIN 3.23	<p>End of Main Extension Steel to Steel, Decreasing, Mueller Stopper</p> <p>Stock Code for the 4 inch Line Stopper updated to match what GTECH construction units, 19 23 148 for the thin wall fittings</p>	January 1, 2011	July 1, 2014
METR 2.25	<p>Ultrasonic Meter Testing</p> <p>1. General</p> <p>1. A.: Grammatical changes; replaced "vendor" with "manufacturer's" and replaced "validate measurement accuracy" with "verify proper meter operation"</p>	January 1, 2012	July 1, 2014

1. B.: Clarification that the "AGA 9 specifications" is "AGA Report No. 9 specifications"

2. Ultrasonic Meter Inspection Schedule

2. A.: Changed the inspection interval from "twice each calendar year" to "once every 3 months."

2. B.: Completely revised to: "With gas flowing through the meter, use the manufacturer's software to create a maintenance report that captures at least two minutes of data. The software uses the captured data to generate reports and graphs detailing the ultrasonic transducer performance as well as the overall meter performance. Save the reports to document the current meter condition and also to develop diagnostic benchmarks."

2. E.: Removed "confirm Gas Control is using the same meter factor as USM." Now only the on-site flow computer meter factor is confirmed to be the same as USM.

5. Inspection Records

This section was totally revised to reflect utilizing electronic records.

A. Complete and save electronic versions of the Ameren Illinois Gas Instrument Calibration Data Sheets for the pressure and temperature transmitters associated with the meter.

B. Save electronic copies of the manufacture's software generated maintenance and/or inspection reports as well as software generated meter configuration files. Save maintenance log and meter configuration files then print a copy of the current meter configuration (or parameter list).

C. Send electronic copies of items A and B to the Gas Meter Engineer - Decatur Central Meter Shop.

D. All meter configuration files, calibration, inspection, and maintenance information shall be maintained on the USM SharePoint site or as a paper record.

Metering SMR team revised this entire section to make it consistent with current processes.

METR
3.01

New Meter Sizing

3. Approved Meters for New Installations

Minor correction made in the capacity table for:

Roots 15C/175 metering pressure of 2 psig - 1670cfh from 1680

Roots 3/3.5M175 metering pressure of 2 psig - 3340cfh from 3370

Roots 5/5.5M175 metering pressure of 2 psig - 5570cfh from 5590

January 1,
2013

July 1,
2014

Roots 7M175 metering pressure of 7"wc - 7000cfh from 6300 and metering pressure of 2 psig - 7790cfh from 7810

METR 3.02	Existing Meter Sizing 4. Existing Rotary Meter Installations Corrections made in the capacity table for the Roots 5M thru 102M with metering pressure of 7"wc and 2 psig. Capacities for the 7"wc metering pressure were corrected to match manufacturer's rated capacities. Capacities for the 2 psig metering pressure were adjusted slightly.	January 1, 2013	July 1, 2014
METR 3.04	Regulator Sizing - 2 psig Delivery Pressure 2" Fisher 299H, 1/2" orifice: Updated the foot note for all pressures to (4) which requires a 2" Fisher 289H relief valve for all pressures.	April 1, 2013	July 1, 2014
POLY 0	Table of Contents Added: POLY 2.09 Plastic Fusion Qualification Added: FORMS Plastic Fusion & Joining Annual Qualification Reference Materials Removed Central Electrofusion Installation Procedural Manual Added: Central MSA 340 Processor Operation Manual Genesis F3Processor Operator Guide Phoenix Battery Processor Model 804 McElroy Pit Bull Hydraulic Machines	April 1, 2013	July 1, 2014
POLY 1	9. Tracer Wire: 9. A.: Revised to include a table with the stock codes for: #12 Solid Soft Drawn Copper and #10 Stainless Steel Stranded tracer wire. Gas Standards Committee approved the use of stainless steel tracer wire particular for long or difficult directional bores where breakage of copper tracer wire could be anticipated. The stainless steel wire is much stronger than the copper. 9. E.: Added consideration could be given to using stainless steel tracer wire for long or difficult directional bores. "If stainless steel wire is used, a test station should be brought up at the location where the stainless joins to the copper wire with a lead running to each wire. The copper and stainless wires should not be directly tied together. See Bore 2.03" 9. G.: Added a table with the stock codes for the split bolt connectors and splice box.	January 1, 2014	July 1, 2014

Corrosion Control group wants to make sure the stainless steel tracer wire and the copper tracer wire are not connected due to dissimilar metals. A test box should be used to terminate the ends for the wire that way there would be continuity for locating purposes.

9. H.: Added a reference to CORR 2.03 for approved coating when attaching tracer wire to steel risers, mains, or services.

Reference added as an enhancement.

POLY 2.09	<p>New: Plastic Fusion Qualifications</p> <p>This new section identifies what is included in Ameren Illinois' plastic fusion qualification, testing and requalification program.</p> <p>This was added to comply with Part 192.285 for qualifying PE pipe joining procedures. Gas Training group prepared these procedures in response to a Notice of Amendment issued by the ICC.</p>	N/A	July 1, 2014
POLY 4	<p>Forms and Reference Materials</p> <p>Added Form 01 - Plastic Fusion & Joining Annual Qualification</p> <p>Reference Materials:</p> <p>Removed Central Electrofusion Installation Procedural Manual</p> <p>Central's manual was removed because it had some different procedures than are in POLY 2.05. POLY 2.05 contains the official electrofusion procedures.</p> <p>Added:</p> <p>Reference 19 - Central MSA 340 Processor Operation Manual</p> <p>Reference 20 - Genesis F3 Processor Operator Guide</p> <p>Reference 21 - Phoenix Battery Processor Model 804</p> <p>Reference 22 - McElroy Pit Bull Hydraulic Machines</p>	April 1, 2013	July 1, 2014
PTRL 1	<p>1. A.: Simple word change, Ameren Illinois replaces Operators</p> <p>2. Frequency of Transmission Patrols</p> <p>Added Note: "Ameren Illinois does not have any Class 4 locations within its operating areas."</p> <p>3. Frequency of Distribution Patrols</p> <p>3. A.: Added a reference link to PTRL 2.02 which defines Critical Area Patrols.</p> <p>Reference to PTRL 2.02 was added to the Critical Area Patrol document that specifies the frequency of patrols. This was done in response to an ICC NOA.</p>	July 1, 2012	July 1, 2014

<p>PTRL 2.01</p>	<p>Transmission Patrols</p> <p>2. Transmission Main Patrols</p> <p>2. B.: Added Note under table: "Ameren Illinois does not have any Class 4 locations within its operating areas."</p> <p>3. Patrol Requirements</p> <p>3. B.: Inserted new item: "Inaccessible segments of transmission line due to flooding, vegetation, difficult terrain, etc.</p> <p>Note: If the completion of the transmission patrol will be delayed beyond the compliance date due to inaccessibility, Gas Compliance should be notified in advance of the compliance date for special consideration of the missed compliance date."</p> <p>Inaccessible to sections of transmission lines are still required to be patrol in order to complete the patrol in GCS, Supervisors must be made aware of these locations in order communicate with Gas Compliance the possibility of not getting the patrol completed by the compliance date.</p> <p>3. C.(3): Added reference to pipeline marker standards; PTRL 3.01, PTRL 3.02, or PTRL 3.04</p> <p>4. Processing Data</p> <p>4. A.: Grammatical: Added "Tech" to "Gas Tech Engineering".</p>	<p>April 1, 2012</p>	<p>July 1, 2014</p>
<p>PTRL 2.02</p>	<p>Critical Area Patrols</p> <p>1. General</p> <p>1. A.: Revise the wording to now state: "This section outlines critical areas along distribution mains that are require to be patrolled to ensure conditions have not deteriorated, putting the gas facilities in danger of damage or leakage and the consequent hazards to public safety." Replaced "special attention" with "to be patrolled". Added "and the consequent hazards to public safety" at the end of the sentence.</p> <p>1. B.: This is former 4. Patrol Requirements language 2. Critical Areas:</p> <p>2.Critical Areas</p> <p>2. F.: New - "Mains identified as exposed or undermined after periods of heavy rains or flooding."</p> <p>4. Processing Data</p> <p>4. A.: Added "patrol" to identify the inspection report used as documentation.</p> <p>4. B.: Revised to state "Notify Gas Supervisor of any change in conditions where follow-up action is required." Added "of any change in conditions" and replaced "may be" with "is".</p> <p>These items were added under Critical Areas in response to a Notice of Amendment issued by the ICC. Additional measures</p>	<p>January 1, 2012</p>	<p>July 1, 2014</p>

needed to be added to address inspection of pipelines subjected to flooding.

PTRL 2.03	<p>Patrol Methods</p> <p>2. Foot Patrol</p> <p>2. A.(5): Inserted new item: "Agricultural field tiling operations in vicinity of the pipeline."</p> <p>2. A.(6): Simply word change, Ameren Illinois replaces operator. Added reference to pipeline marker standards, PTRL 3.01, PTRL 3.02, and PTRL 3.04.</p> <p>3. Vehicular Patrol</p> <p>3. A.(5): Inserted new item: "Agricultural field tiling operations in vicinity of the pipeline."</p> <p>3. A.(6): Simply word change, Ameren Illinois replaces operator. Added reference to pipeline marker standards, PTRL 3.01, PTRL 3.02, and PTRL 3.04.</p> <p>4. Aerial Patrol</p> <p>4. A.(3): Inserted new item: "Agricultural field tiling operations in vicinity of the pipeline."</p> <p>4. A.(5): Deleted the sentence, "These should be reported to the Gas Supervisor for follow up investigation by foot patrol." This duplicated language that is in 4. B.</p> <p>SMR Team felt that field tiling operations should be another item personnel performing a patrol should be observant of since it is common for transmission lines to lay under agricultural land,</p>	October 1, 2011	July 1, 2014
PTST 0	<p>Added new section</p> <p>PTST 2.05 MAOP Determination</p> <p>Forms:</p> <p>Updated Form 01 - Gas Leak & Strength Test Stamp</p> <p>Added Form 02 - Leak & Strength Test Record</p>	April 1, 2013	July 1, 2014
PTST 2.05	<p>New Section: MAOP Determination</p> <p>1. General</p> <p>The purpose of this procedure is to outline determination methods for establishing maximum allowable operating pressure (MAOP) on gas pipeline facilities owned and operated by Ameren Illinois.</p> <p>2. MAOP Determination</p> <p>3. MAOP for Steel or Plastic Pipelines</p> <p>4. Alternative MAOP for Certain Pipelines</p>	N/A	July 1, 2014

- 5. MAOP High Pressure Distribution Systems
- 6. MAOP Low Pressure Systems
- 7. Records

PTST 2.05 added to provide procedures used to determine MAOP for Ameren Illinois' gas facilities. This section was added to comply with Part 192.619, 192.620, 192.621, and 192.623 in response to a Notice of Amendment issued by the ICC.

PTST 4	Forms and Reference Materials Forms: Updated Form 01 - Gas Leak & Strength Test Stamp Added Form 02 - Leak & Strength Test Record Form 01 Gas Leak & Strength Test Stamp is the one used by the Distribution Design Center for facilities with MAOP of 60 psig or less. Two previous stamps have been combined into one test stamp. Form 02 Leak & Strength Test Record is used for projects designed by Gas Tech Engineering and normally used for facilities with MAOP greater than 60 psig	April 1, 2013	July 1, 2014
REPR 1	1. F.: Updated to require contacting Gas Tech Engineering before repairing any high pressure distribution, MAOP over 60 psig, and transmission piping. The change from 100 psig to 60 psig to be consistent with the other sections in O&M. Gas Tech Engineering is responsible for gas facilities with MAOP over 60 psig. 4. Steel Pipe Repair Methods 4. L.: New section added Encapsulation which allows for the use of: Approved manufactured fittings such as Mueller or TDW line stoppers, short stops, save-a-valve nipple or steel pipe with welded cap or Reinforcing saddles for encapsulating leaking service tees, tapered screw plugs, etc. Members of the SMR team indicated this has been a practice in their areas for years and felt it needed to be added to the O&M. In many cases, being able to encapsulate a leaking fitting eliminates the need to isolate a section of main by installing line stopper fittings.	Janu- ary 1, 2014	July 1, 2014
RNST 2.01	Reinstating Mains and Services 3. Reconnecting of Temporarily Disconnected Farm Tap Services 3. B.(2): Inserted new: "When the downstream (second cut) regulator is removed from a farm tap with two stage pressure reduction, the outlet piping from the downstream (second cut)	July 1, 2012	July 1, 2014

regulator to the meter valve shall be pressure tested at 90 psig for a minimum duration as specified in PTST 2.01."

3. B.(3): Revised wording: "When the upstream (first cut) regulator is removal from farm tap with two-stage pressure reduction, piping between the first cut regulator and inlet to the second cut regulator shall be tested as described in PTST 1."

SMR personnel felt this revision was necessary to clarify the difference testing requirements depending on which regulator is removed from a two stage pressure cut farm tap.

STLP 0	Table of Contents Standard Designs Weld Fittings: Added Quick Opening Closures	January 1, 2014	July 1, 2014
STLP 2.01	Design Pressure 1. Design Formula D = Nominal outside diameter of pipe in inches (actual as produced diameter) Added "actual as produced diameter" In an SMR meeting there seem to be some confusion on the meaning of nominal. The addition was made to clarify that nominal outside diameter is the actual outside diameter of the pipe. 6. Dual Coat Steel Pipe Table: Corrected the Design Pressure for the 4, 6, and 8 inch pipe. Error was found in the computed design pressures by Gas Tech Engineering	January 1, 2014	July 1, 2014
STLP 3.01	Weld Fittings Added 7. Quick Opening Closures - ANSI Class 300 and Class 600, Sizes 2, 4, 6, and 8 inches. Gas Standards Committee approved these fittings and added them to the O&M.	April 1, 2010	July 1, 2014
TAPS 1	7. Gauge, Blow-down, By-pass Fittings 7. B.(1): Added weld punch tees as an acceptable fitting along with valve tees, save-a-valve nipples for use on high pressure and transmission line taps and stops. (1) Valve tees, save-a-valve nipple, weld punch tees or other approved fitting shall be used on transmission and high pressured distribution pipeline. Considerations that should be made when selecting a fitting are, but not limited to: (a) Pipe material	January 1, 2014	July 1, 2014

- (b) Pipe wall thickness
- (c) Blow-down time
- (d) By-pass capacity
- (e) Flow volume, cooling effect
- (f) Pipeline MAOP
- (g) Gas Tech Engineering specification

7. B.(3): Clarified that the leak test for cap/plug is done under normal operating pressure with leak detection fluid.

7. B.(5): Stipulated that punch shall be left in the up position on pipelines with MAOP greater than 60 psig.

7. B.(6): Stipulated that punch shall be left in the down position on pipelines with MAOP 60 psig or less.

7. C.: Deleted the distinction between pipelines with MAOP of 60 psig or less. 7. B. now applies to fittings used for taps and stops on all steel pipelines regardless of their MAOP.

Due to feedback from several operating areas that they were not equipped with tapping equipment required for valve tees or save-a-valve nipples and that they have not experienced problems with using punch tees, the SMR Team reinstated the use of punch tees. However, it was recognized that punch tees do have limited capabilities and may not be appropriate for all situations. The team added considerations that should be made when selecting a fitting. For pipelines with MAOP over 60 psig, Gas Tech Engineering will normally specify the fitting to be used.

TAPS 3.01	Mueller Fittings 4. Mueller Bottom-Out Line Stopper Fittings Removed the 2", 19 33 013, H-17160, 250 psig fitting. Mueller discontinued fitting years ago but during the consolidation of materials process and new stock code was set-up for the fitting. Mueller Bottom-Out Line Stopper Fittings for Use on Standard Wall Steel Pipe With Schedule 40 Bottom Opening: Added: 19 33 570 - 10" Mueller H-17260-748, Rating 275 psig. 19 33 571 - 12" Mueller H-17260-750, Rating 275 psig.	January 1, 2014	July 1, 2014

UNCONTROLLED IF PRINTED

- 2. C.(4): Gas Engineer replaces Gas Engineering
- 2. D.: Gas Tech Engineering replaces Gas Engineering
- Supervisor Gas Tech Services replaces Gas Operations and Services - Technical Services Supervisor

ABND 2.01	<p>Abandonment of Gas Facilities</p> <p>1, Mains</p> <p>1. A.(4): Added a sentence, "This leak test will be recorded on the DOJM or As-Built plans and maintained in the permanent job file."</p> <p>1. A.(8): Inserted new item, "Abandoned steel mains shall be inspected for evidence of internal corrosion. See CORR 1"</p> <p>1. A. (11): Gas Tech Engineering replaces Gas Operations and Services - Engineering.</p> <p>2. Services</p> <p>2. A.(8): Since service lines smaller than 2" do not require purging when abandoned, deleted language "after service line has been purged." Added "Always verify that a riser is on an abandoned service line before cutting."</p> <p>2. A.(10): Inserted new item, "Abandoned steel service lines shall be inspected for internal corrosion.</p> <p>See CORR 1"</p> <p>2. A.(14): Inserted new item, "Certain steel tees maybe retired by utilizing the MAZCO tool. Contact Gas Standards and Procedures at 217-535-5069 for approved applications and qualification requirements."</p> <p>2. A.(18): Added the use of a splice box (gel box) is an acceptable alternative to wrapping or encase the end of the tracer wire that is been cut when a plastic service has been cut-off.</p> <p>5. Records</p> <p>5. E.: Added new item, "If there is evidence of internal corrosion it shall be documented on the Corrosion and Steel Damage Evaluation form."</p>	April 1, 2013	January 1, 2014
ABND 2.03	<p>Abandonment of Transmission Facilities</p> <p>Updated work group names:</p> <p>2. D.: Gas Tech Engineering replaces Gas Operations and Services - Engineering and Gas Tech Services replaces Gas Operations and Services - Technical Services</p>	October 1, 2011	January 1, 2014
ACIG 1	<p>Accidental Ignition</p> <p>1. Objective</p>	January 1, 2013	January 1, 2014

UNCONTROLLED IF PRINTED

1. A.: Inserted new item: "Employees should take positive steps to work in a gas free environment whenever possible."

1. B.: Added the word "eliminate". "Employees shall be aware of the hazards of accidental ignition and take steps to eliminate or reduce the hazard."

1. C.: Formerly 1. A. was revised to: "Procedures in this section prescribe steps that are required to minimize the risk of accidental ignition in any structure or area where the presence of gas constitutes a hazard of fire or explosion."

Former 1. C.: Deleted the reference to access to fire extinguisher since it is covered in the procedures.

2. Sources of Ignition

2. A. Smoking and Open Flames: Smoking and open flames are prohibited in:

2. A.(1): Revised to: "Structures containing gas facilities where possible leakage and/or the presence of gas exists."

2. A.(2): Revised to: "Open areas containing gas facilities when the possibility of accidental ignition or gas-in-air mixture exists."

2. B.: Revised to: " Electric Arcing: Where the possibility of accidental ignition of gas-in-air mixture exists:

2. B.(1): Deleted extension cords: "Use intrinsically safe flashlights, portable flood lights and other power tools approved for use in hazardous atmospheres. See Specialized Tools and Equipment site under the Gas Operations and Services website in Scholar for approved intrinsically safe lighting equipment."

2. B.(2): Revised to: "Limit the use of internal combustion engines where possibility of accidental ignition of gas-in-air mixture exists."

2. B.(3): Replaced "metallic" with "steel" gas piping

2. B.(4): Combined the former 2. B.(5) language into this bullet point. "Ground squeeze tool and ground pipe when squeezing 1-1/4" and larger plastic pipe to eliminate external static prior to squeezing off the pipe. Where possible, use a separate excavation in a gas free atmosphere when squeezing off plastic pipe."

2. B.(5): Removed the descriptive information for purge pipe Reference PURG 2.01 which contains that information.

2. B.(6): Deleted "When venting gas, be aware of the wind direction and the direction the vent gas may follow to ensure gas is not being directed toward a potential source of ignition." This is covered in the purging section.

2. B.(7): Added: "Be aware of other potential ignition source such as; overhead power lines, induced voltage, weather conditions such as lightning.

ACIG
2.01

Work Area Protection

Janu-
ary 1,
2013

January
1, 2014

2. Tools and Equipment

2. A.: Deleted extension cords: "Use intrinsically safe flash-lights, portable flood lights and other power tools approved for use in hazardous atmospheres. See Specialized Tools and Equipment site under the Gas Operations and Services website in Scholar for approved intrinsically safe lighting equipment."

2. B.: Inserted new: "Cell phones or other consumer products that are not labeled as intrinsically safe shall not be taken into potentially gaseous atmosphere.

2. C. Revised by combining the former 2. D. and 2. E.: "Trucks, cars, excavation equipment, air compressors, generators, water pumps, welding machines and other portable equipment should be placed a safe distance upwind from blowing gas."

2. E.: Former 2. G. revised to: "Rectifiers should be turned off prior to cutting or separating the pipe under cathodic protection. Contact Corrosion Control personnel for the operating area to determine if pipeline is protected by rectifier." Deleted specifying only transmission and high pressure distribution main. Applies to any rectified pipeline.

3. Welding and Other Hot Work

3. A.: Revised to: "Prior to welding or other hot work in or around a structure or area containing gas facilities, an evaluation should be made with a CGI if the presence of natural gas-in-air is suspected."

3. B. and 3. C.: Raised the LEL limit to 30% from 10% to be consistent with definition of hazardous atmosphere. Welding or hot work should not be conducted if the atmosphere in an excavation is greater than 30% LEL unless the area is ventilated to remove the gas.

3. D.: Substituted "steel" for "metallic" pipe.

3. E.: Deleted language about shutting off or throttling valves since it isn't relevant.

3. E." Formerly 3. F.: Added "combustible" to gas-in-air mixture.

3. E.(2): Added "combustible" to gas-in-air mixture.

3. E.(5): Added reference to PURG 2.01 for use of vacuum purge or air mover.

UNCONTROLLED IF PRINTED

- 3. E.(6): Deleted language on monitoring work area with gas detector since it is covered in the Working Blowing Gas section.
- 3. F.: Substituted "steel" for "metallic" pipe.
- 4. Working with Plastic Pipe
- 4. D.: Change reference for purge pipe to PURG 2.01 from ACIG 1.
- 5. D.(2): Gas Tech Engineering replaces Gas Operations and Services - Engineering .
- 5. E.(1): Gas Tech Services replaces Gas Operations and Services - Technical Services.

BORE 2.05	<p>Typical Sewer Installations</p> <p>12. Add a period after the last sentence.</p>	April 1, 2013	January 1, 2014
CLAS 1	<p>2. Definitions</p> <p>2. D. Potential Impact Circle</p> <p>2. D.(2): Replaced "nominal diameter" with "actual outside diameter" of the transmission line.</p> <p>2. D.(3) Added new item: "Ameren Illinois will add ten (10) percent buffer to the Potential Impact Radius."</p> <p>3. Records</p> <p>3. Cleaned up the language that identifies Pipeline Integrity staff's responsibilities. "Pipeline Integrity staff is responsible for identifying and maintaining the class location and HCAs on all transmission lines. The Pipeline Integrity staff is responsible for identifying any changes in class location, changes in HCAs and notifying the Gas Supervisor of changes that affect leak surveys and patrols."</p>	Octo- ber 1, 2011	January 1, 2014
CLAS 2.01	<p>Class Location Determination</p> <p>1. A.: Clarified that Class Location is based on the number of structures within 660 feet of the "centerline of the pipeline" along a continuous mile of pipe.</p> <p>1. D.: Added new item: "Pipeline Integrity staff utilizes a computer program to perform Sliding Mile class location determinations."</p>	Octo- ber1, 2011	January 1, 2014
CLAS 2.02	<p>Annual Class Location and HCA Study</p> <p>1. A.: Revised language to clarify Pipeline Integrity staff conducts the annual review. "Pipeline Integrity staff conducting annual pipeline review shall record areas and locations of possible changes in the class location and HCA's. Changes in the class location can affect the patrol and leak survey requirements for the pipeline and may change the operating parameters for the pipeline. Changes</p>	Janu- ary 1, 2011	January 1, 2014

UNCONTROLLED IF PRINTED

in a HCA can affect the Integrity Management Plan and pipeline integrity inspection requirements for that area of the pipeline."

2. Action Required for Review of a Class Location Change

2. A.: Revised language to better describe when a class location change study is initiated. "Whenever there is an indication of a class location change for a segment of existing steel transmission pipeline operating at or above 40% of SMYS, the Pipeline Integrity staff shall immediately make a study to determine:"

2. A.(5): Replaced MAOP with Maximum Allowable Operating Pressure.

2. B.: Deleted language about updating leak survey patrol requirements since the updating is addressed later in this section. Changed the required time for confirming or revising MAOP from 18 months to 24 months to match what is in Part 192.

2. B.(1): Combined the previous 2. B.(1) and 2. B.(1)(a): "Action required for pipelines operating at less than 40% of SMYS. Identify any additional survey and/or patrol requirements and update the class location records, electronic mapping and Integrity Management records"

2. B. (2) and 2. B.(2)(a): Cleaned up language to be consistent with Part 192.

2. B.(2): Action required for pipelines operating at or above 40% of SMYS

2. B.(2)(a): If the segment involved has been previously tested in place for a period of not less than 8 hours, the MAOP must be confirmed or reduced so that the MAOP will not exceed the following:

- Class 2 locations - 0.8 times the test pressure
- Class 3 locations - 0.667 times the test pressure
- Class 4 locations - 0.555 times the test pressure

2. B.(3): Added new item regarding updating surveys and patrols. "Identify any additional survey and/or patrol requirements and update the class location records, electronic mapping and Integrity Management records.

CNTS
1

1. C.: Continuing surveillance language was removed leaving a description for System Review. "The System Review is an analysis of the data collected from the surveys, patrols and inspections completed on the transmission and distribution facilities."

April 1, 2012, January 1, 2014

2. Periodic Inspection of Facilities

2. B.(1); Replaced "construction activities" with "excavation activities".

2. B.(2): Inserted new item which should be reported to Gas Supervisor: "Possible structures or encroachment located over or adjacent to the gas pipeline."

2. C.: Updated to which group failed or defective material should be sent. "Gas Standards and Procedures, 10th Floor, 607 East Adams, Springfield, IL 62701".

2. D.: Deleted the inspection of bulletin board for Ameren's Alcohol and Illegal Drugs Policy and Employee Assistance Program.

3. Meter Reading

3. B.: Added meter readers can code conditions into their processors as an alternative to contacting their supervisor.

3. B.(3): Revised one of the conditions meter readers should report to: "Evidence of overbuilding, obstruction, or deterioration of meter set." Removed atmospheric corrosion and disbonded coating since leak surveyors are trained to report these conditions.

4. Reporting Gas Leaks

4. A.: Added examples of non-gas field personnel such as meter readers, contract locators, summer painters, electric personnel. Replaced "smell a gas leak" to "detect odor of gas". Inserted the word "then". This clarifies that non-gas field personnel can continue with their work after reporting the gas odor. Now reads; "Non-gas field personnel such as meter readers, contract locators, summer painters, electric personnel who detect odor of gas at a customer's premise shall immediately report the gas odor to the Company and then may continue their work after reporting the leak."

5. System Review

5. A. & B.: Capitalized System Review

5. E.: Added "abnormal and unusual maintenance conditions" to the conditions to be reviewed.

"Failures, other abnormal or unusual operating and maintenance conditions should be reviewed."

7. System Review Report

7. A., B., C. and D.: Capitalized System Review

7. C.: Gas Tech Services replaces Gas Technical Services.

7. D.: Managing Supervisor Operations - Gas Training and Quality Assurance replaces Gas Compliance

CNTS
2.01

Surface Subsidence Areas

1. B.: Replace "Gas Engineering" with "Pipeline Integrity" as the group the Gas Supervisor should notify when there is suspected subsidence that may affect gas facilities. "Surface subsidence can result from underground mining oper-

Octo-
ber 1,
2011

January
1, 2014

ations, landfills, or embankments. The Gas Supervisor will notify Pipeline Integrity of all reported suspected subsidence that may affect gas facilities."

1. C.: Combined with 1. B.

1. D.: Deleted notifying Pipeline Integrity and Gas Operations and Services with transmission or high pressure distribution facilities are involved. Pipeline Integrity is notified when any gas facilities are involved as stated in 1. B.

6. Embankments

6. A.(1): Gas Tech Engineering replaces Gas Operations and Services

6. B.(3)(d): Clarified that corrective action taken when compression couplings/fittings are within an embankment subsidence area should be encapsulate or remove the coupling/fitting. Replaced "replace" with "remove".

7. Records

7. B.: Inserted new item: "The Gas Supervisor shall notify Pipeline Integrity of all reported suspected subsidence that may affect gas facilities."

3. B: Gas Tech Engineering replaces Gas Engineering

3. E., F., G. H.: Illinois Operations Support - Contractor Services Supervisor replaces Illinois Construction Services - Construction Supervisor

4. Construction Inspector

4. B.: Revised wording, " Contractors hired as construction inspectors shall attend Gas Construction Inspector Training prior to inspecting such work."

5. Major Areas of Focus

5.A.(5): Removed 's

and services 's

which was deleted in January 1, 2013 update

CONS 2.01	Construction Inspector Responsibilities 2. B.(3): Gas Tech Engineering replaces Gas Engineering. Supervisor Gas Tech Services replaces Gas Operations and Services - Technical Service Supervisor 8. I.: Gas Tech Engineering replaces Gas Operations and Services - Engineering	January 1, 2013	January 1, 2014
CORR 0	Changed CORR 2.12 to Tapecoat TC Color Coat from Denso Color Tape	April 1, 2013	January 1, 2014
CORR 1	2. Cathodic Protection Measurements 2. B.: In this section changed P/S readings to volts from millivolts; -0.850 volts instead of - 850 millivolts. 2. C.: Inserted new item: 2. C.: "Although a reading of -0.850 volts is considered adequate, if a reading less negative than -0.900 is obtained when completing a Buried Pipe Examination or reading GCS CP test points the Corrosion Control person for the area must be notified by phone, email, or mail. (1). A copy of the Buried Pipe Examination shall be sent to the Corrosion Control person for the area. See item 5. B. below. (2). The Corrosion Control person for the area shall be notified of deficient readings on GCS CP test points. The compliance date to bring the test point into compliance remains in effect until a reading of, or more negative, than -0.900 is	January 1, 2013	January 1, 2014

obtained. See item 7. I. below." 3. Cathodic Protection of New and Replacement Pipeline Facilities

3. B.: In this section changed P/S readings to volts from millivolts; -0.850 volts instead of - 850 millivolts.

5. External Corrosion

5. B.: Clarification to reinforce it is a copy of the Buried Pipe Examination that is sent to Corrosion Control person.

6. Internal Corrosion 6. A.: Separated tapping coupons from abandoned pipe. "All tapping coupons are to be inspected for evidence of internal corrosion and documented on the Buried Pipe Examination form. See CORR 2.30"

6. B.: "Sections of pipe abandoned or removed for any reason shall be inspected for evidence of internal corrosion."

6. C.: Revised language when there is evidence of internal corrosion; "If evidence of internal corrosion is found in any steel pipe contact the Corrosion Control person for that operating area or qualified Gas Engineer."

6. D.: Minor language change, removed "for that operating area". "Corrosion Control person or qualified Gas Engineer will complete a Corrosion and Steel Damage Evaluation form, CORR 2.31, and enter the information into Pipe Exam Database."

9. Test Lead Connections

Added reference to CORR 3.14 for connection methods.

12. Atmospheric Corrosion

12. C. Corrective Action

12. C.(1): Revised to clarify that when atmospheric corrosion or disbonded coating is found, corrective action must be completed within 12 months.

12. E.(3): Added requirement that if the pit depth is greater than 10% of wall thickness on transmission facilities or greater than 70% on distribution facilities, the inspection will be documented on the Corrosion and Steel Damage Evaluation form.

12. E.(4): Minor revision to wording: "Once cleaned and inspected, the pipeline facilities shall be coated with an approved coating." Removed the word "primed".

13. Pipeline Facilities That Need to be Painted

13. B.: Facilities Maintenance

13. B.(1): Revise job title to Managing Supervisor Operations - Gas Training and Quality Assurance from Manager - Gas Compliance.

CORR 2.03	<p>Coatings</p> <p>1. Approved Coatings</p> <p>1. A.(1): Added a 12 mil minimum and 16 mil maximum coating thickness for the fusion bonded epoxy (FBE).</p> <p>1. A. (2): Specified that the minimum thickness of the abrasive resistant overcoating (ARO) should be 20 mils. Added the (ARO)</p> <p>1. F. Soil to Air Interface Zone</p> <p>1. F.(2): Inserted new item: "For anodeless risers do not wrap the PE to steel transition area. The pipe above the transition should be painted.</p> <p>1. F.(3): Added "gas carrying" for the new risers that may need to be wrapped with non-waxed cold applied tape if significant settling of the soil is expected.</p> <p>4. Approved Field Applied Epoxy Coatings</p> <p>Added the Denso Protal 7200 and Trenton EON 1000GP repair cartridge. The repair cartridge replaces the Hot Melt Stick for repairing FBE coating. Add contact information for purchasing the repair cartridge guns.</p> <p>6. Approved Paint Specification</p> <p>Added Sherwin-Williams Ameren Medium Green paint that Kelly Coppennoll requested that matches painting on some existing regulator stations. The Ameren Medium Green paint is available in gallon cans and in 12 oz aerosol cans.</p> <p>6. A.(4) Note: Deleted "meter gray" so either the meter gray or medium green aerosol paint can be used for touch-ups.</p>	April 1, 2013	January 1, 2014
CORR 2.07	<p>Tapecoat H35</p> <p>3. Coverage</p> <p>3. A.: Updated table for Footage of Pipe Wrapped per Roll of Tapecoat H35</p> <p>3. B.: Corrected stock code for TC Omniprime 49 22 084</p>	Janu- ary 1, 2011	January 1, 2014
CORR 2.08	<p>Denso Butyl 35</p> <p>3. A.: Revised table to "Footage of Pipe Wrapped per Roll of Denso Butyl 35"</p>	Janu- ary 1, 2011	January 1, 2014
CORR 2.12	<p>Tapecoat TC Color Coat replaced Denso Color Tape</p> <p>3. A.: Revised table to "Footage of Pipe Wrapped per Roll of TC Color Coat"</p> <p>3. B.: Updated table on quantity of TC Profile Putty needed for different size fittings.</p>	Janu- ary 1, 2011	January 1, 2014

CORR 2.15	<p>Coating Inspection</p> <p>2. Inspection Requirements</p> <p>2. B.: Updated inspection voltage information and table since coating thickness specifications have been revised. Added the following information: 2. B.(1:) Inspect coating using an approved holiday detector with appropriate voltage range. If the voltage output of a holiday detector does not match the indicated voltage in the chart below, use the next lower setting.</p> <p>2. B.(2) Average total mil thickness 12 mil thru 20 mil would be FBE coating only.</p> <p>2. B.(3) Average total mil thickness 32 mil thru 50 mil would be for FBE with ARO</p> <p>2. B.(4) If the average total thickness is not shown on the chart, contact Superintendent Corrosion Control for the proper test voltages.</p> <p>The inspection voltage table has been revised by listing mil thicknesses in two mil increments with an associated minimum and maximum voltage. Total mil thicknesses of 12 to 20 would be for FBE coating only and mil thicknesses of 32 to 50 would be for FBE with ARO coating.</p>	Janu- ary 1, 2013	January 1, 2014
CORR 2.19	<p>Cathodic Protection Test Points</p> <p>3. Cased Crossings - reformatted</p> <p>Revised language to specify addition tests are for isolation.</p> <p>3. A.: Now reads "Comparison between pipe-to-soil potential and casing-to-soil potential. Both potentials should be measured with the half cell in the same location for a valid comparison. If the difference in potentials is less than 25 mV additional tests for isolation shall be performed. See CORR 3.17</p> <p>3. B.: Now reads "If it is necessary to perform pipe-to-soil readings at different nearby locations, additional testing for isolation shall be performed if the difference in potentials is less than 200 mV.</p> <p>Note: If the casing is documented as shorted and is filled with dielectric filler, only a pipe-to-soil potential for the pipeline is required.</p> <p>Cased crossings with plastic mains do not need to be monitored for electrical isolation.</p>	April 1, 2013	January 1, 2014
CORR 3.15	<p>Rectifier Installation</p> <p>4. Rectifier Ground Bed Header Connection</p>	April1, 2013	January 1, 2014

4. A.: Added stock codes for the Dryconn VisiLock Gel Anode Splice Box, 49 22 428, and the 3M A Anode Splice Box, 62 55 100.

DAMG
0

DAMG 1:
Inserted new item 7. Protection of Excavated Facilities.
8. & 9. Added "Steel" for the 8" and Larger Main

January 1, 2012

January 1, 2014

DAMG
1

2. B. (2) Emergency Locate Request
2. B.(2)(b): Added "An open cut utility locate" as an example of an Emergency locate request.
2. B.(3) Joint Meet Locate Request
2. B.(3)(a): Updated to reflect new regulations for Joint Meets. "It is not a valid locate request and is for meeting purposes only."
2. B.(3)(c): Revised: "Excavators are required to obtain separate locate requests following the Joint Meet for the area to be located." Deleted the language about a joint meet being a 96 hour process and the locating company has 2 days to locate following the joint meet.
2. B.(3)(d): Revised: "A joint meet is a minimum forty eight (48) hour process."
7. Protection of Excavated Facilities - New Item
A. Exposed Ameren gas facilities may be protected from continuing excavation during construction by utilizing Safety Wrap, see stock codes listed below. (1) 4922424 - for 2" or 3" diameter pipe, 48" long.
(2) 4922425 - for 4" diameter pipe, 48" long.
(3) 4922426 - for 6" diameter pipe, 48" long.
(4) Other sizes available non-stock. B. Safety Wrap may be used for temporary protection or permanent protection for PE pipe.
C. Safety Wrap may only be used for temporary protection for steel pipe, and cannot be used for permanent protection.
8. Excavating Near a Transmission, High Pressure Distribution and 8" and Larger Steel Main. (Added the word "Steel")
For clarification have added the word "main", the statement "facilities with MAOP of 100psig or greater", and "steel distribution main" to the following items.
8. A.: Clarified: "Ameren Illinois must take special precautions for Locate Requests in the vicinity of all transmission mains, high pressure distribution facilities with MAOP of 100 psig or greater and steel distribution mains eight (8) inches and larger."

January 1, 2013

January 1, 2014

8. B.: "When Ameren Illinois' locator determines the excavation on a Locate Request may be within fifteen (15) feet of a transmission main, high pressure distribution facility with MAOP of 100 psig or greater or a steel distribution main eight (8) inches and larger, the Locator will forward the Locate Request to Ameren Illinois Damage Prevention group"

8. C.: "When marking transmission mains, high pressure distribution facilities with MAOP of 100 psig or greater and steel distribution mains eight (8) inches and larger, Locator will use flags and marking paint."

8. E.(1): " Where excavation activities are within fifteen (15) feet of a transmission main, high pressure distribution facility with MAOP of 100 psig or greater or a steel distribution main eight (8) inches and larger, Ameren Illinois Damage Prevention personnel or qualified contractor shall monitor the excavation site and document the excavation activities. All documentation shall be maintained on the Damage Prevention and Monitoring SharePoint site or by the local area. The location of the excavation and the condition of the main, if exposed, shall also be documented on the Buried Pipe Examination form (Stock Code 37-41-382), CORR 2.30, or an electronic equivalent."

8. E.(2): "Ameren Illinois Damage Prevention personnel or qualified contractor will contact the excavator to inform them that a transmission main, high pressure distribution facility with MAOP of 100 psig or greater or a steel distribution main eight (8) inches and larger is in the vicinity and an additional evaluation may be required."

8. E.(3): "Where excavation activities are not within fifteen (15) feet of a transmission main, high pressure distribution facility with MAOP of 100 psig or greater or a steel distribution main eight (8) inches and larger, Ameren Illinois Damage Prevention personnel or qualified contractor shall document these findings and the documentation shall be maintained on the Damage Prevention and Monitoring Share-Point site or by the local area. No further action is required."

8. F.:" When boring or trenchless technology is utilized to cross a transmission main, high pressure distribution facility with MAOP of 100 psig or greater or a steel distribution main eight (8) inches and larger, Ameren Illinois personnel or qualified contractor must visually inspect the excavation while in progress until it clears the existing marked facility and verifies the facility was not damaged. A Buried Pipe Examination form, CORR 2.30 or an electronic equivalent shall be filled out if the facility is exposed."

In 8. E.(1): Damage Prevention and Monitoring Sharepoint site replaced the name Excavation Sharepoint site. Refer-

ence to CORR 2.30 or an electronic equivalent was added for Buried Pipe Examination form.

In 8. F.: Reference to CORR 2.30 or an electronic equivalent was added for Buried Pipe Examination form.

9. Emergency Locate Request Near Transmission, High Pressure Distribution, or 8" and Larger Steel Main

For clarification have added the word "main", the statement "facilities with MAOP of 100psig or greater", and "steel distribution main" to the following items.

9. A.: "In addition to responding to the locate request Ameren Illinois must take special precautions for emergency excavation notices in the vicinity of a transmission main, high pressure distribution facility with MAOP of 100 psig or greater or a steel distribution main eight (8) inches and larger."

9. B.: "When excavation on an Emergency Locate Request may be within fifteen (15) feet of a transmission main, high pressure distribution facility with MAOP of 100 psig or greater or a steel distribution main eight (8) inches and larger, the Locator will notify Ameren Illinois Damage Prevention personnel of the pending excavation and remain at the site until relieved by a qualified Ameren Illinois personnel or qualified contractor."

10. Facility Location Information

10. B.: Electronic mapping system replaces AM/FM System. "One Call" added to JULIE

12. Records

12. C.: Typo correction small letter "e" for excavation.

DAMG
2.01

Reporting JULIE Violators

3. Investigation of Reportable Violations

3. C.: "Supervisor Damage Prevention" replaces "Allen Kish" as to who to contact for assistance

4. Reporting a Suspected Violation

4. A. & 4. C.: Corrected group name to Damage Prevention Group.

6. Notification of Damaged Underground Facilities

6. C.: Revised language to : " In the event of any damage to any underground utility facility including Ameren Illinois' facilities damaged by Ameren Illinois crews or their contract crews that results in the escape of any flammable, toxic, or corrosive gas or liquid, the person responsible for the excavation or demolition shall call 911 to notify authorities of the damage." Important to note even if Ameren Illinois crew or an Ameren Illinois contractor damages an Ameren Illinois buried facility a 911 call is required That is the JULIE Law. If

October 1,
2011

January
1, 2014

an Ameren gas crew hits an Ameren gas line they are still required to call 911 but they can tell the 911 operator that a crew is on site and has the situation under control.

EMER 0	Added dash lines to EMER 2.10	Janu- ary 1, 2013	January 1, 2014
EMER 2.01	Customer Contact Center 4. Emergency Gas Call Significant revisions have been made in this section to reflect an updated script that Call Takers are now using when an emergency call is received. Some of the major revisions included in the updated script are listed below. 4. G. Inside Strong Odor, Hear, or See: Eliminated asking customer to try to find out where odor is coming from and to check pilots. Now are advising caller not to open windows or doors to ventilate. Customers are advise to evacuate the premise until we are able to respond and determine the severity of the problem. 4. H. Outside Odor, Hear or See: They are not asking if a gas line or facility is damaged or is gas blowing. There is an expanded list of instructions that are to be provided to caller. 7. Receiving a Carbon Monoxide Call: A minor change here in that all Carbon Monoxide calls from customers will be entered in OAS for tracking purposes. 9. Call Received from a Customer: Reorganized the script with the same basic information as before but added more instructions for Call Takers on how to enter call in OAS.	July 1, 2012	January 1, 2014
EMER 2.04	Gas Field Personnel In the following items clarified that when a non-emergency valve is used to sectionalize the gas system during an emergency, the valve will be designated an emergency valve after the emergency situation has been resolved. Replaced the word "control" with "isolate or sectionalize". 3. Outside Odor Compliant - Hazardous Condition 3. I.: "After the emergency situation has been evaluated, isolate the leak utilizing the methods below appropriate to the extent of the emergency. For example, if gas migration is creating an immediate hazard it may be prudent to utilize emergency valves rather than excavating and squeezing pipe to reduce the immediate hazard. If a non-emergency valve is used to isolate or sectionalize the gas main segments during an emergency situation, the valve will be des-	April 1, 2013	January 1, 2014

ignated as an Emergency Valve after the emergency situation has been resolved. See VALV 2.01"

4. Major Leaks or Line Breaks

4. F.: "After the emergency situation has been evaluated, isolate the leak utilizing the methods below appropriate to the extent of the emergency. For example, if gas migration is creating an immediate hazard it may be prudent to utilize emergency valves to reduce the immediate hazard rather than excavating and squeezing pipe. If a non-emergency valve is used to isolate or sectionalize the gas main segments during an emergency situation, the valve will be designated as an Emergency Valve after the emergency situation has been resolved. See VALV 2.01"

5. Gas in a Sewer - Hazardous Condition

5. G.: "After the emergency situation has been evaluated, isolate the leak utilizing the methods below appropriate to the extent of the emergency. For example, if gas migration is creating an immediate hazard it may be prudent to utilize emergency valves rather than excavating and squeezing pipe to reduce the immediate hazard. If a non-emergency valve is used to isolate or sectionalize the gas main segments during an emergency situation, the valve will be designated as an Emergency Valve after the emergency situation has been resolved. See VALV 2.01"

10. Loss and Restoration of Service

10. H.: Replaced 500 people with 1000 people, approximately 400 meters based on 2.5 people per household.

10. W. (2): Added the Ameren Illinois phone number 1-800-755-5000 for the customer to call if their gas has not been turned back on.

EXCV
1

1. A.: Revised to: "Procedures are required to provide for safety during maintenance and operations activities which includes taking adequate precautions in excavated trenches to protect personnel from the hazards of cave-ins, traffic and equipment, falling loads, or hazardous atmospheres." Added traffic, equipment, falling loads and replaced unsafe accumulations of combustible gas.

January 1, 2011

January 1, 2014

2. Excavations

2. B.: Revised to: "Excavations five (5) feet or more in depth, or excavations of any depth where the Competent Person determines that a cave-in hazard to personnel exists, shall be protected from cave-ins by sloping, benching, and/or shoring/shielding, as appropriate for the soil type(s) before personnel are allowed to enter." Added language "excavations of any depth where Competent Person determines cave-in-hazard to personnel exists."

2. E.: Clarified that excavations in which personnel will enter shall be inspected daily by Competent Person.

5. Soil Classification

5. B.: Revised to: "The Competent Person is required to perform a soil analysis and soil classification to determine the potential for cave-in of an excavation, and to determine the appropriate protective measures, such as sloping, benching, shoring or shielding (trench) box to be utilized." Added the classification to determine the potential for cave-in and determine the appropriate protective measures.

5. C.: Added language that states the soil classification must include both visual and manual tests.

EXCV
2.01

Prior to Excavation

1. Job Site Inspection

1. B.: "shall" replaced "should". "The Competent Person shall inspect the area of proposed excavation for situations or conditions that may pose a potential hazard to the excavation such as:"

1. B.(9): Added "or overhead": " Presence of underground or overhead utilities in the immediate area."

2. Job Preparation

2. A.(3): Added "of potential risk of cave-in or" and "and exit the excavation". "Instruction to employees that at the first sign of potential risk of cave-in or unexpected soil movement, they are to immediately call a halt to operations and exit the excavation until the Competent Person inspects the excavation."

2. B.: Added "or working within the tolerance zone". "Underground utilities shall be located prior to excavating and exposed as practical by hand or vacuum excavation when crossing or working within the tolerance zone."

2. D.: Added "and when necessary, measures taken to prevent inadvertent entry such as barricades, stop logs, or spotter". "Vehicles and equipment not involved in excavation should be parked away from the excavation site to minimize surcharge load on excavation walls and when necessary, measures taken to prevent inadvertent entry such as barricades, stop logs or spotter."

Working in Excavation

January 1,
2012

January
1, 2014

1. Beginning Excavation

1. A.: Added "in order to aid in classification of the soil type". "As excavation begins, the Competent Person should watch how the soil material reacts as it is deposited, in order to aid in classification of the soil type".

1. A.(3): Added "Watch for water standing or running into the excavation." "Observe the moisture content of the soil as the excavation gets deeper. Watch for water standing or running into the excavation."

1. A. (5): New: "Watch for layers sloping into the excavation."

1. C.: Inserted a new item concerning protecting workers and public from falls into an excavation.

1. C.: "Protect workers and public from falls into the excavation or contact with construction equipment and materials. General considerations would include depth of excavation, proximity to roadways or pedestrian routes, and length of time excavation will be left open. When working near roads, the following precautions from the Manual on Uniform Traffic Control Devices, MUTCD, should be followed:" (1) Pedestrians should not be led into direct conflicts with work site vehicles, equipment or operations.

(2) Rope off all work areas with a barricade tape or equivalent and place tape or equivalent to designate a safe pedestrian walkway around obstructions, such as ditches, holes, tool carts, trailers, or piles of dirt on sidewalks. Barricade tape should have "Caution" or "Caution Do Not Enter" printed on the tape.

(3) Pedestrians should be provided with a safe convenient travel path that replicates as nearly as possible the standard sidewalk or footpath.

(4) Consideration should be made to separate pedestrian movements from both work site activity and motor vehicle traffic. (5) Pedestrians should be appropriately directed with advance signing that encourages them to cross to the opposite side of the roadway.

(6) Whenever it is feasible, closing off the work site from pedestrian intrusion may be preferable to channelizing pedestrian traffic along the site with temporary traffic control devices.

(7) When working underground, on private property, in pedestrian lanes or parkways, close all holes in the earth before leaving the location. If this is impracticable, fence the area with a safety fence or equivalent to prevent small children or animals from falling into the excavation. 1. D.: Added "The excavating equipment operator should scale or sweep the excavation face to eliminate loose material that

UNCONTROLLED IF PRINTED

could fall into the excavation and injure a worker." Now reads:

"Soil shall be deposited no closer than two (2) feet from the edge of the excavation as a means for protecting gas field personnel from loose soil material that could fall into the excavation. The excavating equipment operator should scale or sweep the excavation face to eliminate loose material that could fall into the excavation and injure a worker."

1. E.: Clarified by stating "All foreign underground utilities within 18 inches of the proposed excavation shall be uncovered"

2. Inspection of Excavation

2. C.: Revised to read: "Additions/changes to the "Excavation / Soils Checklist" are required whenever there is a change in the soil characteristic of an excavation that could affect the stability of the excavation."

3. Working in Excavation

Previous 3. A & B. & C.: were deleted and incorporated in other items.

3. D.: (Formerly 3. G.) Added "or excavations of any depth where a cave-in hazard to personnel exists". Now reads

"Excavations five (5) feet and deeper, or excavations of any depth where a cave-in hazard to personnel exists, shall have a properly designed protective system to protect workers from a cave-in."

3. G. is former 3. J

3. G.: Gas field personnel shall not work in excavations where there is accumulating or accumulated water unless:

- (1) The water is diverted around the excavation or
- (2) The water is removed from the excavation. The water removal equipment should be monitored on a regular basis to ensure proper operation

Deleted "Gas field personnel are protected from the effects of the accumulated water by wearing rubber boots or waders"

EXCV
2.04

Soil Analysis & Classification

2. Visual Analysis

2. B.(4): Insert new item; "Observe the excavation for signs of bulging, boiling, or sloughing."

3. Manual Analysis

3. A.(1)(a): Inserted new item under Test for Plasticity; "Note that most soils are a mixture of cohesive and granular materials. The goal of plasticity testing should be to determine the sensitivity of the soil to water content change."

January 1,
2011

January 1,
2014

UNCONTROLLED IF PRINTED

Soils with high plasticity will remain cohesive and maintain their strength over a wider range of water content. Soils with low plasticity will be very sensitive to water content changes and will lose their strength quickly, such as during rainy conditions."

3. A.(1)(b): Added "free of large granular material". Now reads "Mold a moist or wet soil sample, free of large granular material, into a ball and then roll it into a 2" long 1/8" diameter thread.

3. A.(1)(c): Added "has a high plasticity" so it now states "If the thread can be held on one end without breaking, the soil is cohesive and has high plasticity"

3. A.(1)(d): Added "has low plasticity" so it now states "If the sample breaks or cannot be rolled into a thread, the soil has low plasticity."

3. A.(2) Dry Strength Test

3. A.(2)(a): Added "Handle" so now states "Handle and observe a dry clump of the soil to see how it breaks apart.

6. Excavation/Soils Checklist

6. A.: Insert new item; "An Excavation/Soils Checklist is required for every excavation greater than two (2) feet in depth if personnel will enter the excavation."

6. B.: (Formerly 6. A.) revised to "The Competent Person is required to complete the Excavation/Soils Checklist form prior to personnel entering the excavation." Added "prior to personnel entering the excavation."

6. C.: Revised wording to "For excavations where an Excavation/Soils Checklist is required, a separate Checklist must be completed for each day an excavation is left open and workers are entering the excavation"

EXCV
2.05

Sloping Protective System

1. A.: Added "into which personnel will enter" to clarify when a protective system is required. Now states "A protective system is required on all excavations five (5) feet in depth or greater into which personnel will enter."

1. B.: Revised wording to "A protective system is also required for all excavations less than five (5) feet in depth if the Competent Person determines there is an indication of potential cave-in risk to personnel entering the excavation."

1. C.: Replaced with "The Competent Person shall select the appropriate configuration based on the results of soil classification and operating conditions in the area of the excavation."

1. D.: New item added: "The Competent Person shall inspect the excavation daily for indications of distress that

Janu-
ary 1,
2011

January
1, 2014

- would adversely affect the stability of the excavation such as:
- (1) Cracks in vertical soil face
 - (2) Surface cracks behind the excavation
 - (3) Water seepage
 - (4) An increase in highly saturated soil at lower level of excavation
 - (5) Sloughing of soil from vertical faces

2. Sloping Protective System

2. A.(2).(a),(b),(c): Changed dimensions to feet from inches.

1-1/2H : 1V (e.g. 9' horizontal to 6' vertical)

1H : 1V (e.g. 6' horizontal to 6' vertical)

3/4H : 1V (e.g. 4' horizontal to 6' vertical)

EXCV
2.06

Sloping and Benching Protective System

1. A. thru D.: Same language as in EXCV 2.05 1.

1. A.: A protective system is required on all excavations five (5) feet in depth or greater into which personnel will enter.

1. B.: A protective system is also required for excavations less than five (5) feet in depth if the Competent Person determines there is an indication of potential cave-in risk to personnel entering the excavation.

1. C.: The Competent Person shall select the appropriate configuration based on the results of soil classification and operating conditions in the area of the excavation.

1. D.: The Competent Person shall inspect the excavation daily for indications of distress that would adversely affect the stability of the excavation such as: (1) Cracks in vertical soil face

(2) Surface cracks behind the excavation

(3) Water seepage

(4) An increase in highly saturated soil at lower level of excavation

(5) Sloughing of soil from vertical faces
2. Sloping & Benching Protective System

Former 2. D. and 2. E. were moved into the General section as shown above.

2. E.: New item; "A single bench is allowed in these configurations for Type A and Type B soils: (1) In Type A soil, a four (4) feet vertical face at the bottom with a three (3) feet wide bench is allowed

(2) In Type B soil, a four (4) feet vertical face at the bottom with a four (4) feet wide bench is allowed.

F.: Expanded language to: "Hydraulic shoring shall be installed from top down and removed from bottom up. At no time may personnel enter the excavation to install the shoring components necessary to protect from cave-in."</p> <p>2. O.: Revised wording to "The ends of the trenches must be protected from cave-in by sloping, benching, or trench-end shielding."</p> <p>2. S.: Expanding language on the use of sheeting. "Sheeting must extend to the top of the excavation and to within two (2) feet of the bottom. If shoring/sheeting is used on a lower vertical section of a slope, the sheeting must extend a minimum of eighteen (18) inches above the bottom of the slope, in order to protect personnel from material rolling into the trench."</p> <p>2. T.: Inserted new item: "Excavations deeper than four (4) feet shall have a means for workers to enter and exit which meets the requirements of EXCV 2.03. The means to enter or exit shall be located no more than twenty five (25) feet laterally from any worker. A ladder must be provided in each location between shoring cylinders where personnel are working."</p> <p>2. V.: Expanded language on walkways. "Any walkways crossing the excavation must meet OSHA walkway standards. Personnel must be protected from falls into excavations that are six (6) feet or deeper."</p> <p>2. W.: Slight modification to language for monitoring atmosphere in a trench when a hazardous atmosphere is expected. "When it can be reasonably expected that a hazardous atmosphere could exist, the atmosphere must be monitored for oxygen content and combustible or toxic gases with a calibrated gas detector."</p>	January 1, 2011	January 1, 2014
EXCV 2.08	<p>Trench Box Protective System</p> <p>2. Trench Box Protective System</p> <p>2. E.: Previous 2. I. has been expanded to "The ends of the box must be either enclosed with aluminum slats, Finn Form plywood or must be sloped at the appropriate allowable slope."</p> <p>2. N.: Expanded language on walkways. "Any walkways crossing the excavation must meet OSHA walkway standards. Personnel must be protected from falls into excavations that are six (6) feet or deeper."</p>	January 1, 2011	January 1, 2014

2. O: Slight modification to language for monitoring atmosphere in a trench when a hazardous atmosphere is expected. "When it can be reasonably expected that a hazardous atmosphere could exist, the atmosphere must be monitored for oxygen content and combustible or toxic gases with a calibrated gas detector."

EXCV
2.09

Working in Hazardous Atmosphere

January 1,
2011

January
1, 2014

1. B.: Expanded language on what constitutes a hazardous atmosphere. "A hazardous atmosphere is present when gas concentrations are measured with a gas detector at 30% LEL or greater when the oxygen level is measured at 19.5% or less, or when toxic gases (carbon monoxide, hydrogen sulfide, etc) are present."

2. Prior to Beginning Work

2. A.: Added the word utilize so now states Gas field personnel shall explore and utilize all available options to eliminate a hazardous concentration of natural gas in an excavation before entering the excavation. This would include:

2. B.: Expanded language on working in an oxygen deficient atmosphere. "If the oxygen level of an excavation is less than 19.5%, ventilating equipment should be used to provide additional oxygen to the excavation and reduce gas concentrations. Gas field personnel working in oxygen deficient excavations shall be provided with breathing equipment and emergency rescue equipment (full-body harness, life line, and means to positively extract a worker) if the oxygen level cannot be raised above 19.5%. In addition, standby personnel, outfitted with the same level of protective equipment, shall be present to provide emergency assistance as needed."

3. Entering Excavation

3. A.: Added "or toxic gases". "The atmosphere of the excavation shall be tested with a gas detector to determine the amount of combustible or toxic gases present and the oxygen level."

3. D.: Revised language to: "Gas field personnel wearing their standard work clothing may work in excavations that are not oxygen-deficient (at least 19.5%), but that may have gas concentration of less than 30% LEL as long as the gas concentration does not rise to 30% LEL or greater."

4. Hazardous Concentration of Natural Gas - Level 1 Requirement

4. A.: Added a reference to WWBG 2.01 for the Level 1 PPE. "The following identifies a hazardous concentration of natural gas in an excavation which requires gas field personnel to wear Level 1 PPE as specified in WWBG 2.01, (no supplied-air breathing apparatus)."

UNCONTROLLED IF PRINTED

4. B.: Combustibles gas-in-air between 30% and 60% of the Lower Explosive Limit (3% natural gas-in-air) and oxygen level remains above 19.5%.

Added Reference 01 - Ameren Supervisor Guidelines for Drug and Alcohol Testing

INCD 1

1. D.: Inserted new: "This procedure identifies when Ameren Illinois employees would be subjected to post-incident alcohol and drug testing."

January 1, 2013

January 1, 2014

2. Natural Gas Incident

2. A. A natural gas incident is an event that involves a release of natural gas from an Ameren Illinois facility and:

2. A.(2): "in-hospitalization" replaces "medical treatment". Now reads - Any personal injury requiring in-patient hospitalization; i.e. public, contractor, emergency responder, Ameren Illinois employee, etc.

2. A.(3): \$50,000 replaces \$25,000 for the estimated property damage cost, excluding cost of gas lost.

New section added:

3. Potential Significant Events

A. An event that does not meet the criteria of a Natural Gas Incident may be deemed to be significant in the judgment of Ameren Illinois.

B. The following events, where a release of natural gas from an Ameren Illinois facility is involved, shall be reported to Gas Compliance and will be evaluated to determine if the event should be considered to be a significant event:

(1) An explosion

(2) Any personal injury requiring medical treatment.

(3) A natural gas fueled fire with estimated property damage exceeding \$25,000.

(4) Damage to any high pressure distribution or transmission main.

(5) Damage to any distribution main with an estimated repair time in excess of eight (8) hours excluding gas service interruption relight time.

C. An event that is deemed to be a significant event shall be reported as a Natural Gas Incident.

4. Courtesy Notification

4. A.(5): Added "Potential significant events that are not deemed to be reportable as a Natural Gas Incident.

UNCONTROLLED IF PRINTED

5. Service Interruption/Curtailment Notification

5. Service Interruption/Curtailment Notification

5. A.: Replaced 500 customers with 1000 people, approximately 400 meters based upon 2.5 people per household.

6. Reporting

6. D.: Added a sentence - Gas Superintendent, Gas Supervisor, or Gas Compliance personnel shall contact Supervisor Gas Control if Gas Control personnel could be subjected to alcohol or drug testing."

8. Reporting Matrix

Separated the previous matrix into two matrix:

8. A.: Gas Compliance shall be contacted when any of the following have occurred:

The new matrix shall be reviewed with all gas employees since they only have two (2) hours after a listed event discovered to notify Gas Compliance

8. B.: Gas Compliance shall make the following report contacts:

The new matrix shall be reviewed with all gas employees since Gas Compliance only has two (2) hours after a listed event is discovered to notify the appropriate agency, ICC, PHMSA, and/or IEMA.

Updated contact information:

10. Corporate Claims Notification (CCMI)

Updated Jackie French's job title

11.: Ameren Illinois Communication Notification:

Stacey Stockton-Shangraw replaced Leigh Morris (retired)

12. Regulatory Affairs Notification

Added Robin Turner's cell phone number

13. Post-Incident Alcohol and Drug Testing

13. A.: Inserted new item: Gas Superintendent, Gas Supervisor, and/or Supervisor Gas Control should immediately contact Clinical Collection Management, Inc. (CCM) to arrange for alcohol and drug testing. To arrange for the test contact:

13. B.(1): Added "Gas Control Specialist" along with Gas Field Personnel who could be subject to Post-Incident Alcohol and Drug Testing if their performance could have contributed to the incident.

INCD 4

January
1, 2014

UNCONTROLLED IF PRINTED

LEAK 2.13. If instrument is being utilized on daily basis for leak survey activity, the unit should be checked at the conclusion of the day's activity to verify the unit is still operating properly.

LEAK
2.09

Leak Surveys - Walking Leak Survey

January 1,
2013

January
1, 2014

1. Walking Leak Survey

1. A.: Revised to read: "The leak survey shall be performed with an industry recognized leak survey instrument that has been accepted for use by the Ameren Illinois Gas Standards and Procedures work group. Operation of these instruments may be based on, but not limited to; Flame Ionization, laser diode, infrared, hyperspectral imaging technology, optical methane detection, or catalytic combustion. See LEAK 4"

1. D.(5): Added "Regulator pits" to list of items that should be checked if encountered along the leak survey route.

1. K.: New section: Fenced Gas Facilities Inspected Annual

(1) Fenced gas facilities could include:

(a) Regulator Station

(b) Valve Station

(c) Pipeline Take Point

(d) Odorizer

(2) Fenced gas facilities that are inspected annually by Gas Tech Service will have all piping, below and above grade, inside the fenced area leak surveyed during the annual inspection and documented on the applicable inspection report or Leak Survey report.

(a) Fenced gas facilities associated with transmission surveys that are located in a Class 3 location will have their own designated Leak Survey since they have to be surveyed twice each calendar year not to exceed 7-1/2 months, LEAK 2.07. These leak surveys will be performed by Gas Tech Service personnel.

(b) These facilities may be shown on the leak survey maps, but they will not be part of the designated transmission or distribution leak surveys. The designated leak survey will stop at the fence.

(c) Facilities annually inspected may be identified on the maps. If there is a question, Gas Supervisor should contact Supervisor Gas Tech Services to confirm that GTS personnel are leak surveying the facility annually or if required bi-annually.

1. L.: Revised section heading to Fenced Gas Facilities Not Inspected Annually. This was the former Fenced Gas Facilities section.

- 1. L.(1): Changed to "Fenced gas facilities"
- 1. L.(2): Changed to "Fenced gas facilities"
- 1. L.(d): Added Large Meter Set is list of possible fenced facilities.
- 1. N. Gas Detection Instrument or FI Unit Indicates a Possible Leak
 - 1. N.(4)(b): Revised wording to "An OAS EMGL order will be created and qualified gas field personnel will be dispatched to the leak." Removed "Gas Supervisor will create OAS EMGL order" since there are numerous individual who create theses orders.
 - 1. N.(5): New item added: If leak surveyor detects an indication of gas from a valve box or pit which contains a gas facility. (a) Surveyor will crack the lid slightly, insert CGI probe, and obtain a sustained gas-in-air reading.
 - (b) Surveyor will check around perimeter of the box or pit for gas migration.
 - (c) Leak will be classified based on the hazard potential and volume on the Leak Classification Guidelines. See LEAK 2.04
- 1. O. Weather limitations
 - 1. O.(1)(d): Corrected reference to bullet point "F" from "E".

LEAK
2.11

Leak Survey - Records and Maps

1. Additional Survey Checks

1. C.: Added sentence "Daily Report Form is not required for fenced gas facilities that are inspected annually by Gas Tech Services. Deficiencies are recorded on the inspection report

2. Maps and Records

2. A.: Added a second sentence, "These leak surveys do not include fenced gas facilities that are inspected annually by Gas Technical Services."

2. B.: New item inserted: "Annual leak surveys performed by Gas Technical Services personnel inside fenced areas are documented on associated inspection forms or leak survey form. Maps are not required for these leak surveys."

2. E.: New item inserted, "If a facility that is annually inspected is shown on the map, the Gas Supervisor should note "annually inspected by GTS" on the map. The facility is not included in the leak survey and will not be highlighted. The transmission or distribution leak survey can be closed without these facilities being highlighted.

MAIN 1

3. Cover

April 1,
2013 January
1, 2014

3. B.: Added language about using Safety Wrap for protection of PE main. "Where the required minimum cover cannot be maintained, Safety Barrier Tape (Stock Code 16 06 958) shall be installed approximately twelve (12) inches below the surface to provide advance warning to excavators. For additional protection, Safety Wrap may be used to protect PE mains in areas where damage may occur. Safety wrap shall not be used for permanent protection of steel pipe. See DAMG 1 for Safety Wrap stock codes. Safety Barrier Tape (16 06 958) must be installed over the Safety Wrap.

3. C.: Expanded to include procedures for initiating an engineering evaluation for additional protection for shallow main and requirement for mapping locations of shallow mains.

"Additionally, mains that may be subjected to anticipated external loads, such as loaded truck traffic, material storage, or farming operations, must be reviewed to determine if additional protection is required to protect the main from damage due to the external loads. When such locations are encountered the Gas Supervisor or Contractor Services Supervisor will contact either Gas Engineer for the area if distribution main is being installed or Gas Tech Engineering if transmission or high pressure distribution is being installed. Engineering personnel will review to determine if additional protection is required and specify the appropriate protection method(s) to protect the main from the anticipated external loads. Location of shallow main should be recorded on the As-Built plans and indicate on Ameren Illinois' gas electronic mapping system."

MAIN 3.23	End of Main, Steel to Steel, Decreasing, Mueller Stopper Material Table Corrected Stock Code of 2" Steel Pipe to 32 23 319	January 1, 2011	January 1, 2014
METR 0	Table of Contents Added METR 2.23 10.: Meter Exchanges Using Portable CNG Tank METR 4: Forms and Reference Materials Update Gas Meter Data Sheet (Rev 5/13) Added: Reference 07 - Meter Guards 2 inch Posts Reference 08 - Meter Guards 4 inch Posts Reference 09 - Grunsky Portable CNG Tank and Bag Procedures	April 1, 2013	January 1, 2014
METR 1	3. Location 3. F.(3): Added information on availability of meter guards for protecting meter exposed to vehicular traffic. Two pre-fab meter guards are now being stocked. Both are 36 inches in width. One is constructed with 2 inch steel posts and cross members. The second has 4 inch posts and 2 inch cross members. 6. Painting Meter Sets 6. A.: Added reference to CORR 2.03 which includes approved paints. 6. B.: Clarified that pre-painted meters and regulators should be touched-up with approved paint if needed. PMRK 3.03	<p>Regulator Stations</p> <p>3. Danger Sign - Stock Code 16 02 285</p> <p>Added the word "Natural" to current sign. Current sign remains a valid sign posted at regulator stations and does not need to be changed until the condition dictates replacement. Once current supply is depleted the new sign will be the replacement stock.</p>	Octo- ber 1, 2011	January 1, 2014
POLY 1	<p>8. Weak Link</p> <p>8. B.(1): For PE pipe sizes less than or equal to 1" CTS</p> <p>8. B.(1)(a): Deleted scoring PE pipe as an acceptable way to create a weak link.</p> <p>8. B.(1)(b): Added "Install a weak link made from a short section of PE pipe one nominal pipe size less than the size being installed and approximately eighteen (18) inches in length; ½" CTS weak link for 1" CTS pipe. The PE pipe must be of the same or lesser density as the pipe being pulled in."</p> <p>8. B.(1)(c): Added "Boring rods that are one (1) inch, or more, larger in diameter than pipe being installed can take the place of a pull plug when the PE pipe is being pulled in behind the boring rods.."</p> <p>8. B.(2): For PE pipe sizes larger than 1"CTS</p> <p>8. B.(2)(a): Deleted scoring PE pipe as an acceptable way to create a weak link.</p>	April 1, 2013	January 1, 2013

8. B.(2)(a): Added language regarding weak link made from one pipe size smaller must be of the same PE pipe density. "The PE pipe must be of the same or lesser density as the pipe being pulled in. MDPE weak link is only acceptable when pulling in MDPE pipe. HDPE weak link is only acceptable when pulling in HDPE pipe."

8. B.(2)(b): Added "Boring rods that are one (1) inch, or more, larger in diameter than pipe being installed can take the place of a pull plug when the PE pipe is being pulled in behind the boring rods.."

POLY 2.05	Electrofusion 1. F.: Added language regarding Friatec and Innogaz fittings. "In the April 1, 2013 O&M Plan, electrofusion fittings shown in the Standard Design sections for MAIN and SERV were primarily Central Plastic products due to the Company's decision to go to a single source provider. However, the formerly stock coded Friatec and Innogaz electrofusion fittings remain approved and can be used until the supply has been depleted. If there is a supply issue with Central Plastic not being able to fill orders in a timely manner, Ameren Illinois will order needed fittings from Friatec and/or Innogaz."	April 1, 2013	January 1, 2014
POLY 2.08	Sale of Polyethylene Pipe 2.: Request from the Public 2. B.: Division Director replaces District/Regional Manager	January 1, 2011	January 1, 2014
POLY 3.02	Electrofusion Fittings Added a Note at the end of the section, "Note: Since Ameren Illinois has gone to single source provider, majority of the fittings listed above are Central Plastic's fittings. However, the formerly stock coded Friatec and Innogaz electrofusion fittings remain approved and can be used until the supply has been depleted. If there is a supply issue with Central Plastic not being able to fill orders in a timely manner, Ameren Illinois will order needed fittings from Friatec and/or Innogaz."	April 1, 2013	January 1, 2014
PRES 0	Added PRES 2.06 Pressure Change Request to Pipeline Supplier PRES 4 Added a new Form: Ameren Pressure Change Request	January 1, 2013	January 1, 2014
PRES 2.04	Overpressure Reporting 1. D.: Managing Supervisor Operations - Gas Training and Quality Assurance replaces Manager Gas Compliance	October 1, 2011	January 1, 2014

PRES 2.06	<p>Pressure Change Request to Pipeline Supplier</p> <p>New procedure is a formal process when Ameren Illinois needs for a Pipeline Supplier to change delivery pressure into an Ameren Illinois gas system. Process is for both temporary and permanent changes. A request form must be completed, submitted to, and approved by the Superintendent Gas Technical Services. Gas Technical Service personnel will coordinate review, evaluation of the requested change and submittal to the Pipeline Supplier. Procedure includes a workflow diagram on how a change request is processed.</p>	N/A	January 1, 2014
PRES 4	<p>Forms and Reference Materials</p> <p>Added a new Form: Ameren Pressure Change Request</p>	January 1, 2013	January 1, 2014
PTST 1	<p>2. Test Medium</p> <p>2. A.: Deleted the restriction for using natural gas for up-rates only. PHMSA allows natural gas as an acceptable test medium.</p> <p>3. Test Recording Methods</p> <p>Process Pressure Gauges Table</p> <p>Retitled the Ashcroft 1279A heading to "Grade 2A, ± 0.5% Full Scale Accuracy, Black Plastic Case, 4-1/2" Face"</p> <p>Stock Codes and pressure ranges for these process gauges has been completely revised and updated in EM-PRV. Currently, EM-PRV has Ashcroft and McDaniel as approved manufacturers. Additional manufacturers can be added when approved.</p> <p>4. Testing</p> <p>4. A. New: "PE and Steel distribution service lines smaller than two (2) inches shall be tested at the following minimum pressures for the minimum duration specified in PTST 2.01:</p> <p>(1) 90 psig for service lines on systems operating at or below a Design MAOP of 60 psig</p> <p>(2) 150 psig for service lines on systems operating at or below a Design MAOP of 100 psig but more than 60 psig</p> <p>(3) For service lines on systems operating over 100 psig but less than 20% SMYS the test pressure is 1.5 times the Design MAOP. If the test pressure on the service line exceeds 20% SMYS of the pipe, it is to be tested in accordance with "D." below. Table lists test pressure that would reach 20% SMYS for steel service lines smaller than 2 inches."</p> <p>4. D.(4): Revised wording to clarify "For any pipeline that requires a separate leak and strength test but will operate at less than 30% SMYS, additional test medium can be</p>	April 1, 2013	January 1, 2014

added to raise the test pressure to at least 1.5 time the planned MAOP. This is a strength test with minimum duration of at least one (1) hour."

9. Test Records

9. A.(1): Added a sentence, "This stamp is being revised so future plans may have a different stamp."

9. A.(3): Added the draft of a new Leak & Strength Test Stamp that will be used projects designed by Gas Tech Engineering.

PTST
2.01

Leak Test

1. B.: Gas Tech Engineering replaced Gas Operations and Services

2. Test Medium

2. A.: Deleted the restriction for using natural gas for up-rates only. PHMSA allows natural gas as an acceptable test medium.

3. Leak Test Duration

3. C.: Gas Tech Engineering replaced Gas Operations and Services - Engineering

3. D.: New: "When testing main segments of various sizes as a single test, the test duration should be determined by the largest diameter of pipe and the length of the entire section of pipe being tested."

4. Leak Test Procedures

4. F.: "bleed of test medium" replaced "bleed off air, nitrogen, or water used as the test medium"

5. Leak Test Records

5. A.: Added reference to PTST 1

5. B.(8): Grammatical, deleted the word "and"

5. D.: Grammatical, deleted an extra "life" in the sentence.

PTST
2.03

Hydrostatic Pressure Testing

1. B.: Gas Tech Engineering replaces Gas Operations and Services - Engineering

2. A.: Gas Tech Engineering replaces Gas Operations and Services - Engineering

2. C.: Gas Tech Engineering replaces Gas Operations and Services - Engineering

3. A.: Gas Tech Engineering replaces Gas Operations and Services - Engineering

January 1,
2013

January 1, 2014

3. C.: Revised to "Ameren Illinois or contractor personnel required to perform the test should be knowledgeable and experienced and qualified in hydrostatic testing procedures including discharge of test water." Deleted the reference to Ameren's OQ course designation.

4. C.: Gas Tech Engineering replaces Gas Operations and Services - Engineering

PUBL 1	1. A.(3): Ameren Illinois replaced Ameren Illinois Utilities	June 1, 2010	January 1, 2014
PUBL 2.01	Public Notifications 4. Pipeline Emergency Response Notifications to Government Organizations 4. D.: Added reference to PUBL 2.02 for annual notification letter. 6. Records 6. A.: Revised wording, "Ameren Illinois Public Awareness Group shall maintain a copy of the annual notification letter sent to government organizations. File is maintained at the Gas Compliance office." 6. C.: Revised wording, "Ameren Illinois Public Awareness personnel will maintain a list of face-to-face visits through NIPA/SIPA meeting and public education programs. File is maintained at the Gas Compliance office." 6. D.: Revised wording, "Ameren Illinois Public Awareness personnel will maintain a copy of the one-call program's notification programs File is maintained at the Gas Compliance office." 6. E.: New item; "Ameren Illinois Public Awareness personnel will maintain lists of Emergency Responder training for fire, police, and other emergency agencies which includes: dates, locations, topics and list of attendees. This information is filed at the Gas Compliance office."	Janu- ary 1, 2013	January 1, 2014
PUBL 2.02	Liaisons with Public Officials 5. Natural Gas Emergency Procedures 5. (2)(g): Updated Ameren Illinois phone number, 1-800-755-5000, that the general public would use to call in a gas emergency.	Janu- ary 1, 2011	January 1, 2014
QUAL 4	Updated Leak Survey - QA1005 form Numerous changes were made to this QA Field Inspection checklist. Revisions were based on field observations that identified a need to expand the tasks associated with leak surveying.	Janu- ary 1, 2012	January 1, 2014

REPR 1	<p>4. Steel Pipe Repair</p> <p>4. J.(5): Added new item: "If composite wrap is determined to be the appropriate repair method then Syntho-Glass XT, manufactured by Neptune Research, shall be used. See REPR 4 for installation guidelines. Before another brand of</p>	January 1, 2013	January 1, 2014

UNCONTROLLED IF PRINTED

composite wrap is used, it must be approved by Gas Standards group in coordination with Corrosion and Gas Tech Engineering groups"

4. J.(6): Added new item: "Syntho-Glass XT can be purchased through Technical Engineering Sales (815-600-2808)."

4. J.(7): Added new item: "Technical Engineering Sales personnel shall provide assistance with material, training and qualification requirements. See REPR 4 for an engineering assessment form which contains information Technical Engineering Sales personnel will need."

10 Repair Records

10.C. Mapping

10. C.(1): Replaced FRAMME with "electronic mapping system".

10. C.(2): Replaced FRAMME with "electronic mapping system".

REPR 2.01

Compression Couplings

2. Main Repair Methods for Compression Couplings

2. A. & B. Grammatical, added the work "and"

2. C. Steel to Steel

2. C.(1): Added three ways one may be able to determine if the pipe has slipped inside the coupling, pull out.

2. C.(1)(a): Wrap shows evidence of being stretched.

2. C.(1)(b): Pipe shows evidence of being pulled or is out of normal alignment with coupling.

2. C.(1)(c): Once wrap is removed, pipe next to coupling is cleaner or shiner than the rest of the pipe.

2. C.(2)(a): Added "at time of the leak repair" so this now reads, If pull out is detected, "Tighten and encapsulate the compression coupling with full encirclement welded split sleeve at the time of the leak repair or

Remove the coupling and replace with a new section of pipe connected by an approved welding procedure in order to eliminate the leak."

2. C.(3)(a): Grammatical, added the work "and"

3. Service Line Repair Methods for Compression Couplings

3. A. Plastic to Plastic

3. A.(1): Grammatical, added the work "and"

3. B.(1): Replaced "should" with "shall": "If the steel portion of the service line is isolated from the cathodic protection system, the service line shall be replaced."

UNCONTROLLED IF PRINTED

3. C. Steel to Steel

To eliminate confusion as to the repair method for compression couplings within 5 feet of a foundation wall, this is now a separate item.

3. C.(1): "If the compression coupling is within 5 feet of a foundation wall:

(a) Replace the service line or

(b) Tighten and encapsulate the compression coupling with a full encirclement welded split sleeve or

(c) Remove the coupling and replace with a new section of pipe connected by an approved welding procedure."

3. C.(2): "If the compression coupling is greater than 5 feet from a foundation wall, visually inspect for pull out of the pipe from the compression coupling:

(a) If pull out is detected: See REPR 2.01 2. C.(1) above

- Replace the service line or
- Tighten and encapsulate the compression coupling with a full encirclement welded split sleeve, or
- Remove the coupling and replace with a new section of pipe connected by an approved welding procedure.

(b) If pull out is not detected:

- The compression coupling may be tightened to repair the leak and
- The Gas Supervisor shall create a DOJM to replace the service, to encapsulate the compression coupling with a full encirclement welded split sleeve or remove the coupling and replace with a new section of pipe connected by an approved welding procedure. The DOJM shall be completed within 30 days

4. Compression Joints on Steel Tees and Valves

Compression joint within 5 feet of foundation is a separate item now.

4. A.: If the compression joint tee or valve is within 5 feet of a foundation wall:

(1) Replace the tee or valve or

(2) If leak is eliminated, install welded straps across the joint, equally spaced around the joint, minimum of two (2) straps, See REPR 3.05, and

(3) Remove the tee or valve and replace with a new section of pipe, tee, or valve connected by an approved welding procedure, within 30 days.

4. B.: "If the compression joint tee or valve is greater than 5 feet of a foundation wall, visually inspect for pull out of the pipe from the compression joint.

(1) If pull out is detected: See REPR 2.01 2. C.(1) above

(a) Tighten the compression joint.

(b) If leak is eliminated, install welded straps across the joint, equally spaced around the joint, minimum of two (2) straps, See REPR 3.05, and

(c) Schedule the replacement of the tee or valve with a weld-in section of pipe, tee, or valve within 30 days. Gas Supervisor shall create a DOJM to replace the compression joint. DOJM shall be completed within 30 days.

(d) If leak is not eliminated replace the tee or valve with a section of pipe, tee, or valve connected by an approved welding procedure.

(2) If pull out is not detected:

(a) Tighten the compression joint to eliminate the leak.

(b) Following the repair by tightening, the Gas Supervisor shall identify if that section of main is scheduled for replacement within the next 36 months as part of a coupled steel main replacement program.

(c) If not scheduled for replacement, the Gas Supervisor shall create a DOJM to replace the compression joint with a new section of pipe, tee, or valve connected by an approved welding procedure. The DOJM shall be completed within 30 days.

REPR 4	Forms and Reference Materials Added two references Reference 01 - Syntho Glass XT Installation Guidelines Reference 02 - Syntho Glass XT Engineering Assessment Form		January 1, 2014

SERV 1	<p>2. Depth</p> <p>2. B.(c): Inserted new item: "Safety Wrap may be used for permanent protection of PE pipe. See DAMG 1 for stock codes. Safety Barrier Tape (16 06 958) must also be installed over the Safety Wrap."</p> <p>5. Location</p> <p>5. D.(3): Deleted "See Exhibit 3" for fire escape since it was not applicable</p> <p>8. PE Service Lines</p> <p>8. F.: Increased minimum thickness to 6 inch of rock free soil to cover PE pipe as a protection against damage from rocks or other abrasive backfill material.</p> <p>13 Records</p> <p>13. D.: New item: "Gas services shall be mapped in the Ameren Illinois electronic mapping system. See SERV 2.07"</p>	April 1, 2013	January 1, 2014
SERV 2.02	<p>Excess Flow Valves</p> <p>3. EFV Sizing</p> <p>3. C.: Inserted new item; "Any proposed 1/2" service that may at any point have an inlet pressure of less than 20 psig should be upgraded to a 1" service and EFV."</p> <p>3. E.(1): Table for 1/2" PE service lines: Deleted values for inlet pressures 10 and 15 psig. 1/2 inch EFV's with inlet pressures below 20 psig do not have flow capacity to support a standard residential gas meter.</p>	April 1, 2013	January 1, 2014
SERV 2.04	<p>Yardlines</p> <p>4. Yardline Installation</p> <p>Reformatted by adding bullet points for the previous text.</p> <p>4. A.: Revised wording to "Yardlines are required to be leak surveyed more frequently which requires additional operating and maintenance resources."</p> <p>4. B.: Revised wording to "Yardlines have the potential to develop corrosion leaks or being damaged by excavation."</p> <p>4. C.: Revised wording to "For these reasons, Ameren Illinois will maintain a new service installation policy that requires all new residential meter sets to be installed within three (3) feet of the building, including manufactured homes and multiple unit buildings, which will avoid the creation of new yardlines."</p>	Janu- ary 1, 2011	January 1, 2014
SERV 2.06	<p>Gas Service Transaction Card</p> <p>3. Distribution</p>	April 1, 2013	January 1, 2014

3. B.: Inserted new item: "A copy of the completed Gas Service Transaction card shall be forwarded to the appropriate poster for entering on the electronic mapping system. This can be done electronically."

SERV 2.07	NEW: Gas Service G/Tech Mapping Provide standardization on how services are to be mapped in G/Tech.		January 1, 2014
SERV 3.06	Farm Tap - Single Cut 60 - 450 PSIG Revised G3511## Material List. Eliminated the material for a 1/2" service line installation since all farm tap services will now be a minimum of 1" CTS.	April 1, 2013	January 1, 2014
SERV 3.07	Farm Tap - Double Cut 451 - 1000 PSIG Revised G3531## Material List. Eliminated the material for a 1/2" service line installation since all farm tap services will now be a minimum of 1" CTS.	April 1, 2013	January 1, 2014
STLP 0	Table of Contents 2.01 Design Pressure Added 6. Dual Coat Steel Pipe	Janu- ary 1, 2013	January 1, 2014
STLP 2.01	Steel Pipe Design Pressure 5. Table: Corrected the Design Pressure values for the 14 inch Schedule 40 pipe. The values for the Schedule 10 had been copied to the Schedule 40. 6. Dual Coat Steel Pipe - New Section Stock Codes have been set up for 2", 4", 6", and 8" Steel Pipe, Schedule 40, Double Random Length. Pipe will have an average of 14 mil FBE and a minimum of 20 mil ARO coating. Table provides pipe information and design pressures.	Janu- ary 1, 2013	January 1, 2014
STLP 3.02	Reinforcing Saddles 1. D. Table: In the Note replaced Gas Engineering or Gas Operations and Services with Gas Tech Engineering. 1. E.: New: "Weldolets that meet ASME B31.8 requirements for reinforcement area is an approved substituted for both a regular and a full encirclement reinforcing saddle for all pressure ranges and all sizes and ratios of header and branches. (1) Weldolets are designed so that they have enough area in the fitting itself to meet the requirements for	Janu- ary 1, 2011	January 1, 2014

extra reinforcement area that is not provided by the branch and header pipe walls.

(2) Weldolets must be selected according to the specifications and requirements set forth in the manufacturer's catalog.

(3) Weldolets may also be used on branches that do not require additional reinforcement as their shape allows for more efficient fluid flow

TAPS 0	<p>Table of Contents</p> <p>Inserted new item in TAPS 1</p> <p>7. Gauge, Blow-down, By-pass Fittings</p> <p>TAPS 4 Forms and Reference Materials</p> <p>Added:</p> <p>Reference 21. Mueller Autoperf Installation Instructions</p>	Janu- ary 1, 2013	January 1, 2014
TAPS 1	<p>1. H.: Inserted new item: "Qualified Individual shall be present while the tapping machine is being assembled, installed, tested and during drilling operations."</p> <p>1. I.: Inserted new item: "Qualified Individual shall be present while the stopping equipment is being assembled, installed, tested and during stopping operations. This Qualified Individual should remain with stopping equipment until such time that pressure variations being monitored are shown to be satisfactory."</p> <p>1. J.: Inserted new item: "Under no circumstances should an open ended pipeline be left unattended while stopping equipment is in operation. Pipe ends shall have an approved weld cap rated for the pipeline pressure installed at the end of each day so that the stopping equipment can be raised, tapping valve closed and equipment left unattended overnight. Caps shall be installed utilizing an approved welding procedure."</p> <p>1. K.: Inserted new item: "When a valve is being utilized to isolate the pipeline, the open ends shall be capped as outlined above."</p> <p>3. B.: Supervisor Gas Tech Services replaces Gas Operations and Services - Technical Services Supervisor</p> <p>3. E. & F.: Gas Tech Engineer replaces Gas Operations & Services - Engineer</p> <p>New 7. Gauge, Blow-down, By-pass Fittings:</p> <p>A. When installing fittings to facilitate tapping and stopping operations consideration should be taken as to the potential need to reuse these fitting in the future. Items to be considered are:</p>	Janu- ary 1, 2013	January 1, 2014

- (1) Purpose of installed control fitting
- (2) Possible need to use control fitting to isolate main segment in an emergency situation
- (3) Location of mainline valves that could be used to isolate main segment
- (4) Accessibility of control fitting
- (5) Potential need for relocating main segment

B. Tapping and stopping operations on pipelines with MAOP over 60 psig may require installation of fittings to be used for a gauge tap, blow-down and/or by-pass. (1) Valve tees, save-a-valve nipple, or other approved fitting shall be used on transmission and high pressured distribution pipeline. Service style tee with an internal cutter/punch assembly shall not be used for gauge taps, blow-downs or by-pass on these mains.

(2) Following completion of the tapping and stopping operations, the valve tee outlet can be capped with a threaded steel cap/plug or a weld cap/plug. The cap/plug shall be leak tested with leak detection fluid.

(3) The valve tee shall be left in the closed position.

C. Tapping and stopping operations on distribution pipelines with MAOP of 60 psig and lower may require installation of fittings to be used for gauge tap, blow-down and/or by-pass. (1) Service tee with an internal cutter/punch assembly is an acceptable fitting along with those listed in 7. B.(1) above.

(2) Following completion of the tapping and stopping operations, fitting outlet can be capped with a threaded steel cap/plug or a weld cap/plug. The cap/plug shall be leak tested with soap.

(3) The punch can be left in the down position. D. The fitting shall be pressure tested in accordance with PTST 1 prior to tapping.

TAPS 3.01	Mueller Fittings 4. Mueller Bottom-Out Line Stopper Fittngs Added 1-1/4" H-17085 19 33 042, not in Mueller catalog any longer but is available.	Janu- ary 1, 2011	January 1, 2014
TAPS 4	Forms and Reference Materials Added: Reference 21 - Mueller Autoperf Tee Installation Instructions	Janu- ary 1, 2013	January 1, 2014

TURN 2.11	<p>Warning Tag</p> <p>4. Isolating an Appliance</p> <p>Revised language regarding locking off meter valve.</p> <p>4. B.: "Gas field personnel may shut-off the meter valve, disconnect and cap the meter set outlet. The meter valve is not required to be locked since the meter set is disconnected from customer piping. The customer or HVAC /plumbing contractor may reconnect the piping and relight the appliance(s) or"</p> <p>4. C.: "If the hazard is isolated at the meter valve, then the valve shall be locked and gas field personnel should follow up to unlock the valve so customer or HVAC /plumbing contractor can relight the appliance(s)."</p> <p>5. Code Violations</p> <p>5. C.(6): Added requirement to provide customer or their representative with the Warning Tag if not installed on piping or appliance. "Install the "Warning" tag on the piping or appliance or provide to the customer or their representative. The original is retained by Ameren Illinois and filed for future reference."</p> <p>5. D. Examples of Code Violations</p> <p>Deleted the note: "Note: All code violations shall be corrected before gas is turned on to a new structure or newly installed appliance(s)."</p> <p>6. Hazardous Conditions</p> <p>6. C.(6): Added requirement to provide customer or their representative with the Warning Tag if not installed on piping or appliance. "Install the "Warning" tag on the piping or appliance or provide to the customer or their representative</p>	January 1, 2013	January 1, 2014
VALV 1	<p>1. Replace "all" with "new". "This section provides information for the placement and inspection of emergency valves and the installation of new valves within the Ameren Illinois gas systems."</p> <p>2. Design Consideration</p> <p>2. A.: Grammatical change, made systems plural.</p> <p>2. B.: Revised language to: Intended valve function (emergency, non-emergency, isolation, blow-down) and desired accessibility (i.e. not in bottom of ditch if at all possible), including avoiding excessive depths."</p> <p>2. C.: Deleted "One hundred percent isolation of a system or any portion thereof."</p> <p>2. E.: Added Gas Tech Engineering designate other situations where a valve needed installed.</p>	July 1, 2012	January 1, 2014

3. Emergency Valve - Location

3. B.: Removed (>60psig) and (≤60psig) from high pressure distribution and distribution.

3. C.: Added "flow control stations" which should have a valve installed at a safe distance from the station.

3. D.: Cleaned up language to: "All emergency valves including blow-down valves are to be entered into Ameren Illinois electronic mapping system. System maps will distinguish these valves as Emergency Valves along with their respective Valve ID #."

3. E.: Cleaned up language to: All emergency valves including blow-down valves are to be entered in Gas Compliance System with the same Valve ID# as that shown in the electronic mapping system."

4. Emergency Valve Inspection

4. C.: Revised to "Any new valve box installation must include a lid marked "GAS"

VALV
2.01

Valve Installation

2. Valve Identification

2. A.: Clarified that the valve ID's are entered on the electronic mapping system.

3. Emergency Line Valves

3. B.: Removed the (MAOP > 60psig) and (MAOP ≤ 60psig)

3. B.(1): Added Gas Tech Engineering as another group that can designate distribution valve as an emergency valve.

3. B.(3): Revise wording on outage zones to: "Zones of Isolation (Outage Zones) should be established to support effective re-lights and emergency management. The size of the zone should be such that the majority of affected customers can have service restored within 24 hours."

4. Emergency Station Valves

4. A.(2): Combined the previous 4. A.(6) into this item by adding "newly installed or newly designated" stations that must have an emergency/fire valve installed.

4. A.(4): Inserted new item that clarifies a safe distance. "A safe distance is generally accepted as being 25 feet of more from the pressure control or flow control station."

4. A. (6): Deleted the previous item (6), moved into item (2) above.

4. C.: Rebuilt Station Defined

4. C.(3)(c) & (i): Clarified what is not considered a "rebuild" when regulator, springs, orifice, liners, or ports are changed

January 1,
2013

January 1,
2014

at a regulator station. As long as the purpose for the change is not to increase or decrease station capacity it is considered a maintenance activity and not a station rebuild.

5. Non-Emergency Valves

Throughout this section "GCS" replaces "Gas Code Compliance system "

5. B.: Grammatical revisions: The valve could be used to aid in the sectionalizing or isolating areas of the system in cases requiring the shut-down of gas for reasons such as:

- (1) Damage to a gas main
- (2) Gas main replacement or relocation project
- (3) Uprating a section of the system

5. C.: Added Gas Tech Engineering as another group who could determine location of an emergency valve.

5. D.: Revised mapping system designation to "gas electronic mapping system".

5. E.(1): Grammatical revision; "Be cautious when entering a valve in GCS that the correct Designation is checked and an Emergency Valve is not erroneously entered as Non-Emergency."

5. F.: Clarified when a non-emergency valve is to be classified as an emergency valve. "If a below grade non-emergency valve is used to isolate or sectionalize gas main segments of a gas distribution system or transmission system during an emergency situation, the valve will be designated as an Emergency Valve after the emergency situation has been resolved. An Emergency Valve ID shall be assigned. The valve shall be entered into the GCS and on the electronic gas system map. In the Remarks section of the Valve module in GCS, enter "valve was used during an emergency situation". This does not include a below grade service line valve used to shut down a service line."

WELD
1

1. B.: Added "regulations and codes" so now reads: "All company and contractor personnel performing work for the company shall follow the specifications, procedures, regulations, and codes presented herein."

January 1, 2013

January 1, 2014

1. C.: Inserted new item: "Ameren Illinois will follow the latest edition of regulations and codes that have been adopted by reference in Part 192."

4. Limitation on Welders

Replaced API 1104 section numbers with title of the section in the following:

4. C.: "A welder may not weld on pipe to be operated at a pressure that produces a hoop stress of 20% or more of SMYS unless within the preceding 6 calendar months the welder has had one weld tested and found acceptable un-

der Qualification of Welders or Acceptance Standards for Nondestructive Testing section of API 1104."

4. D.: "Welders may maintain an ongoing qualification status by performing welds tested and found acceptable under Qualification of Welders or Acceptance Standards for Nondestructive Testing section of API 1104 at least twice each calendar year, but not at intervals exceeding 7-1/2 months."

6. Inspection and Testing of Welds

6. C.: "The acceptability of a weld that is nondestructively tested or visually inspected is determined according to the standards in Acceptance Standards for Nondestructive Testing section of API Standard 1104. However, if a girth weld is unacceptable under those standards for a reason other than a crack, and if Appendix A to API 1104 applies to the weld, the acceptability of the weld may be further determined under that appendix. Contact Ameren Illinois Gas Training Center if assistance is needed to determine the acceptability of the weld."

7. Nondestructive Testing

7. C.: "API 1104 "Acceptance Standard for Nondestructive Testing section" will be used for proper interpretation of each nondestructive test to ensure the acceptability of the weld."

7. F.: Replaced the reference to "item 6 above" with the title of item 6, Inspection and Test of Welds.

WELD 2.01	<p>Safe Welding Practices</p> <p>1.: Deleted the sentence "He/she shall designate precautions to be followed in granting authorization to proceed, in the form of a "Hot Work" permit or noted on Job Briefing, JBO, when necessary.</p> <p>2. Prohibited Areas</p> <p>2. A.(3): Replaced 20% LEL with 30% LEL above which cutting and welding would be prohibited.</p> <p>8. Protection of Personnel</p> <p>8. B. Eye Protection</p> <p>8. B.(1)(g): For booths and screens replaced comply with section 3.5 with Welding Screens and Booths of this part.</p>	Janu- ary 1, 2012	January 1, 2014
WELD 2.02	<p>Welder Performance Qualifications</p> <p>2. Standards and Codes</p> <p>Replaced "latest approved edition" with "latest adopted editions" for the various codes referenced in Part 192.</p> <p>2. A.: Added the abbreviation of (PHMSA Part 192) for Department of Transportation, Code of Federal Regulations,</p>	July 1,2012	January 1, 2014

Title 49, Part 192, "Transportation of Natural and Other Gas by Pipelines."

2. C.: Corrected the title of American Petroleum Institute (API) 1104 Appendix B to "In-Service Welding".

5. Qualification Categories (Initial Test)

5. B. Ameren Illinois Qualification Categories

5. B.(1) Pipeline - (Single): Replaced DOT 192 with PHMSA Part 192.

5. B.(2) Pipeline - (Multiple): Replaced DOT 192 with PHMSA Part 192

5. B.(3) Maintenance: Added "In-Service Welding" as title to API 1104 Appendix B.

5. C. Pipeline - Single Qualification (Butt/Branch welds) (on nominal pipe Diameters)

5. C.(1): Replace API 1104, Section 6.0, Paragraph 6.2, Single Qualification, Latest Edition with API 1104 "Qualification of Welders - Single Qualification"

5. C.(2)(a): Added a "-" in 1-1/4"

5. C.(6)(a): Added a "-" in 1-1/4" and replaced "≤" with "<" than 0.188 wall thickness.

5. C.(7): Replaced "Section 6 of API 1104" with "Qualification of Welders". Replaced "Paragraph 6.2 of API 1104" with "Single Qualification of API 1104".

5. D. Pipeline/Fabrication Multiple - Qualification

5. D.(1): Replaced "Section 6.3 of API 1104" with "Multiple Qualification of API 1104"

5. D.(2)(c): Replaced "API 1104, Section 6.4 and 6.5" with "Visual Examination and Destructive Testing".

5. D.(4): Replaced "Section 6.3 of API 1104" with "Multiple Qualification of API 1104" and "Paragraph 6.3.2 of API 1104" with "Multiple Qualification of API 1104".

5. E. in-Service (Maintenance) Welding Test

5. E.(3): Replaced Paragraph 6.2.2, API 1104, Latest Edition" with "Single Qualification, API 1104".

5. E.(4): Replaced "API 1104. Appendix B, Latest Edition" with "API 1104. Appendix B, In-Service Welding".

5. E.(5): Replaced "Appendix B and Paragraph 6.4 and 6.5" with "API 1104 Appendix B In-Service Welding and Visual Examination and Destructive Testing".

5. E.(7)(a): Replaced with "PHMSA Part 192, (Subpart E, Welding of Steel in Pipelines), (Subpart M - Maintenance), (Appendix C - Qualifications of Welders for Low Stress Level Pipe)".

UNCONTROLLED IF PRINTED

- 5. E.(7)(b): Added "In-Service Welding".
- 6. service Line Welding
- 6. B." Replaced "Appendix C of CFR DOT 192" with "Appendix C - Qualifications of Welders for Low Stress Level Pipe of PHMSA Part 192".
- 7. Workmanship
- 7. A.(2): Replaced "section 9.7, API 1104, latest edition" with "Visual Acceptance Standards for Undercutting in API 1104".
- 7. A.(6): Replaced "API 1104 9.3.7" with " API 1104 Radiographic Testing".
- 9. Destructive Testing
- 9. A.(1): Replaced "DOT 192, Subpart E" with "PHMSA Subpart E, Welding of Steel in Pipelines".
- 9. B. Requalification of Welder
- 9. B.(1): Replaced "welder will be given one more opportunity to". This now reads, "Following on the spot training and procedure review the welder will be given one more opportunity to submit at least two additional sample tests and if both tests are successful there will be no need to perform a full test."
- 9. B.(2): Revised to read. "A welder that fails a requalification test may a qualify, at a later date by participating in additional training and procedure review and producing a full initial test under the supervision of a qualified welding inspector as outlined in this manual for appropriate initial qualification."
- 9. B.(3): Added: "After a period of no less than 5 days, the employee will be re-evaluated, using the same evaluation methods used for the initial qualification. This will ensure that the employee is not being tested on their short-term memory."

Supersedes: April 1, 2013

CHANGE SUMMARY

April 1, 2013

Change Summary April 1, 2013

Docu- ment	Change Summary	Previous Document Dated	Current Docu- ment Dat- ed
FORW	<p style="text-align: center;">Forward:</p> <p style="text-align: center;">Division Director replaces Division Manager</p> <p>Updated Office Phone Numbers for the following individuals:</p> <p style="text-align: center;">Operating & Maintenance Plan: Jim Burke - 618-253-1694</p> <p style="text-align: center;">Standards and Materials: Eddie Lynch - 217-535-5069</p> <p style="text-align: center;">Technical Services: Gerry Turner - 217-535-5023</p>	January 1, 2013	April 1, 2013
ABND 2.01	<p style="text-align: center;">Abandonment of Gas Facilities:</p> <p>Gas Standards Committee made revisions primarily addressing the position a tap should be left in once the abandonment is completed. On all PE mains and steel distribution mains, the cutters/punches are to be left in the down position. On all transmission and high pressure distribution mains, the cutters/punches are to be left in the up position so there is no obstruction inside the pipe.</p> <p style="text-align: center;">1. Mains</p> <p style="text-align: center;">Inserted a new item in the Main, General section:</p> <p>1. A.(5): "If the fitting used to shutoff gas to any main, distribution, high pressure distribution, or transmission, to be abandoned is equipped with a stem which seats closed within the fitting and not an internal cutter/punch assembly, it should be left in the closed position once the abandonment is complete."</p> <p>1. A.(6): Transmission and steel high pressure distribution main need to be free of obstructions so that a pig can be run through the line. Any fitting that has an internal cutter/punch should be left in the up position after abandonment is completed.</p> <p style="text-align: center;">1. B.(3): Inserted new item in PE Mains:</p> <p style="text-align: center;">"Taps should be left in the down position on all PE mains once the abandonment is complete."</p> <p style="text-align: center;">1. C.(1): Inserted new item in Steel Mains:</p> <p style="text-align: center;">"Prior to any cutting on steel pipe an electrical bond should be installed. See ACIG 2.01"</p> <p style="text-align: center;">1. C.(4): Inserted new item for steel distribution mains:</p> <p style="text-align: center;">"Taps with an internal cutter/punch assembly should be left in the down position on distribution mains with MAOP of 60 psig or less once the abandonment is complete."</p> <p style="text-align: center;">1. C.(5): inserted new item for transmission and high pressure main:"Taps with an internal cutter/punch assembly should be left in the up position on transmission and steel high pressure distribution mains, once the abandonment is complete."</p> <p>1. D.(3): Revised language when abandoning a regulator station, any pressurized main remaining shall be treated in same manner as described in the Main section shown above.</p>	January 1, 2013	April 1, 2013

UNCONTROLLED IF PRINTED

	<p style="text-align: center;">2. Services</p> <p style="text-align: center;">2. A. General: New items added:</p> <p>2. A.(7): " Prior to any cutting on steel pipe an electrical bond should be installed. See ACIG 2.01"</p> <p>2. A.(11): "Transmission and steel high pressure distribution main need to be free of obstructions so that a pig can be run through the line. Any service tap that has an internal cutter/punch should be left in the up position after abandonment is completed."</p> <p>2. A.(12): "If the service tap is equipped with a stem which seats closed within the fitting and not an internal cutter/punch assembly, it should be left in the closed position once the abandonment is complete."</p> <p style="padding-left: 40px;">2. A.(13): "If service tap is not accessible, the tap will remain in the open position."</p> <p>2. A.(14): "When service tap is not accessible and a line stopper fitting is installed on the service line, the service stub will be under operating pressure once the" abandonment is complete.</p> <p>2. B.(6): Revised language in PE Service form PE Mains: "Service taps should be left in the down position on all PE mains once the abandonment is complete. In order to leak test the cap connection, run the tee up to allow gas to enter the service stub then return the tee to the down position. " Added "all PE mains"</p> <p>2. C.: Added new items in PE Service Lines with Compression Outlet Tees:</p> <p>2. C.(4): "Service taps with an internal cutter/punch assembly should be left in the down position on steel distribution mains with MAOP of 60 psig or less once the abandonment is complete. In order to leak test the cap connection, run the tee up to allow gas to enter the service stub then return the tee to the down position."</p> <p>2. C.(5): "Service taps with an internal cutter/punch assembly should be left in the up position on transmission and high pressure distribution mains once the abandonment is complete."</p> <p style="text-align: center;">2. D.: Steel Service Lines</p> <p style="text-align: center;">Inserted the following new items</p> <p>2. D.(2): "Service taps with an internal cutter/punch assembly should be left in the down position on steel distribution mains with MAOP of 60 psig or less once the abandonment is complete. In order to leak test the cap connection, run the tee or punch up to allow gas to enter the gas to enter the service stub."</p> <p>2. D.(3): Service taps with an internal cutter/punch assembly should be left in the up position on transmission and high pressure distribution mains once the abandonment is complete.</p> <p>2. D.(5): Included "does not have an accessible service tee" as another situation where a line stopper can be installed on the service line.</p> <p>2. E.(3): When abandoning a farm tap, the pressurized service line remaining shall be treated in the same manner as Service Lines shown above. Deleted the word "Steel" encase there are situations where a farm tap is installed off of HDPE main.</p> <p style="text-align: center;">4. G.: Corrected reference to F. (2) from E. (2).</p>		
<p>BORE 2.05</p>	<p style="text-align: center;">Typical Sewer Installation</p>	<p style="text-align: center;">January 1, 2013</p>	<p style="text-align: center;">April 1, 2013</p>

	Typical 12. Home on Crawl Space - Very Elevated Lot - Corrected the picture and heading.		
CORR 0	Added CORR 3.17 Cased Crossing Monitoring	January 1, 2013	April 1, 2013
CORR 2.03	Coatings 5.: Approved Cold Applied Wax Tapes 5. D.: Deleted the Tapecoat Rugged Wrap since it is not used in the same manner as the Glas-Wrap.	January 1, 2013	April 1, 2013
CORR 2.19	Cathodic Protection Test Points 3. Cased Crossings 3.: Added reference to new Standard CORR 3.17 Cased Crossing Monitoring	April 1, 2012	April 1, 2013
CORR 2.28	Evaluation of Corrosion 5. Allowable Pit Length Tables 5. A. (1): Inserted new, "The tables below are not valid for steel pipe with yield strength specifications less than 35,000 psig. Contact Corrosion Control personnel for allowable pit lengths if pipe is less than 35,000 psig. If the yield strength of the pipe is not known, allowable pit lengths should be based on a pipe with yield strength of 24,000 psig."	April 1, 2012	April 1, 2013
CORR 2.30	Buried Pipe Examination 2. Buried Pipe Examination 2. B.: Clarified by adding "and the existing pipe is planned to remain in service." Buried Pipe Examination is required any time an existing main or service pipe is exposed and that pipe is planned to remain in service. 2. F.: Clarified by adding "or when an existing pipe is planned to be retired and will not remain in service." Buried Pipe Examination is not required for pipe that is being abandoned or is planned to be taken out of service. 3. Distribution 3. A.: Removed "Corrosion and Steel Damage Evaluation" since it is covered in CORR 2.31. 3. A.: Clarified appropriate office by adding "local Operating Center, Damage Prevention Headquarters or Gas Operations and Services Office". 3. B.: In addition, added for transmission or high pressure distribution that are exposed "the office entering the information into PEET should retain a copy for their yearly file and send the original to Pipeline Integrity, Mail Code D-50." 5. Completion Instructions 5. A. 7.: Added to Location Drawing: "Proper dimension should be included which will enable the pipe to be located and mapped." Added a Note: "Data provided by Damage Prevention's Watch and Protect to provide GPS coordinates instead of location drawing."	January 1, 2013	April 1, 2013

	<p style="text-align: center;">7. Records</p> <p>Expanded to more clearly identify what and where records are maintained.</p> <p>7. A.: Added new: "Originals of Buried Pipe Examination Forms for distribution mains and services will be filed year at the appropriate local operating center office, damage prevention office or Gas Operations and Services office."</p> <p>7. B.: Added new: "Copies of Buried Pipe Examination Forms for transmission and high pressure distribution mains and services will be filed by year at the appropriate local operating office , damage prevention office, or Gas Operations and Services office."</p> <p>7. C.: Added new: "Originals of Buried Pipe Examination Form for transmission and high pressure distribution mains and services will be kept by Pipeline Integrity in Decatur."</p>		
<p>CORR 2.31</p>	<p style="text-align: center;">Corrosion and Steel Damage Evaluation</p> <p style="text-align: center;">2. Distribution</p> <p>2. C.: When Corrosion and Steel Damage Evaluation form is completed on transmission and high pressure distribution pipe the information is to be entered into PEET by the appropriate local Operating Center office or Gas Operations and Services office and the original sent to Pipe Integrity, Mail Code D-50.</p> <p style="text-align: center;">6. Records</p> <p>Expanded to more clearly identify what and where records are maintained.</p> <p>6. A.: Added new: "Originals of Corrosion and Steel Damage Evaluations for distribution mains and services will be filed year at the appropriate local operating center office."</p> <p>6. B.: Added new: "Copies of Corrosion and Steel Damage Evaluations for transmission and high pressure distribution mains and services will be filed by year at the appropriate local operating office."</p> <p>6. C.: Added new: "Originals of Corrosion and Steel Damage Evaluations for transmission and high pressure distribution mains and services will be kept by Pipeline Integrity in Decatur."</p>	<p>January 1, 2013</p>	<p>April 1, 2013</p>
<p>CORR 3.15</p>	<p style="text-align: center;">Rectifier Installation</p> <p>2. B.(2): Revised so that Corrosion Control personnel designing the rectifier installation will determine and specify anode spacing and installation methods. Removed the typical anode spacing.</p> <p style="text-align: center;">4.: Rectifier Ground Bed Header Lead Connection</p> <p>4. A.: Added Dryconn VisiLock with Smart Gel Anode Splice Box.</p> <p>4. B.: Added Dryconn VisiLock with Smart Gel Anode Splice Box.</p> <p>4. C.(1): Inserted description of the Dryconn VisiLock with Smart Gel Anode Splice Box.</p> <p>4. C.(2): Identified the previous description as 3M's Scotchcast resin splice kit.</p> <p>4. D.(1): Inserted instructions for installing the Dryconn VisiLock with Smart Gel Anode Splice Box.</p> <p>4. D.(2): Identified previous instruction as those for the 3M's Scotchcast resin splice kit.</p>	<p>April 1, 2012</p>	<p>April 1, 2013</p>

LEAK 2.03	<p>Leak Investigation Form:</p> <p>2. A.(7): GCS No.: Revised to include Gas Supervisor approving Gas Leak Case Field Report but removed Gas Supervisor as the one entering the GLCFR into GCS.</p>	October 1, 2011	April 1, 2013
LEAK 2.04	10. Ameren Illinois Leak Classification Guidelines: Replaced Card with the one that was actually printed in January, 2013. Had initially failed to put the greater than sign ">" in front of 0% LEL	January 1, 2013	April 1, 2013
LEAK 2.05	<p>Gas Leak Case Field Report</p> <p>The Gas Leak Case Field Report Form has been revised and has a Printed date of 01/15/2013</p> <p>2. Leak Case Field Report Sections</p> <p>2. A. Leak Case Information</p> <p>2. A.(2): Deleted "Location "</p> <p>2. A.(7): Added: GPS coordinates - GCS requires in decimal degree format</p> <p>2. A.(12): Added: Job Order # - used to document an associated DOJM order</p> <p>2. B. Surveillance Data</p> <p>2. B.(2): Revised "Volume" by eliminating the Note that were added in the January 1, 2013 O&M update to address >0 LEL to 4% Gas within 5 feet of Foundation Wall since this was not on the current GLCFR form. Form has now been update to include >0 LEL to 4% Gas.</p> <p>2. B.(4): In the Verification Method, added "Below ground leaks must be verified/classified by CGI unless volume is blowing." In the above ground leaks, replaced "Soap" with "Leak Detection Fluid".</p> <p>2. C. Repair Data</p>	January 1, 2013	April 1, 2013

UNCONTROLLED IF PRINTED

2. C.(3): In Pressure Test Data, revised to "required if pipe is replaced or service is disconnected from gas supply and reinstalled after repair is made."

2. C.(3)(d): Revision to title: Pipe Replaced/Srv Reinstated, Reinstated replaced Disconnected. Change was made to clarify that test pressure data is only required when the main or service is temporarily disconnected and then reconnected (reinstated). Permanently disconnect pipe does not require a pressure test.

2. C.(5) Revised title to Leak Checked Back to Main from FI Back to Main

2. C.(6): Deleted P/S Reading since P/S reading is entered on Buried Pipe Examination form.

2. C.(7)(g): Revised title to Incorrect Operations from Operations in order to be consistent with the DOT Annual Report categories.

2. C.(7)(h): Revised title to Not Observed from Other in order to be consistent with the DOT Annual Report categories.

2. C.(11): In Remarks, deleted "Note if soap, leak detection fluid, was used to check repairs for leak."

2. D. Leak Recheck

Specified "below ground" leaks that could have residual gas present versus "below grade"

2. D.(4): Added new: CGI Serial - (required) the serial number of the calibrated CGI used to recheck the leak.

2. D.(5): Revised the Verification Method for below ground rechecks. "The recheck of a repaired leak shall be performed with a gas detection instrument (FI unit or CGI and bar holes) to verify no gas exists below grade."

Gas Leak Case Field Report Form:

Section A:

Removed "Location"

Moved "Located on Federal Land" to below "Leak Location"

Added "JOB ORDER #"

Section B: Surveillance

VOLUME: Added >0%LEL to 4% GAS

VERIFICATION METHOD: LEAK DETECTION FLUID replaced SOAP

Section C: Repair

Retitled LEAK CHECKED BACK TO MAIN replaced FI Back to Main

Retitled PIPE REPLACED/SRV REINSTALLED from Pipe Replaced/SRV Disconnected

Removed P/S Reading

Removed the External and Internal Corrosion Exam for Service and Main sections

LEAK CAUSE:

INCORRECT OPERATIONS replaced Operations

NOT OBSERVED replaced Other

REPAIR TYPE:

UNCONTROLLED IF PRINTED

	<p>Added: WELD and RETIRE to selections Section D Leak Recheck: Added CGI SERIAL: VERIFICATION METHOD: Deleted "Soap" 4. Mechanical Fitting Leak 4. <p>METR 0</p>	<p>In METR 2.12 Rotary Meter Differential Testing corrected Item 4 to "Equipment" from "Test Equipment" to match METR 2.12 document.</p> <p>Added new Standards:</p> <p>METR 3.14 425 Meter, Bypass, 2, 5, & 10 PSIG Delivery, 5 - 60 PSIG Inlet</p> <p>METR 3.17 630 Meter, Bypass, 2, 5, & 10 PSIG Delivery 1-60 PSIG Inlet</p> <p>Revised Standards:</p> <p>METR 3.23 15C/3M Meter, 5 & 10 PSIG Delivery Pressure</p> <p>METR 3.26 5M/7M Meter, 5 & 10 PSIG Delivery Pressure</p>	<p>January 1, 2013</p>	<p>April 1, 2013</p>
<p>METR 2.12</p>	<p>Rotary Meter Differential Testing</p> <p>Supervising Engineer Gas IL Metering and Superintendent Gas Technical Services have made significant revisions to this document. These revisions apply primarily to the Gas Technical Services - Metering Technicians.</p> <p>1.: General has been expanded:</p> <p>1. A.: Combined the previous A. and B. into a single sentence: "The industry standard for testing rotary gas meters at a service location is to measure the pressure drop across the inlet and outlet of a rotary meter. This process is known as differential pressure testing."</p> <p>1. B.: Added a general explanation on why differential tests are performed on rotary meters. "Any significant increase in a rotary meter's internal resistance to flow at a known volume and pressure will increase the pressure drop across the meter. Therefore, the rotary meter differential test is a prime indicator of meter condition. Examples of items that will cause an increase in the internal resistance of a rotary meter: binding of the impellers, dirt or debris, worn bearings, too heavy oil, and incorrect oil level."</p>	<p>January 1, 2013</p>	<p>April 1, 2013</p>

UNCONTROLLED IF PRINTED

1. C.: Move text from Periodic Testing section into the General section. "Manufacturer test results have shown that an increase of up to 50% in differential pressure can be tolerated without affecting the rotary meter accuracy by more than 1%, at flow rates of 10% to 100% of meter capacity."

1. D.: Move text for Periodic Testing section into the General section. "Rotary meter accuracy cannot be directly determined by a differential test."

2.: Initial Installation Differential Test

2. A.: Added the words "related to": "A differential test shall be made on each new rotary gas meter installation to establish an acceptable differential related to individual piping configurations and operating pressures."

3. Periodic Test:

3. B.: Clarified a Periodic Test on a rotary meter is required to be conducted on or before the five (5) year anniversary from the meter's last test date.

4.: Equipment

4. F.: Added "Laptop with the current version of Dresser's Differential Test Acceptance Calculator installed or the manufacturer's factory differential pressure curves."

5. Differential Test

Revised to provide more details on activities required to perform a differential test.

5. Differential Test

The following activities are required to provide accurate differential test results:

1. Install a test gauge to measure the pressure at the meter.
2. Install the differential pressure test equipment into the meter inlet and outlet differential taps. Follow the manufacturer's instructions for proper installation and operating procedures.
3. Verify or establish a stable flow through the meter. The minimum flow rate for a proper test must be 10% of the meter capacity.
4. Time/clock the meter or interrogate the electronic index on the meter to determine the minimum test flow requirement is met.
5. Record the differential pressure reading, metering pressure, the test flow rate. The flow rate is either calculated or from an electronic index.
6. Repeat the test to verify an accurate average reading.
7. Compare the data to existing manufacturer's factory differential pressure baseline curves or use Dresser's Differential Test Acceptance Calculator (dP Calculator) to determine the condition of the meter (PASS or FAIL).
8. Remove all test equipment and confirm the meter is returned to normal operating conditions.

6.: Test Record:

6. G.: Added "Dresser's Differential Test Acceptance Calculator (dP Calculator)" as another item that the results can be compared with along with acceptable curve.

	<p>6. H.: Added "Any maintenance activities performed on the meter (e.g. meter oil change, flushing meter, etc)" that should be documented on the test record.</p> <p>6. I.: Added "Pressure sensing line to the corrector is in the open or "On" position.</p> <p>7. Follow-up Action</p> <p>7. A.: Added "dP Calculator" as another item the results of the differential test can be checked against.</p> <p>7. B.: Added "The meter may require corrective maintenance in the field to reduce the differential pressure to an acceptable level or possibly exchange the meter if the differential pressure cannot be reduced." When differential is more than 50% greater than the normal or manufacturer's curve differential.</p> <p>7. C.: Revised to identify "Corrective maintenance activities could include 1) Changing the oil or 2) Cleaning the meter impeller chamber, which could include flushing with an approved solvent."</p> <p>7. D.: Added "Removed meters must be promptly sent to the gas meter shop for testing and corrective action."</p> <p>7. E.: Added "The corrective maintenance activity or meter exchange should be scheduled if it cannot be accomplished during the initial site visit."</p>		
<p>METR 2.20</p>	<p style="text-align: center;">Meter Header Inspection</p> <p>2.: Inspection/Maintenance When A Meter Set is Not Disassembled</p> <p>2. A.(9): Corrected reference to images of banded regulators which should have been "Item 5" not "4".</p> <p>2. A. (10): Corrected reference to images of substandard regulators which should have been "Item 6" not "5". Corrected typo "or" should have been "of".</p> <p>3.: Inspection/Maintenance When A Meter Is Installed/Changed or Set is Disassembled</p> <p>3. A.(8): Corrected reference to images of banded regulators which should have been "Item 5" not "4".</p> <p>3. 	In the Material List table, the lateral support "uni-strut bracing of equivalent" is listed as a non-stock item.		
METR 3.26	<p>Revision to formerly METR 3.24 5M/7M Meter 5 & 10 PSIG Delivery Pressure. Added 10 PSIG to the Standard</p> <p>In the drawing, delete item designation for the lateral support bracket at the top of the meter loop.</p> <p>In the installation instructions:</p> <p>Added reference METR 3.06 for regulator sizing for 10 psig delivery. Added the MEP for both the 5 and 10 psig delivery pressure.</p> <p>Deleted reference to an electronic corrector required at elevated metering pressure where pressure factor billing is not permitted.</p> <p>Added "8. The relief valve stack should be locked in the Open position."</p> <p>Added "11. Uni-strut bracing or equivalent should be installed on the top of the meter loop (as shown) when conditions warrant additional lateral support for the meter set."</p> <p>In the Material List table, the lateral support "uni-strut bracing of equivalent" is listed as a non-stock item.</p>	January 1, 2013	April 1, 2013
PMRK 3.02	<p>Carsonite Pipeline Markers:</p> <p>Deleting the Single Sided Markers. All markers will be Double Sided and will be 62 and 78 inches long.</p>	April 1, 2012	April 1, 2013
POLY 0	<p>POLY 2.05 3. Electrofusion Couplings and Elbows</p> <p>POLY 3.02 6. Elbows - 90°</p>	January 1, 2013	April 1, 2013
POLY 1	<p>2. D.: Shelf life of PE pipe is 2 years even if it is stored inside or protected from ultraviolet radiation. "The shelf life of PE2406/PE2708 or PE3408/PE4710 shall not exceed 2 years from the manufactured dated stamped on the pipe".</p> <p>8. B.(3): Revised the mechanical weak link language to indicate the Condux break-away swivel is one of the commercially available weak links. The Condux swivel is now included in the Specialized Tools and Equipment site under Gas Operations and Services website on Scholar.</p>	January 1, 2013	April 1, 2013
POLY 2.01	<p>2. B.: Corrected the SDR rating for the 1" CTS PE3408/4710 pipe to 11.4 from 11.5</p>	July 1, 2012	April 1, 2013
POLY 2.05	<p>Electrofusion</p> <p>3. Electrofusion Couplings and Elbows: Added Elbows since they have basically the same electrofusion procedures as couplings.</p> <p>3. A.(6)(a): Added elbow in the preparation instruction. Added instructions on how to mark the area to be scrapped for installation of an elbow. "The elbow has a "knit" line, raised thin line on the outer diameter and indicates insertion depth of the pipe. The knit line should be placed adjacent to the end of the pipe and used as a guide in marking the pipe." Added a picture of an elbow showing the knit line. Added a picture of elbow.</p>	August 1, 2011	April 1, 2013

	<p>3. A. (8): Added "elbow" in the procedures for wiping the scrap area with 96% alcohol solution.</p> <p>3. A. (9): Added "elbow" in the procedures in case the coupling or elbow becomes contaminated prior to installation.</p> <p>3. B.(1)(a): Added "elbow" in the joint assembly instructions for remarking insertion depth. Added instructions on how to mark the area to be scrapped for installation of an elbow. "The elbow has a "knit" line, raised thin line on the outer diameter and indicates insertion depth of the pipe. The knit line should be placed adjacent to the end of the pipe and used as a guide in marking the pipe."</p> <p>3. B.(2), (3), (4), & (5): Added "elbow" in the installation on the pipe instructions.</p> <p>3. B.(5): Added clarification that the maximum gap shown in table is for the coupling.</p> <p style="padding-left: 40px;">3. B.(6): Added a picture of a clamped elbow</p> <p>3. C.: Added "elbow" in the fusion instructions.</p>		
<p>POLY 3.02</p>	<p style="text-align: center;">Electrofusion Fittings:</p> <p>1.: Tapping Tee Kits: Deleted the Friatec and Innogaz stock code columns and renamed the Central Plastics column to "Stock Code". Added Stock Code for the 8 IPS x 1/2"CTS and 8 IPS x 1"CTS tapping tees.</p> <p>2.: High Volume Tapping Tees: Deleted the Friatec and Innogaz stock code columns and renamed the Central Plastics column to "Stock Code". Added 2" thru 6" x 1-1/4" tapping tees. Corrected stock code for the 8"x 2".</p> <p>3.: Couplings: Deleted the Friatec and Innogaz stock code columns and renamed the Central Plastics column to "Stock Code"</p> <p>4.: Reducer Couplings: Deleted the Friatec and Innogaz stock code columns and renamed the Central Plastics column to "Stock Code". Corrected stock codes for the 1-1/4" x 1" CTS and 2" x 1-1/4"IPS.</p> <p>5.: End Caps: Deleted the Friatec and Innogaz stock code columns and renamed the Central Plastics column to "Stock Code". Added 3" thru 8" electrofusion caps.</p> <p style="padding-left: 40px;">6.: Added Elbow - 90°: 2"</p>	<p>April 1, 2012</p>	<p>April 1, 2013</p>
<p>PTST 0</p>	<p style="text-align: center;">Added PTST 4 Forms and Reference Materials Form 1 - Gas Leak and Strength Test Stamps</p>	<p>January 1, 2013</p>	<p>April 1, 2013</p>
<p>PTST 1</p>	<p>1. F.: Added an exception for not pressure testing against a closed valve. "This does not apply to testing against a closed service meter valve as long as test pressure does not exceed 1.1 times pressure rating of valve."</p> <p style="text-align: center;">3. Test Recording Methods</p> <p>3. A.: Revised by deleting the "Calibrated Test" from gauges that are used to record tests that verify MAOP. Clarified that gauges used to verify facilities' MAOP should have a minimum accuracy of ±0.5% full scale, with test duration less than 8 hours. Added that test gauges and calibrating test gauges also have this minimum accuracy.</p> <p>3. B.: Added "Process gauges used to perform a leak and/or strength test should be verified for accuracy (± 0.5%) at mid-scale annually during the first (1st) quarter of the year. New process gauges placed into</p>	<p>January 1, 2013</p>	<p>April 1, 2013</p>

	<p>service do not need to be verified for accuracy until the next first (1st) quarter. A test gauge or calibrating test gauge should be used to verify accuracy of a process gauge.</p> <p>3. C.: Changed "should" to "shall" which requires pressure recording charts on any leak and/or strength test, which verifies the facilities' MAOP, with test duration of 8 hours or longer.</p> <p>3. Table: Added a table listing stock codes for those process gauges that have a minimum of $\pm 0.5\%$ full scale as specified by the manufacturer. Currently, there are two models of Ashcroft gauges stock coded that are essentially the same with the exception of the case material. The Aluminum case model will no longer be purchased but can continue to be used.</p> <p>9. Test Record</p> <p>9. A. (1): Added a copy of the Gas Leak Test Stamp and Gas Strength Test Stamp that is currently placed on plans designed at the Distribution Design Centers and Gas Operations and Services - Engineering.</p> <p>9. A. (2): Added copies of the stamps are in PTST 4 and a copy can be attached to construction or maintenance plans that are pre-stamped.</p>		
PTST 2.01	<p>Leak Test</p> <p>5. Leak Test Records</p> <p>5. C.: Revised to "Gauges can be used for test duration less than 8 hours. See PTST 1". Deleted "record test gauge ID or serial number on the test record".</p>	January 1, 2013	April 1, 2013
PTST 2.02	<p>Strength Test</p> <p>4. Strength Test Records</p> <p>4. C.: Revised to "Gauges can be used for test duration less than 8 hours. See PTST 1". Deleted "record test gauge ID or serial number on the test record".</p>	January 1, 2013	April 1, 2013
PTST 4	<p>NEW: Added:</p> <p>Form 1 - Gas Leak and Strength Test Stamps</p>	N/A	April 1, 2013
REGS 0	<p>Missed deleting the DWG files listed in REGS 4. These files were deleted in REGS 4 in the January 1, 2013 O&M update.</p>	January 1, 2011	April 1, 2013
SECR 2.02	<p>Critical Gas Facility Security Measures</p> <p>Through-out SECR 2.02 the term Manager of the targeted area(s) is used. Ameren has replaced the Manager title with Director. Therefore, the term Division Director of the targeted area(s).</p> <p>2: T. & U. sequencing was corrected. January 1 version had these as 2. L & M. located after 2. S.</p> <p>4. C.(4): Deleted a duplicate statement</p> <p>4. E.: Deleted a duplicate sentence</p> <p>4. J.: Corrected "along" to "alone"; "Minimize the time that an employee is required to work alone at a Critical Gas Facility"</p>	January 1, 2013	April 1, 2013

SERV 0	Deleted SERV 3.08 Farm Tap, Double Cut, 741 - 1000 psig inlet pressure.	October 1, 2011	April 1, 2013
SERV 1	2. A.: Corrected Stock Code for Safety Barrier Tape - 16 06 958. 3. C.: Revised to indicate service lines 2 inch and larger should be backfilled in same manner as a gas main.	January 1, 2013	April 1, 2013
SERV 2.02	Excess Flow Valves 3. EFV Sizing 3. E.: 3/4" Steel EFV's: Maximum Flow values have been reduced by 20%. The initial values shown in the table were determined to be trip flow rates. Manufacturer recommended setting maximum flow values 20% below the trip flow rate. The sizing table was expanded to inlet pressures up to 1000 psig since the double-cut farm tap design goes up to 1000 psig.	January 1, 2013	April 1, 2013
SERV 2.03	Farm Tap Installations 2. B. (2): There is only one standard for a double cut farm tap. Former SERV 3.08 drawing and material list was moved to SERV 3.07. 2. D.: Inserted a new item. "For a double step farm tap, the standard outlet set point of the first cut regulator is 100 psig. The 1805 relief will be set at 120 psig." 2. E.: Changed double-step to double-cut. 4. Testing 4. B.: Changed double-step to double-cut. 5. Inlet Valves 5. A.: Changed double-step to double-cut. 5. B.: Inserted model number of the weld Mueller Valve , H-17900, that can be installed in the service line to a farm tap. 5. D.: Inserted model numbers of Mueller Valves, H-17656 valve tee or H-17800 curb valve tee, that should be used in lieu of a punch tee if the wall thickness of the main is greater than 0.281 inches. Added a reference to TAP 2.05 which provide maximum wall thickness for a punch tee. 7. Farm Tap Capacity Tables 7. B.: Changed 2nd step to 2nd cut and double-step to double-cut 7. C.: Changed 1st step to 1st cut.	January 1, 2013	April 1, 2013
SERV 2.06	Gas Service Transaction Card Revision to Form/Card; Replaced HSR with 1813C regulator 5. Completion Instructions 5. B.(b)(26): Revised language to "Updates to the Service Transaction card may change the service regulator. If service regulator is listed, check the box. If the model is not listed on the card, the box next to the blank line should be checked and the manufacturer model number written in on the blank line.	October 1, 2011	April 1, 2013

CHANGE SUMMARY

January 1, 2013

Change Summary January 1, 2013

Docu- ment	Change Summary	Previous Docu- ment Dated	Current Docu- ment Dat- ed
ABND 0	<p>ABND 2.01 4. Added Verification of Mains or Service Status</p> <p>ABND 2.01 5. Added Records</p> <p>New: ABND 4 Reference 01 Continental Abandonment Kit Instructions</p>	October 1, 2011	Janu- ary 1, 2013
ABND 2.01	<p>Abandonment of Gas Facilities has been totally re-vised and should be reviewed with all gas personnel. The ICC requested an expansion of the abandonment procedures. This section has been divided into five sections: Mains, Services, Inside Meter, Verification of Main or Service Status, and Records.</p> <p>Main was divided into General abandonment proce-dures and then specific procedures for PE Mains, Steel Mains, and Regulator Stations.</p> <p>Service was divided into General abandonment pro-cedures and then specific procedures for PE Services from PE Mains, PE Services Lines with Compression Outlet Tees, Steel Service Lines, and Farm Taps.</p> <p>Inside Meter section contains procedures for aban-doning service lines entering a structure below and above grade.</p> <p>Verification of Main or Service Status has procedures for determining if a main or service line is active, dead, or inserted. This section was added at the re-quest of the ICC.</p> <p>Records is a new section that contains the mapping of service stubs 18 inches or longer that was original-ly under the Services section. Documenting abandon-ment of a Main has been added. Service abandon-ment is recorded on Service Record Cards or Service Transaction Form. Abandonment record will docu-ment leak testing of the cap installed on the remain-ing pressurized main or service line. Reference to the Buried Pipe Examination Form was added. A new screen print of a mapped service stub has been added that is easier to read.</p>	January 1, 2011	Janu- ary 1, 2013
ABND 4	<p>New: Added Reference 01 - Continental Abandonment Kit Instructions</p>		Janu- ary 1, 2013

ACIG 1	<p>2.: Sources of Ignition</p> <p>2. B.(1): Added flashlights to the list of items that are to intrinsically safe so they are not a potential source of ignition. Added reference to the Special Tools and Equipment site in the Gas Operations and Services home page in Scholar for approved intrinsically safe lighting equipment.</p>	October 1, 2011	Janu- ary 1, 2013
ACIG 2.01	<p>Work Area Protection</p> <p>2: Tools and Equipment</p> <p>2. A.: Added flashlights to the list of items that are to intrinsically safe so they are not a potential source of ignition. Added reference to the Special Tools and Equipment site in the Gas Operations and Services home page in Scholar for approved intrinsically safe lighting equipment.</p>	October 1, 2011	Janu- ary 1, 2013
BORE 1	<p>1. C.: Deleted the sentence: "Boring is the most efficient and effective way to install gas pipeline under highways, streets. Driveways, parking lots, railroads, streams or ditches, landscaping, well manicured lawns, and other surface obstacles." Was not relevant to procedures.</p>	January 1, 2011	Janu- ary 1, 2013
BORE 2.04	<p>Boring Across or Near Sewer Lines;</p> <p>1. C.: Replaced " gas main" with "gas line"</p> <p>2. D.: In Pre-Construction Steps added "high risk sewer laterals" to items to visually check for at the jobsite</p> <p>2. E.: Removed "Regardless of which step is taken, the only way to verify location and depth of sewer main or lateral is by physically exposing the line."</p> <p>Incorporated the original 2. F. into 2. E.</p> <p>2. E. (5): Added reference to "BORE 2.05" for assistance in identifying high risk sewer laterals.</p> <p>2. E. (6): New item added "The use of camera inspection for high risk sewer laterals is required unless sewer lateral is located and exposed prior to construction."</p> <p>2. G.(2): Replaced "affected sewer lines" with "high risk sewer lines".</p> <p>3. Camera Inspection of High Risk Sewer Laterals is a new section that has been inserted. A. Camera inspection of sewer lines applies to new construction and replacement projects.</p>	April 1, 2012	Janu- ary 1, 2013

B. High risk sewer lateral is defined as a sewer lateral that is within two (2) feet of the proposed gas facility.

C. High risk sewer laterals that are not located and exposed prior to construction shall be inspected by camera pre and/or post installation of the gas facility.

D. Examples of high risk sewer laterals are shown in BORE 2.05.

4. Construction Steps 4. B.: Deleted "Utilities that may conflict with the proposed drill path shall be exposed." Was covered in 4.C.

4. H.: Changed "are conducted" to "were conducted" in the section regarding hanging door tag.

4. J. New item "The use of camera inspection for high risk sewer lateral is required unless sewer lateral is located and exposed prior to construction."

7. Informational Letter has been updated

8. A.: Word corrections "residents"

8. B.: Added "instructed" - "Resident is instructed to call Ameren Illinois"

BORE
2.05

Typical Sewer Installations

Identified for each typical installation which ones are considered "high risk" and would be candidate for camera inspection.

Those considered high risk are:

Typical 2. Elevated Lot - Outside Cleanout

Typical 3. Original Sewer Abandoned - New Sewer Connected into Old Sewer at Curb

Typical 4. Very Elevated Lot

Typical 5. Home with Basement - Sewer Lift Pump Required

Typical 6. Elevated Lot - Rear Walkout- Sewer Exits Through Sidewall

Typical 8. Level Lot - Home on Slab- Outside Cleanout

Requirements

January 1, 2012

January 1, 2013

1. A.: Updated group name: Illinois Construction Services - Construction Supervisor. This the group that oversees all of the gas contractors in Illinois.
2. A.: Revised wording on when Gas Control should be contacted when Ameren crews are performing work. "When construction activity could potential affect the normal operating parameters of a gas system or facility monitored remotely by SCADA or ERX....."
2. A. (1) thru (7): Added a list of example construction activities that could have a potential for affecting normal operating parameters. (1) Installing control fittings and shutting-off gas flow to a section(s) of main.
- (2) Connecting two mains that could be operating at two different pressures.
- (3) Isolate or temporarily by-passing a pressure control station/gas system(s).
- (4) Activating a new, rebuilt, or relocated pressure control station.
- (5) Uprating a system or sections of a system.
- (6) Repairing a gas main that involves lowering the operating pressure during the repair process.
- (7) Activating a significant extension to an existing system. Gas Engineer or Gas Engineering will determine what is a significant extension. 3. A.: Revised wording on when Gas Control should be contacted when Contract crews are performing work. "When construction activity could potential affect the normal operating parameters of a gas system or facility monitored remotely by SCADA or ERX....."
3. A. (1) thru (7): Added a list of example construction activities that could have a potential for affecting normal operating parameters. (1) Installing control fittings and shutting-off gas flow to a section(s) of main.
- (2) Connecting two mains that could be operating at two different pressures.
- (3) Isolate or temporarily by-passing a pressure control station/gas system(s).
- (4) Activating a new, rebuilt, or relocated pressure control station.

- (5) Upgrading a system or sections of a system.
 - (6) Repairing a gas main that involves lowering the operating pressure during the repair process.
 - (7) Activating a significant extension to an existing system.
- Gas Engineer or Gas Engineering will determine what is a significant extension

3. Replaced Construction Supervisor with Illinois Construction Services - Construction Supervisor throughout the section.

3. D. thru F: These requirements were added since they not only applied to work performed by Ameren crews but also to Contract crew. D. Gas Supervisors or Illinois Construction Services - Construction Supervisor must ensure that gas field personnel are qualified to perform construction activities in accordance with the O&M Plan.

E. Gas Supervisors or Illinois Construction Services - Construction Supervisor/Construction Inspector shall physically verify that gas construction activities meet the requirements of the O&M Plan through observation of gas construction activities in the field.

F. Immediate corrective action will be taken by the Gas Supervisor or Illinois Construction Services - Construction Supervisor/Construction Inspector if any gas construction activities are found to be out of compliance with the O&M Plan.

4. A.: Minor grammatical revision by adding (s) to contractor and construction site to indicate there could be more than one.

5. A.: Modified some of the Major areas of focus associated with contractor oversight.

5. A. (3): Specifies purging of main

5. A. (4): Specifies pigging of main

5. A. (6): Specifies steel coating inspection by jeeeping as a Major activity.

5. A. (7): Added Liquid epoxy coating application as a Major activity.

5. A. (8): Clarification that inspector should be present when the initial welding and/or plastic fusion commences. Then inspector should periodically check on the welding and/or plastic fusion processes to ensure they are being correctly performed.

5. A. (9): Added "ensuring proper depth of cover" when inspecting backfilling.

5. B. & C: Added "Periodically" to indicate the inspector should perform and document a quality assurance inspection when major activity is being performed.

UNCONTROLLED IF PRINTED

The completed QA inspection form is then submitted to the Superintendent Quality Assurance.

9. Operations and Maintenance Projects

New section added to address small projects that could be scattered out such as tapping/stopping, lowering of main, installation of regulator or odorizer station, leak repair, service cut-offs, service riser replacements.

CONS 2.01	<p>Construction Inspector Responsibilities</p> <p>4.: Existing Facilities:</p> <p>4. B.: Added "JULIE 811" to replace "appropriate" for the one call system.</p> <p>6. Safety:</p> <p>6. A.: Replaced "all Ameren Illinois Safety rules" with "Ameren Illinois O&M Plan."</p> <p>6. B.: Inserted "when required" for the use of barricades, warning signals, and flagmen. Added reference to the IDOT Traffic Control Standards that are attached to highway permits.</p> <p>7.: Daily Routine and Check Points for Contractors</p> <p>7. A.: Replaced "standards" with "O&M Procedures". Inspector is ensure contractor is performing work in accordance with the Ameren Illinois O&M Plan.</p> <p>8.: Records</p> <p>8. A.: Revised the location of anodes, test lead wire boxes, insulators, valves, and other appurtenances installed during construction are recorded "accurately on the As Built construction drawings. Measurements are required so these facilities can be recorded in the electronic mapping system."</p> <p>8. I.: Added "pressure tests" to the list of records that are submitted to the Gas Supervisor and/or Gas Operations & Services - Engineering.</p>	October 1, 2011	January 1, 2013
CORR 0	<p>CORR 2.11 3M Scotchkote Hot Melt Patch Compound has been deleted</p> <p>CORR 2.29 Moved the Remedial Action and Corrosion Tracking in GCS into Reference document.</p> <p>New CORR 3.16 : AC Stray Current Test Station</p> <p>CORR 4 added Reference 13 - Corrosion Tracking in DOJM and GCS</p>	July 1, 2012	January 1, 2013

CORR 1	<p>Requirements</p> <p>6.: Internal Corrosion</p> <p>6. E.: Added "See Gas Storage O&M of Internal Corrosion Monitoring procedures in the gas storage fields."</p> <p>7.: Cathodic Protection Monitoring</p> <p>7. B.: In Isolated Service Lines deleted "pressure systems". Isolated service line sampling is based on 10% isolated services in a community.</p> <p>7. B. Tables: Replaced "Systems" with "Community"</p> <p>7. C.: In Isolated Mains Less than 100' deleted "pressure system". Isolated main less than 100' sampling is based on 10% isolated mains in a community.</p> <p>7. D.: In Isolated Fittings deleted "pressure system". Isolated fittings sampling is based on 10% of isolated fittings in a community.</p> <p>12. D. (3): Replaced "approved cold applied tape" with "approved coating" for repairing disbonded coating.</p>	October 1, 2011	January 1, 2013
CORR 2.01	<p>Cathodic Protection Design</p> <p>3.: Electric Isolation 3. A.(3): Added new item: "OVP lightning arrestor (stock code 49 22 423) installation can be considered where lightning and voltage surges are anticipated. See CORR 2.25" 3. A.(4): Added new item: "OVP lightning arrestors should be used across insulation points inside buildings where a combustible atmosphere is anticipated."</p> <p>4.: Insulating Points</p> <p>4. D.(5): New item in the bonding procedure was added: "Extending New Plastic from End of Existing Steel" drawing shows test lead off of steel and tracer wire with Plastic tied into test station. Indicates location of anodes.</p> <p>4. D.(6): New item in the bonding procedures was added: "New Plastic Installed Between Two Sections of Existing Steel". Drawing shows test leads and tracer wire connection at test station and location of anodes to be installed. Contains a note that the use of plastic between two sections of steel should be reviewed by engineering and corrosion control personnel. Consideration should be given to using steel pipe.</p> <p>4. D.(7): New item in the bonding procedures was added: "Relocating Existing Steel with Plastic". Drawing shows test leads and tracer wire connection at</p>	January 1, 2011	January 1, 2013

test station and location of anodes to be installed. Contains a note that the use of plastic between two sections of steel should be reviewed by engineering and corrosion control personnel. Consideration should be given to using steel pipe.

CORR 2.03	<p>Coatings</p> <p>1. A. (2)(a): Clarified the initial layer of FBE coating is approximately 14 mils and the second layer of abrasive resistant over coating is approximately 15 to 20 mils thick.</p> <p>1. A. (2)(a): Added "approved moisture cured wrap" as an alternative to sacrificial hot wrap for covering liquid epoxy coating on girth welds. Corrosion control group will be evaluating moisture cured wraps in 2013.</p> <p>1. A. (2)(b): Added to the pipe coating requirement for distribution pipe 2" and larger being installed by directional boring. "Dual coating would be the same as transmission and high pressure distribution pipe." Added "approved moisture cured wrap" as an alternative to sacrificial hot wrap for covering liquid epoxy coating on girth welds.</p> <p>1. A.(2)(c): Added "approved moisture cured wrap" as an alternative to sacrificial hot wrap for covering liquid epoxy coating on girth welds.</p> <p>1. C.: Eliminated the use of epoxy melt stick for coating repair.</p> <p>1. F. (1): Clarified when repairing disbonded coating on a service riser the wrap should extend to the bottom of the meter valve.</p> <p>1. F.(2) New item added: "Non-wax based cold applied tapes shall be used on risers for new construction where significant settling of adjacent soil is expected."</p> <p>4.: Removed 3M Hot melt patch sticks from Approved Field Applied Epoxy Coating.</p> <p>5. Approved Cold Applied Wax Tapes</p> <p>5. D.: Denso Color Tape products are being replaced with Tapecoat TC Color Coat wax tape products. The current supply of Denso Color Tape products are approved for continued use until supply is depleted.</p>	July 1, 2012	January 1, 2013
CORR 2.04	<p>2. A.: Added "Do not use torch to dry primer." Clarification that primer should be allowed to dry naturally prior to applying hot wrap. Torch can be used to dry or heat the pipe prior to applying the primer but not after primer has been applied.</p>	February 1, 2010	January 1, 2013

CORR 2.05	2. B. Added "Allow primer to dry naturally, do not use a torch to dry primer." Clarification that primer should be allowed to dry naturally prior to applying Tapecoat 20. Torch can be used to dry or heat the pipe prior to applying the primer but not after primer has been applied.	January 1, 2011	January 1, 2013
CORR 2.09	<p>Protal 7200:</p> <p>2. A. thru C.: Replaced "MBX Bristle Blaster" with generic "metal blasting tool".</p> <p>2. C. (1): Added "Ensure air is moisture and oil free." when using a grit blaster to clean metal for Protal 7200.</p> <p>2. F (4): Deleted specifying Denso brand for the foam pad trowels.</p> <p>2. I (1): Deleted the use of hot melt epoxy patch sticks for repair of Protal 7200 coating. Protal 7200 is to be used to repair coating.</p>	April 1, 2012	January 1, 2013
CORR 2.10	<p>Protal 7125:</p> <p>2. A. thru C.: Replaced "MBX Bristle Blaster" with generic "metal blasting tool".</p> <p>2. C. (1): Added "Ensure air is moisture and oil free." when using a grit blaster to clean metal for Protal 7125.</p> <p>2. F.(4): Deleted specifying Denso brand for the foam pad trowels.</p> <p>2. I.(1): Deleted the use of hot melt epoxy patch sticks for repair of Protal 7125 coating. Protal 7125 is to be used to repair coating.</p>	January 1, 2011	January 1, 2013
CORR 2.11	Deleted 3M Scotchkote Hot Melt Patch Compound 226P as an approved coating repair product. CORR 2.11 is being left blank for the time being.	April 1, 2012	January 1, 2013
CORR 2.13	<p>Trenton No 2A Wax Tape</p> <p>2.: Application</p> <p>2. C. and D.: Deleted specifying "Glas-Wrap" brand for the mesh outer wrap. There are other mesh wraps available</p>	July 1, 2012	January 1, 2013
CORR 2.15	<p>Coating Inspection</p> <p>2. B.: Revised the Expected Average Thickness and the Test Voltage for the FBE Coating with Abrasive Resistant Layer (dual coated pipe).</p> <p>6.: Coating Repairs</p>	April 1, 2012	January 1, 2013

	6. B.: Deleted reference to defects larger than 1/16". All coating defects can be repaired in the same manner.		
CORR 2.16	Measuring Cathodic Protection Potentials 4. B.: Added Note with Ameren Stock Code for replacement Porous Plug 4. B.(6)(e); Added stock codes for replacement Copper Sulfate Crystals and Anti-freeze for the Copper Sulfate Reference Electrode.	January 1, 2011	January 1, 2013
CORR 2.29	Records 1.: New, added a General section CORR 2.29 has been substantially reduced in size by moving the OAS and GCS instructions into a reference document that is now in the Forms and Reference Materials section 4.: Other Cathodic Protection Record Activities 4. A.(1): Added a reference to CORR 2.30 which is the Buried Pipe Examination Form instructions. 4. A.(5): Added the mailing address for Gas Operations and Services - Pipeline Integrity group.	July 1, 2012	January 1, 2013
CORR 2.30	6.: Updated the Flow Chart for Processing Buried Pipe Examination Form	April 1, 2012	January 1, 2013
CORR 2.31	5.: Updated the Flowchart Buried Pipe Examination - Corrosion and Steel Damage Evaluation	October 1, 2011	January 1, 2013
CORR 3.16	New standard for AC Stray Current Test Station		January 1, 2013
CORR 4	Added Reference 13 - Corrosion Tracking in DOJM and GCS	October 1, 2011	January 1, 2013
DAMG 1	Requirements 5. Damage Prevention Notification to Excavators and General Public: 5. A.: Added "Maintenance of lists and coordinating notifications is handled jointly by Damage Prevention and Public Awareness groups." 5. B. Added "Agricultural Field Tile Contractors" to firms that will receive annual notification.	April 1, 2012	January 1, 2013

5. C.: Public Awareness information has been added with regards to Damage Prevention Notification to Excavators and the General Public: "Ameren Illinois will maintain a list of known excavators and field tiling contractors that could operate within Ameren Illinois territory. The list will be developed from various sources including state contractor licensing boards, local associations, JULIE, and Ameren Illinois operating areas. The list will be reviewed and updated annually"

5. D.: "Ameren Illinois will distribute the notification annually to the known excavators and field tiling contractors that are on the list."

5. E.: "Ameren Illinois developed an Excavator Handbook and Farming Brochure that will be distributed to excavators and field tiling contractors."

6. C.: Added if blasting activity is within 100 feet of a gas facility the inspection must include a leak survey.

EMER 0	<p>Added EMER 2.04 1. General</p> <p>Revised EMER 2.04 7. to Explosion and/or Fire Near Gas Pipeline Facilities</p> <p>EMER 4: Added Form 03 - Ameren Shipping Paper for CNG to the forms section</p>	July 1, 2012	January 1, 2013
EMER 2.04	<p>Gas Field Personnel</p> <p>1.: Added a General section</p> <p>2. Inside Odor Complaint - Hazardous Condition</p> <p>2. A.: Grammatical revisions: "Evacuate the structure, ask occupants to leave the structure immediately."</p> <p>2. C.: Clarified "safe distance away from the structure" when instructing occupants to vacate a structure. 2. D.: Combined former 1. E. (1) thru (4) into one sentence "Contact Ameren Illinois Dispatcher and/or Gas Supervisor - request additional assistance and request they contact proper authorities such as Fire Department, Police Department, electric and other affected utilities, etc.</p> <p>2. J.: Revised to: "Ventilate the structure only after external sources have been disconnected." Eliminated instruction to open doors.</p> <p>2. L. (1): Revised if gas is found when bar testing or leak surveying surrounding mains and services, a complete leak investigation as outlined in LEAK 2.02 is to be performed.</p>	October 1, 2011	January 1, 2013

2. L. (2): Grammatical change, replaced "Proceed to" with "see EMER 2.04 4."

3. Outside Odor Complaint - Hazardous Condition

3.: Revised: "When gas is detected outside of the structure, a reading of 30% LEL (1.5% gas in air) or greater in the open atmosphere where gas could enter a structure or ignition sources are in close proximity is considered a hazardous condition."

3. A.: Grammatical revision: "Evacuate the affected area."

3. B.: Inserted new: "Continue to monitor gas concentration with the CGI." (ICC)

3. C.: Clarified "Make sure no vehicular equipment is operated within the affected area." 3. D.: Combined former 1. C. (1) thru (4) into one sentence "Contact Ameren Illinois Dispatcher and/or Gas Supervisor - request additional assistance and request they contact proper authorities such as Fire Department, Police Department, electric and other affected utilities, etc."

3. G.: Grammatical change, replaced "Proceed to" with "see EMER 2.04 4."

3. H.(1): Grammatical change "structure(s)'

3. I.: Added new item on use of non-emergency valves: "If a non-emergency valve is used to control gas during an emergency situation, the valve will be designated as an Emergency Valve after the emergency situation has been resolved. See VALV 2.01"

3. I.(4): Added as a means of isolating a section of main: "Construct a by-pass around damaged area and isolate damaged section."

4. Major Leaks or Line Breaks

4. B.: Combined former 3. B. (1), (2), (5), (6) into one sentence "Contact Ameren Illinois Dispatcher and/or Gas Supervisor - request additional assistance and request they contact proper authorities such as Fire Department, Police Department, electric and other affected utilities, etc."

4. F.: Added new item on use of non-emergency valves: "If a non-emergency valve is used to control gas during an emergency situation, the valve will be designated as an Emergency Valve after the emergency situation has been resolved. See VALV 2.01"

5. Gas in a Sewer - Hazardous Condition

5. B.: Combined former 4. B. (1) thru (4) into one sentence "Contact Ameren Illinois Dispatcher and/or Gas Supervisor - request additional assistance and request they contact proper authorities such as Fire Department, Police Department, electric and other affected utilities, etc."

5. D. (1): Eliminated repeating instructions to be given when evacuating a structure by referencing procedures in EMER 2.04 1. above.

5. G.: Added new item on use of non-emergency valves: "If a non-emergency valve is used to control gas during an emergency situation, the valve will be designated as an Emergency Valve after the emergency situation has been resolved. See VALV 2.01"

5. H.: Word changes so it reads: "Once the gas supply has been shut off, ventilate the structure after external ignition sources have been disconnected."

6. Fire, Ignition, or Explosion - Gas Related

6.: Revised wording to: When responding to a gas related fire, ignition or explosion our first priorities is are public safety and employee safety. The following steps will outline the appropriate actions.

6. B.: Combined former 5. B. (1), (2), (5), (6), (7) into one sentence "Contact Ameren Illinois Dispatcher and/or Gas Supervisor - request additional assistance and request they contact proper authorities such as Fire Department, Police Department, Ambulance, electric and other affected utilities, etc."

6. C.: Inserted new: Gas Supervisor shall notify the Gas Superintendent with a brief explanation of the situation and the types of gas facilities that may be affected.

6. D. (2): Replaced with: "If Fire Department has shut-off valve, if possible, visually verify the valve is off."

Former 5. D. (3): Removed " If cause of fire has not been determined or there is a possibility that gas is involve". Now states "Advise the Fire Chief or fireman in charge that a gas investigation will be required. See INVVE 2.02"

Former 5. G: Deleted " Assist Fire Department or responding emergency agency in providing minor first aid care to those injured, if requested"

Former 5. H.: Deleted "If Fire or Police personnel have not arrived, investigate if there are any missing persons associated with the situation."

Former 5. J.: Deleted "Gas Supervisor should make arrangements to pick-up copy of the Fire Report as soon as it is available. If situation required an Incident

UNCONTROLLED IF PRINTED

Investigation, Fire Report, if available, should be part of the documentation

7. Explosion and/or Fire Near Gas Pipeline Facilities

7. A.: Moved "explosion" ahead of "fire".

7. B.(1) & (2): Moved "explosion" ahead of "fire".

7.C.: Revised wording to: "If following the evaluation, there is concern that gas facilities may be impacted; gas field personnel should notify a Gas Supervisor."

7. D.: Added "fireman in charge " as another individual gas field personnel could contact.

7. E.: Grammatical change: "Gas Supervisor shall notify the Gas Superintendent with a brief explanation of the situation and the types of gas facilities that may be affected."

8. Low Pressure Situation

8. A.: Inserted new:" Pressure below 4" W.C. on low pressure systems and 2 PSIG on distribution pressure systems may cause pilot outage."

8. C.(4): Deleted "and/or relief valves" since low pressure would only result if ice covered regulator vents.

8. E.: Revised the steps to be taken when low pressure situation is discovered:

(1) Identify the extent and provide a general geographical location of the low pressure area.

(2) Request additional assistance if necessary.

(3) Determine if the low pressure will create a customer outage by checking the pressures at the extremities of the system. Check for pilot outages and close the meter valve for those customers affected if the pressure drops below a safe level.

(4) Utilize maps showing critical valves and pressure control stations to assist in isolating the area.

(5) Isolate the affected area to conserve pressure in adjacent areas.

(6) Discuss the possibility of bypass operations to stabilize the distribution pressure.

(7) Discuss possible curtailments of large use customers. 8. F.: Revised wording to: "Gas Supervisor should notify Gas Control if situation and advise on any assistance that is needed or can be provided with the affected system(s)."

9. High Pressure Situation

9. D.: Revised wording to: "Gas field personnel should immediately notify Gas Supervisor if the systems pressures are above the MAOP of the system."

9. E.: Revised wording to: "Gas Supervisor should notify Gas Control if situation and advise on any assistance that is needed or can be provided with the affected system(s)."

9. F.: New item: "Gas Supervisor or Gas Operations & Services - Gas Technical Services Supervisor should ensure an operator qualified regulator personnel or technician has been notified and dispatched."

9. H.: Grammatical change: "Use valves to throttle or shut down the feed to the system until the pressure is within the normal operating range."

9. J.: Clarified that following repairs normal operating pressure should be reestablished.

10. Loss and Restoration of Services

10. F(3): Deleted "confirm the extent of outage" when contacting Gas Control.

10. f.(4): Corrected it is Gas Operations and Services - Gas Technical Services Supervisor that should be contacted when transmission or high pressure distribution facilities are involved.

10. F.(6): Added "Affected" to clarify which industrial or commercial customers Gas Supervisor should notify of a loss of service.

10. H.: The threshold for contacting the IEMA is now 500 customers if they are going to be without gas for 24 hours or longer. Reduced from 1000.

10. M.(3): Added "Ameren Security personnel" to those who could witness a forcible entry and stand-by while work is performed inside the premise.

10. M.(7): Clarified: Claim Department is (CCMI).

10. R.: Revised wording to: "Gas Supervisor should notify Gas Control if situation and advise on any assistance that is needed or can be provided with the affected system(s)."

10. S.: Replace "local media" with Ameren Illinois Communication" as ones that should be updated on the restoration progress.

10. T.(4): Inserted new item: "Customer may choose to relight their own appliance unless the 30 second leak test fails."

10. T.(5): Delete the reference to using the stove to purge customer's piping.

10. T.(6): Revised wording to: "Light the pilots on the gas utilization equipment. Place the equipment into operation. Note: During the warmer times of the year the customer may not want their pilots lit on the space heating equipment"

10. T.(8): Added: "Claims Department (CCMI) may be utilized to process HVAC invoices." when pilots will not remain lit and Supervisor has to call an HVAC dealer to correct the problem.

10. W.(1): Replace "local media" with Ameren Illinois Communication" to update when restoration is complete.

EMER 2.10	6. D.: Specified Shipping papers for CNG 6. E.: Updated sample of Shipping Paper for CNG	July 1, 2012	January 1, 2013
EMER 4	Added Form 03 - Ameren Shipping Paper for CNG	January 1, 2011	January 1, 2013
FORW	4. G.: Added Gas Technical Services group to Gas Operations and Services	July 1, 2012	January 1, 2013
<u>GLOS</u>	Added the following definitions to the Glossary: Combination Leak and Strength Test Covered Task Leak Test Manufactured Home NDT _ Nondestructive Testing NFDP - New Facility Design Pressure Qualified Welder Qualified Welding Inspector Security Threat Levels Elevated Threat Level Imminent Threat Level Sunset Provision Strength Test Tie-In Test Welding Procedure Qualification Report (WPQR) Welding Procedure Specifications (WPS)	January 1, 2012	January 1, 2013

Modified definition of Polyethylene Pipe by adding the MAOP for medium density (PE2406/2708) and high density (PE 3408/4710)

Modified definition of Test Duration by adding "duration begins after test pressure has stabilized"

Deleted the following definitions:

LEAK 2.02: New Section Headings

Inserted LEAK 2.02 3. Approaching Structure

LEAK 2.02 5. Below Grade Gas Facilities

LEAK 1	<p>Requirements</p> <p>2. D.: Inserted new item under Leak Investigations. "During a leak investigation, if a leak is detected, gas field personnel should perform a sniff test to check if odorant is readily detectable. See LEAK 2.03</p>	October 1, 2011	January 1, 2013
LEAK 2.01	<p>Indoor Leak Investigation:</p> <p>The Subject Matter Resource Team completed an intensive review of this section and has made numerous revisions. The entire section should be reviewed thoroughly with all gas field personnel.</p> <p>1. A.: Delete "is required" so sentence now reads "Ameren Illinois responds to all leak or odor complaints in a priority manner.</p> <p>1. B.: Added "and employee" so sentence now reads "The top priorities for an indoor leak investigation is to ensure public and employee safety."</p> <p>1. E.: Deleted "Any response time greater than one hour will be investigated." since it stated in LEAK 1.</p> <p>2. A.: Revised the minimum required equipment to only a Combustible Gas Indicator (CGI).</p> <p>2. D.: Revised to simply state "Confirm location".</p> <p>2. E. Moved into a new section "Approaching Structure"</p> <p>3. Inserted New section "Approaching Structure" Some items that were previously listed in "Customer Not Home" and "Customer Is Home" have been moved into this new section. 3. A.: Observe for indications of gas leakage:</p> <p>(1) Listen for the sound of escaping gas and smell for the odor of natural gas</p> <p>(2) Check the area for dead or dying grass, shrubs, or trees</p> <p>(3) Look for signs of recent construction activity that could have damaged gas facilities (4) If the meter is checked, observe test hand for rapid movement. If open fuel line is suspected shut-off meter valve. Before touching the gas meter, check meter set with volt stick.</p> <p>3. B.: Knock on the door Do Not ring the doorbell.</p>	April 1, 2012	January 1, 2013

4. Customer Is Home was moved ahead of Customer Not Home or Can't Get Into Structure.

5.: Previously 3. Customer Not Home is now 5. Customer Not Home or Can't Get Into Structure.

5. A.: Added "Check outside meter test hand for movement. If open fuel line is suspected shut-off meter valve and implement EMER 2.04."

Customer Is Home and Customer Not Home or Can't Get Into Structure sections have too many modification and revisions to list in this Change Summary. These sections should be reviewed in detail with all gas field personnel.

6. Leak on Customer Facilities: Deleted the distinction between "exposed customer facilities" and "inaccessible customer facilities" so any leak on customer facilities is now treated in the same manner.

6. A.: Indoor gas leak on customer facilities:

(1) Make simple repairs when possible

(2) If simple repair cannot be made then:

(a) Isolate the gas leak at the appliance control valve, customer owned valve, or meter set.

(b) Notify customer of the gas leak and advise customer they are responsible for making the repairs. Complete 6H screen and issue a Warning Tag. See TURN 2.11

6. B. If the gas leak is not an immediate hazard (i.e. soap bubble holds) an exception may be made due to cold weather conditions or a commercial/industrial process with the approval of the Gas Supervisor. Notify customer of the gas leak and advise customer they are responsible for making the repairs with the following option:

(1) The customer can immediately call a qualified plumbing or heating professional to make the repair and the Company will turn the leak over to them once they arrive. In the case of a commercial/industrial process that has their own in-house maintenance personnel, the Company will turn the leak over to the customer if maintenance personnel are immediately on-site.

(2) Complete the OAS 6H screen and issue Warning Tag. See TURN 2.11

7. A. In the Records section a minor clarification was added to make it clear that a Leak Investigation Form should be completed for all leaks on company facilities. The form can be completed on the MDT, 7. B.

LEAK
2.02

Outdoor Leak Investigation:

October 1,
2011

Janu-
ary 1,
2013

The Subject Matter Resource Team completed an intensive review of this section and has made numerous revisions. The entire section should be reviewed thoroughly with all gas field personnel.

1. A.: Delete "is required" so sentence now reads "Ameren Illinois responds to all leak or odor complaints in a priority manner.

1. B.: Added "and employee" so sentence now reads "The top priorities for an indoor leak investigation is to ensure public and employee safety."

1. E.: Deleted "Any response time greater than one hour will be investigated." since it stated in LEAK 1.

2. Upon Arrival:

2. A.: Minimum equipment for investigation was moved from the previous and deleted Equipment and Materials section. Minimum equipment for an investigation was reduced to an FI unit, CGI, or Gas Detection Instrument; Gas Leak Field Case Report form, and Probe or Drive Rod.

3. Inserted new section "Approaching Area" which contains a list of items to inspect the area for using the sense of sight, smell, and hearing. These were originally contained under the "Upon Arrival" section.

5. Changed title to Below Grade Gas Facilities from Subsurface Atmosphere Sampling.

5. A.: Added several more locations that should be considered when performing an investigation.

5. J.(4): Added "If you suspect migration to a structure(s), obtain additional samples inside. Refer to Hazardous Conditions section below."

7. A.(1): Under Hazardous Condition added a clarification on that implementation of the Emergency Plan may be required when there a 30% LEL or greater reading in the open atmosphere where gas could enter a structure or ignition sources are in close proximity.

7. C.: Added "If there is an indication of gas migration into a structure where gas field personnel cannot gain access, see LEAK 2.01 5. F. - Customer Not Home or Can't Get Into Structure.

8. A.(1): Added "Make simple repairs when possible" for leaks on customer owned facilities.

8. B.(1): Deleted "The Company will disconnect service until repairs are made" since it is really not an option up to the customer when there is a leak on

UNCONTROLLED IF PRINTED

their facilities. The option available to the customer is for them to have a HVAC/plumbing contractor or maintenance personnel immediately on site so Ameren gas field personnel can turn the leak over to them.

9. B.: Minor grammatical change by adding "make" - If using MDT make appropriate entries

LEAK
2.04

Leak Classification and Surveillance:

April 1, 2012

Janu-
ary 1,
2013

4. D.: In Leak Classification Criteria additional steps must be taken when a sustained reading of 2% LEL or less is obtained within 5 feet of a foundation. These additional investigation measures may include: 1) Rechecking the reading with a second CGI to verify a 0% LEL reading or 2) Physically digging up the service at the foundation and visually inspecting for a leak.

4. F. Added a new item: Any indication of a leak on relief valve facilities at a regulator station should be reported to Gas Tech Services Supervisor as soon as possible.

7. Venting a Leak has been revised for both below grade Class 1 within 5 feet of a foundation and a Class 1 found in a tunnel/sanitary sewer. Once reclassified to a Class 2, both situations daily surveillance is required and the leak must be repaired within 15 days. 7. A.: A below grade Class 1 leak where gas is detected 0 - 5 feet from a foundation may be vented as an immediate corrective action by physically digging up the gas facilities and allowing gas to vent to atmosphere. Once the readings 0 - 5 feet from the foundation are less than 2% Gas after venting:

7. A.(1): The leak may be properly reclassified to a Class 2 leak if the leak is no longer an immediate hazard nor is in imminent danger of becoming a hazard.

7. A.(2): However, the leak shall be repaired within fifteen (15) days and surveillance shall be performed each day until the leak is repaired.

7. B. A below grade Class 1 leak found in a tunnel/sanitary sewer may be vented by placing a slotted lid over the manhole and allowing gas to vent from the sewer to the atmosphere as immediate corrective action. Once the readings after venting are less than 4% gas:

7. B.(1): The leak may be properly reclassified to a Class 2 leak if the leak is no longer an immediate hazard nor is in imminent danger of becoming a hazard 7. B.(2): However, the leak shall be repaired with-

in fifteen (15) days and surveillance shall be performed each day until the leak is repaired.

10. Ameren Illinois Leak Classification Guidelines card has been revised. A new Volume category has been added: 0 to 4% LEL which applies only to Hazard Potentials; Entering Structure and 0' to 5' Foundation Wall. Volume category >2 % LEL to 4% Gas no longer applies to Hazard Potentials Entering Structure and 0' to 5' Foundation Wall.

The note on the card has been revised, "A reading of 2.0% LEL (0.10% gas) or less is considered 0% gas for leak classification/documentation purposes and is not a reportable reading if the reading is greater than 5 feet from a foundation wall.

11. C.(2)(a): Corrected Refer to 7. A.(2) to 7. C.(2).

12. A.(1): Removed "and/or leak detection fluid" from a method for performing a recheck of a repaired below grade leak. Verification of a recheck on a below grade leak can only be done with a CGI.

12. A.(3)(c): Added: Where residual gas is detected in the soil and the reading is 0 to 5 feet from a foundation wall, daily recheck shall be performed.

12. B. (1): Removed CGI, FI as a means for performing a check on above grade leak repair. Above grade leak repair can only be verified with leak detection fluid.

LEAK
2.05

Gas Leak Field Case Report:

October 1,
2011

January 1,
2013

2. B.(2): Under Volume a note has been added. Since the GLFCR cannot be modified at this time a note has been added to address the change in gas concentration for leak "Entering Structure" or "0' to 5' Foundation". The limit is now 0% LEL to 4% LEL. On the GLFCR, the >2 LEL to 4% Gas will have to be marked.

2. B.(4): Under Surveillance Data, Verification Method added "Above Grade leak can only be verified with, "Soap", leak detection fluid.

2. B.(5): Removed ", "

2. B.(7): Under Reasons for uprating added "multiple public calls" to list of reasons why a leak is being uprated.

2. C.(3)(d): Under Repair Data, Pressure Test Data for Pipe Replaced/Srv Disconnected added abandoned or retired service lines when the box should not be checked.

2. C.(5): Under P/S Reading added "Entry is no longer needed. P/S Reading is required to be entered

UNCONTROLLED IF PRINTED

on Buried Pipe Examination Form and entered in PEET.

2. C.(6): Added the word "back" to clarify that a cut service line is to be FI from the cut back to the main.

2. C.(7): Service Main External and Internal Corrosion Exam: Added "This section does not replace Buried Pipe Examination Form."

2. C.(8)(a): Minor word change "above grade piping" replaced "above ground piping" under Leak Cause - Corrosion.

2. C. 8)(d): Minor word change "above grade facilities" replaced "above ground facilities" under Leak Cause - Outside Force.

2. C.(8)(g): Added "(Incorrect Operation)" after Operations under Leak Cause. Annual DOT Report now contains "Incorrect Operations" instead of "Operations".

2. C.(12); Under Pressure added (MAOP 20% SMYS or greater) to define a Transmission gas main.

2. C.(13): Under Remarks added "Note if soap, leak detection fluid, was used to check repair for leaks ."

2. D. Leak Recheck: Minor word change "below grade leaks" replaces "below ground leaks"

LEAK 2.06	Leak Process Flow Charts Updated Below Grade Gas Leakage - Class 1 to reflect the new procedures when a Class 1 leak 0 to 5 feet from foundation or in a sewer is vented.	January 1, 2011	Janu- ary 1, 2013
LEAK 2.08	Leak Surveys - Equipment 2. G.: Inserted new item under Flame Ionization Instrument - Portable: "If FI unit is being utilized on daily basis for leak survey activity, the unit should be checked at the conclusion of the day's activity to verify the unit is still operating properly."	July 1, 2012	Janu- ary 1, 2013
LEAK 2.09	Walking Leak Survey: 1. J.(5): Added "large commercial/industrial meter sets, or extensive above grade piping facilities" that may require longer than a two second sweep when leak surveying 1. K.(2): Deleted "Regulator Station" from the list of fenced gas facilities. Leak surveying of fenced regulator station is addressed separately in the revised 1. K. (5) 1. K.(4): Removed "annual" so that leak survey of buried or above grade facilities in a fenced area may	April 1, 2012	Janu- ary 1, 2013

be performed during maintenance inspection and recorded in GCS.

1. K.(5): Replaced with language for fenced regulator stations: "Buried gas facilities an above grade facilities within a fenced area of a regulator station will be leak surveyed during the annual maintenance inspection and recorded in GCS."

LEAK 2.13	<p>Calibration of Gas Detection Instruments</p> <p>1. ODOR 1	2. A.: Minor word change: "is normally injected into" replaced "shall be added to" 2. B.: Minor item: "0.65" replaced ".65"	October 1, 2011	January 1, 2013
ODOR 2.02	Odorization Operation 2. A.: Revised to "Odorizer equipment is typically installed at the point of supplier and point of withdrawal from a storage field." versus Odorizer equipment shall be installed. 3. A.(3): In odorization equipment list removed "Fisher" from "Dosador" odorization system 3. F.: Added to sealing for threaded joints "Caution should be taken to avoid sealing compound or Teflon tape from entering the odorant stream. This will prevent wicking effect that can cause a vapor odor to occur." 4. A.(1); Revised: Gas Control will contact Gas Technical Services Supervisor or dispatch a gas technician if there is a deviation from normal that needs investigated. They will not contact area Gas Supervisor or Gas Dispatch. 4. E.: New item: "Gas Operations and Services -Technical Services Supervisor or Engineer should conduct	October 1, 2011	January 1, 2013

UNCONTROLLED IF PRINTED

an annual review of odorant injection rates on small systems where thermal expansion shows increase in volume in the summer months. This review should calculate the odorant concentration by measuring the odorant utilized and dividing by the corrected volume of gas during the period."

5. Liquid Odorant Tank to Tank Transfer is totally new section. This section provides detailed procedures when filling odorizer tank.

6. C.: Revised that if there is a large odorant spill the Gas Technical Services Supervisor and Division operations should be notified as soon as possible.

6. D.: Simplified wording to "Notify Gas Dispatch and Gas Control" when there is a large odorant spill.

6. E.: Added "Liquid odorant" to clarify type of leak.

6. F.: Added Ameren Environmental Services is the group to coordinate disposal of odorant container/ tank.

6. G.: Minor word change, "SCADA" replaced "monitoring data"

ODOR
2.03

Odorant Intensity Testing

July 1, 2012

January 1,
2013

3. H.: Added a clarification "A lower percentage indicates stronger odorant intensity in the gas." for detectable levels from 0.1% up to 0.8% gas in air.

3. I.: Added "Corrective action shall be documented in GCS." when intensity readings are outside the acceptable range.

3. K.: Replaced "him/her" with "customer"

4.: Modified section heading to "Employee Threshold Testing"

4. A. & B.: Deleted these two items that referred to annual perception testing.

5. C.(2): Clarified by adding "for each odorized system" for pre-determined specific test point locations.

8.: Modified section heading to "Record"

8. A. thru C.: Deleted these items since they referred to monthly review by supervisor. As intensity readings are recorded in GCS, those reading out of range will be flagged. This section now states "Records shall be retained in the Gas Compliance System for three (3) years.

E.: Deleted "Mercury"</p>	October 1, 2011	January 1, 2013
PRES 2.01	<p>Mechanical Chart Recorders</p> <p>2. C.(4): Replaced "System Pressure" with "Normal Operating Pressure" for information to be entered on the chart.</p> <p>2. D.: Revised wording of sentence to "The gas field personnel shall review the chart for any high, low, or erratic pressures other than the normal operating pressure for that station or system." Normal operating pressure replaced "pressures other than those defined for that station or system."</p> <p>3. B.: When reviewing recording charts, any indication of abnormally high, low, or erratic pressures must be immediately investigated. Added the word "immediately".</p> <p>4. A.: Added Pressure recorders should be checked annually for accuracy.</p>	January 1, 2011	January 1, 2013
PRES 2.02	<p>Electronic Recorders</p> <p>1.: Removed the name "Mercury" as the brand of ERX throughout PRES 2.02.</p> <p>1.: Added a statement that these procedures apply to transmission and distribution systems and not to the Gas Storage Fields.</p> <p>2. B.: Wording change, Gas Operations and Services - Technical Services personnel replaces Gas Operations and Services - Technical Services Supervisor. Gas Control contacts the GTS Technician directly when there is an alarm.</p>	October 1, 2011	January 1, 2013

2. C.: Wording change, Gas Operations and Services - Technical Services personnel replaces Gas Operations and Services - Technical Services Supervisor. The GTS Technician investigates the situation and corrects any deficiencies.

2. E.: Revised to indicate that Gas Control sends out weekly ERX reports to Gas Operations and Services - Gas Technical Services Supervisors rather than Gas Supervisors. 2. F.: New item: The weekly ERX Report will include a list of ERXs that are not communicating with the host computer. Gas Operations and Services - Gas Technical Services Supervisor will dispatch Gas Technical Services personnel to the location to determine why the unit had lost communication and if possible remedy the situation. If the situation cannot be corrected at that time, the Technical Services personnel will collect and review weekly data until the unit resumes communicating with the host.

4. A.: Under Records added Gas Operations and Services - Gas Technical Services Supervisor receives weekly ERX report from Gas Control.

PRES 2.05	<p>New: ERX Alarm Change Request</p> <p>This section provides the procedures that must be followed in order to authorize Gas Control to change any ERX alarm settings. No alarm setting, temporary or permanent, will be changed without written request and approval by Gas Technical Services Supervisor or Gas Operation and Services - Engineer. The request form should be completed and transmitted electronically.</p> <p>This section lists situation when a request form must be submitted. It also provides a list of activities that do not require a request form.</p>		January 1, 2013
PRES 4	Added Form 03 - ERX Alarm Change Request Form	January 1, 2011	January 1, 2013
PTST 0	Inserted new item PTST 1 3. Test Recording Methods	July 1, 2012	January 1, 2013
PTST 1	<p>Requirements</p> <p>1. F.: Insert new item: "Test pressures higher than normal operating pressures shall not be applied against a closed valve. Valve shall be separated from pipe segment being tested if required test pressure is above normal operating pressure.</p>	July 1, 2012	January 1, 2013

1. G.: Inserted new item: "Do not pressure test with air against a service tee, high volume tee, punch tee, valve tee, or 3-way tee that has been tapped on a pipe pressurized with natural gas.
3. Test Recording Methods - New item that specifies the acceptable method for recording pressure tests.
 - A. Pressure recording charts should be used on any leak and/or strength test, which verifies the facilities MAOP, with test duration of eight (8) hours or longer.
 - B. Pressure chart recorders shall be calibrated annually not to exceed fifteen (15) months.
 - C. Calibration of Ameren owned recorders shall be maintained in Gas Compliance System.
 - D. Contractors shall provide a copy of pressure chart recorder calibration for any project utilizing the recorder.
 - E. Calibrated Test gauges can be used on leak and/or strength test, which verifies the facilities MAOP, with test duration less than eight (8) hours. See METR 2.22
 - F. Process gauges can be used when performing strictly a leak test. Gauge should be in good condition and the needle should be zeroed prior to the subjecting the gauge to pressure
4. A.: Identified service lines two inch and larger would be tested in the same manner as main.
4. B.: Identified service lines two inch and larger would be tested in the same manner as main.
4. C.: Identified service lines two inch and larger would be tested in the same manner as main.
5. E.: Specified maximum allowable test pressure for PE pipe: PE2406/2708 has a maximum test pressure of 120 psig and PE3408/4710 has a maximum test pressure of 200 psig.
7. A.: Revised: For components attached to existing pipeline with a MAOP of 100 psig or less the minimum test pressure duration is 10 minutes.
7. B.: Revised: For components installed on system with MAOP over 100 psig the minimum pressure test duration is 10 minutes or the duration specified by Engineering based on the MAOP of the system.
9. B.: Under Test Records, the pressure recording chart will be the official record and shall be retained in the final as constructed job packet.

PTST
2.01

Leak Test

January 1,
2011

January 1,
2013

3. B.: Revised the wording: "For mains and 2 inch and larger service lines, the leak test duration shall be 5 minutes per 100 feet of pipe length per inch of nominal pipe diameter with minimum test duration as listed below for the specific pipe diameter. Test duration begins after the test pressure has stabilized." 3. C.: Insert new item to clarify the 20 hour test duration: "For pressure tests with a minimum required time longer than twenty (20) hours, consult with Gas Operations and Services - Engineering to review the proposed test based on the pipe material and size, test pressure, and the ability to break the test into smaller segments."

3. D. Table Note 2.: Clarified use of duration formula: "The following formula can be used to determine the minimum test duration for the specific pipe diameters and "L" being rounded up to the next 100 foot increment as noted above."

4.B.(3): Inserted new item under Leak Test Procedures: "If water is used follow the procedures in PTST 2.03 - Hydrostatic Pressure Testing."

4. C.: Added "and stabilized" to reinforce the test duration does not begin until the test pressure has stabilized.

4. E.: New item when pressure testing is being recorded on a chart: "If pressure test is being recorded by a chart recorder, the inspector or person responsible for the test should document, on the chart, the reason for any pressure fluctuation, such as temperature, vibration, vandalism, leak, etc, once the test duration has begun. Documentation can be attached to the chart if needed"

4. F.: Added "water" to the test medium that would have to bleed off after a leak test.

5. Leak Test Records

5. B.: Revised to "Test records shall include at a minimum the following information:"

5. B.(1) Expanded the "Description of facilities being tested" by providing a list of information that should be recorded. Description of facilities should include: Pipe size and type, length of test segment, beginning and ending location of test segment, measurements, stationing, GPS coordinates, facility identification, or other methods that will describe the location.

5. B.(3): Corrected: should be test company not test Ameren Illinois.

UNCONTROLLED IF PRINTED

5. B.(9)(a): Added "calibration date" should be recorded on the recording chart.

5. B.(9)(b): Added "Owner of pressure recording chart" is to be recorded on the chart..

5. B.(9)(c): Revised pressure recording chart is now required for required test durations of 8 hours or longer.

5. B.(9)(d): Added: "Pressure recording chart should be installed and recording at some point during the pressurization to ensure it is recording the correct pressure. A test gauge, METR 2.22, may be used to verify accuracy of the recording chart if there is question."

5. B.(9)(e): Added: "If the test segment is going to be blown down following the test record at least the initial start of the blow down to verify operation of the recorder. Document on the chart, if the test segment is not being blown down at the completion of the test"

5. B.(9)(f): Added: "Document the cause of any pressure fluctuation on the recording chart once the pressure has initially stabilized such as, temperature change, vibration due to outside forces, vandalism, leak and etc."

5. B.(9)(g): Added: "Pressure fluctuation due to temperature change that occurs during test duration should be documented with calculation verifying the fluctuation is not due to a leak. Adjust the absolute pressure at the end of the test with a multiplying factor:" A formula for calculating temperature factor is included in this section.

5. B.(9)(h): Added: Document the beginning and end of test period(s). If recording chart is recording both a leak and a strength test that have different test pressures and duration, the beginning and end of each test should be documented.

5. C.: Added: If test gauge is used to record leak test, record the test gauge ID or serial number on the test record.

5. D.: Added: Test records shall be retained in the final as constructed job packet.

PTST
2.02

Strength Test

1. A.: Revised wording: "When a separate strength test is required, it shall be performed after the leak test is successfully completed." 1. B.: Added: When strength testing a valve, valve should be in open position. If valve is left in the closed position, the test pressure should not exceed 1.1 times the valve's pressure rating.

January 1,
2011

January 1,
2013

2. A.: Added reference to PTST 2.03 - Hydrostatic Testing when water is used as test medium.
3. B.: Added reference to PTST 2.03 - Hydrostatic Testing since water is used as test medium.
4. Strength Test Records: added the same language from PTST 2.01 5. that specified what information should be recorded on pressure recording chart.
4. B.: Revised to "Test records shall include at a minimum the following information:"
4. B.(1) Expanded the "Description of facilities being tested" by providing a list of information that should be recorded. Description of facilities should include: Pipe size and type, length of test segment, beginning and ending location of test segment, measurements, stationing, GPS coordinates, facility identification, or other methods that will describe the location.
4. B.(3): Corrected: should be test company not test Ameren Illinois.
4. B.(9)(a): Added "calibration date" should be recorded on the recording chart.
4. B.(9)(b): Added "Owner of pressure recording chart" is to be recorded on the chart..
4. B.(9)(c): Revised pressure recording chart is now required for required test durations of 8 hours or longer. 4. B.(9)(d): Added: "Pressure recording chart should be installed and recording at some point during the pressurization to ensure it is recording the correct pressure. A test gauge, METR 2.22, may be used to verify accuracy of the recording chart if there is question."
4. B.(9)(e): Added: "If the test segment is going to be blown down following the test record at least the initial start of the blow down to verify operation of the recorder. Document on the chart, if the test segment is not being blown down at the completion of the test"
4. B.(9)(f): Added: "Document the cause of any pressure fluctuation on the recording chart once the pressure has initially stabilized such as, temperature change, vibration due to outside forces, vandalism, leak and etc."
4. B.(9)(g): Added: "Pressure fluctuation due to temperature change that occurs during test duration should be documented with calculation verifying the fluctuation is not due to a leak. Adjust the absolute pressure at the end of the test with a multiplying factor:" A formula for calculating temperature factor is included in this section.

4. B.(9)(h): Added: Document the beginning and end of test period(s). If recording chart is recording both a leak and a strength test that have different test pressures and duration, the beginning and end of each test should be documented.

4. C.: Added: If test gauge is used to record leak test, record the test gauge ID or serial number on the test record.

4. D.: Added: Test records shall be retained in the final as constructed job packet.

PTST 2.03	Hydrostatic Pressure Testing 2. B.: Added that copy of the Ameren Illinois EPA Water Pollution Control Permit should be part of the final job packet when hydrostatic pressure testing is performed.	July 1, 2012	January 1, 2013
PUBL 2.01	2. E.: Updated to Ameren Illinois Communications rather than Corporate Communications 6. B.: Updated to Ameren Illinois Communications rather than Corporate Communications	January 1, 2011	January 1, 2013
QUAL 0	QUAL 4: Added Form 18 - Inaccurate or Incorrect Record Notification	January 1, 2012	January 1, 2013
QUAL 4	Added Form 18 - Inaccurate or Incorrect Record Notification	January 1, 2012	January 1, 2013
REGS 4	Updated the PDF versions of the regulator station designs with the 10-11-2011 version. Added "The DGN and DWG files are on the Organizational Data Drive at O:\Gas\Reg Station Design Standards. The DGN and DWG files contain the active drawing files. Deleted the DWG drawing from the Forms and Reference Materials section since majority of O&M users cannot access DWG files.	January 1, 2011	January 1, 2013
REPR 1	Requirements 1. B.: Added a sentence "See SAFT 1 for safety related conditions that may require a report to the ICC and PHMSA 1. M.: New: "Prior to welding or cutting activities on any steel pipeline take the proper precautions to eliminate any chance of accidental ignition. See ACIG 2.01"	April 1, 2012	January 1, 2013

4. Steel Pipe Repairs Methods 4. G.(2): Insert new item: An electric bond shall be installed prior to cutting metallic gas piping and maintain until all reconnections are completed or a gas free environment exists. See ACIG 2.01

4. G.(4): Added "See ACIG 2.01 if segment is being installed on a rectified system." ACIG 2.01 states rectifiers should be turned off prior to cutting or separating the pipe

REPR 2.01	<p>Compression Couplings</p> <p>1. D.: Grammatical, added "ed" to install.</p> <p>2. C.(3)(b): Deleted the item that references couplings not encapsulated at time of repair when pull out was not detected.</p> <p>2. C.(3)(c): Is now (3)(b) and has been revised to require a compression coupling that was tightened to repair a leak to be encapsulated or removed within 30 days even if pull out was not detected.</p> <p>3. Service Line Repair Methods for Compression Couplings</p> <p>3. C. (3)(b) Deleted the item that references couplings not encapsulated at time of repair when pull out was not detected.</p> <p>3. C.(3)(c): Is now (3)(b) and has been revised to require a compression coupling that was tightened to repair a leak to be encapsulated or removed within 30 days even if pull out was not detected.</p>	January 1, 2012	January 1, 2013
REPR 3.02	<p>Dresser Reinforcing Sleeves</p> <p>Added notes below tables for Style 110, 220, and 220S: Pressure ratings listed in the tables are based on Class 3 design factor of 0.50. Pressure ratings can be adjusted for Class 1, Class 2, or Class 4 locations. Design factor for Class 1 is 0.72, for Class 2 is 0.60 and Class 4 is 0.40. Contact Engineering before adjusting pressure ratings.</p>	October 1, 2011	January 1, 2013
SECR 0	<p>Security Plan has been significantly revised by Ameren Security due in part to a change in threat level classification. There are now two Threat Levels that replace the original 5 Color Coded Levels.</p> <p>The Security Plan should be reviewed in depth with all gas personnel.</p> <p>SECR 2.02 Title changed to Critical Gas Facility Security Measures</p>	January 1, 2011	January 1, 2013

SECR 1	<p>2. A.: Definition of Critical Gas Facility has been significantly expanded.</p> <p>2. B.: New term: Baseline Security Measures - measures taken at all facilities during normal operating conditions</p> <p>2. C.: New term; Enhanced Security Measures - measures taken at critical facilities during normal operating conditions</p> <p>2. D.: New term: Elevated Threat Alert - warns of a credible terrorist threat against the United States and its territories that is general in both timing and target, or details significant trends and developments in terrorism such that it is reasonable to recommend implementation of protective measures to thwart or mitigate against an attack.</p> <p>2. E.: New term: Imminent Threat Alert - warns of a credible, specific, and impending terrorist threat or on-going attack against the United States and its territories that is sufficiently specific and credible to recommend implementation of protective measures to thwart or mitigate against an attack.</p> <p>2. I.: Revised Ameren Critical Gas Facilities with criteria listed in the revised Transportation Security Administration Office of Pipeline Safety Security Guidelines issued April 2011.</p>	January 1, 2011	January 1, 2013
SECR 2.01	<p>Communicating Security Threats</p> <p>4.: Call Tree - updated the contacts - Change Regional VP to VP Operations & Tech Services and deleted the VP Gas Supply & System Control</p> <p>Updated phone number for the VP Operations & Tech Services</p> <p>Delete the Mattoon and Peoria Dispatch Offices</p>	January 1, 2011	January 1, 2013
SECR 2.02	<p>Critical Gas Facility Security Measures</p> <p>This section has been totally rewritten and should be reviewed in depth with all gas personnel.</p>	January 1, 2011	January 1, 2013
SERV 1	<p>Requirements</p> <p>2. Depth</p> <p>2. A.: On the depth of service line an new item has been added: "Additionally, service tee should have minimum of twenty four (24) inches cover. When the required minimum cover for the service tee cannot be provided, Safety Barrier Tape, (Stock Code 19 06 958), shall be installed approximately twelve (12)</p>	April 1, 2012	January 1, 2013

inches below the surface to provide advance warning to excavators."

2. C.: Inserted new item that address where minimum cover cannot be provide: "Where the required minimum cover for the service line cannot be provided, Safety Barrier Tape shall be installed approximately six (6) inches below the surface to provide advance warning to excavators. Additionally, location of where service line buried depth is less than eighteen (18) inches should be recorded on the Gas Service Transaction Sheet/Card. Method of protection should also be recorded on the Gas Service Transaction Sheet/ Card."

2. F.: New item added that addresses plowing or boring of service lines: "Prior to plowing or boring in a service line, the proposed service line route should be inspected for public and privately owned buried facilities, especially sewer laterals that may conflict with the gas service line. Buried facilities that cross or are within eighteen (18) inches of the proposed plow path should be exposed or verified not to be in conflict with plow path and plow depth."

5. Location:

5. A.: Revised to specify "New residential" service lines should installed on the most direct route from the main to the proposed meter location. 5. B.: Revised location requirement to that addresses where preferred service riser location does not meet clearance requirements. "All new residential gas meters shall be located immediately adjacent to an outside wall at a location readily accessible by meter readers and emergency responders. The preferred location of the meter riser is within 2 to 5 feet of the front corner of the structure as long as the clearance requirements list below can be achieved. Alternate location would be the next closest point that meets clearance requirements. The gas meter can be installed on the front side of the home if agreed upon by Ameren Illinois and the property owner."

5. C.: Inserted new item that address when clearance requirements should be met when relocating or replacing an existing service line. A table is provided that lists activity and clearance requirements.

5. D.: Grammatical change which just rearranged the words of issues that should be taken into consideration when locating a commercial meter location.

9. Pressure Testing 9. C.: Replaced "shall" with "should": "Service line being pressure tested should be disconnected from the meter set or customer pip-

ing while the line is under test and until the test pressure has been released."

SERV 2.02	<p>Excess Flow Valves</p> <p>3. EFV Sizing</p> <p>3. B.: Revised to clarify the service line shall not be reduced in size downstream of the EFV. 3. D.: Inserted new item on how to select an EFV: "When selecting an EFV, the maximum capacity of the meter being specified should be used for the maximum flow. Select the EFV that has the maximum design flow that is closest to the selected meter and has a service length that is shorter than the maximum length that corresponds with the maximum design flow. The maximum meter capacity should not exceed the listed maximum design flow."</p> <p>3. D.(1): Revised table for 1/2" PE Service line EFV's by combining both Perfection Series 400 and UMAC Series 350 into a single table. Both manufacturers have the same stock code so either one could be supplied. A designer would not know which one was being issued.</p> <p>3. D.(2): Revised table for 1" PE Service line EFV's by combining both Perfection and UMAC EFV's into single table for comparable series.</p> <p>3. E.: Revised table for the 3/4" steel EFV by combining Perfection and UMAC into single table for comparable series.</p>	January 1, 2012	January 1, 2013
SERV 2.03	<p>Farm Tap Installation</p> <p>6. B.: Added: "Install a 5 lb anode on the tracer wire at the farm tap outlet. Do not bond the tracer wire to the farm tap piping."</p> <p>7.: Farm Tap Capacity Tables</p> <p>7. B.: Single Cut Farm Tap Capacity Table: Expanded table to include the three stock coded 3/4" steel EFV's</p> <p>7. B. Notes: Revised Notes 2. And 3. to include "Max flow" for the 1/2" and 1" outlet EFV's.</p> <p>7. C.: Double Cut Farm Tap Capacity Table: Expanded table to include the three stock coded 3/4" steel EFV's.</p>	April 1, 2012	January 1, 2013
SERV 3.06	<p>Single Cut Farm Tap, 60 to 450 psig Inlet Pressure</p> <p>Updated Material List:</p> <p>Item 2: Added series 700/800 EFV in description</p>	October 1, 2011	January 1, 2013

Item 6: Added Pete's Plug in description

Item 12: Added 1" Union for 1" outlet

Item 14: Added specifications for risers

Item 18: Added Tracer wire to table

Revised Note below table: "Item 1: 6" and larger transmission and high pressure distribution mains or 2" and smaller Schedule 80 pipe requires the use of either the Mueller H-17656 Valve Tee or Mueller H-17800 Curb Valve Tee if the wall thickness of the pipe is unknown or cannot be verified. See TAPS 2.05 for maximum wall thickness for AutoPerf Service Tees."

SERV 3.07	Double Cut Farm Tap, 451 to 740 psig Inlet Pressure Updated Material List: Item 2: Added 700/800 EFV in description Item 9: Added Pete's Plug in description Item 10: New: 3000 psig rated tee replacing malleable street tee Item 17: Added 1" Union for 1" outlet Item 19: Added specifications for risers Item 20: Added Series 350/400 and Series 700/800 to EFV description Item 25: Added Tracer wire to table Revised Note below table: "Item 1: 6" and larger transmission and high pressure distribution mains or 2" and smaller Schedule 80 pipe requires the use of either the Mueller H-17656 Valve Tee or Mueller H-17800 Curb Valve Tee if the wall thickness of the pipe is unknown or cannot be verified. See TAPS 2.05 for maximum wall thickness for AutoPerf Service Tees."	October 1, 2011	January 1, 2013
--------------	---	--------------------	--------------------

SERV 3.08	Double Cut Farm Tap, 741 to 1000 psig Inlet Pressure Updated Material List: Item 2: Added 700/800 EFV in description Item 9: Added Pete's Plug in description Item 10: New: 3000 psig rated tee replacing malleable street tee Item 17: Added 1" Union for 1" outlet Item 19: Added specifications for risers	October 1, 2011	January 1, 2013
--------------	---	--------------------	--------------------

Item 20: Added Series 350/400 and Series 700/800 to EFV description

Item 24: Added Tracer wire to table

Revised Note below table: "Item 1: 6" and larger transmission and high pressure distribution mains or 2" and smaller Schedule 80 pipe requires the use of either the Mueller H-17656 Valve Tee or Mueller H-17800 Curb Valve Tee if the wall thickness of the pipe is unknown or cannot be verified. See TAPS 2.05 for maximum wall thickness for AutoPerf Service Tees."

STLP 0	Added: STLP 1 12: Pipe Thread Sealers	January 1, 2012	Janu- ary 1,2013
STLP 1	<p>Requirements</p> <p>3. Joining: 3. B.: New item: "Threading is acceptable for joining steel pipe that is used for above ground assemblies such as, but not limited to, meter sets, pressure control stations, odorization stations, compressor stations, etc."</p> <p>3. C.: New item: Threaded caps are approved for use in abandoning gas facilities. See ABND 2.01</p> <p>12: Pipe Thread Sealers (New Item)</p> <p>12. A.: All threaded connections should be made using an approved pipe thread sealers or Teflon thread tape</p> <p>12. B.: The following criteria must be met for a pipe thread sealer to be approved. (1) Minimum pressure of 1000 psig</p> <p>(2) Immediate cure time, can be pressurized immediately after assembly</p> <p>(3) Brushable to temperatures of zero (0) degrees Fahrenheit or lower</p> <p>(4) Minimum two (2) years shelf life</p> <p>(5) Health Hazards Rating of one (1) or less</p> <p>(6) Flammability Rating of two (2) or less</p> <p>(7) Reactivity Rating of zero (0)</p> <p>12. C.: Approved Pipe Thread Sealers - Table listing the approved stock coded thread sealers. There is also a table with the Hazardous Materials Identification System coding of the thread sealers explained.</p>	April 1, 2012	Janu- ary 1, 2013

STLP 2.01	Design Pressure 5.: Steel Pipe Stock Code Table: Added a column listing the Pipe Schedule for each stock coded pipe.	January 1, 2012	January 1, 2013
TAPS 0	TAPS 4: Added two items to Reference Materials	October 1, 2011	January 1, 2013
TAPS 1	Requirements 1. G.: Revised requirements for Tapping Request Form to include all sizes of transmission and high pressure distribution pipeline, and distribution pipelines 6" and large. A Tapping Request Form is required when any tapping equipment, regardless of size of fitting, and personnel are being requested from another operating center. 1. I.: Inserted new: "Tapping and stopping equipment should be in good operating condition prior to beginning tapping and stopping operations. Prior to beginning a tapping and/or stopping operation a dry run should be made." 1. J.: Inserted new: "Tapping and stopping equipment that malfunctions should be tagged out-of-service and repaired before being used again." 2.: Equipment Selection: 2. B.: Revised the Max Working Pressure for Stopping operations with a Mueller Unit No. 3SW to 275 psig. Previous was 230 psig. 3.: Planning Requirements 3. C.: Added a clarification on the tapping and stopping machine rating. The machine is to be rated for at least the actual operating pressure at the time of the tapping and stopping operations. The stopper fittings shall be rated for the MAOP. 3. F.: Added new: Gas Engineer or Gas Operations & Services - Engineer is to provide the purging plan(s) that is to be included in the job packet. See PURG 2.01 4. Pre-Job Conference 4. D.(6): Inserted new: Re-pressurization and purge plan 4. D.(8): Expanded Responsibilities of involved personnel to include operator qualifications and span of control. 4. D.(10): Added new: "Location and accessibility of isolation valve(s) that will be or could be used and method of tagging valve as out of service."	October 1, 2011	January 1, 2013

4. D.(11): Added new: "Method of communication between qualified field personnel monitoring pressures and tapping/stopping operations."

5.: Identification of Pipe Before Tapping

5. D.: Added "wall thickness" to the list of pipe properties to review before tapping.

5. E.: Revised to: "To ensure the exposed pipe is the one to be tapped, gas field personnel should consider extending the excavation or installing a small tap on the pipe to verify content and/or pressure."

6.: Fitting Placement

6. B.: Added "longitudinal seam" along with circumferential seam that should not be tapped through.

6. D.: Added reference to WELD 2.04 - Maintenance welding procedures.

8.: Tapping/Stopping/Completion

8. G.: Grammatical revision: "If Gas Control was monitoring, contact them upon completion of tapping/stopping operations and verify their monitoring parameters have returned to normal operation."

TAPS 2.05	<p>Mueller Autoperf Tee</p> <p>2.: Installation Instructions</p> <p>2. B.: Added: "soap" to the sentence "Do not quench with water or soap."</p> <p>2. G.: Corrected spelling of "perforation"</p> <p>3.: Maximum Pipe Wall Thickness:</p> <p>Revised Note below table that allows use of the Autoperf tee on any size pipe if the wall thickness is known or can be verified to be less than 0.281 inches.</p>	October 1, 2011	January 1, 2013
TAPS 4	<p>Added two references</p> <p>Reference 19 - Mueller H-17045 Steel Service Tee Stopping Instructions</p> <p>Reference 20 - TDW Hot Tapping and Stopple Pipe Plugging</p>	January 1, 2011	January 1, 2013
TURN 0	<p>TURN 2.02 5. Changed to Initiating Service</p> <p>New TURN 4 Updated Warning Tag</p>	January 1, 2011	January 1, 2013
TURN 2.02	<p>Large Commercial - Industrial Customer</p> <p>5.: Initiating Service 5. C.: Revised to: "Check existing regulator pressure set point and adjust if necessary."</p>	January 1, 2011	January 1, 2013

UNCONTROLLED IF PRINTED

(1) If customer's gas equipment is not in operation, use blow-down facility to create flow.

(2) Use test gauge to set and check pressure. See METR 2.22.

(3) A lock-up test should be performed on all new meter set installations and on existing meter sets where a new regulator has been installed."

6.: Records 6. A.: Revised wording to: "Gas field personnel shall complete Gas Meter Data Sheet for all meters that are to meter at an elevated pressure (> 7" w.c./0.25 psig). See METR 2.16 for instruction.

6. B.: Revised wording to: "Completed Gas Meter Data Sheet shall be submitted to Gas Supervisor for review and distribution. See METR 2.16 for distribution list."

TURN 2.11	<p>Warning Tag</p> <p>2.: Inspecting Customer Piping and Appliances</p> <p>2. B.: Added reference to TURN 4 for copying of Warning Tag</p> <p>2. C.: Added reference to TURN 4 for copying of Warning Tag</p> <p>5.: Code Violations</p> <p>5. B.: Added reference to TURN 4 for copying of Warning Tag</p> <p>6.: Hazardous Conditions</p> <p>6. B.: Added reference to TURN 4 for copying of Warning Tag</p> <p>7.: Customer Mailing</p> <p>7. A.: Added reference to TURN 4 for copying of Warning Tag</p> <p>8.: Records</p> <p>8. A.: Added reference to TURN 4 for copying of Warning Tag</p>	October 1, 2011	Janu- ary 1, 2013
TURN 4	New with copy of Form 01 - Warning Tag Stock Code 16 01 263		Janu- ary 1, 2013
VALV 2.01	<p>Valve Installation</p> <p>3. Emergency Line Valves</p> <p>3. A.(1): Inserted "sectionalizing block" to clarified that transmission line must have a sectionalizing block</p>	April 1, 2012	Janu- ary 1, 2013

valve spaced as follows: This makes language consistent with VALV 1.

3. A.(2): Replaced "emergency" with "sectionalizing block" valve to identify where blow down valves are to be installed.

Clarified that any non-maintenance work intended to either increase or decrease regulator station capacity is considered a Station Rebuild and must meet emergency valve requirements. Made following changes:

4. C.(1): Added "or decrease" for non-maintenance work.

4. C.(3)(c): Added "or decrease" when changing regulators

4. C.(3)(i): Added "or decrease" for changing springs, orifices, liners, or ports.

5. Non-Emergency Valves 5. F.: Added new item: If a non-emergency valve is used to control gas during an emergency situation, the valve will be designated as an Emergency Valve after the emergency situation has been resolved. An Emergency Valve ID shall be designated. The valve shall be entered into the Gas Compliance System and on the electronic gas system map.

WELD 0	<p>WELD 4 Revisions to:</p> <p>Reference 09 - ENE - Ameren-F03 Rev 4</p> <p>Reference 10 - ENE - Ameren-F04 Rev 3</p> <p>Reference 14 - ENE - Ameren F08 Rev 3</p> <p>Reference 23 - ENE - Ameren WF03 Rev 3</p> <p>Reference 24 - ENE - Ameren WF04 Rev 3</p> <p>Reference 36 - ENE - Ameren F04R Rev 2</p>	April 1, 2012	January 1, 2013
WELD 1	<p>Requirements</p> <p>7. G.: Revision on storage of radiographic film: ". If the Company requests the actual radiographic film be retained, the film shall be processed, handled and stored in a manner such that the images can be interpreted for at least three (3) years." Added the statement "If Company request the actual radiographic file be retained" to clarify not all radiographic film had to be stored.</p>	July 1, 2012	January 1, 2013
WELD 2.04	<p>Maintenance Welding</p> <p>6. Welding Procedures</p>	April 1, 2012	January 1, 2013

UNCONTROLLED IF PRINTED

6. B.(5): Deleted the procedure on moving the transducer across pipe in an overlapping "Z" pattern.

CHANGE SUMMARY

July 1, 2012

Change Summary July 1, 2012

Document	Change Summary	Previous Document Dated	Current Document Dated
BORE 2.03	<p>2. J. & K.: Corrected "allowable tensile load" from "allowable load tension" to correspond with terminology used in Poly pipe reference documents.</p> <p>2. Table: Change table heading to ALLOWABLE TENSILE LOAD"</p> <p>2. Note below table made the same change "Allowable Tensile Load".</p>	April 1, 2012	July 1, 2012
CORR 0	CORR 2.03: Deleted "6. Trent #2A	April 1, 2012	July 1, 2012
CORR 2.03	6.: Deleted Trent #2A Wax Tape since this is the same product that is in CORR 2.13 Trenton #2A Wax Tape.	April 1, 2012	July 1, 2012
CORR 2.13	<p>2. B.: Reformatted the section on Application of Trenton #2A Wax Tape.</p> <p>2. B. (1): A thin coat of Temcoat Primer can be applied to wet or cold surfaces.</p> <p>2. B. (3): Revised language in Apply Primer. The Temcoat Primer needs to be rubbed and pressed firmly to displace moisture and ensure adhesion.</p> <p>2. C.: Reformatted section on Apply Tape:</p> <p>2. C. (5): Added "mesh outer wrap, Glas-Wrap, can be used to protect the tape during backfilling operations</p> <p>2. D. Reformatted Applying Trenton Fill-Putty (profiling material).</p> <p>2. D.: Minor revision to clarify that a "wire" brush should be used to remove dirt, loose rust or old coating from the surface prior to applying the Trenton Fill-Putty.</p> <p>2. D. (4): Added "mesh outer wrap, Glas-Wrap, can be used to protect the tape during backfilling operations</p>	January 1, 2011	July 1, 2012
CORR 2.29	<p>2. B. (3)(j)&(p): Under Remedial Action for CP repairs, eliminated the reference to AmerenIP in the instruction on completing: (j) IRMA and (p) SIMP screens.</p> <p>3. D. (2): Deleted the "Former IP" section. All areas within Ameren Illinois are now using the same procedure, 3. D. (1), for performing Isolated Section Check for required number of annual readings</p>	April 1, 2012	July 1, 2012

UNCONTROLLED IF PRINTED

EMER 0	Added EMER 2.10 - CNG Trailers	January 1, 2011	July 1, 2012
EMER 2.01	4. D.: Added "leak surveyor (in-house or contracted)" as another group the Call Taker does not have to relay safety instructions to if an individual in this group would call in a gas odor.	January 1, 2011	July 1, 2012
EMER 2.08	2. D.: Revision to situations where it isn't necessary to submit the fitting for failure analysis. 2. D. (3): Revised wording to "Leaks due to loose threaded fittings." 2. D. (4): Added "Aldyl-A and Plexco" descriptor to tapping tee caps and "compression couplings, tees, valves" to fittings with known problems.	April 1, 2012	July 1, 2012
EMER 2.10	New Section added - CNG Trailers. Ameren Illinois has 6 CNG trailers, 4 with 8.1 MCF capacity at 3600 psig and 2 with 6.1 MCF capacity at 3600 psig. Trailers are located in Belleville, Kewanee, Decatur, Peoria, and Springfield. CNG trailers are under the control of Gas Technical Support. Contact information is included.		July 1, 2012
FORW	5.: Update Contacts for Compliance with John Bozarth's name	April 1, 2012	July 1, 2012
<u>INCD 1</u>	6.: Updated Gas Compliance Contact List with John Bozarth's name	January 1, 2012	July 1, 2012
LEAK 2.08	2. G.: Revision to handling bottle/cylinder of hydrogen/nitrogen gas mixture for FI unit. Added if bottle has not been used and has sat in storage for approximately a month or longer bottle should be rolled prior to filling FI unit's cylinder. If the bottles/cylinder is being transported in vehicle the bottle/cylinder does not need to be rolled prior to filling the FI unit's cylinder. 3. H.: Deleted the 1 hour and revised wording to "short duration or intermittent leak survey where use of an FI unit is impractical."	April 1, 2012	July 1, 2012
<u>MAIN 1</u>	3. A. Table: Added heading to table of minimum cover for mains "PHMSA PART 192.327 Minimum Cover Requirements" and deleted asterisks from Distribution Mains and High Pressure Distribution Mains. 9. D.: Updated reference to the appropriate welding section for joining, WELD 2.03 Construction of Pipeline and Pipe Systems	April 1, 2012	July 1, 2012

METR 0	METR 2.10 Small Diaphragm Meter Repair: Totally revised with new topic headings	April 1, 2012	July 1, 2012
METR 2.10	Totally revised the entire Small Diaphragm Meter Repair procedures with Manufacturer specific domestic meter repair procedures: American Class A & B repair, Rockwell Class A & B repair, and Sprague Class B repair.	January 1, 2011	July 1, 2012
METR 2.20	2. A. (9): Corrected the word "or" with "of" 3. A. (8): Corrected the word "or" with "of"	January 1, 2011	July 1, 2012
METR 2.24	5. A. (5): Added a reference to METR 2.20 - Meter Header Inspection when checking for corroded bolts on banded regulators when replacing large volume diaphragm meters	January 1, 2011	July 1, 2012
ODOR 2.03	3. D.: Revised the calibration interval for odorometer to annual not to exceed 12 months from annual not to exceed 15 months. Manufacturer's calibrations are good for 1 year.	January 1, 2012	July 1, 2012
PMRK 0	Inserted Replacement Stickers as PMRK 3.01 2.	October 1, 2011	July 1, 2012
PMRK 3.01	1.: Updated the sticker information on the 3 styles of stocked COTT markers. New sticker has the 800 755 5000 Ameren Illinois phone number. 2.: Added Stock Number for replacement sticker for the COTT pipeline marker.	January 1, 2011	July 1, 2012
POLY 0	Added Reference 15 - Performance Pipe Butt Fusion New Brochure April 2012 to Forms and Reference Materials	October 1, 2011	July 1, 2012
POLY 2.01	2. A. Table: Deleted the 1000 ft coil of 4" PE2406/2798 pipe. Storeroom will stock the 40 ft stick and 600 ft coil pipe. 2. A. Added Note 3 below table of PE 2406/2708 pipe. "PE2406/2708 risers are the same SDR as the pipe." 2. B.: Added Notes below table of PE 3408/4710 pipe. "PE3408/4710 services, 1" CTS and 2" IPS require a SDR 7.0 riser." "Use SDR 7.0 with Design Temperature of 120° F to calculate maximum design pressure for 1" CTS and 2" IPS PE 3408/4710 service line pipe." 3. B.: Added Notes below Design Temperature table. "120°F temperature due to service line riser exposure to sun." "73°F temperature used for buried gas PE pipe with no above ground exposure."	May 1, 2010	July 1, 2012
POLY 2.04	1. C.: New item: "Butt fusion is not allowed when connecting two pipe sections with a wall thickness difference that exceeds one SDR value (SDR 7.0 vs SDR 11.0) or two pipe	October 1, 2011	July 1, 2012

sections of different densities (PE2406/2708 vs PE3408/4710)

POLY 2.06	2. D.: Added Note that the 1" CTS PE3408 Stab coupling is sized for SDR 11.5 pipe and is not compatible with the 1" PE3408/4710 service riser pigtail which is SDR 7.0. Electro-fusion is the only means of connecting the service pipe to the riser pigtail.	October 1, 2011	July 1, 2012
POLY 4	Added Reference 15 - Performance Pipe Butt Fusion New Brochure April 2012	January 1, 2011	July 1, 2012
PTRL 1	2. Table: Deleted "and Critical Area Patrols" from heading of 3rd column in Frequency Table to make consistent with PTRL 2.01. Critical Area Patrols applies only to distribution pipelines.	March 1, 2010	July 1, 2012
PTST 0	Added PTST 2.03 3. Safety	April 1, 2012	July 1, 2012
PTST 1	3. A.: Added "This is a combination leak and strength test." to the testing of mains and service with MAOP of 60 psig or less. 3. B.: Added "This is a combination leak and strength test." to the testing of mains and service with MAOP above 60 psig and below 100 psig. 3. C.(2): Inserted statement "Separate leak and strength tests are required if 1.5 times the design MAOP test pressure equals or exceeds 20% SMYS of the pipe." Inserted to match language in Part 192.507 3. C.(3): Revised wording to clarify "When a leak test is performed separately from a strength test, the leak test shall be at a minimum test pressure of 100 psig for minimum of 1 hour or for the duration specified in PTST 2.01 whichever is longer." 7. B. Table: Correct Weld-End Insulator from Weld-In	April 1, 2012	July 1, 2012
PTST 2.03	Hydrostatic Pressure Testing procedures have been significantly expanded from the January 1, 2011 version. There are too many revisions to list. Expanded the Environment Protection Requirement section and added a Safety section. Prior to performing any hydrostatic testing this entire section should be reviewed with those performing the test.	January 1, 2011	July 1, 2012
PURG 2.01	1. B.: Inserted a new item "Gas Engineering or Gas Operations and Engineering will provide detailed purging plans prior to blow-down or purging operations on transmission or high pressure distribution mains." 3. D.: Inserted a new item "Blow-down valves should be turned to fully open position as quickly as possible to mini-	January 1, 2012	July 1, 2012

mize possible erosive damage to the valve which could occur attempting to pass a high volume of gas through a partially opened valve."

REGS 2.01	<p>1.: Minor word changes only in E., F., and G.</p> <p>2. D.(3): Added vent screens should be in place on vent lines.</p> <p>2. E.: Clarified above grade piping is checked for atmospheric corrosion and risers are to be checked for disbanded coating.</p> <p>2. F. (1)(a)&(b): New: When checking for leakage, this section identifies what piping is considered station piping when: (a) pressure control station is located within a fenced area and (b) pressure control station is not located within a fenced area. Follow procedures in LEAK 2.09 - Walking Survey when checking for leakage.</p> <p>2. F. (2): References LEAK 2.04 and LEAK 2.05 for leak classification and reporting.</p> <p>2. F. (4): Any below grade leak found during an inspection shall be documented on a Gas Leak Field Case Report.</p> <p>2. F. (5): All above grade leaks identified during an inspection can be collectively documented on one Leak Case Field Report for the station. All above grade leaks must be reported even if they are repaired at the time of the inspection.</p>	January 1, 2012	July 1, 2012
RNST 2.01	<p>4. A.: Added sentence to reinstating requirements when main is temporarily disconnected but not disturbed. "When reconnected, tie-in joints shall be leak tested with leak detection fluid with main under normal operating pressure."</p> <p>4. B.: Revised requirements when temporarily disconnected main is moved within the trench. Main shall be visually inspected to make sure that all joints are sound and no damage has been done to pipe. Main does not have to be pressure tested prior to reconnection. When it is reconnected the tie-in joints shall be leak tested with leak detection fluid with main under normal operating pressure.</p> <p>4. C.(1): Revised requirements when temporarily disconnected main is lifted out of the trench but is being returned to the same trench. Main shall be visually inspected to make sure that all joints are sound and no damage has been done to pipe. Main does not have to be pressure tested prior to reconnection. When it is reconnected the tie-in joints shall be leak tested with leak detection fluid with main under normal operating pressure.</p> <p>4. C.(2): Added requirement for a temporarily disconnected main that is lifted from the trench and reconnected in a different location. This main shall be pressure tested in the same manner as new lines in their final location. The pipe shall be visually inspected to make sure all joints are sound</p>	April 1, 2012	July 1, 2012

and no damage has been done to the pipe. When it is re-connected the tie-in joints shall be leak tested with leak detection fluid with main under normal operating pressure.

4. D.(3): New sentence added to requirements when mains are cut into sections: "Connections to the undisturbed sections of main shall be leak tested with leak detection fluid with the main under normal operating pressure.

SERV 3.01	1/2" CTS Service with flex riser: Minor revision to wording under Installation. Standardized PE designation PE2406/2708 and PE3408/4710 to match POLY 2.01. Modified wording the range of MAOP for PE2406/2708 and PE3408/4710	January 1, 2011	July 1, 2012
	Material List Tables: Expanded description for the risers to include PE3408/4710, SDR 7.0. Same riser is used for both PE2406/2708 and PE3408/4710 service lines.		
SERV 3.02	1/2" CTS Service with rigid riser: Minor revision to wording under Installation. Standardized PE designation PE2406/2708 and PE3408/4710 to match POLY 2.01. Modified wording the range of MAOP for PE2406/2708 and PE3408/4710	January 1, 2011	July 1, 2012
	Material List Tables: Expanded description for the risers to include PE3408/4710, SDR 7.0. Same riser is used for both PE2406/2708 and PE 3408/4710 service lines.		
SERV 3.03	1" CTS Service with flex riser: Minor revision to wording under Installation. Standardized PE designation PE 2406/2708 and PE 3408/4710 to match POLY 2.01. Modified wording the range of MAOP for PE 2406/2708 and PE3408/4710	January 1, 2011	July 1, 2012
	3.: Added new line: PE3408/4710 service line shall require a PE3408 riser that is SDR 7.0, Stock Number 19 72 139.		
	4.: Added new line: PE2406/2708 riser shall not be used on a PE 3408/4710 service.		
	5. Inserted new line: Caution: Electrofusion coupling is the ONLY approved means of connecting PE3408/4710 service line, SDR 11.5, with the PE3408/4710 riser, SDR 7.0. Butt fusion is not allowed when connecting two pipe sections with a wall thickness difference that exceeds one SDR value.		
	Material List Tables: Expanded description for the PE2406/2708 service riser to include PE2406/2708, SDR 11.5		
	Expanded description for the PE3408/4710 service riser to include PE3408/4710 SDR 7.0		
SERV 3.04	1" CTS Service with rigid riser: Minor revision to wording under Installation. Standardized PE designation PE 2406/2708 and PE 3408/4710 to match POLY 2.01. Modified wording the range of MAOP for PE 2406/2708 and PE3408/4710	January 1, 2011	July 1, 2012

3.: Added new line: PE3408/4710 service line shall require a PE3408 riser that is SDR 7.0, Stock Number 19 72 140. 4.: Added new line: PE2406/2708 riser shall not be used on a PE 3408/4710 service. 5. Inserted new line: Caution: Electrofusion coupling is the ONLY approved means of connecting PE3408/4710 service line, SDR 11.5, with the PE3408/4710 riser, SDR 7.0. Butt fusion is not allowed when connecting two pipe sections with a wall thickness difference that exceeds one SDR value.

Material List Tables: Expanded description for the PE2406/2708 service riser to include PE2406/2708, SDR 11.5 Expanded description for the PE3408/4710 service riser to include PE3408/4710 SDR 7.0

SERV 3.05	2" IPS Service: Minor revision to wording under Installation. Standardized PE designation PE 2406/2708 and PE 3408/4710 to match POLY 2.01. Modified wording the range of MAOP for PE 2406/2708 and PE3408/4710	January 1, 2011	July 1, 2012
--------------	---	--------------------	-----------------

3.: Added new line: PE3408/4710 service line shall require a PE3408 riser that is SDR 7.0, Stock Number 19 72 154.

4.: Added new line: PE2406/2708 riser shall not be used on a PE 3408/4710 service.

5. Inserted new line: Caution: Electrofusion coupling is the ONLY approved means of connecting PE3408/4710 service line, SDR 11.5, with the PE3408/4710 riser, SDR 7.0. Butt fusion is not allowed when connecting two pipe sections with a wall thickness difference that exceeds one SDR value.

Material List Tables: Expanded description for the PE2406/2708 service riser to include PE2406/2708, SDR 11.0

Expanded description for the PE3408/4710 service riser to include PE3408/4710 SDR 7.0

Added 6 new material tables for 2" PE3408/4710 service. Initial Standard did not include PE3408/4710 service line.

TURN 2.05	7. B.: Expanded information on Flammable Vapor Ignition Resistant (FVIR) hot water heaters. Conventional residential 50 gallons or smaller water heaters manufactured after July 1, 2003 had to be FVIR. Power vented residential water heaters 50 gallon and smaller manufactured after July 1, 2006 had to be FVIR. Finally all remaining residential water heaters manufactured after July 1, 2007 had to be FVIR. Residential FVIR water heaters installed in a garage do not have to be raised 18 inches off the floor.	January 1, 2011	July 1, 2012
--------------	--	--------------------	-----------------

7. F.: New: Added an example of the FVIR label that is attached to the water heater. This is the only visible way of verifying the water heater is FVIR.

	7. G.: New: Added an example of the label that is on non-FVIR water heaters.		
TURN 2.14	6. E.(2): Inserted new item for Changing of Meter Valves "On-The-Fly". "The operating pressure range of the service should be verified prior to changing the meter valve. Contact Gas Supervisor when or if there is a question on the operating pressure." This safety precaution should verify that the current operating pressure should not exceed that listed in the table for the various size valves.	January 1, 2011	July 1, 2012
VALV 1	<p>3. A.(1): Clarification that transmission line must have "sectionalizing block" valves spaced to meet the requirements for each Class location. These sectionalizing block valves are classified as Emergency Valves.</p> <p>3. A.(2): New: "Each section of transmission main between the sectionalizing block valve must have an emergency blow-down valve(s) with enough capacity to allow the line to be blown down as rapidly as practical." Generally, engineering practice is to size blow-down valves so that the section can be blown down in 30 minutes or less. This is not the case in all situations but is a general guideline.</p> <p>3. A.(3): New: "Each staffed compressor station with greater than a total of 1000 horsepower shall have emergency valve(s) and emergency blow-down valve(s) that shut off flow into the station." Requirement in Part 192.167.</p> <p>3. C.: Added reference to VALV 2.01 for installation of emergency valve used to control a regulator station.</p> <p>3. D.: New: "All emergency valves and emergency blow-down valves are to be entered in Ameren Illinois' electronic mapping system. System maps will distinguish these valves as Emergency Valves along with their respective Valve ID#,"</p> <p>3. E.: New: "All emergency valves shall be entered in Gas Compliance System with the same Valve ID # as that shown in the electronic mapping or on gas system maps</p>	January 1, 2011	July 1, 2012
VALV 2.02	<p>2. B.: Added requirement to "Verify valve ID on tag/label is correct and readable. Replace or schedule for replacement if needed."</p> <p>Made a distinction between below ground and above ground valves for leakage inspection.</p> <p>2. H.: "Below ground valves shall be checked for leakage with an approved gas detection instrument which reads percent gas-in-air on the LEL or Gas scale. Valve should have a final leakage check at the conclusion of the inspection."</p>	January 1, 2012	July 1, 2012

2. I.: "Above ground valves shall be checked for leakage with either a leak detection instrument or leak detection fluid at the conclusion of the valve inspection."

4. D.: Revision to language "Gas Supervisor should review the inspection sheets and other maintenance work listed in the GCS Valve Tracking Module "Other Work" tab. Added: Maintenance work that can be reported in Valve Tracking includes: replacement of valve number tags, miscellaneous work, mechanical maintenance, lubricate valve, new insulator needed, new gasket needed, data correction, clear vegetation, clear valve box,

Clean internal (flush), clean external, bond wire. And align valve box."

VALV 2.05	Correction of effective date on Page 2. Should be January 1, 2011 not 2010.	June 1, 2010	January 1, 2011
WELD 1	<p>1. C.: Added the O&M section references to the individual nondestructive testing procedures.</p> <p>6. B.(1): Added some clarification in the inspection and test of welds on pipeline that operates at or above 20% SMYS.</p> <p>"Welds that are visually inspected and approved by a qualified welding inspector need not be nondestructively tested if: (a) the pipe's nominal diameter is less than 6 inches or (b) the pipeline is to be operated at a pressure that produces a hoop stress of less than 40% SMYS and the welds are so limited in number that nondestructive testing is impractical."</p> <p>6. C.: New "The acceptability of a weld that is nondestructively tested or visually inspected is determined according to the standards in Section 9 of API Standard 1104. However, if a girth weld is unacceptable under those standards for a reason other than a crack, and if Appendix A to API 1104 applies to the weld, the acceptability of the weld may be further determined under that appendix. Contact Ameren Illinois Gas Training Center if assistance is needed to determine the acceptability of the weld."</p> <p>7. D.: New under Nondestructive Testing: "Welds on pipelines requiring nondestructive test will be tested in accordance with one of the approved methods contained in this section: WELD 2.06 - Radiographic Examination, WELD 2.07 - Magnetic Particle Inspection, and WELD 2.08 - Liquid Penetration Inspection."</p> <p>7. F.: Added a clarification to the situation where welder is isolated from the principal welding activity. If the weld meets the requirements in section 6. a sample of the welder's work for each day must be nondestructively tested.</p> <p>7. G.: Added the requirement "The actual radiographic film is to be stored in a manner such that it can be interpreted for</p>	January 1, 2012	July 1, 2012

at least 3 years. Gas Operations and Services - Engineering will file/store the film."

8. C.: Clarification under Repair or Removal of Defects: "The repair segment must be inspected in the same manner that the defect was found to ensure its acceptability."

8. E.: Minor, capitalized Heat Affected Zone

WELD 2.02	5. C. (2)(a): Correction under single qualification. Test 1 for the welder is two 1-1/4" butt welds on pipe less than 0.188 wall thickness. The original version was in error because it include less than or equal to 0.188 wall.	January 1, 2012	July 1, 2012
WELD 2.03	8. O.(1): Clarification in Welding Requirements under Pre-heating of Welds. Pyrometers can be either direct reading or infrared. 8. S.(3): Revised preheat temperatures to be consistent throughout the document. Preheat for stripper passes from a minimum of 200 degrees F to a maximum of 500 degrees F. 8. T.(2): Revised preheat temperatures to be consistent throughout the document. Preheat for back welding from a minimum of 200 degrees F to a maximum of 500 degrees F. 8. X.(8): Revised preheat temperatures to be consistent throughout the document. Preheat for weld repairs from a minimum of 200 degrees F to a maximum of 500 degrees F. The pyrometer can be either direct reading or infrared.	January 1, 2012	July 1, 2012

Supersedes: April 1, 2012

CHANGE SUMMARY

April 1, 2012

Change Summary April 1, 2012

Docu- ment	Change Summary	Previ- ous Docu- ment Dated	Current Docu- ment Dated
APPR 2.04	<p>3. F.: Change Covered Task Description for Course 0431 in Third Step Gas Technical Services Apprentice training to match the match same course in the Storage Field Apprentice training.</p> <p>0431 - Pneumatic Loaded Pressure Limiting/Relief Device-Inspect, Testing, Preventive & Corrective Maintenance</p>	Janu- ary 1, 2011	April 1, 2012
BORE 2.01	<p>3. E.: In Boring Site Evaluation inserted additional items to check for as evidence of subsurface facilities: cisterns, septic tanks, leach field piping, and sewer lateral cleanouts</p> <p>4. D. (3): Expanded sanitary system items that land owners are responsible for locating prior to boring operations: Now reads: Sanitary/septic system including drain tiles, leach fields, and tanks.</p> <p>4. D. (4): Added "Potable water wells and private water lines." to the list of items land owners should locate.</p> <p>4. L. Added reference to BORE 2.04 3. H. for sewer listening device requirements when locating and marking sewer lines and laterals prior to boring.</p>	Janu- ary 1, 2011	April 1, 2012
BORE 2.03	<p>3. A.: Expanded language on steel pipe coating by adding the "coating shall meet requirements contained in CORR 2.03" along with a coating inspection in accordance with CORR 2.15.</p> <p>3. C.: Clarified welded joint coating requirements for pipe being pulled back through a bore hole to make them consistent with CORR 2.03: Transmission and high pressure distribution pipe 2 inch and larger should be coated with liquid epoxy and covered with sacrificial hot wrap tape. Transmission, high pressure distribution pipe smaller than 2 inch and all sizes of distribution pipe can be coated with either liquid epoxy & sacrificial hot wrap or two layers of hot wrap.</p> <p>3. K.: Deleted: Coating requirements for transmission pipe and distribution pipe 2 inch and larger in diameter are in CORR 2.03 since it is covered in 3. C.</p>	Janu- ary 1, 2012	April 1, 2012
BORE 2.04	<p>1. B.: Added "services" along with PE mains that could be mistakenly installed through sewer lines.</p> <p>6.: Updated the Example Letter that is sent annually to local plumbers, city sewer departments and operators of sewer cleaning businesses advising them that boring, for the installation of a gas main and/or service, can enter a sewer line on some rare occasions, potentially causing a sewer problem.</p>	Janu- ary 1, 2012	April 1, 2012

UNCONTROLLED IF PRINTED

7.: Removed sample of door hanger since it was not the one currently is use. Current door hanger is in process of being updated with Ameren Illinois logo and single phone number 1-800-755-5000. Replaced with information on the door hanger, stock code number and Ameren Illinois phone number.

CNTS 1	<p>5. D. (9): New added to records to review for the System Review: "Inactive Services (Services inactive for 10 or more consecutive years) See SERV 2.05".</p> <p>7. B.: Revised: "The Gas Supervisor and/or Gas Engineer is responsible for completing the applicable portions of the system review report for their Operating Center(s). Removed Gas Supt from being responsible. 7. C.: New added: "Gas Operations and Services Supervisors (Corrosion Control, Pipeline Integrity, Tech Services) who have responsibilities for facilities within the Operating Center and Division should complete those sections of the system review and forward a copy to the appropriate Gas Superintendent for inclusion with his system reviews.</p> <p>7. D.: The Gas Superintendent is responsible for ensuring system review report for each Operating Center in the Division has been completed. The individual Operating Center reports can be submitted and do not have to be consolidated into a Division report. The completed report(s) shall be forwarded to Gas Compliance (PWN-427) upon completion.</p>	October 1, 2011	April 1, 2012
CNTS 4	<p>Form 01 - System Review has been updated: Replaced Operating Center for Division Added "Inactive Services" (Inactive for 10 or more yrs)</p>	October 1, 2011	April 1, 2012
CORR 0	<p>New CORR 2.03 6. - Trent #2A Wax Tape Application Procedures</p>	October 1, 2011	April 1, 2012
CORR 2.03	<p>1. A. (2)(a): In coatings for steel pipe installed by directional boring, added "high pressure distribution pipe 2" and larger to the same coating requirements as transmission pipe 2" and larger. Pipe shall be dual coated with initial layer of FBE and second layer of an abrasive resistant coating.</p> <p>Revised wording for coating on girth welds. Girth welds shall be coated with liquid epoxy and covered with sacrificial hot wrap. Tape is to be wrapped toward the pull head.</p> <p>1. A. (2) (b): Revised girth weld coating requirements on distribution pipe 2" and larger to include either: liquid epoxy and sacrificial hot wrap or two layers of hot wrap.</p> <p>Added the direction of wrap which is toward the pull head.</p> <p>A. (2)(c): Added coating requirements for all steel pipe smaller than 2" that is installed by directional drilling. Pipe shall be coated with fusion bonded epoxy (FBE), approximately 14 mils thick. Girth welds shall be coated with an approved hot or cold</p>	October 1, 2011	April 1, 2012

wrap or with liquid epoxy and sacrificial wrap. Tape shall be wrapped toward the pull head.

5. C.: Clarification: Cold applied wax tape can have a "mesh" outer wrap to protect the tape during backfilling. Glas-Wrap is a product name for the "mesh" wrap.

6. A. thru I.: New product added: Trent #2A Wax Tape. Bullet points A. thru I. are the application procedures for this wax tape.

7. A. (4): Added approved spray paint that can be applied primarily to gas facilities that are inspected annually. The approved spray paint can be used to touch-up small defects and bolts until a total repaint is necessary. Sherman-Williams Acrylic Modified Enamel - Meter Gray, Stock No. 30 51 579.

CORR 2.09	2. A.(8): Added "Dry Film Thickness Indicator" to required tools for applying Protal 7200 epoxy coating.	January 1, 2011	April 1, 2012
CORR 2.11	2. F.: Removed "(380 microns)" equivalent to the 15 mils	January 1, 2011	April 1, 2012
CORR 2.15	2. B.: Revised Inspection Voltage for Coating Inspection. Replaced the Coating Thickness vs Test Voltage Table with a condensed version based on Pipe Diameter. Inspection Voltage Table is divided into 2 tables: Standard FBE Coating and FBE Coating with Abrasive Resistant Layer. Added a Note: "For average thickness more than 2 mils thicker or thinner than indicated in the table above contact the Superintendent of Corrosion Control for proper testing voltages." 6. B.: Revisions on coating repairs: Reduced size of defect to 1/16" from 1/2" diameter on epoxy coated pipe that requires repair. Added "approved field applied liquid epoxy" for an approved epoxy coating repair method in addition to 1 complete wrap of an approved tape. 6. C.: Reduced size of defect to 1/16" from 1/2" diameter on Fusion Bonded Epoxy (FBE) coated pipe that requires repair. Added "approved field applied liquid epoxy" for an approved epoxy coating repair method in addition to the hot melt patch stick. 6. D.: Added "defects on coal tar coated pipe" should be repaired with full encirclement of an approved tape. This is same repair method as for defects in polyethylene coated pipe.	January 1, 2011	April 1, 2012
CORR 2.18	2. B.: Removed graph of "Potential vs Time" under -850 mV Polarized Potential under Cathodic Protection Criteria.	January 1, 2011	April 1, 2012

CORR 2.19	<p>4.: Added "as near to" and "as" in the first sentence. Clarifies that when measuring P/S at a major foreign pipeline crossing, the reading should be taken "as near" to directly over the actual crossing "as" possible. This allows flexibility in cases where the crossing is not readily accessible due surface conditions such as under pavement or water.</p> <p>5. C.: Corrected format by adding "C."</p>	Janu- ary 1, 2011	April 1, 2012
CORR 2.20	<p>5. D.: Corrected formatting by replacing "E." with "D."</p>	Janu- ary 1, 2011	April 1, 2012
CORR 2.21	<p>9. B.(2): Corrected Surface Area formula for calculating square feet of surface area.</p> <p>9. B. Schematic Notes: Typical Current Application at a residential meter set: Revised "Notes: 1." Removed the requirement that the interrupter "on cycle" does not have to be "3 times" the "off cycle". Added "(usually time on is longer than time off)</p>	Janu- ary 1, 2011	April 1, 2012
CORR 2.23	<p>2.: Updated the Stock Number for the 6" x 6" Insulator Square. Stock Number is 25 59 128 replaces the former IP stock number.</p>	Janu- ary 1, 2011	April 1 2012
CORR 2.24	<p>2.: Revised "When to Test" when checking for stray currents. Added "when rectifier installations are discovered near Ameren facilities" to the list of locations where low potential readings may indicate stray currents.</p> <p>3. A.: Added a clarification when performing test, potentials should be taken along the Ameren pipeline at 5 feet to 10 feet intervals which constitutes a "close interval survey".</p>	Janu- ary 1, 2011	April 1, 2012
CORR 2.25	<p>3. H. (2)(c): Added Stock Number for Over Voltage Protector</p>	Janu- ary 1, 2011	April 1, 2012
CORR 2.27	<p>6. B. (8): Revision to Point designation for the input taps to Point C from Points D & E on the typical rectifier circuit drawing in Troubleshooting Procedures</p> <p>6. B. (19): Correction made, changed "not" to "no". Now reads: "If DC voltage is present at the rectifier output terminals, but no current is flowing, there is an open in one of the external DC leads."</p> <p>8. B. (2): In Troubleshooting Tips, revised "If maximum DC output amps at rated DC volts is half output" there are checks listed that should be made. This is a revision from; If maximum DC output voltage at rated DC current is half output."</p> <p>8. C.: Revised Typical Rectifier Circuit drawing by adding a fuse between Points D and F.</p>	Janu- ary 1, 2011	April 1, 2012

8. D.: Added a second Rectifier Circuit Diagram.

CORR 2.28	2. B. (3): Deleted the Note below Table 1 that addressed wall thicknesses for pipe diameters not listed in table.	January 1, 2011	April 1, 2012
CORR 2.29	<p>1. B. (1)(a) & (1)(b): Major revision to Construction Order Review Process for projects prepared by the Belleville and Peoria Design Centers that have an impact on steel gas facilities. Revisions detail the involvement with Corrosion Control personnel during "Preconstruction - Proposed Work" and "Preconstruction - Final Design" processes.</p> <p>1. B. (1)(c): Revision made to the "Post Construction - As Builds" now include a table listing Corrosion Technician/Engineer responsible for Corrosion Control within each Division and Operating Area.</p> <p>1. C. thru 1. E. of the January 1, 2011 O&M have been deleted. Procedures by legacy companies have been deleted since project design will be performed by either the Design Centers in Belleville & Peoria or Gas Engineering.</p> <p>1. B. (2): Clarified Gas Engineering Work as "working designed outside of DDC process". Gas Engineering Work would typically be performed by Gas Operations and Services- Engineering or Division based Gas Engineer' 2. A. (7): Revision made to the instruction for Tracking Repair Orders on the CP Deficiency Tracking and Completed Orders SharePoint Site. Instructions now state: "Entering in the completion date removes the test point from this view but the re-read must be entered into CTS before entering the completion date in Share Point for the order. When the weekly update is done, the completed order is moved to the Completed Orders list.</p>	January 1, 2011	April 1, 2012
CORR 2.30	2. G. (5): Inserted New item when Buried Pipe Examination should be completed: "Retirement of a gas main or service - the form should be filled out for the main remaining in service after the retirement. If there is bare metal exposed on the steel main or if a steel service off of the steel main is retired, a pipe-to-soil potential shall be taken on the main remaining in service or on the steel service stub."	October 1, 2011	April 1, 2012
CORR 3.13	Added a second drawing showing test lead connections to the pipe adjacent to the insulated flanges as an alternate to connecting test leads to the flanges	February 1, 2010	April 1, 2012
CORR 3.15	<p>2. B.(1): Added the word "typically". " A 20' x 500' easement is typically required for the rectifier installation</p> <p>3.: Typical Rectifier Installation with Linear SPL (SOCK) Anode System has been deleted from Standard Design.</p> <p>3.: is now Rectifier Ground Bed Anode Installation</p>	January 1, 2011	April 1, 2012

- 3. A.: Added a Note below the drawing; "Overall canister length is 7 feet"
- 3. B.(3): Increased the recommended depth of anode hole to 10 feet from 9 feet.
- 3. C.: In the Material List for Stock No. 49 22 404, added to the anode package description "total length of package is 84" (7 feet)".
- 4. B.: In Rectifier Ground Bed Header Lead Connection now specifies a #4 & strand CP cable. This is a change from a #2 cable.

**DAMG
1**

- 3. E.: Deleted "When practical use white paint, flags or stakes to outline proposed excavation."
- 4. A.(6): New procedure added for personnel standing by on a difficult to locate gas facility. If the gas facility is exposed by the excavator, gas personnel should obtain and record measurements that can be used for future locating. Service line measurements should be recorded on the Service Transaction Card/Sheet or Service Record Card. Measurements taken on mains should be submitted to the appropriate group for recording on electronic gas system maps.

If the gas facility is PE pipe, gas personnel should check for the presence of a tracer wire. If tracer wire is in good condition, gas personnel should report it to their gas supervisor for follow-up to see if wire had possibly been cut and could be repaired.

January 1, 2012 April 1, 2012

**EMER
2.02**

- 3. D.: Updated contact information for Gas Technical Services personnel. During cold weather electrical outage dispatcher may need to contact GTS prior to restoring electrical service. Gerry Turner is initial contact with the other GTS supervisors as alternate contacts for their respective divisions.

January 1, 2011 April 1, 2012

**EMER
2.08**

- 1. B.: Added language that the Supervising Engineer of Distribution Integrity Management Program (DIMP) be involved in determining what actions should be taken as a result of failed material analysis.
- 2. F.: Updated the Failed Gas Material Tag and added the Stock Code number for the tag.
- 2. G. (4): Inserted a new item under actions Gas Compliance takes after being notified of failed or defective material: "Notify the Supervising Engineer of the Distribution Integrity Management Program of the failure and results of the pipeline."
- 2. G. (5): Deleted "and other identified gas operating personnel". Gas Coordinators will be notified and they will distribute the information to the appropriate operating personnel.

January 1, 2011 April 1, 2012

FORW

- 5.: Gerry Turner's name and phone numbers replaced Vern Maas in the Contacts

October 1, 2011 April 1, 2012

LEAK 2.01	1. B.: Deleted this item - "An indoor odor complaint should be responded to immediately." 1. A. states response to all leak and odor complaints in a priority manner.	October 1, 2011	April 1, 2012
LEAK 2.04	10.: Updated Ameren Illinois Leak Classification Guidelines card. Deleted classification for an Above Grade leak with Wall to Wall Paving since this is not an applicable classification	October 1, 2011	April 1, 2012
LEAK 2.07	2. A. (9)(f): Revised wording of an item to inspect for on meter set during Transmission Survey. "Corroded bolts on banded regulators. (Rockwell 8012, Lancaster Model 61, Universal Model 61)"	October 1, 2011	April 1, 2012
	2. A. (9)(g): Deleted requirement for notifying Gas Supervisor of banded regulators. Banded regulators with corroded bolts are to be reported as indicated in (f).		
	2. B. (7)(f): Revised wording of an item to inspect for on meter set during Distribution Survey. "Corroded bolts on banded regulators. (Rockwell 8012, Lancaster Model 61, Universal Model 61)"		
	2. B. (7)(g): Deleted requirement for notifying Gas Supervisor of banded regulators. Banded regulators with corroded bolts are to be reported as indicated in (f).		
	2. C. (12)(h): Revised wording of an item to inspect for on meter set during Business District Survey. "Corroded bolts on banded regulators. (Rockwell 8012, Lancaster Model 61, Universal Model 61)"		
	2. C. (12)(i): Deleted requirement for notifying Gas Supervisor of banded regulators. Banded regulators with corroded bolts are to be reported as indicated in (h).		
	2. E. (8)(h): Revised wording of an item to inspect for on meter set during Inside Meter Survey. "Corroded bolts on banded regulators. (Rockwell 8012, Lancaster Model 61, Universal Model 61)"		
	2. E. (8)(i): Deleted requirement for notifying Gas Supervisor of banded regulators. Banded regulators with corroded bolts are to be reported as indicated in (h).		
LEAK 2.08	2.: Added "Portable" to Flame Ionization Instrument to distinguish between the hand-held and mobile FI instruments.	October 1, 2011	April 1, 2012
	2. E.: Expanded language for inspecting and calibrating an FI unit by stating inspection and calibration shall be performed in accordance with manufacturer's operating manual. See LEAK 4 which has the various manufacturers' operating manuals		
	2. F.: Revised language to state "Follow the manufacturer's operating manual instructions for the FI unit being used for start-up procedures, required maintenance such as filters, daily operational checks and operating instructions.		

- 3. I.: Added to Gas Detection Instruments, "Follow the instrument's operating/instruction manual for calibration procedures, daily operational check, instrument inspection and maintenance, and operating instructions. See LEAK 4."
- 4. F.: Added to Combustible Gas Indicator instruments, "Follow the instrument's operating/instruction manual for calibration procedures, daily operational check, instrument inspection and maintenance, and operating instructions. See LEAK 4."
- 6. D.: Expanded language for inspecting and calibrating an FI unit by stating inspection and calibration shall be performed in accordance with manufacturer's operating manual. See LEAK 4 which has the various manufacturers' operating manuals
- 6. E.: Revised language to state "Follow the manufacturer's operating manual instructions for the FI unit being used for start-up procedures, required maintenance such as filters, daily operational checks and operating instructions.
- 6. F.: Deleted "Filters in the sampling tubes mounted on the front of the vehicle should be checked daily and replaced weekly when being used continuously for leak survey." This would be included in manufacturer's instructions.
- 7. B.: Added daily checks and maintenance for the Remote Methane Leak Detector (RMLD) be in accordance with manufacturer's operating manual.
- 8. F.: Added daily checks and maintenance for the Optical Methane Detector (OMD) be in accordance with manufacturer's operating manual.

<u>LEAK</u> <u>2.09</u>	1. G.: Inserted new: "In agricultural areas, leak survey should be performed when the height or density of crops will not hinder the surveyor in walking the approximate location of the gas line or the ability to detect leakage."	January 1, 2012	April 1, 2012
<u>LEAK</u> <u>4</u>	Form 05 updated, removed Send to Gas Compliance Specialists since the information can be entered into GCS by local operations	January 1, 2012	April 1, 2012
<u>MAIN</u> <u>1</u>	3. A.: Removed "A depth of 30 inches is recommended for distribution and high pressure distribution mains." from below the minimum depth table.	January 1, 2012	April 1, 2012
METR 0	Title change in METR 2.14 7. Atmospheric Corrosion Inspection Follow-up METR 4: Added Reference 05 - Fisher CS800 Series Instruction and Parts Manual	January 1, 2012	April 1, 2012
METR 2.04	4. C.: Updated the Periodic Testing requirements for a ultrasonic meter. Ultrasonic meter must be interrogated twice a calendar year, not to exceed 7-1/2 months. The pressure and tem-	January 1, 2011	April 1, 2012

perature transducers shall be calibrated at the same time as the meter is interrogated.

METR 2.14	2. B.: Revised: "Supervisor Gas Metering will establish the correctors to be inspected each calendar year and have OAS orders created."	January 1, 2011	April 1, 2012
	2. C.: New added: "The Gas Technical Services Supervisor is responsible for scheduling the annual inspection of electronic correctors."		
	5. B.: Added "F." behind $\pm 1^\circ$		
	6. C.(1): Expanded instructions for Battery Maintenance when main battery has low reading. "If the voltage is at or below 5.50 volts for the 9 volt replacement packs and 4.3 volts for the 6 volt receptacle packs, replace the battery pack or the D-cell batteries."		
	6. D. (2): New added in the Follow-up Action: "Proper notification of potential billing adjustments shall be communicated to CAD by the GTS Supervisor."		
	6. E.: New added Atmospheric Corrosion Inspections;		
	6. E.(1): New: Atmospheric Corrosion (Y/N)		
	6. E.(2): New: Disbonded Coating (Y/N)		
	6. E.(3): New: Needs Painting (Y/N)		
	7.: New: Atmospheric Corrosion Inspection Follow-up 7. A.: New: Gas metering facilities that have any of the corrosion control inspection activities marked (Y) for YES shall be documented in the Gas Compliance System for tracking and scheduling of any follow-up actions that are required.		
	7. B.: After initial review by the immediate Gas Supervisor, the appropriate information shall be sent to the Superintendent Corrosion Control, (Mail Code D-47), for final review and data entry into GCS.		
	7. C.: The corrective action work required will follow the procedures identified in the Corrosion Control section (CORR) of the Gas Operating and Maintenance Plan.		
	8. A.: New in Records: The electronic corrector inspections shall be completed in OAS.		
	8. C.: New in Records: The completed form shall be reviewed by the GTS supervisor and forwarded to IL Metering.		
METR 3.01	Correction on Roots 5 / 5.5 M 175 and on Note 3. American 5.5M. Original had 5.3M	January 1, 2012	April 1, 2012
METR 3.03	2.: Added a Stock Number for the 3/4"x 1" American 1813C, 1/4" orifice plus added (4) footnote that addresses inlet pressure greater than 48 psig and required relief valve.	January 1, 2012	April 1, 2012

Added (4) footnote to 1" x 1" American 1813C, 1/4" orifice for inlet pressure greater than 48 psig and required relief valve.

Added 1-1/4" American 1813C-HC, 1/4" orifice to the approved regulators for 7" w.c. delivery.

Replaced the 2" Fisher S203's with 2" Fisher CS803-IT regulators. Note the change in orifice sizes: 1/4" orifice is now 3/8" x 1/4", the 3/4" orifice has been replaced by a 5/8" orifice, and the 1".

Revised Note 3. To reflect the Main and Monitor springs for the Fisher 803-IT

Added Note 4. That addresses the relief valve size and spring setting required for operating pressures greater than 48 psig for the American 1813C and 1813C-HC regulators.

METR 3.04	<p>2.: Added a Stock Number for 3/4" x 1" American 1813C, 1/4" orifice for delivery pressure of 2 psig.</p> <p>Added 1-1/4" American 1813C, 1/4" orifice to the approved 2 psig delivery pressure regulators.</p> <p>Replaced the 2" Fisher S203H regulators with 2" Fisher CS823-IT regulators. Note the change in orifice sizes: 1/4" orifice is now 3/8" x 1/4" and the 3/4" orifice has been replaced by a 5/8" orifice.</p> <p>Note 5. Revised to reflect Main and Monitor springs for the Fisher CS823-IT regulators.</p>	Janu- ary 1, 2012	April 1, 2012
METR 3.05	<p>2.: New added 2" Fisher CS823-IT, 1/2" orifice and 2" Fisher CS823-IT, 3/4" orifice regulators to the approved 5 psig delivery pressure regulators. Provided capacity information.</p> <p>Changed the note designation to (2) for the 2" Fisher 299H, 1/2" orifice with inlet pressure of 60 psig.</p> <p>Replaced Note 3. with Main and Monitor spring specifications for the 2" Fisher CS823-IT.</p>	Janu- ary 1, 2011	April 1, 2012
METR 3.06	<p>2.: Inserted 1-1/4" Fisher CS400IR, 1/4" orifice as an approved alternate regulator for 7" w.c. delivery. Capacity information is included.</p> <p>Added Note 6. with Main spring specification, and instructions not to exceed 54 psig MAOP due to limited internal relief capacity.</p> <p>3.: Inserted 1-1/4" Fisher CS400IR, 1/4" orifice as an approved alternate regulator for 2 psig. delivery. Capacity information is included.</p> <p>Added Note 6. with Main spring specification and set point information.</p>	Janu- ary 1, 2012	April 1, 2012

METR 3.07	Meter Set Design Standards: Added Maximum Emergency Pressure (MEP) for 7" w.c., and 2 psig delivery pressures.	January 1, 2012	April 1, 2012
thru METR 3.14	Maximum Emergency Pressure is 2 psig downstream of meter set for 7" w.c. delivery pressure. Maximum Emergency Pressure is 6 psig downstream of meter set for 2 psig delivery pressure.		
METR 3.16	Revised 15C Compact Meter Set, 7" w.c., to reflect new Fisher CS803-IT regulator. Revised Material List to reflect new regulator and deleted a nipple and elbow formerly used in vent. Installation 2.: Added - Maximum Emergency Pressure (MEP) is 2 psig downstream of meter set	April 1, 2010	April 1, 2012
METR 3.17	Revised 15C Compact Meter Set, 2 psig, to reflect new Fisher CS823-IT regulator. Revised Material List to reflect new regulator and deleted a nipple and elbow formerly used in vent. Installation 2.: Added - Maximum Emergency Pressure (MEP) is 6 psig downstream of meter set	April 1, 2010	April 1, 2012
METR 3.18	Revised 15C/3M Meter, 7" w.c., to reflect new Fisher CS803-IT regulator. Revised Material List to reflect new regulator and deleted a nipple and elbow formerly used in vent. Installation 2.: Added - Maximum Emergency Pressure (MEP) is 2 psig downstream of meter set	April 1, 2010	April 1, 2012
METR 3.19	Revised 15C/3M Meter Set, 2 psig, to reflect new Fisher CS823-IT regulator. Revised Material List to reflect new regulator and deleted a nipple and elbow formerly used in vent. Installation 2.: Added - Maximum Emergency Pressure (MEP) is 6 psig downstream of meter set	April 1, 2010	April 1, 2012
METR 3.20	Installation inserted 2. Maximum Emergency Pressure is 10 psig downstream of meter set for 5 psig delivery pressure.	April 1, 2010	April 1, 2012
METR 3.21	Revised 5M/7M, 7" w.c., to reflect new Fisher CS803-IT regulator. Revised Material List to reflect new regulator and deleted a nipple and elbow formerly used in vent. Installation 2.: Added - Maximum Emergency Pressure (MEP) is 2 psig downstream of meter set	April 1, 2010	April 1, 2012
METR 3.22	Revised 5M/7M Meter Set, 2 psig, to reflect new Fisher CS823-IT regulator. Revised Material List to reflect new regulator and deleted a nipple and elbow formerly used in vent. Installation 2.: Added - Maximum Emergency Pressure (MEP) is 6 psig downstream of meter set	April 1, 2010	April 1, 2012

METR 3.23	Maximum Emergency Pressure is 10 psig downstream of meter set for 5 psig delivery pressure.	April 1, 2010	April 1 2012
METR 4	Added Reference 05 - Fisher CS800 Series Instruction and Parts Manual	Janu- ary 1, 2011	April 1, 2012
PMRK 3.02	1.: Updated Carsonite pipeline marker sticker that has the 1-800-755-5000 phone number. Added a table for the Replacement Sticker with Stock Number.	Janu- ary 1, 2011	April 1, 2012
POLY 2.02	2. B.: Added "Inspect the pipe for damage" to the sentence "clean the area where the squeeze is to be made."	May 1, 2010	April 1, 2012
POLY 3.02	4.: Stock Code 19 22 351 originally assigned to the Innogaz 2"IPS x 1 1/4"IPS has been combined with Stock Code 19 22 248 which was originally assigned to the Friatec reducer coupling. Currently, only the Innogaz reducer coupling is being purchased and stocked under 19 22 248.	Janu- ary 1, 2012	April 1, 2012
PTRL 2.01	2. B. Table: Removed "Critical Area Patrols" from column heading.	Janu- ary 1, 2012	April 1, 2012
PTST 0	In PTST 2.04 added 4. Utilizing Compressed Gas Cylinder	Octo- ber 1, 2011	April 1, 2012
PTST 1	3. A.: Added "PE and Steel" in front of distribution main. 3. E.: Inserted procedures for required testing of farm tap piping. 3. E. (1): Testing procedures for farm taps with a single pressure reduction. 3. E. (2): Testing procedures for farm taps with two stage pressure reduction. 3. E. (3): Regulator(s) and relief valve shall be removed during pressure test. 3. E. (4): Following the pressure test, the regulator(s) and relief valve connections shall be soap tested at normal operating pressure. 4. D.: New: "PE pipe shall not be hydrostatically pressure tested. 7. B.: Added two additional items to the Pretested Appurtenances: Kerotest & PSI Weld-in Insulators and Kerotest Rotary Meter Loops.	Janu- ary 1, 2012	April 1, 2012

PTST 2.04	<p>4: New item inserted: Utilizing Compressed Gas Cylinder 4. A.: An adjustable regulator with gauges for upstream and downstream pressures is required for pressure testing applications.</p> <p>4. B.: Regulator, valves, gauges, hoses, and fittings designed and rated for the intended application and pressure shall be used. 5. C.: Added under Tube Trailer Requirements: "If nitrogen is used, initial cooling may occur causing the pressure to rise. If Nitrogen from a liquid transport is used, ensure only vaporized nitrogen is introduced in the pipe."</p>	January 1, 2011	April 1, 2012
REPR 1	<p>1. L.: Additional wording added to emphasize importance of contacting corrosion control personnel when the repair of steel pipe involves installing a section of PE pipe. Corrosion control personnel must ensure the cathodic protection of the affected pipeline segment is being met, maintained, and is adequate.</p> <p>2. F.: Added "Corrosion and Steel Damage Evaluation shall be completed by the appropriate and qualified individual. See CORR 2.31" when there is a leak repair is a result of corrosion.</p> <p>2. G. New item added "Depending on the condition of the pipe, pipe coating and extent of the corrosion, Corrosion Control personnel should determine if further investigation and testing is needed to ensure adequate cathodic protection is being maintained."</p> <p>4. C. (1): In Non-Leaking Pipe Defects added a sentence "See Approved Repair Methods tables as to when deposition welding can be used."</p> <p>4. H.: Welded Full Encirclement Split Sleeve section has been revised. Previous references to the 1/4" vent holes have been moved to the WELD 2.04 which contains installation instructions.</p> <p>4. H. (3): New items that address preparing the pipe for the installation of the full encirclement sleeve: cleaning the pipe and removing the coating. If there is severe corrosion present, Gas Supervisor should be contacted to determine if split sleeve is appropriate. Gas Supervisor may need to consult with Gas Engineering and/or Corrosion Control personnel.</p> <p>4. H. (5): Added "Welding of the full encirclement sleeve shall be in accordance with manufacturer's instructions and WELD 2.04.</p> <p>8. A.: Under Service Line Repairs added "Compression couplings can be used for Make Safe repairs on distribution service."</p>	January 1, 2012	April 1, 2012
RNST 0	<p>RNST 2.01: Inserted new: RNST 2.01 3. Reconnection of Temporarily Disconnected Farm Tap Services</p>	January 1, 2012	April 1, 2012

RNST 2.01	<p>3.: Inserted a new item "Reconnection of Temporarily Disconnected Farm Tap Services"</p> <p>3. A.: New: "When possible it is recommended that only the regulator head be removed, leaving the regulator body connected to the farm tap piping. Utilizing this method will not require testing the service line prior to replacing the regulator because the service line has not been disconnected from the gas source."</p> <p>3. B. (1) & (2): New: Provides the testing requirements for existing single stage and two-stage farm taps if the regulator(s) have been removed from the farm tap piping. Single stage farm taps require testing of the service line at 90 psig. Two-stage farm taps require testing of the piping between the two regulators to be tested at 1.5 times the inlet MAOP, PTST 1 and PTST 2.01. The service line from the outlet of the second regulator is to be tested at 90 psig.</p> <p>3. B. (3): New: "Regulators and relief valves shall be removed during the pressure test."</p> <p>3. C: New: "Regulator and relief valve connections shall be soap tested at normal operating pressure once service has been reinstated."</p>	January 1, 2012	April 1, 2012
SERV 1	<p>8. G.: Delete the word "General" from the first sentence. Inserted references to Service Standards, SERV 3.01, 3.02, 3.03 and 3.04, to be followed when installing either a flex riser or a rigid riser. 9. C.: New inserted: "Service line being pressure tested shall be disconnected from the meter set or customer piping while the line is under test and until the test pressure has been released."</p>	January 1, 2012	April 1, 2012
SERV 2.03	<p>4.: Testing of farm tap piping section was rearranged and wording revised.</p> <p>4. A.: Revised wording to simply state that farm tap piping shall be tested in accordance with PTST 1 which specifies procedures for farm tap piping.</p> <p>4. C.: Revised to specify all connections between the inlet riser and outlet riser shall be soap tested at operating pressure after regulator(s) and relief valve are installed.</p>	January 1, 2011	April 1, 2012
STLP 1	<p>10. Buried Pipe Examination</p> <p>11. Corrosion and Steel Damage Evaluation</p> <p>These items were listed on the October 1, 2011 O&M update but were inadvertently left off the January 1, 2012 O&M update.</p>	January 1, 2012	April 1, 2012
VALV 2.01	<p>4. C. (1): Added "Any work or equipment change that increases station capacity is considered a rebuild." Clarification on what constitutes a rebuild for pre - March 31, 1971 stations.</p>	January 1, 2011	April 1, 2012

4. C. (3)(c): Added "with same or equivalent as long as station capacity does not increase" to distinguish between maintenance work and station rebuild.

4. C. (3)(i): Added "as long as station capacity does not increase" to distinguish between maintenance work and station rebuild.

WELD 0	Added Reference 47 under WELD 4	January 1, 2012	April 1, 2012
WELD 2.04	<p>1. B.: Removed the word "petroleum" from in front of gas. Maintenance welding is any welding performed on pipeline or pressure piping system that contains gas or any liquid under static or flowing conditions.</p> <p>6. D. (2): Insert new item that addresses utilizing the vent holes in the full encirclement sleeves for venting of gas during repair. An appropriate weld fitting should be welded over the vent hole. The vent stack would be connected to the weld fitting. Following completion of repair, a steel plug/cap would be installed in the weld fitting and welded to prevent removal.</p> <p>6. D. (12): Added "The sleeve shall be coated with an approved coating. See CORR 2.03"</p>	January 1, 2012	April 1, 2012
WELD 2.09	<p>3. A.: Added personnel operating the thickness gauge shall be thoroughly familiar with manufacturer's instructions in the operation, application, and calibration of the instrument.</p> <p>3. B: Deleted the sentence about personnel using the ultrasonic wall thickness instrument having to demonstrate their proficiency to authorized Ameren Representative.</p>	January 1, 2012	April 1, 2012
WELD 4	Added Reference 47: ENE - Ameren-ISW-02 Thin Wall, GMAW welding procedure specification and supporting welding procedure qualification report. (Wire, in-service welding procedure)	January 1, 2012	April 1, 2012

Supersedes: January 1, 2012

CHANGE SUMMARY

January 1, 2012

Change Summary January 1, 2012

Docu- ment	Change Summary	Previ- ous Docu- ment Dated	Current Docu- ment Dated
BORE 2.02	<p>2. H.: Inserted "and where applicable exposed" so that the sentence reads: Underground utilities shall be located, marked, and where applicable exposed prior to proceeding with boring operations.</p> <p>3. A. (2): Added under Conventional Rod Boring: All marked buried facilities crossing the proposed bore path or are within the 18" tolerance zone should be exposed or verified not to be in conflict with boring and back reaming operations. Pot holes should be of such depth to ensure the buried facilities will not be damaged by boring and back reaming operations.</p> <p>3. A. (3): Clarified an in-depth job briefing covers all of the subjects on the Job Briefing Form with a reference to EXCV 4 which has a copy of the form.</p> <p>4. A. (1) - (3): Revised by using essentially the same language as used under 3. Conventional Rod Boring - A. Prior to beginning pneumatic piercing tool operations: Ensure proper job site protection, expose or verify buried facilities crossing or are within 18" of bore path are not in conflict, and conduct in-depth job briefing.</p> <p>4. A. (3): Clarified an in-depth job briefing covers all of the subjects on the Job Briefing Form with a reference to EXCV 4 which has a copy of the form.</p> <p>4. M. (4): Added a 4th item that workers should check while the piercing tool is in operation: Observe the pot holes as the piercing tool passes the pot hole(s).</p> <p>5. A. (1) - (5): Revise to use consistent language for "Prior to beginning operation" as used under Pneumatic Piercing Tool and Conventional Rod Boring operation.</p> <p>5. A. (1): Revised wording to clarify that the drilling supervisor should visually inspect the planned drill path to ensure all known buried utilities and substructures that cross or are within the 18" tolerance zone have been identified, exposed, or verified not to be in conflict with the boring or back reaming operations.</p> <p>5. A. (2): Inserted a new item: If sewer line, main or laterals, are not exposed or their depth are not verified, Gas Supervisor should refer to BORE 2.04 for available options. BORE 2.04 is Boring Across or Near Sewer Lines.</p> <p>5. A. (4): Inserted a new item: Ensure proper job site protection and required traffic control is in place.</p>	Janu- ary 1, 2011	Janu- ary 1, 2012

UNCONTROLLED IF PRINTED

5. A. (5): Inserted a new item: Gas Supervisor, crew leader, or foreman should conduct in in-depth job briefing covering all of the subjects on the Job Briefing Form with entire crew.

5. L.: Changed "Test holes can be used" to "Pot Holes should be used".

5. AA.: Inserted "Pot holes should be used to observe the back reamer as it passes to ensure there is no damage to exposed utilities and other structures."

5. EE - 5. GG.: Moved the following items from BORE 2.03 4. I. thru K. Items address disposal of drilling mud and spoils associated with directional boring.

5. EE.: Dispose excess drilling mud in compliance with local ordinances, regulations, and environmentally sound practices.

5. FF.: Biodegradable additives for producing drilling mud are available.

5. GG.: Spoils and drilling fluids are not permitted to be disposed of into storm, sanitary, or other drainage systems.

BORE 2.03

1. E.: Added "Installing pipe should be planned so that back-reaming and pull in for a leg can be completed on the same day."

Janu- ary 1, 2011	Janu- ary 1, 2012
-------------------------	-------------------------

2. H.: Added "breakaway device" as an option to a weak link that can be used when pulling PE pipe through bore hole.

2. J.: Deleted reference to table number for the Maximum Load Tension.

2. K.: Inserted new item: Shear pins that do not exceed the maximum load tension of the pipe being pulled should be installed in the breakaway device."

2. S. - X.: These items were originally under BORE 2.03 4. PE and Steel Pipe. ICC requested they be put under the separate PE Pipe and Steel Pipe sections.

2. S.: "If possible, the pipe and back reamer should be observed as they pass through the pot holes"

2. T.: "It is recommended that an additional length of pipe that is 1% of the length of pull or 10 feet, whichever is greater, be pulled through the entrance pit" Added reference to REPR 1 if damage has occurred to pipe.

2. U.: "The annular region between the pipe and the bore-hole should be filled with drilling mud....."

2. V.:" Drilling mud in this annular region should not be removed after installation, but permitted to solidify...."

2. W.: "Pipe should be pulled into the hole before the drilling mud sets up."

2. X.: "An additional pipe length, sufficient for joining the next segment, should be pulled into the entrance pit."

UNCONTROLLED IF PRINTED

2.: Maximum Allowable Load Tension (ATL) table: Updated with revised Maximum Allowable Load Tension that can imposed on MDPE and HDPE pipe as it is being pulled through the bore hole or plow trench. Maximum tension was calculated using Performance Pipe technical references. The maximum pull length of pipe has been deleted from the new table.

3. C.: Inserted new item: "Weld joints will be coated with liquid epoxy and covered with a sacrificial hot wrap tape or two layers of hot wrap tape. Tape shall be applied toward the pulling head of the pipe. A sacrificial piece of tape may be applied to the lead edge to help prevent any rollback of the tape."

3. E. - J.: These items were originally under BORE 2.03 4. PE and Steel Pipe. ICC requested they be put under the separate PE Pipe and Steel Pipe sections.

3. E.: "If possible, the pipe and back reamer should be observed as they pass through the pot holes"

3. F.: "It is recommended that an additional length of pipe that is 1% of the length of pull or 10 feet, whichever is greater, be pulled through the entrance pit" Added "depending on nature of damage, contact Gas Operations and Services engineering and/or corrosion control personnel to determine extent of investigation and procedures to utilize. Added reference to REPR 1.

3. G.: "The annular region between the pipe and the bore-hole should be filled with drilling mud....."

3. H.: " Drilling mud in this annular region should not be removed after installation, but permitted to solidify...."

3. I.: " Drilling mud in this annular region should not be removed after installation, but permitted to solidify...."

3. J.: "An additional pipe length, sufficient for joining the next segment, should be pulled into the entrance pit."

BORE 2.04

2. C.: Revised to "Consider obtaining maps and drawings of sewer system from the city or other entity. Maps can provide location and approximate original installation depth" ICC pointed out the depth on these maps may not be accurate today due to changes in surface configuration. Maps should provide a good indication of location.

Janu- ary 1, 2011	Janu- ary 1, 2012
-------------------------	-------------------------

2. F.: Revised by adding "Regardless of which step is taken to identify potential conflict with sewer line the only way to verify location and depth of sewer main or lateral is by physically exposing the line. If location of the line is known, excavate a sufficient depth below the proposed bore path to verify the sewer line is deep enough that it will not be damaged by the drill head or back reamer."

2. F. (1): Revised to "Access available outside and inside clean-outs and measure depth of the sewer line lateral. Use of steel tape or similar item and a pipe locator may assist in determining location of sewer lateral. Worker should avoid direct

contact with contents of the sewer line by using rubber/neoprene gloves, protective eye wear, and coveralls." ICC pointed out that locators should not be used to determine depth of sewer line.

2. F. (3): Added a sentence when obtaining depth of sewer line by measuring at manholes. "On gravity flow sewer mains, it is reasonable to assume sewer line has a constant grade between manholes. The depth to the top of pipe below the surface can be determined based on that fact. The same is not true for forced sewer systems."

2. F. (4): Combine two bullet points with regards to estimating approximate depth of sewer base on where it exits the structure. Drawings that represent typical sewer installation can be found at the end of this section.

2. F. (5): Repeated that sewer lateral depth must be verified by exposing or excavating a sufficient depth below the proposed bore path to ensure the lateral will not be damaged by the drill head and/or back reamer.

2. G.: Inserted new item concerning forced sewer lines. "Forced sewer system mains and laterals must be physically exposed or pot holes excavated to a sufficient depth below, below proposed bore path to ensure the sewer line will not be damaged by drill head or back reamer."

2. H.(3): Inserted " Use of sewer listening device as described below in 3. H." to the options that can be used when location of sewer lines and laterals cannot be positively identified.

3. D.: Revised to "Every effort should be made to maintain a separation of 1 foot between buried utilities and structures upon final installation of the gas main and/or service. Added reference to MAIN 1 or SERV 1 which describe measures that can be taken when separation is less than 1 foot.

<u>CONS</u> <u>0</u>	Corrected "affective date" from January 1, 2010 to January 1, 2011	January 1, 2010	January 1, 2011
<u>CONS</u> <u>1</u>	5. C.: Quality Assurance forms are to be sent to the Superintendent Gas Quality Assurance.	October 1, 2011	January 1, 2012
<u>DAMG</u> <u>0</u>	DAMG 1 revised to 7.: Excavating Near a Transmission, High Pressure Distribution, or 8" and Large Main 8.: Emergency Locate Requests Near Gas Transmission, High Pressure Distribution, or 8" and Larger Main 9.: Facility Location Information 10.: QA Process	January 1, 2011	January 1, 2012

UNCONTROLLED IF PRINTED

DAMG
1

- 4. A.: Deleted "Normal" since all JULIE Requests are handled in same manner.
- 4. A. (1): Revised to provide more detail in how JULIE reviews Requests and determines when a Dig Request Notice should be sent to Ameren Illinois requesting their facilities to be located and marked.
- 4. A. (2): Revised to provide more detail on how Ameren Illinois reviews JULIE Dig Request Notices to determine which facilities need to be located and marked.
- 4. B. (1): Revised - JULIE transmits Emergency Locate Requests directly to Ameren Illinois. Following a quick review, the Emergency Ticket can either be cleared or transmitted to the appropriate locating contractor.
- 4. C. (2): Clarified that paint or flags will be used to mark an excavation when no facility is present. Marking an excavation is one of the options for providing a response when Ameren Illinois does not have buried facilities present.
- 5. F.: Added an item for providing Damage Prevention information to excavator who is not calling JULIE prior to digging. When Ameren Illinois becomes aware of such contractor the contractor will be contacted, information provided and their name will be added to the list of known excavators.
- 7.: The entire section has been replaced with new procedures that describe actions now being performed under Ameren Illinois Damage Prevention's Watch & Protect program for excavations conducted within 15 feet of all gas transmission or high pressure distribution mains, or an 8" or larger gas main. Procedures outline the duties of the qualified personnel who monitor such excavations.
- 8.: The Emergency Locate Request Near Transmission Mains has now been expanded to also include all high pressure distribution mains and all mains 8" and larger.
- 9.: The original bullet point "9." has been deleted and those items have been incorporated into bullet point "7".
- Former 10. now is 9.: Revised to state that Operating Divisions and Business Unit is responsible for ensuring that "as-built" information is being submitted in a timely fashion to those individuals or groups responsible for maintaining the electronic gas system maps for their respective areas of responsibility. The Divisions or Business Units are not responsible for maintaining the maps since mapping is in process of being centralized.
- 10.: New section added that describes the Damage Prevention group Quality Assurance process for monitoring the performance of the locating company(s).

October 1,
2011

January 1,
2012

EXCV
2.03

- 2. B.: Revised to make consistent with EXCV 2.04 6.D. Excavation/Soils Checklist is required each day an excavation is left open and workers are entering the excavation. Clarified a

January 1,
2011

January 1,
2012

checklist is required when workers are entering the excavation. A daily checklist is not required for excavations left open and workers are not entering the excavation.

3. F. (2): Revised wording to a ladder that is labeled as meeting OSHA requirements. OSHA does not approve items.

GLOS

Added the following definitions:

Clean Construction or Demolition Debris (CCDD)

Pipeline Maintenance Welding

Qualified Welder

Qualified Welding Procedures

Uncontaminated Soil

INCD
0

Inserted new item: INCD 1 4. Service Interruption/Curtailment Notification which moved other items down one number

Changed INCD 1 7. To Reporting Matrix from Incident Reporting Matrix

INCD 4: Updated Potential Incident Report Form

January 1, 2011

January 1, 2012

INCD
1

2. A. (3): Revised: Deleted the "cost of lost gas" from: Estimated property damage exceeding \$25,000, including loss to Ameren Illinois and/or others.

2. A. (4)(e): Removed "Gas service interruption to more than 500 customer" from "Significant Event" that is reported in same manner as a Natural Gas Incident.

3. A. (1): Clarified when courtesy notification to the ICC as a result of "Fire and Police Emergency Response to a release of natural gas by moving items originally listed separately as 3. A. (3), 3. A. (4) and 3. A. (5) to a subset of 3. A. (1). This is meant to eliminate reporting every time the fire or police respond or are on the scene of a gas event.

3. A. (1) (a): Release of natural gas from Ameren Illinois facility that would result in evacuation of more than one residential customer.

3. A. (1) (b): Evacuation of multiple occupancy buildings such as restaurant, store, apartment, school, church, hospital, nursing home, factory, etc.

3. A. (1) (c): Closure of major road, highway, railroad, etc.

4.: Inserted a new item: Service Interruption/Curtailment Notification that lists events that are reported to IEMA and ICC.

4. A.: Gas service is interrupted to more than 500 customers or

4. B.: Supply or pressure problems cause the Company to curtail firm load to more than 50 customers.

October 1, 2011

January 1, 2012

6.: Updated by removing Tom Stassi from the Gas Compliance Contact List.

7.: Changed name to Reporting Matrix since it addresses more than a Natural Gas Incident.

7. Matrix Table: Items rearranged to match PHMSA's listings. Added a new item "Unintentional estimated gas loss of 3,000 MCF or more" Table also includes IEMA notification events.

<u>INCD</u> <u>4</u>	Form 03 - Potential Incident Report Form updated. The Reporting Matrix was renamed and rearranged to match the Reporting Matrix in INCD 1	January 1, 2011	January 1, 2012
<u>LEAK</u> <u>0</u>	Added LEAK 2.05 4. - Mechanical Fitting Leak. Was missed when October 1, 2011 revision were issued. LEAK 4: Added Reference 13 - 46 Hawk Manual	October 1, 2011	January 1, 2012
<u>LEAK</u> <u>2.09</u>	<p>1. A.: Added "laser diode based gas detection instrument" as an instrument that can be used for Walking Leak Survey. This is due to the Southern Cross 46 Hawk instrument that is now available.</p> <p>1. D.: Added a list of items that should be sampled when present along the route of the gas main and/or service: man-holes, catch basins, electric and telephone duct openings, and water meter boxes.</p> <p>1. G.: Added "laser diode based gas detection instrument's intake should be as close to ground surface as practical"</p> <p>1. G. (3): Inserted "The instrument's intake probe should be moved slowly from side to side as the surveyor walks along the general location of the gas line."</p> <p>1. H. (1): Inserted "The instrument's intake probe should be moved slowly from side to side as the surveyor walks along the general location of the gas line." When surveying service lines.</p> <p>1. I. (2): Added to surveying regulator stations, farm taps, outside meter sets; "If the instrument is equipped with probe stiffener, the stiffener can be used to extend the probe, if necessary, to sweep over the above ground piping."</p> <p>1. L. (1) (a): Added a statement "If the surveyor is using the Southern Cross 46 Hawk, a CGI is not necessary. The 46 Hawk can be used to classify leak since it will quantify and pinpoint below ground leaks." This is in reference to actions to be taken when the FI or Gas Detection Instrument indicates a possible Class 1 below ground leak.</p> <p>1. M.(1) (a): Revised list of adverse conditions that should be taken into consideration in determining if weather or conditions are suitable for a walking leak survey. Adverse weather conditions include: steady rain, standing water, heavy frost layer, or ice covering the ground surface.</p>	October 1, 2011	January 1, 2012

1. M. (1) (b): Added if the area to be leak surveyed is covered by one or more of the conditions listed in (a), a walking survey should not be performed. Survey could be moved to other areas not experiencing the conditions such as an area covered by a hard surface.

1. M. (1) (c): Added steady wind speeds of approximately 25 mph or greater may result in an inaccurate survey. When continuous, high wind condition exists, surveyor should be moved to an area that is shielded by buildings or geographic features.

1. M. (1) (d): Added when leak surveying over frozen ground, the surveyor should perform the survey in the same manner as if the gas line was under hard surface.

1. M. (2): Added "Snow cover has little effect on gas migration unless there is a frost cap or heavy frost under the snow."

LEAK
4

Added Reference 13 - 46 Hawk Manual

January 1, 2011 January 1, 2012

Correcting a printing error that had Mechanical Fitting Leak Data printed on back of Leak Survey Daily Report

Form 04 - Leak Survey Daily Report Form

Form 05 - Mechanical Fitting Leak Data Form

MAIN
1

3. B.: Added a requirement for recording locations on our electronic gas system maps where minimum cover could not be obtained when installing a gas main and additional protective measures had to be installed.

October 1, 2011 January 1, 2012

8. A.: Deleted the field tile exemption for the 12" clearance with gas transmission lines. The 12" clearance applies to all underground utilities and structures.

8. B.: Clarified the 12" clearance is for both vertical and horizontal directions from high pressure distribution and distribution mains.

8. C.: Inserted an item that provides some options for providing protection to a main if minimum cover cannot be achieved. Options include: installing a shield such as a sleeve, Tuff-N-Buff, rubber matting, fiberglass or PVC shield, or a casing pipe installed around or along the main. Gas Engineering may specify an alternative protection method.

8. F.: Added "steam pipes" as an example of a heat source to protect PE pipe from either by sufficient clearance or insulation.

11. C.: Revised backfill material requirements by increasing the minimum cover over the pipe from 3" to 12" of clean construction material, granular material equal to or less than 1/4" in size, or sand before excavated material containing larger material is placed in the excavation.

11. D.: Added description of acceptable excavated material that can be placed in an excavation after the initial cover is

placed. The excavated material should be free of rocks larger than 2", construction debris, concrete/asphalt chunks, brush, skids, or other material that could damage the pipe or coating.

11. E.: Added "If suitable material is not available to initially cover the pipe, a rock shield such as Tuff-N-Nuff or a rigid sleeve can be installed around the main, may be used in lieu of material listed in "C".

METR 0	<p>Added:</p> <p>METR 2.14 7. Corrosion Control Inspection Follow Up</p> <p>METR 2.19 7. Corrosion Control Inspection Follow Up</p> <p>METR 2.25 - Ultrasonic Meter Testing</p> <p>METR 3.03, METR 3.04 - Updated sizing tables with American 1813C regulator capacities</p> <p>METR 3.07 thru METR 3.14 - Updated by replacing Fisher HSR with American 1813C regulator.</p> <p>METR 4:</p> <p>Updated Form 01 - Electronic Corrector Inspection Form (January 1, 2012)</p> <p>Added:</p> <p>Form 04 - Ultrasonic Gas Flow Meter Inspection Form, Rev 1</p> <p>Added:</p> <p>Reference 02 - American 1813C Tech Bulletin</p> <p>Reference 03 - American 1813C Operating Instruction Manual</p> <p>Reference 04 - American 1813C Repair Parts</p>	Janu- ary 1, 2011	Janu- ary 1, 2012
METR 2.11	<p>5. B. (8): Revised to provide manufacturer specific instructions on replacing diaphragm meter indexes.</p> <p>6. C.: Inserted new item requiring contractor to provide an electronic copy of programming (marriage) and MRB (divorce) files for all meters where applicable.</p> <p>6. H.: Added procedures that will be followed by Ameren Illinois for sample testing meters repaired by contractor.</p>	Janu- ary 1, 2011	Janu- ary 1, 2012
METR 2.16	<p>3. B.: Added that additional copies of the completed Gas Meter Data Sheet should be sent to End User Transportation (EUT) for gas transmission customer and Customer Accounts (CAD) when there are potential billing adjustments.</p> <p>4. C. (1) (c): Changed Corrector Factor to Corrector Information in the Installation Information to match the form.</p>	Octo- ber 1, 2011	Janu- ary 1, 2012
METR 2.19	<p>3. D.: Added three corrosion control inspection items, atmospheric corrosion, disbonded coating, and needs paint when performing pressure factor verification.</p>	April 1, 2010	Janu- ary 1, 2012

UNCONTROLLED IF PRINTED

	7.: Added Corrosion Control Inspection Follow-up procedures and reporting requirements. Items have been added to the spreadsheet used when verifying pressure factors		
METR 2.25	Completely new section for Ultrasonic Meter Testing		January 1, 2012
METR 3.01	1. B.: Added Ameren Illinois Metering as another group to contact for selection of meters larger than 7M175 and delivery pressure greater than 5 psig. 3.: Added a note (4) to the American AC 250 that an alternate meter option is the Sensus R275 AccuWave.	January 1, 2011	January 1, 2012
METR 3.02	1. B.: Added Ameren Illinois Metering as another group to contact for selection of meters larger than 7M175 and delivery pressure greater than 5 psig. 3.: Table: Added the Rockwell R275 meter to the meter capacity table.	January 1, 2011	January 1, 2012
METR 3.03	Updated Regulator Sizing capacities for 7" w.c. Delivery Pressure. Replaced American 1813C for Fisher HSR and removed Fisher S303 no longer available	January 1, 2011	January 1, 2012
METR 3.04	Updated Regulator Sizing capacities for 2 psig Delivery Pressure. Replaced American 1813C for Fisher HSR	January 1, 2011	January 1, 2012
METR 3.06	Updated by removing American 1813C from the Alternate Approved list.	January 1, 2011	January 1, 2012
METR 3.07	Updated Standard with American 1813C regulators	April 1, 2010	January 1, 2012
METR 3.08	Updated Standard with American 1813C regulators	April 1, 2010	January 1, 2012
METR 3.09	Updated Standard with American 1813C regulators	April 1, 2010	January 1, 2012
METR 3.10	Updated Standard with American 1813C regulators	April 1, 2010	January 1, 2012
METR 3.11	Updated Standard with American 1813C regulators	April 1, 2010	January 1, 2012

UNCONTROLLED IF PRINTED

METR 3.12	Updated Standard with American 1813C regulators	April 1, 2010	Janu- ary 1, 2012
METR 3.13	Updated Standard with American 1813C regulators	April 1, 2010	Janu- ary 1, 2012
METR 3.14	Updated Standard with American 1813C regulators	April 1, 2010	Janu- ary 1, 2012
METR 4	Updated Form 01 - Electronic Corrector Inspection Form (January 01, 2012) By adding corrosion inspection items, pressure valve - found and as left position, CAD notification, and Supervisor review Added the following: Form 04 - Ultrasonic Gas Flow Meter Inspection Form, Rev 1 Reference 02 - American 1813C Tech Bulletin Reference 03 - American 1813C Operating Instructions Manual Reference 04 - American 1813C Repair Parts	Janu- ary 1, 2011	Janu- ary 1, 2012
ODOR 2.03	3. H.: Added "readily detectable" to clarify which odorant intensity reading has acceptable range of 0.1% up to 0.8% gas in air.	Janu- ary 1, 2011	Janu- ary 1, 2012
OQAL 0	Revised title of OQAL 1 13. To OQ Review Added OQAL 4 - Forms and Reference Materials Added Form 01 - Ameren Illinois Contractor Hiring Checklist	Janu- ary 1, 2011	Janu- ary 1, 2012
OQAL 1	12. D.: Added new section: Hiring Requirements for Contractors Qualified Under the Ameren OQ Plan. Provides requirements for hiring contractors who have to be qualified under Ameren's OQ Plan since the contractor either does not have an OQ Plan or has not been OQ'd by a third party.	Janu- ary 1, 2011	Janu- ary 1, 2012
OQAL 4	New section that contains: Form 01 - Ameren Illinois Contractor Hiring Checklist		Janu- ary 1, 2012
PMRK 1	2.: This section has been revised to better clarify what locations within Class 1/Class 2 versus Class 3/Class 4 locations should be identified with pipeline markers/signs	Octo- ber 1, 2011	Janu- ary 1, 2012

PMRK 3.04	1. B.: Deleted statement that signs are made of polyethylene material.	October 1, 2011	January 1, 2012
POLY 3.02	2.: Corrected Stock Number for Central Plastic 3"IPS x 2"IPS HVTT 5.: Corrected Stock Number for Central Plastic 1" IPS End Cap	October 1, 2011	January 1, 2012
PRES 4	Reprint of Form 1 - Operational Checklist to correct bullet point symbols	January 1, 2011	January 1, 2011
PTRL 2.01	3. A. & C.: Inserted "Exposed transmission pipeline segment(s)" to list of items to be on look-out for and document during patrol. Deleted reference to "previously reported". 3. E.: Deleted since it referred to "critical area" patrol which now only applies to distribution mains. 4. A.: Revised Processing Data: Gas Supervisor will notify both Gas Operations and Services - Pipeline Integrity group and Gas Engineering if patrol indicates a possible change in class location or HCA, exposed transmission line, or any deficiencies that might affect serviceability of the transmission main.	October 1, 2011	January 1, 2012
PTRL 2.02	1.: Deleted reference to transmission mains from critical area patrol. Critical area patrol only applies to distribution mains. 2. E.: Added a new critical area for distribution mains located within 100 feet of blasting operation 3. A. & B.: Deleted reference to transmission mains. 4. (2): Deleted since it had reference to PTRL 2.01 Transmission Patrols 6. B.: Deleted reference to transmission mains.	October 1, 2011	January 1, 2012
PTST 1	1. C.: Inserted a new item: All nondestructive testing and/or repairs shall be completed before a pipeline segment is subjected to any leak or strength testing. Final tie-in welds will be non-destructive tested as required prior to pressurizing of the pipeline segment. 1. D.: Inserted a new item to clarify that by-pass installed utilizing fittings on existing pipe and steel or PE pipe shall be pressure tested in the same manner as new pipeline segment. This does not apply to by-pass connected between tapping and stopping equipment which would be checked for leaks at the operating pressure. 3. C.: Revised the language for pressure testing mains with MAOP less than 30% SMYS and at or above 100 psig. Pressure testing these mains can be performed in a couple of manners: 1) a single combination leak/strength test at 1.5 times the MAOP or 2) leak test at a minimum of 100 psig	October 1, 2011	January 1, 2012

UNCONTROLLED IF PRINTED

for 1 hour or the duration specified in PTST 2.01 followed by a strength test at 1.5 times the MAOP for a minimum of 1 hour.

3. D.: Deleted

3. E. Table: Corrected Yield Strength on Grade B pipe to 35,000 PSI and changed PSIG to PSI on X-42 and X-52 pipe

6. A.: Revised language for testing components attached to existing pipeline require testing at pressure of 1.5 times the planned MAOP with a minimum duration of 10 minutes or the minimum duration shown in PTST for the size of fitting being used.

6. B.: Added for components installed on systems with MAOP over 100 psig, Gas Operations and Services - Engineering or Gas Engineering will specify not only the test pressure but also the minimum test duration.

PURG 2.01	8. A.: Revised to limit use of vacuum purge/air mover to only distribution pressure systems and on pipes with nominal diameter of 6" and smaller	October 1, 2011	January 1, 2012
QUAL 0	Forms and Reference Materials: Added Form 17 - Steel Welding	January 1, 2011	January 1, 2012
QUAL 4	All of the Quality Assurance forms have been updated with additional items to be checked during inspections. Added Form 17 - Steel Welding	January 1, 2011	January 1, 2012
REGS 2.01	1. G.: Inserted a new item that addresses Gas Control involvement in Operational Inspections on regulator stations equipped with SCADA equipment and/or electronic pressure recorder. Individual performing operational inspection should contact Gas Control prior to and after completion of inspection. Any changes in alarm settings must be submitted to Gas Control by the Gas Operations and Services - Technical Services Supervisor.	October 1, 2012	January 1, 2012
REPR 0	Inserted: REPR 2.01 4. Compression Joints on Steel Tees and Valves Added: WELD 3.05 - Welded Strapping For Compression Joints	January 1, 2011	January 1, 2012
REPR 1	3. B. (2): Added "Tapered screw plug is an approved repair method for small, non-corrosion leaks in steel main operating at 60 psig or less. There was not room in the table below to list tapered screw plug. Refer to REPR 1 4. D."	October 1, 2011	January 1, 2012
REPR 2.01	1. D.: Added these procedures outline approved methods for repairing leaking compression couplings on both mains and services and compression joints on tees and valves installed	January 1, 2011	January 1, 2012

UNCONTROLLED IF PRINTED

on mains. Procedures include strapping joints where pull out is detected and leak is eliminated.

4.: Inserted new section on Compression Joints on Steel Tees and Valves. Section outlines procedures for repairing leaking compression joints.

6. E.: Added a records requirement to record location of repaired compression couplings that have not been encapsulated.

6. F.: Added a records requirement to record location of strapped compression joint tees and valves

REPR 2.02	Corrected "effective date" on page 2 that was missed when initially issued.	January 1, 2011	January 1, 2011
REPR 3.05	Added a new Standard Design section on Welded Strapping For Compression Joints.		January 1, 2012
SAFT 1	Corrected "effective date" on document from October 1 2010 to October 1 2011	June 1, 2010	October 1, 2011
SERV 1	<p>2. Section on Depth has been significantly rewritten to include more detailed available options if minimum depth of 18" cannot be achieved.</p> <p>2. B.: Added that specify available options to include: relocation of service to different location, insertion in a metallic pipe, install concrete pad above service line, or other engineering designed means of protection. Location where minimum depth cannot be achieved and protective measures are utilized should be recorded on Gas Service Transaction Card/Sheet.</p> <p>2. C.: Formerly 2. A. which stated service lines shall be installed at a depth which will protect them for excessive external loading and local activities. Expanded the list of activities to now include loaded truck traffic and material storage in addition to the existing language of gardening and farming operations.</p> <p>3. A.: Added "sand" in addition to "well-compacted soil" as a means of providing proper support of service line.</p> <p>3. B.: Added "screened" to the ¼" or less size granular material used to support pipe installed in or across a previously excavated area or unstable soil.</p> <p>3. C.: Added to specify a minimum layer approximately 6" thick of clean construction material, granular material ¼" or less in size, or sand should be placed over the service line before excavated material containing rock, gravel, or cinders is placed in the excavation.</p>	October 1, 2011	January 1, 2012

3. D.: Added to specify excavated material used for backfill must be free of rock larger than 2", construction debris, concrete/asphalt chunks, brush, skids, or other debris that could damage the pipe or its coating.

3. E.: Added options for protecting the pipe if suitable material is not available to cover the pipe. Available options are: rock shield such as Tuff-N-Nuff, or rigid sleeve. Gas engineering may specify other means or material.

4. A.: Clarified that the clearance between the gas service line and buried electric lines or steam pipes is 12" in both the vertical and horizontal direction.

4. A. (1): Added to provide means to shield or sleeve the pipe if the 12" clearance cannot be achieved.

4. A. (2): Added to require recording on Gas Service Transaction Card/Sheet there is reduced clearance between the buried electric or steam line.

4. B.: Added that minimum clearance between service line and other buried utilities, water, sewer, telephone, or CATV is 6".

5. C. (1): Expanded locations to avoid in setting a gas meter to include within 12" of a vent or air intake in addition to the first floor window.

5. C. (2): Added "AC unit" to the list of potential ignition sources that require the meter sets to be more than 3 feet away.

5. E.: Expanding language regarding protecting plastic service lines from shearing action or backfill settlement. The service lines shall be protected by compacting sand or soil backfill under, around, and over the service line connection to main, farm tap, or service riser. Protective sleeve shall be installed over the service line connection to service tee. See Standard Designs in SERV 3 section.

6. F.: Replaced "consideration should be given to installing property line valve on 2" and larger service line" with "A property line valve should be installed on all service lines 2" and larger, where possible.

SERV
2.02

1. B.: Revised service lines in which EFV's are to be installed.

1. B. (1): Individual or branch residential service lines with up to a combined 4 individual meters.

1. B. (2): Individual commercial customer service line with total connected load of 1000 CFH or less.

1. B. (3): Inlet pressure, maximum flow, service size and length are compatible with the EFV sizing tables.

1. D.(1) & (2): Added what constitutes a Replaced Service.

1. D. (1): Replacement of service tee and service line from the gas main to or through the service riser.

January 1,
2011

January 1,
2012

- 1. D. (2): Replacement of the service line from the existing tee to or through the service riser.
- 2. C.: Added "commercial farm taps for single customer with total connected load of 1000 CFH or less" where a steel EFV is installed on outlet of the high pressure distribution service tee and another EFV on the outlet riser of the farm tap for distribution service.
- 3. D.: Expanded tables to include the 2 approved manufactures of PE EFV's, UMAC and Perfection.
- 3. E.: Expanded tables to include the 2 approved manufacturers of the steel EFV's. UMAC and Perfection.

STLP 0	Inserted: STLP 1 2: General.	October 1, 2011	January 1, 2012
STLP 1	<p>1.: Moved original B. and C. to new section 2.</p> <p>2.: Inserted a new section "General" that includes references to construction requirements in MAIN 1 and SERV 1 along with reference to STLP 2.01 for steel pipe stock codes.</p> <p>2. A.: Added new item to address marking of steel pipe. "Steel pipe, coated or bare, shall have indelible ink identification markings or stamping that clearly identifies the pipe specifications. If the identification markings have faded or are no longer readable the steel pipe shall not be installed."</p>	January 1, 2011	January 1, 2012
STLP 2.01	5.: In Note at bottom of Stock Code table added "Yield strength shown in table is minimum strength. Multi-stenciled pipe will indicate a range of yield strengths. Pipe shall be inspected prior to use to ensure it meets yield strength requirements for its planned MAOP."	January 1, 2011	January 1, 2012
TAPS 2.04	1.: Corrected by replacing "Mueller" with "T. D. Williamson"	January 1, 2011	January 1, 2012
VALV 2.02	<p>1. B.: Inserted "Communication with Gas Control, prior to and after, when any inspection and/or maintenance work is scheduled to be performed on any valve that is monitored through the SCADA system and/or operated by Gas Control."</p> <p>3. C.: Following maintenance of a valve monitored by Gas Control verify with Gas Control that valve operation has returned to normal.</p>	October 1, 2011	January 1, 2012
WELD	The Welding Section has been changed completely. All of the January 1, 2011 sections have been deleted and replaced with completely new procedures.	January 1, 2011	January 1, 2012

WELD 0	Totally new Table of Contents	January 1, 2011	January 1, 2012
WELD 1	Revised significantly with too many changes to list	January 1, 2011	January 1, 2012
WELD 2.01	New section: Safe Welding Practices		January 1, 2012
