FORWARD

October 1, 2022

1.0 Purpose

The Ameren Illinois' Gas Operating and Maintenance (O&M) Plan describes procedures and requirements for the operation and maintenance of Ameren Illinois' (AIC) natural gas transmission and distribution facilities. The O&M manual also describes routine and emergency reporting and notification requirements. This manual meets the requirements of 49 CFR §192.605 and Illinois Administrative Code Section 590.30.

2.0 Annual Review

Gas Standards and Procedures will ensure the O&M plan is reviewed each calendar year not to exceed 15 months for the effectiveness of existing procedures.

3.0 New and Revised Procedures

New and revised procedures shall be approved by Gas Standards and Procedures personnel and will be included in the next periodic update of the O&M manual. New and revised procedures may be a result of:

Safety concerns.

New technology.

New equipment, instruments or tools.

Material that is being evaluated or has been approved for use.

Regulatory requests.

Company review and evaluation.

Gas Training and Operator Qualification (OQ) staffs will review and determine if the procedure involves a covered task requiring operating personnel to be OQ'd and if training is needed prior to implementation.

Any revisions to the O&M plan shall be communicated to all affected AIC personnel.

4.0 O&M Plan Filing and Management

Gas Standards & Procedures is responsible for the updating and distribution of new and revised procedures. The O&M plan is available electronically to all employees and contractors involved with the operation and maintenance of AIC's gas facilities.

Pipeline Safety and Compliance shall file an electronic copy of the latest version of AIC O&M plan with the Illinois Commerce Commission (ICC) via an AIC hosted, password protected technology platform as required in the Illinois Administrative Code Section 590.30.

ABANDONMENT OF FACILITIES

October 1, 2021

ABND 1 Requirements**1.0 Purpose**

This document describes the requirements for abandoning natural gas transmission and distribution facilities in accordance with 49 CFR §192.727.

2.0 Scope

This document addresses the following:

[3.0 - Target Audience](#)[4.0 - Pre-Abandonment Planning](#)[5.0 - Project-Specific Procedures](#)[6.0 - Records](#)**3.0 Target Audience**

- Distribution Design.
- Gas Field Personnel.
- Gas Engineering.
- Gas Supervisor.
- Gas Tech Engineering (GTE).
- Gas Tech Services (GTS) Supervisors.
- Gas Tech Services (GTS) Personnel.
- Gas Storage Engineers.
- Gas Storage Field Supervisors.
- Gas Storage Field Operators.
- Gas Construction Services Supervisors.
- Gas Control.

4.0 Pre-Abandonment Planning

4.1 Additional general topics for consideration include:

4.1.1 Determine if the proposed abandonment could have an impact on the associated gas system(s), thus requiring follow-up review.

4.1.2 If abandonment results in a potential impact on the associated gas system(s), consult with the affected work groups:

- Corrosion Control.
- Gas Tech Services.
- Gas Control.
- Gas Supervisor.
- Gas Engineer.
- Safety Supervisor.
- Gas Tech Engineering.
- Environmental Services

4.1.3 Is the abandonment part of a replacement, relocation, emergency, or maintenance project?

4.1.4 Where is the location of the abandonment within the system?

4.1.5 Does abandonment involve transmission or high-pressure distribution facilities, mains, pressure control stations, valves, odorizers, ERXs, or SCADA monitoring devices or facilities?

4.1.6 Does abandonment involve any pipeline that crosses a roadway?

UNCONTROLLED IF PRINTED

- 4.1.7 Does abandonment involve any pipeline that crosses over, under, or through a commercially navigable waterway?
 - 4.1.8 Does abandonment involve an underground natural gas storage facility?
 - 4.1.9 Is the cathodic protection affected on the remaining system?
 - 4.1.10 Are there other gas sources entering into the system?
 - 4.1.11 Is the system remotely monitored by Gas Control?
 - 4.1.12 Is there a need for system modeling to identify and quantify potential impact(s) due to abandonment?
 - 4.1.13 Is there an associated environmental impact (i.e. contaminated soil, pipe coating, building demolition)?
- 4.2 If Gas Control is requested to provide monitoring, Gas Control shall be notified before and after the project.

5.0 Project Specific Procedures

- 5.1 Gas Tech Engineering (GTE) or Gas Storage Engineering (GSE) shall prepare written project procedures for abandoning facilities on projects the meet the following criteria:
- 5.1.1 Transmission facilities, or
 - 5.1.2 High pressure distribution facilities with MAOP over 100 psig, or
 - 5.1.3 Joint abandonment of transmission lines or high pressure distribution mains with MAOP over 100 psig with connected services.

If the abandonment is a result of an emergency project or maintenance project, procedures can be developed as a joint effort between regional engineering and GTE. The Regional Gas Supervising Engineer shall ensure the abandonment job packet is submitted to GTE.

- 5.2 Engineering personnel (i.e. Distribution Design Specialist or Engineer, Region Gas Engineer) shall prepare written project specific procedures for abandoning facilities on projects that meet the following criteria:
- 5.2.1 Distribution facilities with MAOP up to and including 100 psig, and
 - 5.2.2 Joint abandonment of distribution main with 10 or more connected services.
- 5.3 Specific procedure will include, at a minimum:
- 5.3.1 Operation Checklist, refer to [PRES 2.1 9.0](#) Activities Requiring an Operational Checklist and Written Procedures.
 - 5.3.2 Written procedures along with maps should address such issues as:
 - 1. Maps should show locations of such items as:
 - 1 a. Location of control fittings and tie-end connections.
 - 1 b. Tap locations for services on corner lots to insure there are no unanticipated customer outages.
 - 1 c. Location of the current feeds to the section to be abandoned

- 1 d. Main and/or service valves to be closed during the abandonment project.
- 1 e. Location of insertion and exhaust purge points.
- 1 f. Pressure monitoring locations in adjacent connecting sections that are to remain active, if possible.
2. Sequence of shutting of gas supply and tie-over operations.
3. Need for installation of gauge taps for pressure gauges.
4. Abandonment of services associated with main abandonment.
5. Check of cathodic protection on the remaining active sections.
6. Removal of above grade and grade level appurtenances.
7. Handling of unforeseen problems that may arise during the operations.

The responsible Engineer or Engineering group should be consulted with prior to making any significant changes such as: the cut-off location, abandonment method, method to purge.

5.3.3 Purge Plan in accordance with [PURG 2](#) Purging: Methods

5.3.4 A pre-job meeting should be held to review the written procedures.

5.3.5 When required communicate with other work units:

1. Region Gas Operations.
2. Gas Tech Engineering.
3. Gas Tech Services.
4. Gas Storage Engineering.
5. Gas Storage Field Personnel.
6. Corrosion Control.
7. Ameren Illinois Call Center
8. Distribution Control - Gas Dispatch

5.4 If Gas Control is requested to provide monitoring, Gas Control shall be notified before and after the project.

6.0 Records

6.1 Retire all abandoned distribution and transmission mains in Ameren Illinois electronic gas mapping system.

6.2 Retain information on the abandoned facilities in Maximo.

End of Instructions.

Operator Qualification (OQ) Required?

YES.

UNCONTROLLED IF PRINTED

ABANDONMENT OF FACILITIES

October 1, 2022

ABND 2.1 Abandonment of Gas Facilities

1.0 Purpose

This document provides the requirements for abandoning natural gas transmission, high pressure distribution, and distribution facilities including services, regulator stations, farm taps, inside meters, and vaults in accordance with 49 CFR §§ 192.475 and 192.727.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Abandonment - General](#)

[5.0 Transmission Lines and Distribution Mains](#)

[6.0 Services](#)

[7.0 Inside Meters](#)

[8.0 Verification of Main or Service Status](#)

[9.0 Commercially Navigable Waterways](#)

[10.0 Vaults](#)

[11.0 Records](#)

Attachments

[Attachment 1 - Continental Abandonment Kit Instructions.](#)

[Attachment 2 - Mueller Steel Abandonment Cap for H-17800 Curb Stop Tees.](#)

[Attachment 3 - Polywater AFT Sealant.](#)

3.0 Target Audience

- Distribution Design.
- Gas Engineering.
- Gas Supervisor.
- Gas Field Personnel.
- Gas Tech Engineering (GTE).
- Gas Tech Services (GTS) Supervisor.
- Gas Tech Services (GTS) Personnel.
- Gas Storage Engineering.
- Gas Storage Field Supervisors.
- Gas Storage Field Operators.
- Gas Construction Services Supervisors.

4.0 Abandonment - General

4.1 Abandonment means permanently removed from service. (§192.3).

4.2 Abandon inactive pipelines that are not maintained. (§192.727(c)).

4.3 See the following resources when pipeline facilities may have or contain materials requiring special handling.

4.3.1 [MAIN 2.5](#) Pipe Coating and Gasket Removal.

UNCONTROLLED IF PRINTED

4.3.2 [PCBH 1](#) PCB Handling: Requirements.

5.0 Transmission Lines and Distribution Mains (§192.727(b))

5.1 General.

- 5.1.1 Identify all the sources of gas feeding into the section of transmission line or distribution main to be abandoned. If there is a two-way feed or more into that section:
1. Pressure gauges will be installed to monitor the pressure of the remaining system and the section of main to be retired.
 2. Gauges shall be monitored to ensure there is not an unplanned interruption of service. See [PRES 2.1 Section 5.0](#) Pressure Monitoring While Performing Work Activities.
- 5.1.2 Install an electrical bond prior to any cutting on steel pipe. See [ACIG 2 Section 6.0](#) Welding and Other Hot Work.
- 5.1.3 Shut off the gas flow from all sources of gas supply to the main being abandoned using one of the following:
1. Line stopper fitting. See [TAPS 1](#) Tapping and Stopping.
 2. Valve.
 3. Squeeze off. See [POLY 2.2](#) Squeeze Off when squeezing off PE main.
- 5.1.4 Purge the transmission line or distribution main to be abandoned of gas. See [PURG 2 Section 6.0](#). Purging of Gas with Air During Abandonment.
- 5.1.5 Remove a section of pipe between the pressurized section(s) and the section being abandoned.
- 5.1.6 Inspect the abandoned steel pipe for evidence of internal corrosion. (§192.475) See [CORR 1 Section 10.0](#) Internal Corrosion Inspection.
1. Perform a corrosion evaluation if evidence of internal corrosion is present. See [CORR 1 Appendix B](#) - Corrosion and Steel Damage Evaluation Form.
- 5.1.7 Following installation of a welded, threaded, or fusion cap or a blind flange on the remaining live stub:
1. Introduce gas under normal operating pressure.
 2. Check the connection for leaks with leak detection fluid or a leak detection instrument.
 3. Record this leak test on the DOJM or As-Built plans and retain it in the permanent job file.
- 5.1.8 Coat the pressurized stubs of steel pipe with an approved coating. See [CORR 2.3 Section 4.0](#) Approved Coatings.
- 5.1.9 Leave fitting closed once abandonment is complete if the fitting used to shut-off the gas supply is:
1. Equipped with a stem which seats closed within the fitting.
And
 2. Does not have an internal cutter/punch assembly.

5.1.10 Seal all open ends of the abandoned pipe, including side outlets, former lateral connections, and disconnected service taps with one of the following:

1. Expanding polyurethane foam.
2. Expander plug.
3. Threaded cap.
4. Welded cap.

5.1.11 Remove valve boxes or drive valve boxes below grade and backfill with suitable material whenever possible.

5.1.12 If the valve box cannot be removed or driven below grade, remove the lid and fill the valve box with:

- Dirt,
- Other suitable material.
- Concrete,
Or
- Rock,
- Sand,

5.1.13 Leave the valve box lid off after abandonment.

5.1.14 Notify Gas Tech Engineering if the transmission line or distribution main is located under a navigable waterway. See [Section 9.0](#).

5.2 PE Mains.

5.2.1 Permanently seal all open ends of pressurized PE mains.

1. For PE mains 1¼ inch and larger use an approved PE fusion cap.
2. For PE mains 1 inch and smaller use a stab or fusion cap.

5.2.2 Cut the tracer wire as close as possible at the connection. Protect the cut end of the tracer wire at the main by one of the following:

1. Wrap it with vinyl mastic tape (Stock Code 25 53 225).
2. Encase it in a splice box (Stock Code 49 62 001).
3. Verify that the tracer wire cannot be pulled out of the splice box.

5.3 Steel Transmission Lines and Distribution Mains.

5.3.1 Permanently seal all open ends of pressurized steel lines or mains. Use one of the following that is properly sized and pressure rated:

1. Welded steel cap.
2. Blind flange.
3. A threaded cap may be installed on mains smaller than 2 inches.

5.3.2 Remove bonds between retired sections and any cathodic protection structures.

1. Notify Corrosion Control personnel for the area when the bond is removed to ensure the integrity of remaining cathodic protection structure.
2. If the bond was with a foreign structure, Corrosion Control shall notify the owner of that structure.

5.4 Regulator Stations.

- 5.4.1 Remove all above ground piping associated with a permanently abandoned regulator station.
- 5.4.2 Seal all retired piping that remains in the ground in accordance with applicable procedures contained in this section.
- 5.4.3 Treat any pressurized mains remaining in same manner as described in [this section](#).
- 5.4.4 If regulator station is in a vault or pit, see [Section 10.0](#) for abandonment of the vault or pit.

6.0 Services (§192.727(d))

6.1 General.

- 6.1.1 For discontinuance of service to customer, see [TURN 2.3 Section 7.0](#) Hard Disconnect.
- 6.1.2 Install an electrical bond prior to any cutting on steel pipe. See [ACIG 2 Section 6.7](#) Welding and Other Hot Work.
- 6.1.3 Disconnect the abandoned service from all sources of gas supply. Shut off the gas supply using one of the following:
 1. Service tee.
 2. Manual service line shut-off valve.
 3. Line stopper fitting. See [TAPS 1](#) Tapping and Stopping.
 4. Squeeze off. See [POLY 2.2](#) Squeeze Off when squeezing off PE service line.
- 6.1.4 Disconnect services within 18 inches of the main whenever possible. If the service stub exceeds 18 inches, it shall be documented. See [Section 11.0](#).
- 6.1.5 Retire PE services 2 inches and larger with inline tee or side saddle connections in the same manner as main. See [Section 5.1](#).
- 6.1.6 For PE service line with tapping tee connection:
 1. Run down the service tee punch.
 2. Install an electrofusion, butt fusion, or stab cap on the remaining pressurized section of the PE service line.
 3. Stab caps can be used on ½-inch thru 1-inch PE service lines.
 4. See:
 - [POLY 2.4](#) Butt Fusion,
 - [POLY 2.5](#) Electrofusion, Or
 - [POLY 2.6](#) Mechanical Joining for installation procedures.
- 6.1.7 For a PE service line that has an existing EFV:
 1. Cut off the EFV so that the remaining stub is less than 18 inches if the remaining stub is of sufficient length to allow for proper installation of a fusion or stab cap.
 2. If there is not sufficient length available, the cap shall be installed downstream of the EFV and as close as feasibly possible to the EFV.

3. See:
 - [POLY 2.4](#) Butt Fusion,
 - [POLY 2.5](#) Electrofusion, Or
 - [POLY 2.6](#) Mechanical Joining
- 6.1.8 Following installation of the cap:
 1. Introduce gas under normal operating pressure into the remaining stub.
 2. Check the cap connection checked for leaks with leak detection fluid or a leak detection instrument.
- 6.1.9 Coat the steel service stub with an approved coating. See in [CORR 2.3 Section 4.0](#) Approved Coatings.
- 6.1.10 If service tap is not accessible or the service line is being abandoned along with the main, the tap shall remain in the open position.
- 6.1.11 Service lines that are:
 1. Two inches or larger in nominal diameter shall be purged as main when the service line is:
 - 1 a. 500 feet or longer and operating at 100 psig or less, or
 - 1 b. 100 feet or longer and operating above 100 psig.
 - 1 c. See [PURG 2 Section 6.0](#) Purging of Gas with Air During Abandonment.
 2. Smaller than 2 inches nominal diameter and shorter than 500 feet do not have to be purged due to the size of pipe and small volume of gas present at atmospheric pressure.
- 6.1.12 Inspect abandoned steel service lines for evidence of internal corrosion. (§192.475) See [CORR 1 Section 10](#). Internal Corrosion Inspection.
- 6.1.13 Seal all open ends of abandoned service lines before introducing an ignition source (e.g. welding, cadweld, hot wrap, etc.) near the end of the service line. Seal the open ends of an abandoned service line using one of the following:
 1. Expanding polyurethane foam.
 2. Expander plug.
 3. An approved cap (e.g. PE stab or fusion cap; steel threaded or welded cap).
- 6.1.14 If the PE service is being abandoned with the main, the tracer wire does not need to be cut-off close to the main connection. Otherwise, cut the tracer wire for PE service as close as possible at the main. Protect the cut end of the tracer wire at the main by one of the following:
 1. Wrap it with vinyl mastic tape (Stock Code 25 53 217).
 2. Encase the tracer wire in a splice box (Stock Code 49 62 001).
 3. Verify that the wire cannot be pulled out of the splice box.
- 6.1.15 Certain steel tees shall be retired by utilizing the MAZCO tool. Contact Gas Standards and Procedures at 217-535-5069 for approved applications and qualification requirements.
- 6.1.16 Remove above ground piping.

UNCONTROLLED IF PRINTED

Always verify that a riser is on an abandoned service line before cutting.

1. The riser shall be removed to a minimum of 6 inches below grade. If the riser is encased in concrete or asphalt, it can be cutoff at the surface and sealed with an expander plug or an approved cap.
2. Customer side above grade piping shall be removed back to the fitting closest to the structure. Customer pipe shall be capped or plugged.

6.1.17 Remove valve boxes or drive valve boxes below grade and backfill with suitable material whenever possible.

6.1.18 If the valve box cannot be removed or driven below grade, remove the lid and fill the valve box with:

- Dirt,
- Other suitable material.
- Concrete, Or
- Rock,
- Sand,

6.1.19 Leave the valve box lid off after abandonment.

6.1.20 The retirement of the service and the leak test shall be recorded in the Service Card module within ClickMobile.

6.2 PE Service Lines with Compression or Stab Outlet Tees.

6.2.1 1/2" CTS PE service lines being retired from a Continental tee with a compression outlet, shall be retired using the Continental abandonment kit (Stock Code 19 72 160). See [Attachment 1](#) for instructions.

6.2.2 For PE service lines 1" and smaller with an outlet stab fitting, cut off the stab fitting at the butt fusion joint if a long enough stub exists to allow for the proper installation of an electrofusion cap. See [POLY 2.5](#) Electrofusion.

6.2.3 Service taps with an internal cutter/punch assembly shall be left in the down position on steel distribution mains with MAOP of 100 psig or less once the abandonment is complete.

1. In order to leak test the cap connection, run the tee up to allow gas to enter the service stub then return the tee to the down position.

6.3 Steel Service Lines.

6.3.1 Run the punch down on steel service lines having a service tee containing a punch.

1. If complete shutdown is obtained, an approved steel cap shall be installed on the remaining pressurized section of steel service line.

6.3.2 Service taps with an internal cutter/punch assembly shall be left in the down position on steel distribution mains with MAOP of 100 psig or less once the abandonment is complete.

1. In order to leak test the cap connection, run the tee or punch up to allow gas to enter the service stub.

UNCONTROLLED IF PRINTED

- 6.3.3 A service tee that does not contain a punch but does have a completion plug shall be stopped off in accordance with the proper Mueller or T.D. Williamson procedure. See [TAPS 3](#). Forms and Reference Materials for procedures.
- 6.3.4 Shutting down a steel service line not having:
1. An accessible service tee,
Or
 2. A service tee containing a punch or completion plug,
Or
 3. A complete shutdown is not obtained in [6.3.1](#) above,
Then:
 4. Shutdown may be obtained by the following methods:
 - 4 a. Install a line stopper fitting on the service line to obtain complete shut-down and then install an approved steel cap. See [TAPS 1](#) Tapping and Stopping.
 - 4 b. Shut down the section of main where the service is located to stop the flow of gas to the service and the cap the service line stub with an approved steel cap.
- 6.3.5 Transmission and steel high pressure distribution mains need to be free of obstructions so that a pig can be run through the line.
1. Any service tap that has an internal cutter/punch shall be left in the up position after abandonment is complete.
 2. If the service tap is equipped with a stem which seats closed within the fitting and not an internal cutter/punch assembly, it shall be left in the closed position once the abandonment is complete.
- 6.3.6 Cap the pressurized service line stub. Use one of the following that is properly sized and pressure rated:
1. Welded steel cap.
 2. Blind flange.
 3. A threaded cap can be installed on services smaller than 2 inches.
- 6.3.7 Service tees with a compression outlet shall have capped pipe or properly sized solid plug inserted into the outlet.
1. If the solid plug is not restrained with a cap, the outlet shall be strapped to prevent movement of the capped pipe or plug.
- 6.3.8 Steel service line with an EFV:
1. Cut off the EFV to allow the service length to remain under 18 inches provided the remaining stub is of sufficient length to allow for proper installation of an approved steel cap.
 2. If there is not sufficient length, the cap shall be installed downstream of the EFV and as close as feasibly possible to the EFV.
- 6.3.9 Mueller has a Steel Abandonment Cap for the H-17800 Curb Stop/Valve Tee. The Steel Abandonment Cap can be used to replace a leaking Curb Stop/Tee cap. See [Attachment 2](#) for installation instructions.

Table 1: Mueller Abandonment Caps for H-17800 Curb Stop Tee		
Stock Number	Description	Size
19 33 706	Cap, Mueller Tee Retirement	2 inches
19 33 707	Cap, Mueller Tee Retirement	1 inch
19 33 708	Cap, Mueller Tee Retirement	1¼ inches

6.3.10 Service line being abandoned as part of an active joint mains and services abandonment project, the squeezed off section of the service line shall have an approved steel threaded or welded cap installed.

6.4 Farm Taps.

6.4.1 Remove all above ground piping associated with a permanently abandoned farm taps.

6.4.2 Seal all retired piping that remains in the ground in accordance with [Section 6.0 Services](#).

6.4.3 Treat any remaining pressurized service line in the same manner as Service Lines in [Section 6.0 Services](#).

7.0 Inside Meters

7.1 Remove all unused piping and fittings inside the structure, if feasible.

7.2 Seal open end of service with an expander plug, an approved cap, or approved cement material. Both may be inserted from inside the building.

7.3 If the pipe size and material allow for installation of an approved threaded cap, a cap shall be installed just inside structure at point of entry.

Consideration shall be given to customer's request for an alternative method of sealing the pipe end.

7.4 Service line that enters the building wall above grade shall be cut off and an approved threaded or welded cap installed as close as possible to the outside wall. Outside piping shall be removed and sealed in the same manner as a service riser. See [Section 6.1.16](#).

7.5 Service line entering the structure below grade and cut-off outside of the structure wall, shall have an approved cap of like material installed on the stub going through the wall as close to the wall as possible. The other open end of the abandoned service line shall be sealed in the same manner as indicated in [Section 6.1.13](#).

8.0 Verification of Main or Service Status

If the status of an existing main or service line cannot be confirmed through records, the options in [Section 8.1](#), [Section 8.3](#), and [Section 8.4](#) are available for checking whether or not there is gas present in the line.

- 8.1 Initially check to see if the main or service has connectivity to the known active gas system by:
- 8.1.1 Connecting a pipe locator to the pipe in question or to an active nearby gas facility. See [LOCT 1](#) Locating: Methods.
 - 8.1.2 Checking the pipe in question for a P/S reading. Reading of less than -700 mv may indicate an abandoned main or service. Contact a Corrosion Control Technician to validate that the segment is not part of an active cathodically protected system.

Corrosion Control Technicians have the ability and instruments (e.g., short locator or current interrupter) to determine if the pipe is connected to an active system.

The following options are dependent on the possibility that the existing pipe could have an inserted live gas line.

- 8.2 The possible maximum operating pressure on the main or service shall be verified before tapping into the pipe by verifying the MAOP of the other live gas lines in the vicinity.
- 8.3 If there is no possibility of the pipe in question having a live line inserted in it, there are two options available:
- 8.3.1 The first option is to install a service tee on the line, tap the service tee to see if there is gas present.
 - 1. Follow the same procedures required when installing a service tee on a live pipeline.
 - 2. If there is gas present when the line is tapped, the outlet of the service tee shall be properly capped and abandoned.
 - 3. If there is no gas present, the outlet of the service tee shall be sealed with expanding polyurethane foam, expander plug, or an approved cap.
 - 4. The second option is to drill a small hole through the pipe wall using an intrinsically safe drill with a small bit, minimum 1/8 inch.

Be extremely careful not push too hard on the drill when drilling because the inserted pipe that may be present could be damaged by the drill bit.

- 5. The individual drilling the hole shall be dressed in Level I PPE. See [WIGE 2.2](#) Personal Protective Equipment.
- 6. Prior to drilling the hole, a properly sized and pressure rated steel clamp shall be loosely installed on the pipe and positioned to where it can be slid over the hole if there is gas on the pipeline.

7. Once a hole has been drilled through the pipeline wall and no gas is present, a thin object such as tracer wire, marker flag staff, or welding rod can be inserted through the hole to check for an inserted pipe.
 8. If pipeline is dead, the hole shall be sealed with the clamp.
 9. If gas is present, a permanent repair will be required. See:
 - 9 a. [REPR 1 Appendix B](#) - Steel Distribution Pipe Repairs.
 - Or
 - 9 b. [REPR 1 Appendix E](#) - PE Pipe Repairs.
 10. Ensure the gas is under expected operating pressure and not residual gas remaining in the pipeline.
- 8.4 If there is a possibility of insertion, the existing pipeline can be drilled using an intrinsically safe drill with a small bit, minimum 1/8 inch. For the steps to follow, see Section [8.3.1.4](#) through Section 8.3.1.10, above.

9.0 Commercially Navigable Waterways (§192.727(g))

- 9.1 Gas Operations and Services shall report abandoned pipeline facilities that cross over, under, or through a commercially navigable waterway.
- 9.2 Submit data on pipeline facilities abandoned after October 10, 2000 to the National Pipeline Mapping System (NPMS) in accordance with the NPMS "Standards for Pipeline and Liquefied Natural Gas Operator Submissions."
- 9.3 A copy of the NPMS Standards can be obtained at www.npms.PHMSA.dot.gov or by contacting the NPMS National Repository at 703-317-3073.
- 9.4 The NPMS Standards provide details for preparing data for submission as well as details on how to submit the data.
- 9.5 Digital data format is preferred, but hard copy submissions are acceptable if they comply with the NPMS Standards.
- 9.6 Reports may be submitted by mail, fax, or e-mail to the Office of Pipeline Safety, Pipeline and Hazardous Materials Safety Administration, U.S. Department of Transportation, Information Resources Manager, PHP-10, 1200 New Jersey Avenue, SE., Washington, DC 20590-0001; fax (202) 366-4566; e-mail InformationResourcesManager@PHMSA.dot.gov.

The report must contain the location, diameter, date of abandonment, method of abandonment, and a certification that the facility was abandoned in accordance with all applicable laws.

10.0 Vaults (§192.727(f))

- 10.1 Concrete and masonry vaults/pits shall have tops removed and the side walls removed, at a minimum, one foot below grade.
 - 10.1.1 If vault/pit has a concrete/solid floor, bust out a hole in the floor to provide a drain.
 - 10.1.2 Fill the vault/pit with soil, sand, or crushed stone with the top 12 inches, at a minimum, of compacted soil.

UNCONTROLLED IF PRINTED

10.1.3 If the vault/pit was located in a hard surface area, such as concrete or asphalt, cap the hole with the appropriate hard surface material.

11.0 Records

11.1 Update the main record(s) to document the retirement and leak test performed to check the capping of the pressurized main. Update the Ameren Illinois (AIC) electronic gas mapping system to reflect the abandonment.

11.2 If the remaining service stub is longer than 18 inches, indicate such in AIC's electronic mapping system.

11.2.1 Use the "Miscellaneous Text" annotation on the segment of the main to which the stub is tied. Place an annotation showing the stub's:

- Length.
- Location (e.g. 35' E. of CL N. 16th St.).
- Diameter.

11.2.2 See example annotations on Figure 1.

Figure 1: Examples of Miscellaneous Text Annotations for Stubs and Caps

11.2.3 In ClickMobile, indicate a full retirement on the service record, but the 'stub greater than 18 inches' box shall be checked.

11.3 Update the service record card within ClickMobile to document the retirement and leak test performed to check the capping of the pressurized stub.

- 11.4 Buried Pipe Examination Form shall be completed within ClickMobile to report condition of the remaining pressurized main(s) and/or service line(s). See [CORR 1 Appendix A - Buried Pipe Examination](#).
- 11.5 If there is evidence for internal corrosion it shall be documented on the Corrosion and Steel Damage Evaluation form within ClickMobile. See [CORR 1 Appendix B - Corrosion and Steel Damage Evaluation](#).

End of Instructions.

ACIG 0 Accidental Ignition: Table of Contents, January 1, 2011.

Revision Notes

UNCONTROLLED IF PRINTED

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

ACCIDENTAL IGNITION

April 1, 2023

ACIG 1 Requirements

1.0 Purpose

This document prescribes the steps required to minimize the risk of accidental ignition in any structure or area where the presence of natural gas constitutes a hazard of fire or explosion in accordance with 49 CFR §192.751.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Sources of Ignition](#)**3.0 Target Audience**

- Gas Engineering
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Engineering (GTE)
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Construction Services Supervisors
- Gas Construction Inspectors
- Gas Construction Contractor Supervisors

4.0 Sources of Ignition (§192.751(a))

Employees shall know the causes of accidental ignition and how to avoid their effects. These causes and avoidance procedures may include:

4.1 Smoking and Open Flames

4.1.1 Smoking, the use of vaping devices, and open flames are prohibited in:

1. Structures containing gas facilities where possible leakage and/or the presence of gas exists.
2. Open areas containing gas facilities when the possibility of accidental ignition of a gas-in-air mixture exists.

4.2 Mechanical Sparking and Electric Arcing

4.2.1 Where the possibility of accidental ignition of a gas-in-air mixture exists, use only **flashlights**, **work** lights, tools, **equipment** and communication devices that **are labelled or certified as intrinsically safe** and approved for use in a **Class 1 Division 1** hazardous environments.

1. Class 1 the environment contains flammable gases, vapors, and liquids
2. Division 1 an environment where ignitable gases, vapors, or liquids can exist under normal conditions, maintenance work, or because of leakage.

4.2.2 Do not use on/off switches or make electrical connections and disconnections in hazardous environments.

4.3 Static Electricity Arcing

UNCONTROLLED IF PRINTED

- 4.3.1 Install an electric bond across the area of the **steel** pipe to be cut or separated.

Maintain the bond until all reconnections are complete or a gas free environment exists.

- 4.3.2 **Ground the squeeze-off tool prior to squeezing off PE pipe. See [POLY 2.2 Sub-section 5.1](#) Before Starting Squeeze-off, for eliminating external static charge on 1-1/4 inches PE pipe and larger.**

Where possible, use a separate excavation in a gas free environment when squeezing off plastic pipe.

- 4.3.3 Use grounded, metallic pipe for purge vents during purging operations. See [PURG 2](#) Purging: Methods.

4.4 Internal Combustion Engines

- 4.4.1 Limit the use of internal combustion engines where the possibility of accidental ignition of a gas-in-air mixture exists.

Position cars, trucks, excavation equipment, compressors, generators, pumps, welding machines, etc., a safe distance upwind from the blowing gas.

4.5 Overhead Electric Lines

- 4.5.1 Follow the procedures in [CORR 2.6](#) AC Interference on Buried Pipelines and Stray Current prior to working on gas facilities under or in close proximity to overhead electric lines.

Overhead electric lines can produce arcing by:
- Inducing a voltage onto a pipeline. - Conducting a voltage and current caused by lightning or a ground fault.

4.6 Lightning

- 4.6.1 Do not preform purging and blowdown operations when there is lightning in the area.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Appendices

NONE.

Attachments

NONE.

Compliance Requirements

49 CFR §192.751 Prevention of accidental ignition.

Document Rescission

ACIG 1 Accidental Ignition: Requirements, October 1, 2021.

Revision Notes

Location of Changes	Summary of Changes
Paragraph 4.2.1 - Intrinsically Safe	<p>Revised – Where possibility of accidental ignition of a gas-in-air mixture exists, use only flashlights, work lights, tools, equipment, and communication devices that are labelled or certified as intrinsically safe and approved for use in a Class 1 Division 1 hazardous environment.</p> <p>1. Class 1 the environment contains flammable gases, vapors, and liquids</p> <p>2, Division 1 an environment where ignitable gases, vapors, or liquids can exist under normal conditions, maintenance work, or because of leakage.</p>
Paragraph 4.2.1	Remove Table 1 that list types of intrinsically safe devices. Listed power tools and electronics are completely intrinsically safe.
Paragraph 4.2.2	Removed Table 2 that listed devices not to use in a hazardous environment unless they are intrinsically safe.
Paragraph 4.3.1	Added the word "steel" to clarify an electric bond is used on steel pipe.
Paragraph 4.3.2	Grammatical revision – Ground the squeeze-off tool prior to squeezing off PE Pipe. See POLY 2.2 Subsection 5.1 Before Starting Squeeze-off for eliminating external static charge on 1-1/4 inches PE pipe and larger.

ACCIDENTAL IGNITION

April 1, 2023

ACIG 2 Work Area Protection**1.0 Purpose**

This document prescribes the steps that are required to minimize the risk of accidental ignition in any structure or area where the presence of gas constitutes a hazard of fire or explosion in accordance with 49 CFR §192.751 and 29 CFR §1926.651(g)(1)(i).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 General](#)****[5.0 Tools and Equipment](#)****[6.0 Welding and Other Hot Work](#)****[7.0 Working with Plastic Pipe](#)****[8.0 Isolating Pipeline Segments on Planned Work to Minimize the Potential of Ignition](#)****3.0 Target Audience**

- Gas Engineering.
- Gas Field Personnel.
- Gas Supervisors.
- Gas Tech Engineering (GTE).
- Gas Tech Services (GTS Supervisors)
- Gas Tech Services (GTS) Personnel.
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Construction Services Supervisors
- Gas Construction Inspectors
- Gas Construction Contractor Supervisors
- Gas Control

4.0 General (§192.751(c))

4.1 Secure the work area through the use of the following when uncontrolled blowing gas is present.

4.1.1 See **[WIGE 2.1](#)** Hazardous Environment for:

1. Identifying a hazardous outdoor environment.
2. Establishing a safe zone.
3. Working in a hazardous outdoor environment.

4.1.2 Items for securing and visually marking include, but are not limited to:

- Barricades.
- Caution tape.
- Cones.
- Fencing.
- Marking paint.
- Signs (e.g., detour, road closed).

4.1.3 Personnel for marking and securing the area include, but are not limited to:

1. Qualified Emergency Responders (See **[EMER 2.3](#)** Emergency Responder).

UNCONTROLLED IF PRINTED

2. Law enforcement.
3. Traffic flaggers.

The intent of deploying any of the above steps is to keep public motor vehicle and pedestrian traffic away from the potential hazard.

- 4.2 See [ACIG 1](#) Accidental Ignition: Requirements to minimize the dangers of accidental ignition during repair operations and procedures.

5.0 Tools and Equipment (§192.751(a))

Gas Field Personnel shall use tools and equipment that are intrinsically safe and approved for use in hazardous environments. See [ACIG 1](#).

- 5.1 The following equipment shall be placed at a safe distance upwind from blowing gas:

- Air compressors.
- Cars.
- Excavation equipment.
- Generators.
- Trucks.
- Water pumps.
- Welding machines.
- Other portable equipment.

- 5.2 Locate a Vapor Extraction Unit (VEU) in the work area where the gas concentration is safe for open ignition sources.
 - 5.2.1 The VEU shall be equipped with preventative safety devices to ensure explosive levels of natural gas are not pulled through the unit.
 - 5.2.2 The safety devices shall be calibrated, and the unit operated in accordance with the manufacturer's operating instructions.
- 5.3 Locate VEU or Compression System (ZEVAC) air/gas vent seat at least 15 feet away from the air compressor or other ignition sources.
- 5.4 Locate ventilating equipment used to move air containing natural gas to where the gas concentration is safe for open ignition sources.
- 5.5 At least 1 fire extinguisher shall be on the jobsite and upwind from the work area. See [EXCV 2.9](#) Working in Hazardous Environment.

6.0 Welding and Other Hot Work §192.751 and §1926.651(g)(1)(i)

- 6.1 Prior to welding or other hot work in or around a structure, area, or excavation containing gas facilities:
 - 6.1.1 Evaluate the environment for the presence of natural gas, oxygen, and carbon monoxide.
 - 6.1.2 Use a checked and calibrated CGI. See [LEAK 2.5 Section 6.0](#) Combustible Gas Indicator (CGI).

Additional testing may be needed if other toxic gases, such as hydrogen sulfide, are suspected to be present. Contact Safety Supervisor if other sampling is needed.

- 6.2 No welding or other hot work operations shall be conducted within a structure, area, or excavation if its environment meets one of the criteria below. See [EXCV 2.9](#) Working in Hazardous Environment.
 - 6.2.1 When the concentration of natural gas is 30% LEL (1.5% gas-in-air) or greater.
 - 6.2.2 When the oxygen level is 19.5% or less.
 - 6.2.3 When carbon monoxide and other toxic gases are present.
- 6.3 If any of the criteria in 6.2 are met for a structure, area, or excavation, ventilating equipment shall be used to:
 - 6.3.1 Reduce the concentration of natural gas to less than 30% LEL.
 - 6.3.2 Increase the oxygen level to more than 19.5%.
 - 6.3.3 Dilute carbon monoxide and other toxic gases.
- 6.4 A Qualified Field Gas Person shall check and monitor the environment in the immediate area where the work is being done until the work is complete. See [EXCV 2.9](#) Working in Hazardous Environment.

Ventilating equipment may be needed until the work is complete. For other solutions see [EXCV 2.9](#) Working in Hazardous Environment and [WIGE](#) Working In Gaseous Environment.

- 6.5 Gas in an excavation with steel pipe may be flashed (ignited) to ensure that a hazardous concentration has not accumulated prior to welding.
- 6.6 Minimize the possibility of creating a combustible gas-in-air mixture during welding operations by:
 - 6.6.1 Keeping the pipeline or main either full of gas or completely purged of gas;
 - 6.6.2 Maintaining a slight flow of gas moving toward the welding operation and flashing (igniting) the gas either through a metallic stack or at the weld prior to welding;
 - 6.6.3 Closing all open ends with tape, a cap, or plugging material immediately after a cut is made;
 - 6.6.4 Purging a main with inert gas (nitrogen) or air;
 - 6.6.5 Ensuring that two openings shall not left open at the same time unless the line has been completely purged of natural gas;Or
 - 6.6.6 Extracting the gas from the main with a vacuum purge or air mover. See [PURG 2](#) Purging: Methods - Vacuum Purge/Air Mover.

- 6.7 Install an electric bond prior to cutting steel gas piping. Maintain the bond until all recon-nections are complete or a gas free environment exists.

Install bond cables in a manner that ensures they do not become dislodged during work and they provide minimal electrical resistance between pipe sections.

7.0 Working with Plastic Pipe (§192.751(b))

- 7.1 Ground the squeeze-off tool prior to squeezing off PE pipe.
- 7.2 Refer to **POLY 2.2 Subsection 5.1** Before Starting Squeeze-off for additional steps for eliminating external static charge on 1-1/4 inched PE pipe and larger.
- 7.3 Maintain the ground until the squeeze tool is removed.

Where possible, use a separate excavation in a gas free environment when squeezing off plastic pipe.

- 7.4 Metallic pipe shall be used for purge vents and shall be grounded during purging operations. For purge pipe length, see **PURG 2**. Purging: Methods.

8.0 Isolating Pipeline Segments on Planned Work to Minimize the Potential of Ignition (§192.751(b))

- 8.1 Do not cut any portion of a pipeline that is under pressure.
- 8.2 Plan the job to shut off or minimize the escape of gas.
- 8.3 Sequence the steps to limit the time and amount of gas to which personnel are exposed.
- 8.4 Follow the procedures contained in **WIGE 2.1** Hazardous Environment when applicable.
- 8.5 When isolating pipeline segments, consider the following during the planning phase:
- 8.5.1 Is the pipeline segment within a system monitored by Gas Control? If so, involve Gas Control in the planning.
 - 8.5.2 Should Gas Tech Engineering be requested to perform a system model to ensure isolating the pipeline segment will not result in an unintentional loss of service to customers?
 - 8.5.3 Is unattended, isolating equipment protected to prevent unauthorized operation?
 - 8.5.4 Are valves blanked or locked? Attach lock-out tags, (Stock Code 16 01 410), to valves.
 - 8.5.5 Are valves, that cannot be blanked or locked, tagged to advise personnel not to operate the valve?

- 8.6 Monitor pressures at the work site to alert gas field personnel of an unintentional increase or decrease in pressure as follows.
- 8.6.1 When the pipeline segment is monitored remotely:
1. Contact Gas Control at the start of the project to discuss monitoring parameters and at what values Gas Control should alert field operations of potential problem(s).
 2. Once the project is completed and system is returned to normal, Gas Supervisor, Gas Engineer, or Gas Tech Service Supervisor should contact Gas Control to verify monitoring parameters are all functioning properly.
- 8.6.2 Pressure monitoring procedures shall be established with safe pressure limits.
- 8.6.3 Personnel assigned to operate isolation equipment shall monitor pressures, both upstream and downstream, by the use of gauges or vents.
- 8.6.4 Personnel monitoring at remote locations shall have communication with the work site and the person in charge of the operation.

End of Instructions.

Operator Qualification (OQ) Required?

YES.

APPR 0 Apprentice Training: Requirements, January 1, 2016

Revision Notes

Location of Changes	Summary of Changes
Entire document	Format of document has been changed to match the format of October 2022 Issue

1.0 Purpose

This document outlines the formal training programs for new gas field personnel. The programs provide co-workers with the knowledge, skills and abilities needed for proper construction, operation, maintenance and inspection of the Ameren Illinois's gas facilities. This is accomplished using a blended training approach of CBT's, Classroom Instruction, Hands On, and Safe Start Principles.

2.0 Scope

This document address the following:

[Section 3.0 – Target Audience](#)

[Section 4.0 – Gas Apprentice Training Overview](#)

3.0 Target Audience

- Gas Training Personnel
- Gas Operator Qualification Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel
- Gas Corrosion Technicians
- Gas Storage Apprentices
- Gas Tech Services

4.0 Gas Apprentice Training Overview

Gas apprentice training programs include the following:

4.1 B31Q- based apprenticeship training by covered task

4.2 Ability Development Program (On the Job Training - OJT)

4.2.1 The ability development program outlines the specific tasks or activities the apprentice should be assigned to between each training session. These assignments ensure that adequate exposure has been given to the apprentice to develop the necessary skills to perform the tasks or activities.

4.3 Gas Apprentice Performance Appraisal

4.3.1 Apprentice Performance Appraisals are to be completed every three months after the apprentice begins the program through the completion of the program.

4.4 Computer Based Training

4.5 Home Study Program

4.6 Examination Testing and Failures

4.7 SafeStart Advanced Safety Awareness Training

End of Instructions

Operator Qualification (OQ) Required?

NO

APPRENTICE TRAINING

October 1, 2022

APPR 2.1 Gas Journeyman

1.0 Purpose

This document provides the requirements for training, OTJ training, and examinations for Ameren Illinois' Gas Journeyman Apprenticeship program in accordance with 49 CFR 192.805.

2.0 Scope

This document addresses the following:

[Section 3.0 – Target Audience](#)

[Section 4.0 – General](#)

[Section 5.0 – Gas Journeyman Training Curriculum](#)

[Section 6.0 – Home Study Course](#)

[Section 7.0 – Examination & Failures](#)

Appendices:

[Appendix A – Recommended OJT Summary](#)

[Appendix B – \(OJT\) Breakdown by Type of Work with Associated B31Q Covered Task](#)

[Appendix C – Gas Apprentice Performance Appraisal](#)

[Appendix D – Gas Apprentice Session Evaluation](#)

[Appendix E – Operator Qualification](#)

3.0 Target Audience

- Gas Training Personnel
- Gas Operator Qualifications Personnel
- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Apprentices

4.0 General

UNCONTROLLED IF PRINTED

- 4.1 Throughout the Gas Journeyman Apprenticeship, the apprentice will be assigned to Gas Service Work and Gas Construction Work to ensure exposure to specific Covered Tasks.
 - 4.1.1 This will correspond to the training session they are currently preparing to attend.
- 4.2 Once the applicable training is successfully completed, an initial qualification evaluation will be conducted.
- 4.3 At the end of the apprentice program the apprentice will come to the Training Center to take an Apprentice Final exam and be OQ qualified as a Gas Journeyman.

5.0 Gas Journeyman Training Curriculum

- 5.1 Apprentice Orientation & Safety Basics (Held approx. 1 month prior to formal Apprenticeship Program)
 - 5.1.1 Introduction to Training Center Staff and Apprentice Program
 - 5.1.2 Professionalism / Expectations / OJT
 - 5.1.3 Drug and Alcohol Compliance
 - 5.1.4 Insight Learning Management System
 - 5.1.5 Measure and Order Level 1 PPE suits
 - 5.1.6 Distribution of CF33s and Introduction to Operating and Maintenance Plan and Field Safety Manual.
 - 5.1.7. Basic Gas Safety
 - 5.1.8 Basic Excavation Safety
 - 5.1.9 Understanding Job Briefings
 - 5.1.10 Rubber Glove Testing Procedures for Subsurface Electrical Hazards
- 5.2 Gas Basics (Session # 1000)
 - 5.2.1 Operator Qualification / Abnormal Operating Conditions / Direct Observation
 - 5.2.2 Personal Protective Equipment
 - 5.2.3 Firefighting and Proper Fire Fighting Techniques
 - 5.2.4 Characteristics and Hazards of Natural Gas
 - 5.2.5 Recognizing and Reporting Gas Emergencies
 - 5.2.6 Meter Set Inspection and Painting
 - 5.2.7 Includes Initial Qualification on Covered Task # 0991 – Coating Application and Repair – Brushed or Rolled, 0141 – Visual Inspection for Atmospheric Corrosion, 1011 – External Coating Application and Repair - Wrapped and 1201 - Temporary Isolation of Service Lines and Service Discontinuance. Refer to [OQAL 2.1](#) for Cover Task description.
- 5.3 PE Joining (Session #1100)
 - 5.3.1 Installation of PE Pipe
 - 5.3.2 Electrofusion
 - 5.3.3 Butt Fusion
 - 5.3.4 Mechanical Joints

5.3.5 Squeezing Plastic, Static and Grounding

5.3.6 Pressure Testing ≤ 100 PSIG (plastic facilities)

5.3.7 Service Transaction Documentation

5.3.8 Includes Initial Qualification on Covered Task # 0681, 0691, 0701, 0751, 0761, 0781 - Plastic Fusion and Joining. Refer to [QQAL 2.1](#) for Cover Task description

5.4 Job Site Protection (Session #1200)

5.4.1 Conducting Effective Tailboard Meetings / Job Briefing

5.4.2 Excavation Safety

5.4.3 ATSSA Flagging Certification / Certification

5.4.4 Soil Classification, Soils Checklist and Competent Person Training

5.4.5 Job Site Protection

5.4.6 Public Safety Advisor Training

5.5 Working In Gaseous Atmosphere (Session #1300)

5.5.1 Respirator Safety

5.5.2 O&M Procedures

5.5.3 Blowing Gas Protocols

5.5.4 Supplied Air Operation and Calibration

5.5.5 Level 1 and Level 2 Requirements

5.6 Critical Thinking & Problem Solving

5.6.1 Observations

5.6.2 Performing and Analysis

5.6.3 Assessment & Action

5.6.4 Risk – Safety – Impact

5.7 Maps, Symbols & Documentation

5.7.1 Business Process

5.7.2 Working With Maps / Symbology

5.7.3 Map Mark Ups

5.7.4 EPOCH Overview

5.8 Pipefitting (Session # 2300)

5.8.1 Preventing Injuries When Wrenching

5.8.2 Calculating Offsets, Finding Set, Travel and Run

5.8.3 Flanges

5.8.4 TracPipe

5.8.5 Hand Threading, Power Threading

5.8.6 Wrenches, Joints and Threads

5.8.7 System Upgrading

UNCONTROLLED IF PRINTED

5.9 Equipment Operation (Session # 2400)

5.9.1 Backhoe Operational Safety

5.9.2 Trencher Operational Safety

5.9.3 Boring Safety

5.9.4 Hand Signals

5.9.5 Equipment Operation

5.9.6 Sewer Listening Device / Preventing Sewer Cross-Bore

5.9.7 Subsurface Electrical Hazards

5.10 Direct Operated Regulators and Reliefs, Customer Meters (Session # 1500)

5.10.1 Locating, Installing and Protecting Customer Meters & Regulators

5.10.2 Customer Pressure Regulating and Limiting and Relief Devices

5.10.3 Operations and Maintenance of Regulators and Relief

5.10.4 Direct Operated Regulators and Reliefs

5.10.5 Meter Reading

5.10.6 Meter Selection and Sizing

5.10.7 Odor Intensity Training

5.10.8 Gas Meter Data Sheets

5.11 Leak Investigation (Session # 3100)

5.11.1 Gas Detection Instruments

5.11.2 Leak Surveying and Patrols

5.11.3 Gas Leaks and Migration

5.11.4 Leak Investigation

5.11.5 Leak Classification and Documentation

5.11.6 DIMP

5.12 Customer Premise (Session # 3200)

5.12.1 Combustion and Ventilation Air

5.12.2 Venting

5.12.3 Pilots

5.12.4 Control Valves / Safety checks

5.12.5 Gas-Air Adjustments

5.12.6 Lighting Appliances

5.12.7 Code Violations and Hazardous Conditions

5.12.8 Leak Investigations on Customer Equipment

5.12.9 Carbon Monoxide

5.13 Construction, Maintenance and Repair (Session #2000)

UNCONTROLLED IF PRINTED

- 5.13.1 Installation of Steel & Plastic Pipe
- 5.13.2 Repair of Imperfections and Damage
- 5.13.3 Squeezing Steel & Plastic
- 5.13.4 Leak Clamps and Sleeves
- 5.13.5 Casings, Vents, and Seals
- 5.13.6 Pressure Testing \geq 100 PSIG (steel facilities)
- 5.13.7 Facility Retirement and Abandonment
- 5.13.8 Bonding and Grounding
- 5.13.9 Farm Tap Design
- 5.13.10 Documentation
- 5.14 Cathodic Protection (Session #2100)
 - 5.14.1 Cathodic Protection System – Maintenance
 - 5.14.2 Atmospheric Corrosion
 - 5.14.3 Measuring Corrosion
 - 5.14.4 Pipe Coating Inspection, Installation, and Maintenance
 - 5.14.5 Pipe to Soil Testing
 - 5.14.6 Exothermic Welding
 - 5.14.7 Buried Pipe Exam Documentation
- 5.15 Valve Inspection and Maintenance (Session #1400)
 - 5.15.1 O&M Procedures
 - 5.15.2 Valve Types
 - 5.15.3 Flushing and Lubricating
 - 5.15.4 Valve Inspection Documentation
- 5.16 Tapping & Stopping (Session 3000)
 - 5.16.1 Tapping – Valve Tee
 - 5.16.2 Tapping and Stopping – $\frac{3}{4}$ " Low Pressure Fitting
 - 5.16.3 Tapping and Stopping - 2" Low Pressure Fitting
 - 5.16.4 Tapping and Stopping - 4" Low Pressure Fitting
 - 5.16.5 Stop Off With A One Way Feed
 - 5.16.6 Stop Off With A Two Way Feed
 - 5.16.7 Tap PE Side Wall Fitting
 - 5.16.8 Mueller Autoperf Tee
- 5.17 Damage Prevention / Location (Session #3300)
 - 5.17.1 JULIE Law, Damage Prevention
 - 5.17.2 Pipeline Patrols and Markers

5.17.3 Claims and Documentation for damaged facilities

5.17.4 Locating Theory and Principles

5.17.5 Conductive Locating

5.17.6 Inductive Locating (One Man and Two Man)

5.17.7 Inductive Clamp Locating

5.17.8 Depth Calculation Using Triangulation

5.18 Pilot Operated Regulators and Pilot Operated Reliefs (Session # 2200)

5.18.1 Operation of Pilot Operated Regulators and Reliefs

5.18.2 Testing, Preventative and Corrective Maintenance of Commercial Meter Sets

5.18.3 Tube Bending

5.18.4 Introduction to Gas Control

5.18.5 Overview of Odorizer Operation, SCADA System, Gas Storage Field Operation

6.0 Home Study Course

6.1 All apprentices will complete the Home Study Course. This course is intended to give the apprentice an overview of all Company Standards, policies and procedures.

6.2 The apprentices are assigned a specific Home Study Exercises and Reading Assignments which are to be completed between their training sessions and prior to the beginning of their next training session.

6.2.1 This work is to be done on the apprentice's own time.

6.2.2 Activity sheets covering the information in the Home Study/Home Reading Assignments will be turned in upon completion in class.

6.3 The apprentice is required to successfully complete the Home Study Course with a passing grade of 80% on all exercises, exams and activities.

6.4 The Home Study Program encompasses the content of the:

6.4.1 Gas Operating and Maintenance Plan

6.4.2 Utility Work Zone Traffic Control Field Manual

6.4.3 Manufacturers' Instructions and Handouts

6.4.4 Other Company Documents

7.0 Examinations & Failures

7.1 Examinations

7.1.1 Each Region Gas Superintendent and Gas Supervisor will receive a report of the apprentice's scores at the completion of each Training Cell.

1. All apprentices must achieve a minimum score of an 80% on all training cell module exams, training cell session exams and home study exams.

2. If an apprentice scores less than 80% on any of these exams please refer to "1st Failure".

7.2 1st Failure

7.2.1 The apprentice will meet with a Gas Training Supervisor and review all items missed on the exam.

7.2.2 The Region Gas Superintendent and Gas Supervisor will be notified of the failure(s).

7.2.3 The apprentice will be retested on the exam(s) before the beginning of the next scheduled Training Cell.

7.2.4 If the apprentice scores higher than 80% they will continue in the program. If the apprentice fails the exam for a 2nd time please refer to "2nd Failure".

7.3 2nd Failure

7.3.1 If the apprentice fails an exam for the second time the apprentice will be suspended from the program until a meeting can be held with the apprentice, Training Supervisor, Superintendent of Training & Qualification and the Region Gas Superintendent and/or Gas Supervisor. At this time a course of action will be determined.

7.4 3rd Failure

7.4.1 Any apprentice who fails any examination for the third time will be automatically removed from the program.

Appendix A, Recommended OJT Summary

A-1. The Gas Apprentice should be exposed to each category of tasks during each 9 month progression of the program to the extent possible. Total hours / jobs worked as shown in the table below are cumulative over the duration of the apprenticeship and should be achieved prior to completion of the program.

Type Of Work (Hours Worked)	Total Hours
Cathodic Protection	72 HOURS
PE Installation	280 HOURS
Steel Installation	44 HOURS
Repairs	74 HOURS
Maintenance	80 HOURS
Pressure Control	80 HOURS
Tapping	32 HOURS
Damage Prevention	24 HOURS
Odorization	16 HOURS
Pipeline Patrol	72 HOURS
Equipment Operation	264 HOURS

UNCONTROLLED IF PRINTED

Type of Work (# Jobs)	Total Jobs Worked
Inside Leak Investigation	30 EA
Outside Leak Investigation	30 EA
Customer Meter Installations/Exchanges - Small (Meter Size 630 CFH and under)	40 EA
Customer Meter Installations/Exchanges - Large (Meter Size 800 CFH and above)	10 EA
Appliance Relights/Turn-ons	60 EA
Locating	30 EA

Appendix B, (OJT) Breakdown by Type of Work with Associated B31Q Covered Task

Type Of Work	B31Q Covered Task and Description
Cathodic Protection	0001, CP Readings 0041, Installing and Maintaining Electrical Connections 0051, Cadwelding 0081, Installing CP Isolation Devices 0201, Inspect Pipe for Damage 0211, Measure/Characterize Pipe Damage 0991, Coating Application and Repair Brushed and Rolled 0141, Visual Inspection for Atmospheric Corrosion 0151, Visual Inspection of Buried Pipe Components When Exposed 0161, Visual Inspection for Internal Corrosion 0171, Measure External Corrosion 0181, Measure Internal Corrosion 0191, Measure Atmospheric Corrosion 1011, External Coating Application and Repair-Wrapped 1421, Examination Techniques (Visual Coating Exam and Jeeping)

UNCONTROLLED IF PRINTED

<p>PE Installation</p>	<p>0561, Pressure Test < 100 psig 0571, Pressure Test ≥ 100 psig 0591, Leak Test at Operating Pressure 0641, Inspection of Pipe for Damage Prior to Installation 0681, Joining with Stab Fittings 0691, Joining Non-Bottom Out Compression Fittings 0701, Joining Bottom Out Compression Coupling 0751, Joining PE Butt Heat Fusion Manual 0761, Joining PE Butt Heat Fusion Hydraulic 0781, Joining PE Pipe Electrofusion 0901, Install PE Pipe in Ditch 0911, Install PE Pipe in Bore 0921, Install PE Pipe Plow/Pull 0931, Install PE Pipe Plow/Plant 0941, Install Tracer Wire 0981, Backfilling 1141, Squeeze Off PE Pipe</p>
<p>Steel Installation</p>	<p>0561, Pressure Test < 100 psig 0571, Pressure Test ≥ 100 psig 0591, Leak Test at Operating Pressure 0641, Visual Inspect Pipe and Components Prior to Installation 0721, Joining of Pipe, Threaded Joints 0731, Joining of Pipe, Flange Assembly 0861, Installation of Steel Pipe in a Ditch 0871, Installation of Steel Pipe in a Bore 0881, Installation of Steel Pipe Plowing/Pull-In 0891, Field Bending of Steel Pipe 0971, Installation of Casing Spacers, Vents and Seals</p>

- C-2. The conscientious completion of this form by all parties and counseling with the apprentice is very important.
- C-3. In order for mutual benefit to be obtained by its use, it should be discussed in its entirety with the apprentice each month. This performance appraisal must be submitted to the Gas Training Center staff as well as the union.

Appendix D, Gas Apprentice Session Evaluation

- D-1. The Gas apprentice session evaluation form is used to:
 - D-1.1 Notify the gas supervisor of what areas of training have been completed
 - D-1.2 Communicate what type On the Job Training (OJT) exposure is needed.
 - D-1.3 Communicate observations of apprentice's behavior and performance while in training.

Appendix E, Operator Qualification

E-1. Each Gas Apprentice will be qualified during the Gas Journeyman Apprentice Program as identified in the table below. 30-60 days before becoming a Journeyman, the apprentice should be re-qualified on all Gas Journeyman Covered Tasks to achieve one qualification date going forward.

B31Q Task Number	Covered Task Description	Class Session Number	Initial
0141	Corrosion Monitoring - Atmospheric, External and Corrosion Internal	1000	1000
0201	Visual Inspection of Installed Pipe and Components for Mechanical Damage	1000	1000
0991	Coating Application and Repair – Brushed or Rolled	1000	1000
1011	External Coating Application and Repair - Wrapped	1000	1000
1201	Temporarily Disconnect Customer Services	1000	1000
0681	Joining – Stab Fittings PE Pipe	1100	1100
0691	Joining of Pipe-Non Bottom Out Compression Coupling	1100	1100
0701	Joining of Pipe-Bottom Out Compression Coupling	1100	1100
0711	Joining of Pipe - Compression Coupling	1100	1100
0751	Joining of PE Pipe – Butt Heat Fusion	1100	1100

1.0 Purpose

This section outlines the formal training programs for Corrosion Control for new gas field personnel. This is accomplished using a blended training approach of CBT's, Classroom Instruction, Hands On and Safe Start Principles.

2.0 Scope

This document addresses the following:

[Section 3.0 – Target Audience](#)

[Section 4.0 – Corrosion Technician](#)

[Section 5.0 – Senior Corrosion Control Technician](#)

[Section 6.0 – Additional Training](#)

[Section 7.0 – Home Study Course](#)

Appendices:

[Appendix A – Home Study CBT's](#)

[Appendix B – Corrosion Control Technician Qualifications](#)

3.0 Target Audience

- Gas Training Personnel
- Gas Operator Qualifications Personnel
- Gas Corrosion Control Technicians / Specialists
- Gas Corrosion Control Supervisors

4.0 Corrosion Technician

4.1 1000 - Cathodic Protection Basics

4.1.1 Basic Electricity

4.1.2 Basic Chemistry

4.1.3 Basic Corrosion Theory

4.1.4 Reference Electrodes (Half-Cells)

4.2 1100 – Corrosion

4.2.1 Corrosion Cells

4.2.2 Polarization

4.2.3 Anode/Cathode Ratio

4.2.4 Causes of Corrosion

4.3 1200 – Corrosion Control – CP

4.3.1 Cathodic Protection

4.3.2 Factors Influencing Operation of Cathodic Protection

4.3.3 Criteria for Cathodic Protection

4.4 1300 - Field Measurements

4.4.1 Safety

4.4.2 Field Measurements (annual, isolated, crossings, casings, bonds, wells)

4.4.3 Electrical Isolation

4.4.4 Measuring Electrolyte Resistivity

4.4.5 Measuring pH

4.5 1400 - Equipment

4.5.1 Use of Pipe Locating Devices

4.5.2 Use of Current Interrupters

4.5.3 Coupon Measurements

4.6 1500 - Stray Current

4.6.1 Introduction to Stray Current Interference

4.6.2 Stray Current Corrosion Control

4.7 1600 - Monitoring

4.7.1 Monitoring Cathodic Protection Effectiveness

4.7.2 Recordkeeping

4.8 1700 - CP Systems

4.8.1 Installing CP Components

4.8.2 Galvanic (Sacrificial) Anodes

4.8.3 Impressed Current Ground beds

4.8.4 Connections

4.8.5 Installation of Rectifiers or Other Power Sources

4.9 1800 - Evaluating Corrosion

4.9.1 External Corrosion Above and Below Grade

4.9.2 Internal Corrosion

4.9.3 Pit measurement

4.10 1900 - Troubleshooting

4.10.1 Finding a Short

4.10.2 Testing Casings

4.10.3 Current Requirement Tests

4.10.4 Stray Current Tests

4.10.5 Trouble Shoot and Repair a Rectifier

4.10.6 Conduct Close Interval Surveys and Record Data, Draw Conclusions

4.10.7 Perform Insulator Tests

4.10.8 Read Bonds and Record Data

4.10.9 Measure Current and P/S at Anode Beds

4.11 1950 - Internal Corrosion (Optional)

5.0 Senior Corrosion Control Technician

5.1 2050 – Corrosion Theory

5.1.1 The Corrosion Cell

5.1.2 Electrolyte

5.1.3 Polarization

5.1.4 Passivity

5.1.5 Forms of Corrosion

5.2 2150 – Cathodic Protection Fundamentals

5.2.1 Polarization of a Structure

5.2.2 Current Requirements

5.2.3 Components of Galvanic Cathodic Protection

5.2.4 Components of Impressed Current Cathodic Protection

5.2.5 DC Power Sources for Cathodic Protection

5.2.6 Rectifier Testing

5.3 2250 - Advanced Field Measurements

5.3.1 Pipeline Current Measurements

5.3.2 Surface Coating Evaluation Techniques on Buried Pipelines

5.3.3 Electrical Isolation

5.3.4 Casings

5.4 2350 – DC Stray Current Interference

5.4.1 Static (Steady State) Stray Current

5.4.2 Dynamic Stray Currents

5.4.3 Resolving Interference Problems

5.5 2450 – AC Interference

5.5.1 AC Testing and Mitigation

5.6 2550 - Major Objectives of a Cathodic Protection System

5.6.1 Coating

5.6.2 Monitoring

UNCONTROLLED IF PRINTED

5.6.3 Detailed Field Survey

5.6.4 Records

6.0 Additional Training

6.1 2600 – Purdue Basics

6.2 2650 – Purdue Intermediate

6.3 2700 – Rectifier Repair

6.4 2750 – NACE Cathodic Protection Tester (CPI)

6.5 2800 – Purdue Advanced

6.6 2850 – NACE Cathodic Protection Technician (CPII)

7.0 Home Study Course

7.1 The Corrosion Technician will be assigned specific Computer Based Training Modules that correspond to their upcoming training session. To complete each section, the Corrosion Technician will study the course work and fill out the home study exercise provided for each section and complete the CBT's online. This work is to be done on the Corrosion Technician's own time.

7.2 The Corrosion Technician is required to successfully complete the Home Study Course with a passing grade of 80% on all exercises and exams.

End of Instructions

Operator Qualification (OQ) Required?

YES

See Appendix B – Corrosion Control Technician Qualifications

Appendix A, Home Study CBT's

Home Study CBT	ASME B31Q Number
Measure Structure-to-Electrolyte Potential	0001
Conduct Close Internal Survey	0011
Measure Soil Resistivity	0021
Inspect and Monitor Galvanic Ground Beds/Anodes	0031
Installation and Maintenance of Mechanical Electrical Connections	0041
Installation of Exothermic Electrical Connections	0051
Inspect or Test Cathodic Protection Bonds	0061
Inspect or Test Cathodic Protection Electrical Isolation Devices	0071
Install Cathodic Protection Electrical Isolation Devices	0081
Troubleshoot In-Service Cathodic Protection System	0091
Inspect Rectifier and Obtain Readings	0101
Maintain Rectifier	0111
Visual Inspection for Atmospheric Corrosion When Exposed	0141
Visual Inspection of Buried Pipe and Components	0151
Visual Inspection for Internal Corrosion	0161

UNCONTROLLED IF PRINTED

Measure External Corrosion	0171
Measure Internal Corrosion	0181
Measure Atmospheric Corrosion	0191

Appendix B, Corrosion Control Technician Qualifications

B-1. Qualifications

- 0001: Measure Structure-To-Electrolyte Potential
- 0011: Conduct Close Interval Survey
- 0021: Measure Soil Resistivity
- 0031: Inspect and Monitor Galvanic Ground Beds
- 0041: Installation and Maintenance of Mechanical Connections
- 0051: Installation of Exothermic Electrical Connections
- 0061: Inspect or Test Cathodic Protections Bonds
- 0071: Inspect or Test Cathodic Protection Electrical Isolation Beds
- 0081: Install Cathodic Protection Electrical Isolation Devices
- 0091: Troubleshoot In-Service Cathodic Protection System
- 0101: Inspect Rectifier and Obtain Readings
- 0111: Maintain Rectifier
- 0121: Collect Sample for Internal Corrosion Monitoring
- 0131: Insert and Remove Coupons/Probes for Internal Corrosion Monitoring
- 0141: Visual Inspection for Atmospheric Corrosion
- 0151: Visual Inspection of Buried Pipe and Components When Exposed
- 0161: Visual Inspection for Internal Corrosion
- 0171: Measure External Corrosion
- 0181: Measure Internal Corrosion
- 0191: Measure Atmospheric Corrosion

1.0 Purpose

This section outlines the formal training programs for new gas storage field personnel. This is accomplished using a blended training approach of CBT's, Classroom Instruction, Hands-On and Safe Start Principles.

2.0 Scope

This document addresses the following:

[Section 3.0 – Target Audience](#)

[Section 4.0 – First Step](#)

[Section 5.0 – Second Step](#)

[Section 6.0 – Third Step](#)

[Section 7.0 – Additional Training \(Required\)](#)

[Section 8.0 – Additional Training \(Optional\)](#)

Appendices:

[**Appendix A - ASME B31Q Operator Qualifications Performed at the end of First Step**](#)

[**Appendix B - ASME B31Q Operator Qualifications Performed at the end of Second Step**](#)

[**Appendix C - ASME B31Q Operator Qualifications Performed at the end of Third Step**](#)

3.0 Target Audience

- Gas Training Personnel
- Gas Operator Qualification Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Personnel

4.0 First Step

4.1 Apprentice Orientation (Held 1 month prior to formal Apprenticeship Program)

4.1.1 Introduction to Training Center Staff, Apprentice Program and Policies

- 4.1.2 Professionalism / Expectations/OJT
- 4.1.3 CBT - Password and ID's - How to log into the system
- 4.1.4 Measure and Order Level 1 suits
- 4.1.5 Information for fit testing / medical van (need prior to session 1300)
- 4.1.6 Distribution and Introduction to Operating & Maintenance Plan and Gas Operations Field Reference Guide
- 4.2 Gas Basics (Session #1000)
 - 4.2.1 Abnormal Operating Conditions
 - 4.2.2 Direct Observation
 - 4.2.3 Drug and Alcohol Compliance
 - 4.2.4 Personal Protective Equipment
 - 4.2.5 Firefighting and Proper Fire Fighting Techniques
 - 4.2.6 Characteristics and Hazards of Natural Gas
 - 4.2.7 Recognizing and Reporting Gas Emergencies
 - 4.2.8 Meter Set Inspection and Painting
- 4.3 Job Site Protection (Session #1200)
 - 4.3.1 Conducting Effective Tailboard Meetings
 - 4.3.2 Excavation Safety
 - 4.3.3 ATSSA Flagging Certification / Certification
 - 4.3.4 Competent Person Training
 - 4.3.5 Soil Classification and Competent Person Training
 - 4.3.6 Job Site Protection
 - 4.3.7 Hand Signals
- 4.4 Working In Gaseous Environment (Session #1300)
 - 4.4.1 Respirator Safety
 - 4.4.2 Policies and Procedures
 - 4.4.3 Blowing Gas Protocols
 - 4.4.4 Breather Box Operation and Calibration
 - 4.4.5 Level 1 and Level 2 Requirements
- 4.5 Valve Inspection and Maintenance (Session #1400)
 - 4.5.1 Policies and Procedures
 - 4.5.2 Valve Types
 - 4.5.3 Flushing and Lubricating
- 4.6 Storage Field Geology (Session #4700)
- 4.7 Reading Blueprints (Session #4750)
- 4.8 Reading Schematics and Symbols (Session #4800)

UNCONTROLLED IF PRINTED

5.0 Second Step

5.1 Steel Mains and Services (Session #2000)

- 5.1.1 Installation of Steel Pipe
- 5.1.2 Repair of Imperfections and Damage
- 5.1.3 Leak Clamps and Sleeves
- 5.1.4 Casings, Vents and Seals
- 5.1.5 Pressure Testing \geq 100 PSIG
- 5.1.6 Service Discontinuance
- 5.1.7 Farm Tap Design

5.2 Cathodic Protection (Session #2100)

- 5.2.1 Cathodic Protection System - Maintenance
- 5.2.2 Monitoring Atmospheric Corrosion
- 5.2.3 Coating Maintenance and Examination
- 5.2.4 Pipe to Soil Testing
- 5.2.5 Exothermic Welding
- 5.2.6 Hot Wraps / Epoxy Repair Sticks

5.3 Direct Operated Regulators and Reliefs, Customer Meters (Session #2200)

- 5.3.1 Locating, Installing and Protecting Customer Meters & Regulators
- 5.3.2 Customer Pressure Regulating and Limiting and Relief Devices
- 5.3.3 Operations and Maintenance of Regulators and Relief
- 5.3.4 Direct Operated Regulators and Reliefs
- 5.3.5 Valve Changing

5.4 Pipefitting (Session #2300)

- 5.4.1 Preventing Injuries When Wrenching
- 5.4.2 Calculating Offsets, Finding Set, Travel and Run
- 5.4.3 Flanges
- 5.4.4 TracPipe
- 5.4.5 Hand Threading, Power Threading
- 5.4.6 Wrenches, Joints and Threads

5.5 Equipment Operation (Session #2400)

- 5.5.1 Backhoe Operational Safety
- 5.5.2 Trencher Operational Safety
- 5.5.3 Equipment Operation
- 5.5.4 Sewer Listening Device

5.6 Electrical Measuring Instruments (TPC 204.1) (Session #4900)

UNCONTROLLED IF PRINTED

5.7 Basic Electricity and Electronics (TPC – 201) (Session #4950)

5.8 Valve Maintenance and Piping System Protection (TPC 347) (Session #5000)

6.0 Third Step

6.1 Evaluating Corrosion (Session #1800)

6.1.1 External Corrosion Above and Below Grade

6.1.2 Internal Corrosion

6.1.3 Pit Measurement

6.1.4 Pipe Damage

6.2 Troubleshooting (Session #1900)

6.2.1 Troubleshooting

6.2.2 Finding a Short

6.2.3 Testing Casings - Reverse Current

6.2.4 Current Requirement Tests

6.2.5 Stray Current Tests

6.2.6 Trouble Shoot and Repair a Rectifier

6.2.7 Conduct Soil Resistivity Tests

6.2.8 Conduct Close Order Surveys and Record Data, Draw Conclusions

6.2.9 Perform Insulator Tests

6.2.10 Read Bonds and Record Data

6.2.11 Measure Current and P/S at Anode Beds

6.3 Leak Investigation (Session #3100)

6.3.1 Flame Ionization Unit

6.3.2 Combustible Gas Indicator

6.3.3 Surveying and Patrols

6.3.4 Odorization

6.3.5 Outside Leak Investigations

6.3.6 Inside Leak Investigations

6.3.7 Carbon Monoxide Testing

6.3.8 Leak Documentation

6.4 Damage Prevention / Locating (Session #3300)

6.4.1 JULIE Law, Damage Prevention

6.4.2 Locating Theory and Principles

6.4.3 Conductive Locating

6.4.4 Inductive Locating (One Man and Two Man)

6.4.5 Inductive Clamp Locating

UNCONTROLLED IF PRINTED

6.4.6 Depth Calculation Using Triangulation

6.5 Complex Pressure Control (Pilot Operated Regulators and Reliefs) (Session #4100)

6.6 Hydrostatic Pressure Testing (Session #4200)

6.7 Odorizer Inspection and Maintenance (Session #4350)

6.8 Basic Pneumatic Skills (TPC 309) (Session #5050)

6.9 Developing Pneumatic Skills (TPC 310) (Session #5100)

6.10 Lockout / Tagout (Session #5150)

6.11 Pressure Test – Liquid Medium (Session #6000)

6.12 Compressors (Session #6500)

6.12.1 Compressor Start up and Shutdown - Manual

6.12.2 Compressor Preventive Maintenance

6.12.3 Reciprocating Compressor Inspection, Testing and Corrective Maintenance

6.13 Pumps (Session #6600)

6.13.1 Pump Start-up and Shutdown

6.13.2 Pump Preventive Maintenance

6.13.3 Centrifugal Pump Inspection/Testing and Corrective Maintenance

6.13.4 Reciprocating Pump Inspection/Testing/Corrective Maintenance

6.14 Overfill Protection Systems (Session #6750)

6.15 Explosive Atmosphere Detection and Alarm System Performance Test / Corrective Maintenance (Session #6800)

6.16 Breakout Tanks (Session #6850)

7.0 Additional Training (Required)

7.1 Fire Fighting Training (Session #4850)

8.0 Additional Training (Optional)

8.1 PE Mains and Services (Session #1100)

8.2 Purdue Basics (Corrosion) (Session #2600)

8.3 Tapping and Stopping (Session #3000)

8.4 Leak Investigation (Session #3100)

8.5 Customer Premise (Session #3200)

8.6 OAS Training (Session #4000)

8.7 Byers Mapping Training (Session #4050)

8.8 Rectifier Inspection and Maintenance (Session #4150)

8.9 Coating Application (Sprayed) (Session #4250)

8.10 Fit-up Weld Repair Sleeve (Session #4300)

8.11 Mobile Leak Survey (Session #4400)

- 8.12 Gas Control Operations (Session #4450)
- 8.13 Gas Storage Operations (Session #4500)
- 8.14 Large Diameter Tapping (Session #4600)
- 8.15 Advanced Appliance Operations (Session #4650)
- 8.16 Reciprocating Compressors (Session #5200)
- 8.17 Fundamental of Programmable Logic Controllers (Session #5250)
- 8.18 Excel XP Level 1 (Val-Tech) (Session #5300)
- 8.19 Dehydration (Session #5310)

Revision Notes Location	Summary of Changes
Entire document	Format of document has been changed to match the format of October 2022 Issue

Subsection 4.4	Working In Gaseous Environment replaces Working With Blowing Gas
Appendix C – 3rd Step	<p>Added Covered Tasks:</p> <p>1381- Operate Gas Pipeline – Local Facility Remote=Control Operations</p> <p>1631 - Launching and or receiving internal Device (pigs) lines out of service</p> <p>1641 - Launching and or receiving internal Device (pigs) lines in of service</p> <p>1671 - Inspect & Maintain a Pipeline Heater</p> <p>1681 - Inspect & Maintain Liquid Knockout System</p> <p>1691 - Inspect & Maintain Glycol Dehydration System</p> <p>1701 - Inspect & Maintain Mole Sieve Dehydration System</p>

Appendix A- ASME B31Q Operator Qualifications Performed at the end of First Step

ASME B31Q Number	Covered Task Description
0211	Measure and Characterize Mechanical Damage on Installed Pipe and Components
0561	Pressure Test - Non-liquid Medium < 100 psig
0591	Leak Test at Operating Pressure
0641	Visually Inspect Pipe and Components Prior to Installation
0981	Backfilling
0991	Coating Application and Repair - Brushed or Rolled
0301	Manually Opening and Closing Valves
0311	Adjust and Monitor Flow or Pressure - Manual Valve Operation
0321	Valve Corrective Maintenance

0331	Valve - Visual Inspection and Partial Operation
0341	Valve Maintenance

Appendix B, ASME B31Q Operator Qualifications Performed at the end of Second Step

ASME B31Q Number	Covered Task Description
0001	Measure Structure-to-Electrolyte Potential
0041	Installation and Maintenance of Mechanical Connections
0051	Installation of Exothermic Electrical Connections
0081	Install Cathodic Protection Electrical Isolation Devices
0201	Visual Inspection of Installed Pipe and Components for Mechanical Damage
0141	Corrosion Monitoring - Atmospheric, External and Corrosion Internal
0151	Visual Inspection of Buried Pipe and Components when Exposed
0161	Visual Inspection for Internal Corrosion
0171	Measure External Corrosion
0181	Measure Internal Corrosion
0191	Measure Atmospheric Corrosion
0381	Spring Loaded Pressure Regulating Device - Inspect, Testing, Preventive & Corrective Maintenance
0411	Spring-Loaded Pressure Limiting and Relief Device- Inspect, Testing, Preventive & Corrective Maintenance
0571	Pressure Test - Non-liquid Medium \geq 100 psig
0721	Joining of Pipe - Threaded Joints

UNCONTROLLED IF PRINTED

0731	Joining of Pipe - Flange Assembly
0861	Installation of Steel Pipe in a Ditch
0951	Installation of Pipe Above Ground
0971	Installation/Maintenance Casing spacers vents seals
1011	External Coating Application and Repair - Wrapped
1191	Maintenance Valves Upstream of Customer Meter
1341	Provide or Assure Adequate Pipeline Support During Operator Initiated Excavation Activities
0961	Above Ground Supports and Anchors - Inspection, Preventive/Corrective Maintenance
1301	Install and Maintain Pipeline Markers
1321	Damage Prevention During Excavation Activities by or on Behalf of the Operator
1331	Damage Prevention Inspection During Third Party Excavation or Encroachment Activities as Determined Necessary by Operator

Appendix C, ASME B31Q Operator Qualifications Performed at the end of Third Step

ASME B31Q Number	Covered Task Description
1261	Walking Gas Leakage Survey
1291	Locating Underground Pipelines
1311	Inspect Pipeline Surface Conditions - Patrol Right of Way or Easement
0391	Pilot-Operated Pressure Regulating Device -Inspect, Testing, Preventive & Corrective Maintenance

UNCONTROLLED IF PRINTED

0421	Pilot Operated Pressure Limiting/Relief Device-Inspect, Testing, Preventive & Corrective Maintenance
0431	Pneumatic Loaded Pressure Limiting/Relief Device-Inspect, Testing, Preventive & Corrective Maintenance
0581	Pressure Test - Liquid Medium
1221	Odorization - Odorizer Inspection, Testing, Preventive/Corrective Maintenance
0091	Troubleshoot In-service cathodic Protection System
0121	Collect Sample for Internal Corrosion Monitoring
0131	Insert and Remove Coupons/Probes for Internal Corrosion
0221	Inspect, Test and Maintain Sensing Devices
0251	Inspection/Testing, Corrective/Preventive Maintenance - Overfill Protection Systems
0261	Inspection, Testing, Corrective/Preventive Maintenance - Tank Gauges for Leak Detection
0361	Electric Actuator/Operator Inspection and Testing Preventive/Corrective Maintenance
0371	Hydraulic Actuator/Operator Inspect/Testing, Preventive/Corrective Maintenance
0401	Controller Type Pressure Regulating Device - Inspect, Testing, Preventive & Corrective Maintenance
0441	Compressor Start up and Shutdown - Manual
0451	Pump Start-up and Shutdown
0461	Compressor Preventive Maintenance
0471	Reciprocating Compressor Inspection, Testing and Corrective Maintenance
0501	Pump Preventive Maintenance

UNCONTROLLED IF PRINTED

0511	Centrifugal Pump Inspection/Testing and Corrective Maintenance
0521	Reciprocating Pump Inspection/Testing/Corrective Maintenance
0551	Explosive Atmosphere Detection and Alarm System Performance Test/Corrective Maintenance
0821	Tubing and Fitting Installation - Instrument, Control and Sampling
1361	Station Emergency Shutdown System - Inspection, Testing and Corrective Maintenance
1381	Operate Gas Pipeline – Local Facility Remote=Control Operations
1631	Launching and or receiving internal Device (pigs) lines out of service
1641	Launching and or receiving internal Device (pigs) lines in of service
1671	Inspect & Maintain a Pipeline Heater
1681	Inspect & Maintain Liquid Knockout System
1691	Inspect & Maintain Glycol Dehydration System
1701	Inspect & Maintain Mole Sieve Dehydration System

1.0 Purpose

This section outlines the formal training programs for new gas field personnel in Gas Technical Services. This is accomplished using a blended training approach of CBT's, Classroom Instruction, Hands-On and Safe Start Principles.

2.0 Scope

This document addresses the following:

[Section 3.0 – Target Audience](#)

[Section 4.0 – First Step](#)

[Section 5.0 – Second Step](#)

[Section 6.0 – Third Step](#)

Appendices:

[Appendix A - ASME B31Q Operator Qualifications Performed at the end of First Step](#)

[Appendix B - ASME B31Q Operator Qualifications Performed at the end of Second Step](#)

[Appendix C - ASME B31Q Operator Qualifications Performed at the end of Third Step](#)

3.0 Target Audience

- Gas Training Personnel
- Gas Operator Qualifications Personnel
- Gas Tech Services (GTS) Supervisor
- Gas Tech Services (GTS) Personnel

4.0 First Step

4.1 Operation and Maintenance of Distribution Regulator Station Equipment (Session #1000)

4.1.1 Functions of a Regulator

4.1.2 Essential Elements

4.1.3 Regulators: Spring Loaded, Pilot Loaded, Controller and Actuator Type

4.1.4 Overpressure Protection: Relief Valves, Monitor Systems, Security Valves

4.1.5 Regulator Station Inspections and By-Pass Operations, ERX, Program

4.2 Operation and Maintenance of Transmission Regulator Station and Measuring Equipment (Session #1100)

4.2.1 Flow Meters-Orifice Metering

4.2.2 Pipeline Heaters

4.2.3 Filtering Equipment

4.2.4 Electronic Controllers

4.2.5 Pneumatic Controllers

4.2.6 Standby and Back Up Systems

4.2.7 Pressure Monitoring Distribution and Transmission

4.3 Gas System (Session #1200)

4.3.1 Components of the Total Gas System, Producer, Intrastate Pipeline, Distribution Company

4.3.2 Components of Ameren Illinois Gas System, Pipeline Interface, Transmission System, Distribution System, Gas Storage Facilities, Review Gas System Study

4.4 Operation and Filing of Odorizing Equipment (Session #1300)

4.4.1 Injection Pumps

4.4.2 Differential Meter Type

4.4.3 Bypass

4.4.4 Odorant Testing and Sampling

4.4.5 Odorant Requirements

4.4.6 Odorization Requirements

4.5 Metering, Instrumentation Operation, Maintenance and Calibration (Session #1400)

4.5.1 Gauges, Spring, Electronic, Recording, Manometer

4.5.2 Electronic Correctors

4.5.3 Differential and Accuracy Testing, Roots Program, Record Keeping, Oil Changing

4.5.4 Types of Meters, Diaphragm, Rotary, Turbine, Orifice, Ultrasonic

4.5.5 Meter Testing Programs, Sample Testing, Periodic Testing, Mileage Testing

4.5.6 New Meter Testing

5.0 Second Step

5.1 Operation and Maintenance of a Distribution Regulator Station and Equipment (Session #2000)

5.1.1 Regulators: Spring Loaded Regulators, Types, Uses, Pilot Loaded Regulators, Types, Uses, Controller and Actuator type

5.1.2 Over Pressure Protection: Relief Valves, Spring, Pilot, Security Valves

5.1.3 Monitor Regulator System, Uses, Types-Open and Working, Piping Configurations

5.2 Operation and Maintenance of Transmission – Regulator Stations and Measuring Equipment (Session #2100)

5.2.1 Flow Meters-Orifice Metering: Uses, Types

5.2.2 Filtering Equipment

UNCONTROLLED IF PRINTED

5.2.3 Electronic Controllers: Uses-Types-Inspections

5.2.4 Pneumatic Controllers: Uses-Types-Inspections

5.2.5 Standby and Back up systems

5.2.6 Pipeline Heaters: Maintenance

5.2.7 Systematic Checks

5.3 Operation and Filing of Odorizing Equipment (Session #2200)

5.3.1 Injection Pump, Bypass, Differential Meter: Reading, Filling, Field Inspections, Record Keeping

5.3.2 Odorant Testing and Sampling: When, Where, Why

5.3.3 Use of Odorometer and Odorator

5.4 Construction (Session #2300)

5.4.1 Read and Understand Blueprints for Station Construction: Symbols Used, Measurement, Fittings, Construction Standards

5.4.2 Station Installations and Set-Up for Operation

5.4.3 Station Prefabrication

5.4.4 Testing of Station and Equipment: Pressure Limits, Recording Devices, Hydrostatic Testing, Nitrogen Testing

5.4.5 Proper Placement of Control Lines: Distribution and Transmission Stations Industrial Meter Sets

5.5 Metering, Instrumentation Operation, Maintenance and Calibration (Session #2400)

5.5.1 Electronic Correctors: Inspections, Calibrate, Record Keeping, Review Electronic Corrector Inspection Gas Metering Procedure

5.5.2 AMR Devices

5.5.3 Pulse Accumulators

5.5.4 USMS Accounts

5.5.5 Meter Testing: Diaphragm, Rotary, Turbine, Ultrasonic, Orifice

5.5.6 Review Gas Metering Procedures Associated with Field Testing

6.0 Third Step

6.1 Operation and Maintenance of Distribution Regulator Station and Equipment (Session #3000)

6.1.1 Systematic Checks

6.1.2 Catalytic Heaters

6.1.3 Erx: Calibrate, Maintenance

6.1.4 Upgrading and Uprating of System Pressures-Review Procedures

6.2 Operation and Maintenance of Transmission – Regulator Stations and Measuring Equipment (Session #3100)

6.2.1 Generators and Backup Equipment, Maintenance Inspections

6.2.2 Gas Transmitters-Pressure and Differential Pressure: Program, Calibrate

UNCONTROLLED IF PRINTED

6.2.3 Telemetry Equipment

6.2.4 Remote Operating Controllers (ROC's, RTU's, HP's)

6.2.5 Rerouting Gas for Efficient Operation of Storage Facilities

6.2.6 Rerouting Gas for Construction and Emergency Operations

6.3 Operation and Filing of Odorization Equipment (Session #3200)

6.3.1 YZ Data Download

6.3.2 Odorant Transfer-Bulk and Portable Tank

6.3.3 Pump-Maintenance and Rebuild

6.3.4 Troubleshooting

6.3.5 Cleaning Up Spills and Deodorizing

6.4 Metering, Instrumentation Operation, Maintenance and Calibration (Session #3300)

6.4.1 Correctors: Program, Modems, Troubleshoot

6.4.2 AMR devices: Program, Wire, Troubleshoot

6.5 Basic Electronics Course (Session #3400)

End of Instructions

Operator Qualification (OQ) Required?

YES

1.0 Purpose

This section outlines the formal training programs for gas personnel and non-gas personnel who are designated as an Emergency Responder.

2.0 Scope

This document addresses the following:

[Section 3.0 – Target Audience](#)

[Section 4.0 – Curriculum](#)

3.0 Target Audience

- Gas Training Personnel
- Gas Operator Qualification Personnel
- Gas Apprentices
- Designated Emergency Responders
- Gas Supervisors
- Electric Supervisors with Emergency Responder Personnel
- Meter Changer Supervisors

4.0 Curriculum

4.1 Gas Basics (Session #1000)

- 4.1.1 Abnormal Operating Conditions
- 4.1.2 Direct Observation
- 4.1.3 Drug and Alcohol Compliance
- 4.1.4 Personal Protective Equipment
- 4.1.5 Characteristics and Hazards of Natural Gas
- 4.1.6 Recognizing Gas Emergencies
- 4.1.7 Recognizing and Reporting Gas Leaks
- 4.1.8 Disconnect Customer Services

Operator Qualification (OQ) Required?

YES

1201: Disconnect Customer Services

1.0 Purpose

This section outlines the formal training programs for the Gas Meter Specialist Program and Gas Meter Reader Program for new gas field personnel.

2.0 Scope

This document addresses the following:

[Section 3.0 – Target Audience](#)

[Section 4.0 – Gas Meter Reader Program Curriculum](#)

[Section 5.0 – Gas Meter Specialist Program Curriculum](#)

Appendices

[Appendix A – Qualifications](#)

[Appendix B – OJT Summary](#)

[Appendix C – \(OJT\) Breakdown by Type of Work with Associated B31Q Covered Task](#)

3.0 Target Audience

- Gas Training Personnel
- Gas Operator Qualifications Personnel
- Gas Meter Readers
- Gas Meter Specialists

4.0 Gas Meter Reader Program Curriculum

4.1 Gas Basics (Session #1000)

- 4.1.1 Abnormal Operating Conditions
- 4.1.2 Direct Observation
- 4.1.3 Drug and Alcohol Compliance
- 4.1.4 Personal Protective Equipment
- 4.1.5 Characteristics and Hazards of Natural Gas
- 4.1.6 Recognizing Gas Emergencies
- 4.1.7 Recognizing and Reporting Natural Gas Leaks
- 4.1.8 Meter Set Inspection

5.0 Gas Meter Specialist Program Curriculum

5.1 The Gas Meter Specialist Program includes all the courses required for the Gas Meter Reader Program as well as the following:

5.1.1 Direct Operated Regulators and Reliefs, Customer Meters (Session #1500)

1. Locating, Installing and Protecting Customer Meters and Regulators
2. Customer Pressure Regulating, Limiting and Relief Devices

5.1.2 Pipefitting (Session #2300)

1. Preventing Injuries When Wrenching
2. Wrenches, Joints and Threads

5.1.3 Customer Premise (Session #3200)

1. Combustion and Ventilation Air
2. Venting
3. Pilots
4. Control Valves
5. Gas-Air Adjustments
6. Lighting Appliances
7. Code Violations and Hazardous Conditions
8. Pressure Checks, Delivery and Lock-Up
9. Low Flow and Shut-In Test
10. Turn On Gas
11. Track Pipe Recognition

End of Instructions

Operator Qualification (OQ) Required?

YES

Appendix A, Qualifications

A-1. ASME B31Q Operator Qualifications Performed at the End of the Program

ASME B31Q Number	Covered Task Description
0991	Coating Application and Repair - Brushed or Rolled
1201	Disconnect Customer Services
0141	Corrosion Monitoring - Atmospheric, External and Corrosion Internal
1161	Install Meters and Regulators - Residential, Small Commercial

A-2. Note: Only ASME B31Q Number 0141 is required for the Gas Meter Reader Program

Appendix B, Gas Meter Specialist OJT Summary

B-1. Minimum OJT Summary

Type Of Work	Program Minimum OJT Hours
Cathodic Protection	24
Service Work	56
Pressure Control	32

UNCONTROLLED IF PRINTED

Appendix C, (OJT) Breakdown by Type of Work with Associated B31Q Covered Task for Meter Specialist

Type Of Work	B31Q Covered Task and Description
Cathodic Protection	0991, Coating Application and Repair Brushed and Rolled 0141, Visual Inspection for Atmospheric Corrosion 0191, Measure Atmospheric Corrosion 1011, External Coating Application and Repair-Wrapped
Service Work	1201, Disconnect Customer Service 1161, Install Meters and Regulators- Residential and Small Commercial
Pressure Control	0381, Spring Loaded Pressure Regulating Devices - Inspection and Testing, Preventative and Corrective Maintenance

APPRENTICE TRAINING

October 1, 2022

APPR 2.7 Hiring Gas Field Personnel

1.0 Purpose

- 1.1 To successfully perform the duties required of gas field personnel, employees must have certain basic skills and abilities.
- 1.2 This section describes the evaluation tools and the hiring process that Ameren Illinois utilizes to evaluate and screen applicants for the various contract positions that are collectively referred to as "Gas Field Personnel".
- 1.3 This section also outlines the process by which applicants with previous gas experience are evaluated for placement within Ameren Illinois' Apprenticeship Program or qualified as a Journeyman.

2.0 Scope

This document addresses the following:

[Section 3.0 – Target Audience](#)

[Section 4.0 – General](#)

[Section 5.0 – Evaluation Tools](#)

[Section 6.0 – Hiring Process](#)

3.0 Target Audience

- Gas Training Personnel
- Gas Operator Qualification Personnel
- Gas Superintendents
- Gas Supervisors

4.0 General

- 4.1 The term "Applicant(s)" in this section shall mean all external applicants plus all internal applicants that have no union affiliation or a union affiliation different than the one where the opening exists.
- 4.2 The following procedures will be applied to all applicants from outside Ameren Illinois or Ameren Missouri.
- 4.3 These procedures will also be applied to internal employee applicants if permitted by the affected labor contract.
- 4.4 An existing employee who is not a member of a bargaining unit, or who is a member of a bargaining unit different from the one where the opening exists, will be evaluated under the terms of this section.

5.0 Evaluation Tools

5.1 Construction and Skilled Trades (CAST) Testing

- 5.1.1 The CAST test is a written examination designed to predict an applicant's probability of success in a construction and skilled trade position.

UNCONTROLLED IF PRINTED

5.1.2 All applicants for gas field personnel positions are required to successfully complete the CAST test prior to being given further consideration in the hiring process.

5.1.3 Applicants completing the CAST test will be classified as either "Recommended" or "Not Recommended".

5.2 Gas Evaluations (Gas E.V.'s)

5.2.1 The Gas E.V.'s are physical evaluations designed to assess whether or not an applicant has the basic physical strength, endurance and coordination required by an entry level gas field personnel position.

5.2.2 All applicants for gas field personnel positions are required to successfully complete the Gas E.V.'s before being given further consideration in the hiring process.

5.2.3 Applicants participating in the Gas E.V.'s will be classified as either "Recommended" or "Not Recommended".

5.3 Operator Qualification Testing (O.Q. Testing)

5.3.1 This evaluation tool will be used only for those applicants with past gas related experience.

5.3.2 The purpose of the O.Q. testing is to evaluate past experience such that, if the applicant is subsequently placed in the position, the precise starting point within the Apprenticeship Program may be determined.

5.3.3 As an example, if an applicant with previous experience is able to demonstrate proficiency through the O.Q. testing process, he/she may be started as a second or third step apprentice (potentially even a Journeyman) rather than as a first step apprentice.

6.0 Hiring Process

6.1 When the normal bidding process has failed to identify a successful bidder for an open gas field personnel position, the following process will be used to consider other applicants for the position:

6.1.1 The hiring location will contact the Staffing Department of the Human Resources function.

1. The Staffing Department and the hiring location will discuss the pool of applicants currently available and determine if additional recruiting is needed.
2. Once candidates have been identified, the Staffing Department will assist the hiring location in administering the CAST test to all applicants.
3. Applicants receiving a "Recommended" score from the CAST test will be asked to complete an employment application.

6.1.2 Once the application is received, the Staffing Department will initiate criminal and reference background checks.

NOTE:	Since background checks may take several weeks to complete, final results are not always available before an offer of employment is extended
--------------	--

6.1.3 Applicants receiving a "Recommended" score from the CAST test will be interviewed by the hiring location.

- 6.1.4 All interviews will be properly documented. Based upon the interview results, none, some or all of the applicants may be selected for further evaluation utilizing the Gas E.V.'s.
- 6.1.5 Applicants selected for further evaluation will be scheduled for the Gas E.V. testing at the Pawnee Training Center.
1. Each such applicant will be sent a letter by the Staffing Department that describes each of the activities included in the Gas E.V. test.
 2. The estimated time required to complete the Gas E.V.'s is approximately eight hours.
 3. It is recommended that a gas supervisor from the hiring location observe the Gas E.V. testing, however, supervisors from the hiring location may not participate in the actual evaluation of the applicant.
 4. Applicants involved in the Gas E.V.'s will be scored as "Recommended" or "Not Recommended".
- 6.1.6 Applicants with prior gas experience who receive a "Recommended" score from the Gas E.V.'s may also be further evaluated at Pawnee to establish placement within the Apprenticeship Program, up to and including certification as a Journeyman.
- 6.1.7 After consultation with the Staffing Department, the hiring location will make the final selection from the applicants that have received a "Recommended" score from both the CAST test and the Gas E.V.'s.
- 6.1.8 If the offer is to be made to an applicant with prior gas experience, the Pawnee Training staff will advise the hiring location of the appropriate starting position based upon the results of the O.Q. testing.

Revision Notes

Location of Changes	Summary of Changes
BORE 2.1	New sections added for each Boring Method and for Pipe Installation.

BORE 1 Location Criteria and Requirements

1.0 Purpose

This document provides the requirements and location criteria for boring in accordance with 49 CFR §§ 192.325 and 192.361.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Boring Operations](#)

[5.0 Boring Site Evaluation](#)

[6.0 Bore Site Preparation](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialists
- Gas Construction Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 Boring Operations

4.1 Boring refers to:

4.1.1 Underground lateral displacement of soil by mechanical means from one tap hole to another tap hole

or

4.1.2 Underground lateral displacement of soil by mechanical means which enters the ground surface at one location and exits the ground surface at a different location.

4.2 Bore, when possible, across:

4.2.1 State highways

4.2.2 Railroads

4.2.3 Paved streets

4.2.4 Roads

4.2.5 Paved driveways

4.2.6 Waterways

4.2.7 Other obstructions.

4.3 Boring operations must be conducted in such a manner to:

4.3.1 Protect the safety of the general public, customers and employees.

UNCONTROLLED IF PRINTED

- 4.3.2 Avoid damage to all other underground utilities and structures.
- 4.3.3 Prevent damage to or excessive stresses or strain on the gas pipeline being installed.

Only Operator Qualified equipment operators should operate or be in direct observation of the operation of the boring equipment.

- 4.4 There are four (4) boring methods:
 - 4.4.1 Conventional bore with bore rods
 - 4.4.2 Pneumatic piercing tool
 - 4.4.3 Horizontal directional drilling
 - 4.4.4 Auger Boring
- 4.5 Follow proper depth and clearance requirements as outlined in [MAIN 1](#) and [SERV 1](#). Refer to 49 CFR §§ 192.325 Underground clearance and 192.361 Service line installation.

5.0 Boring Site Evaluation

- 5.1 The following questions shall be answered by visually inspecting the boring site for suitability by walking the area:
 - 5.1.1 Is there sufficient room at the site for entrance and exit pits, support vehicles, fusion machines and stringing out the pipe to be pulled in?
 - 5.1.2 Is there sufficient set-up room to obtain the desired depth and angle of bore, prior to the bore head reaching the feature which it is to bore under?
 - 5.1.3 Is there evidence of substructures such as?
 1. Manhole covers
 2. Valve box covers
 3. Meter boxes
 4. Telephone and cable television boxes
 5. Electrical transformers
 6. Conduit
 7. Drop lines from utility poles
 8. Pavement patches
 9. Previous locator markers
 10. Cisterns
 11. Septic tanks and leach field piping
 12. Sewer lateral cleanouts
 - 5.1.4 Are there the following, which could affect calibration or operation of boring equipment and instruments?

1. Overhead cable TV, power, telephone lines
2. Fiber-trace lines
3. Chain link fences
4. Metal structures
5. Reinforce concrete
6. Traffic signal loops
7. Cathodic protection
8. Water
9. Cell phones
10. Other sources.

5.1.5 Is there the need for traffic control and/or flagmen if close to street, road or highway?

5.2 Mark out proposed work location prior to calling JULIE (Joint Utility Locating Information for Excavators), the "One-Call" program.

5.3 Plan the drill path that:

5.3.1 Is straight as possible to minimize friction when pulling back.

AND

5.3.2 Minimizes restoration costs.

5.4 Determine the extent of the area where Ameren Illinois has the right to access the area for installation and maintenance of gas facilities

6.0 Bore Site Preparation

6.1 Notify land owners that they need to locate and mark their buried facilities when applicable. Some examples are:

6.1.1 Buried roof drain lines

6.1.2 Buried customer owned gas and/or electric line(s)

6.1.3 Sanitary/septic system including drain tiles, leach fields, and tanks

6.1.4 Potable water wells and private water line

6.1.5 Sprinkling system piping

6.1.6 Invisible fence cable

6.2 Determine the proposed drill path, including its proposed depth, and the location and depth of all substructures along the path.

The drill path should be as straight as possible to minimize the frictional resistance during pull back and to maximize the length of pipe that can be installed in a single pull.

6.3 Horizontal directional drilling paths shall follow equipment manufacturer's recommended horizontal and vertical angle of curvature.

- 6.4 Establish locations for all entrance and exit pits.
- 6.5 For horizontal directional drilling operation:
 - 6.5.1 Exit and entrance pit areas should be of sufficient size to contain the drilling mud, if used, and spoils.
 - 6.5.2 Take precautions to keep drilling fluids out of the sewers, and other drainage systems, including streams and river by doing one or all of the following:
 - 1. Dig a small retention pit.
 - 2. Build a berm to control the fluid.
 - 3. Block off the sewer inlets or catch basins with sand bags.
 - 4. Use an inflatable pit for catching and holding fluids.
 - 6.5.3 A contingency clean-up plan shall be developed.

End of Instructions.

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

BORING

April 1, 2023

BORE 2.1 Boring Operations and Pipe Installation

1.0 Purpose

This document provides information for boring operations and pipe installation in the bore, in accordance with minimum requirements of 49 CFR §§ 192.325, 192.327, 192.329, and 192.376.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Boring Operations](#)

[5.0 Conventional Rod Boring](#)

[6.0 Pneumatic Piercing Tool Boring](#)

[7.0 Directional Drilling](#)

[8.0 Auger Boring and Jack & Bore Method](#)

[9.0 Pipe Installations](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialists
- Gas Construction Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 Boring Operations

4.1 General

4.1.1 Directional bore personnel include:

1. Machine operators
2. Locators, working in the vicinity of the bore path from the machine to the bore head.
3. Gas personnel, working in the vicinity of the bore path from the machine to the bore head

4.1.2 Pipe installed by any boring method shall comply with the depth and clearance requirements contained in [MAIN 1](#) and [SERV 1](#). (49 CFR §§ 192.325, 192.327, 192.329, and 192.376)

4.2 Boring Safety

4.2.1 Follow the safety guidelines specified in this document.

4.2.2 To protect all workers in the area, gas field personnel must:

UNCONTROLLED IF PRINTED

1. Know what procedures the boring operator is trained to follow.
2. Apply safe work practices at the excavation site. See [EXCV 2.3](#) Work in Excavation.
3. Ensure excavations are in accordance with OSHA Standards before entering. See [EXCV 1](#) Requirements.
4. Wear the appropriate PPE.
5. Clothing should be snug fitting and in good shape.

Loose fitting clothing, long hair, and tattered clothing can get caught in the rotating rods, resulting in serious personal injury.

4.2.3 Since boring operations may encounter an energized electric cable which could energize the boring machine, the following safety precautions should be followed:

1. The area around the boring machine should be marked to warn persons of the potential electrical hazard. The following, but not limited to, items can be used to mark the area:
 - 1 a. Cones
 - 1 b. Tape
 - 1 c. Barricades
2. Other than the boring machine operator, no one should touch the machine during the boring operations.
3. Directional boring units shall be grounded in accordance with manufacturer's instructions.
4. Boring machine operators shall remain in the operator's seat, where applicable, and not allow any part of their body to contact the ground while the boring machine is in operation.
5. All personnel working in the vicinity of the boring operations, who may be exposed to subsurface electrical hazards, shall wear boots meeting the most current edition of ASTM Standards F2412 and F2413 Electrical Hazard (EH) rating. **During work in muddy or wet conditions, rubber insulated EH-rated boots (either over-boots or safety-toed boots) shall be worn.**

4.2.4 Gas field personnel shall use a guide rod hook to align rotating boring rods.

Never straddle or stand-on the boring rods while they are rotating.

No one shall be in the excavation or ditch while boring equipment is in operation.

Gas field personnel are allowed in the excavation for the purpose of aligning the pneumatic piercing tool and getting it started.

4.2.5 Keep unauthorized personnel away from the work area.

4.3 Prior to Beginning Operations

4.3.1 Ensure proper job site protection and required traffic control is in place.

4.3.2 All marked buried facilities crossing the proposed bore path or that are within the tolerance zone shall be exposed in accordance with [the Subsurface Utility Protection section of the](#) AIC Field Safety Manual.

4.3.3 Potholes shall:

1. Extend eighteen (18) inches on either side of the locator's marks
and
2. Be of such depth to ensure the buried facilities will not be damaged by boring and back reaming operations and that there is sufficient clearance as stated in [MAIN 1 Paragraph 10.2.1](#) and [SERV 1 Section 6.0](#) Underground Clearances.

4.3.4 Verify the depth of water lines and gravity sewers, under hard surfaces, such as state highways, driveways, etc., by checking water line valve boxes and sewer manholes, where it may be hazardous or infeasible to expose facilities prior to boring.

1. If the depth of an underground facility cannot be verified to be clear of the proposed bore path, then the Ameren Damage Prevention team should be contacted in order to determine a course of action which best limits risk and is in compliance with JULIE requirements.
2. The facility shall be uncovered, at a minimum, on each side of the hard surface before boring begins.

4.3.5 If sewer line, main or laterals, are not exposed or their depth are not verified, Gas Field Personnel shall refer to [BORE 2.2](#), Boring Across or Near Sewer Lines, for available options.

4.3.6 When necessary, measures to avoid interference from overhead electrical, telephone and cable lines should be made.

4.3.7 Determine who will be communicating with the boring machine operator during the actual boring operation and the means of communicating:

1. Hand signals
or
2. Radio.

4.3.8 Gas Supervisor, crew leader, or foreman shall conduct an in-depth job briefing covering all of the subjects on the Job Briefing Form with entire crew.

5.0 Conventional Rod Boring

5.1 Establish location for the entrance and exit excavation.

UNCONTROLLED IF PRINTED

Entrance and exit excavation must be long enough and deep enough for gas field personnel to position the rod boring equipment at the appropriate depth and angle of entry.

- 5.2 Equipment with the boring motor should be positioned in-line with the projected bore path.
- 5.3 Inspect the drill rods for damaged:
 - 5.3.1 Connector ends
 - 5.3.2 Cracks
 - 5.3.3 Bent rods.
- 5.4 Assemble rods with no more than two (2) rods, approximately 10 feet each, exposed outside of entrance pit at one time.
- 5.5 Machine operator should monitor the boring rate and investigate any obstruction to determine if it might be hazardous.
- 5.6 Machine operator should control the machine travel speed so as not to put the bore rods under undue stress or strain.

Boring rate should be slow and steady.

- 5.6.1 Pipe locator can be connected to bore rods to determine approximate location of drill head and possible obstructions, when required. Refer to [LOCT 1](#).

Do not attempt to attach locator to the rods until they are no longer rotating and drive motor is disengaged.

- 5.6.2 Workers shall observe potholes as the drill head, back reamer and rods cross, when potholes have been excavated to expose other underground facilities and the proposed bore path, to ensure the facility has not been damaged and to check the depth of the bore.
 - 1. If drill head and rods are not visible in potholes a determination shall be made if the drill path is in proper alignment or at the proper depth. Refer to [Section 4.3.3](#) for information on depth of pothole.
- 5.6.3 Machine operator shall shut off the boring machine motor while the:
 - 1. Drill bit is being removed
and
 - 2. Back reamer installed

6.0 Pneumatic Piercing Tool Boring

- 6.1 Establish location for the entrance and exit excavation.

UNCONTROLLED IF PRINTED

Entrance and exit excavation shall be long enough and deep enough for gas field personnel to position the pneumatic piercing tool at the appropriate depth and angle of entry.

- 6.2 Select the proper size of pneumatic piercing tool for the pipe size being installed.
- 6.3 Gas field personnel shall inspect the following to ensure they are in good condition:
 - 6.3.1 The piercing tool.
 - 6.3.2 The tool's tail hose.
 - 6.3.3 Control valve.
 - 6.3.4 Air hose and air hose connectors.
- 6.4 Air hose connections shall be secured by positive means to prevent accidental disconnection with one of the following:
 - 6.4.1 Thor self-locking connectors. See Figure 1.

Figure 1. Thor self-locking connector

- 6.4.2 Chicago fitting connectors with safety clip provide secured connections. See Figure 2.

Figure 2. Chicago fitting connector

- 6.5 After assembly, the piercing tool shall be placed in the excavation and test run made to ensure the forward and reverse control is functioning properly.
- 6.6 The tail hose should be marked to provide workers with indication of the tool's progress. Based on the mark, if the piercing tool has not entered the exit excavation this may be an indication the tool has either taken:
 - 6.6.1 A nose dive.

or

UNCONTROLLED IF PRINTED

- 6.6.2 Has gone deeper than the exit excavation
or
- 6.6.3 Has drifted to one side or the other.
- 6.7 Dig out a starter hole in the end of the entrance excavation where the nose of the piercing tool can be inserted.
- 6.8 Worker(s) shall support the piercing tool at the angle of the planned bore path.
- 6.9 The worker operating the control valve will turn on the air to the tool allowing the tool to begin hammering its way into the bank.
- 6.10 The worker(s) supporting the tool shall leave the excavation once the tool has advanced far enough along the bore path that it has become stable.
- 6.11 A worker should check on the progress of the piercing tool on a regular basis.

Based on the observations, the operation may need to be halted, the tool backed out and repositioned.

- 6.12 Worker(s) shall shut off the air to the piercing tool when it enters the exit excavation.

7.0 Directional Drilling

- 7.1 Establish a location for the entrance and exit excavation.

As a rule of thumb, the entrance angle of the bore rod should normally be between 8 degrees and 18 degrees. However, conditions may warrant a steeper angle as long as it does not exceed minimum bending radius of the rod or pipe. A minimum of one complete length of drill rod (ten (10) feet for smaller rigs and thirty (30) feet for larger rigs) should be utilized before leveling out to the appropriate depth.

- 7.2 Entrance and exit pits shall be of sufficient size to contain the drilling mud, if used, and spoils.
- 7.3 Check that the specified burial depths comply with regulations or permits.
- 7.4 Ensure that:
 - 7.4.1 Drilling equipment size is adequate for the job, including pilot hole boring and pipe pull back.
 - 7.4.2 An adequate supply of water and additives (e.g., bentonite) for preparation of drilling fluids is available if needed.

The required amount and viscosity of the drilling mud will be a function of soil conditions, drilling rate, cutting and hole size, pump capacity, etc.

Because there can be possible soil condition changes along the drill path, it may be necessary to alter the drilling fluid viscosity during the drilling operation.

- 7.5 Drilling muds or liquid additives shall be used during drilling and back reaming when soil conditions require it.
- 7.6 A filter shall be used with the drill pump to prevent clogging of the drill head jets.

In some cases, improved performance and operation can be achieved simply by removing one or more of the jets from the drilling head to allow free flow of the mud. Removing jets also can minimize clogging problems.

- 7.7 Begin boring by drilling the pilot hole; **mark the bore head progression with spray paint.**
- 7.8 Drilling shall proceed downhill whenever possible to ensure that the drill mud remains in the hole.
- 7.9 Workers shall observe potholes as the drill head, back reamer and rods cross to ensure the facility has not been damaged and to check the depth of the bore, where potholes have been excavated to expose other underground facilities and the proposed bore path.
 - 7.9.1 If drill head and rods are not visible in potholes, a determination shall be made if the drill path is in proper alignment or at the proper depth. Refer to [Section 4.3](#) Prior to Beginning Operations for information regarding depth of pothole.
- 7.10 Cease drilling operations if an unidentifiable or unanticipated resistance or sudden movement of the drill string is encountered.
 - 7.10.1 Proceed only after the disturbance source has been identified and/ or eliminated.
- 7.11 If a substructure is damaged, notify the appropriate utility or owner immediately.
- 7.12 The hole shall be back reamed, if the pilot bore-hole bit does not provide a bore hole that is approximately 1.5 times the pipe nominal diameter or greater, to accommodate and permit free sliding of the pipe into the bore-hole.
- 7.13 The diameter of the back-reamed hole should typically be greater than 1.5 times the nominal diameter of the pipe. Refer to [Table 1](#).

The terms and conditions listed in a required boring permit may limit the back-reamer size.

For large diameter pipe such as 6 inch and greater, pulling back a series of progressively larger reamers may be needed prior to beginning pullback operations.

Table 1

Recommended Back-ream Diameters for Different Pipe Sizes

Nominal Pipe Diameter (in.)	Back-ream Hole Diameter (in.)
1 or less	1.5 to 2
2	3 to 4
3	4.5 to 6
4	6 to 8
6	9 to 12
8	12 to 14
10 and greater	Minimum 6 inches greater than pipe OD

7.14 Dispose excess drilling mud in compliance with local ordinances, regulations, and environmentally sound practices.

Spoils and drilling fluids are not permitted to be disposed of into sewers (storm or sanitary) or other drainage systems including streams and rivers.

8.0 Auger Boring and Jack & Bore Method

8.1 These operations are done by a contractor. Review contractor's procedures for conformance with AIC safety standards.

9.0 Pipe Installation

9.1 General

9.1.1 Installing pipe shall be planned so that back-reaming and pull in for a leg can be completed on the same day.

9.1.2 Pipe installation shall be performed in a manner that minimizes:

1. Over stressing/straining the pipe
and
2. Damage to the pipe coating/surface.

9.1.3 See [MAIN](#), [STLP](#), and [POLY](#) sections of the O&M Plan for additional installation requirements.

9.1.4 The line shall be pressure tested to company standards after installation. Refer to [PTST 1](#).

9.1.5 Completed pipe installations shall be back flagged in accordance with [DAMG 1 Section 11.0 Back Flagging](#).

9.2 PE Pipe

9.2.1 The tracer wire may be attached to the leading end of the PE pipe or to the pulling head and pulled in with the pipe.

Electrical continuity of the tracer wire is essential for PE pipe installation and, therefore, it should be free of splices if at all possible.

When installing gas main or service lines under streets, highways, streams, creeks or any area that would be difficult to access should the tracer wire break, pulling back two tracer wires should be considered and is strongly encouraged. The wire ends should be connected.

- 9.2.2 Consideration should also be given to using stainless steel tracer wire for long and/or difficult directional bores or plow-ins. See [POLY 1](#) for stock codes.
- 9.2.3 A swivel shall be attached to the reamer, or drill rod, to prevent rotational torque being transferred to the pipe during pull-in.
- 9.2.4 A weak link or breakaway device shall be attached between the swivel and the leading end of PE pipe to prevent over stressing PE pipe. Refer to [POLY 2.3](#) for weak link requirements.
- 9.2.5 If the breakaway device is a swivel it can be connected to the leading end of the PE pipe.

AIC document [POLY 2.3](#) "Polyethylene Pipe: Installation Requirements", has tables which list the maximum tensile loads for MDPE and HDPE pipe along with corresponding mechanical weak links that have a breaking load less than the maximum tensile load for each pipe size.

- 9.2.6 The leading pipe end shall be capped or plugged to prevent water, drilling fluids and other foreign materials from entering the pipe as it is being pulled back.
- 9.2.7 The following should be used to protect the pipe being pulled:
1. Pipe rollers, skates or other protective devices or means to prevent damaging pipe from the edges of the pit or substructures during pull-in.
 2. Rollers under sticks of pipes to protect the pipe from gouges, eliminate ground drag, and reduce the pull-in force.

Use of scrap pipe for rollers is acceptable.

- 9.2.8 Gas field personnel shall check the pipe for the following that would impair the serviceability of the PE pipe:
1. Damage to the pipe surface
 2. Gouges

3. Cuts
 4. Scrapes
- 9.2.9 Gas field personnel shall inspect the PE pipe as it is being pulled-in to ensure pipe surface is not being damaged.
1. If damage is observed, gas field personnel should stop the installation process.
 2. Damage shall be evaluated as per the procedure outlined in [POLY 2.7](#) Polyethylene Pipe: Evaluating PE Pipe Damage.
 3. Damaged pipe shall be repaired or replaced before resuming installation. Refer to [REPR 1](#) Repairs: Requirement.
- 9.2.10 Additional length of pipe shall be pulled back through the entrance pit, exposed, cleaned and examined for scratches, scores, gouges, cuts, damaged coating and other forms of damage.
1. If damage has occurred additional investigation is required to determine extent of damage.
- 9.2.11 Line Tamer should be used on 4-inch and larger coiled pipe, when necessary. See Figure 3 for a photo of a Line Tamer.

Figure 3. LineTamer

- 9.2.12 Observe the bore head, back reamer and leading end of pipe as they pass through the potholes to ensure adequate clearance between the pipe and other buried facilities. See [Section 4.3](#) for pothole depth requirements.

9.3 Steel Pipe

- 9.3.1 Steel pipe coating shall meet requirements contained in [CORR 2.3](#), Coatings, and inspected in accordance with [CORR 2.3](#) Coatings, before being pulled into bore hole.
- 9.3.2 Weld joints shall be coated in accordance with [CORR 2.3](#) Coatings.
- 9.3.3 When pulling steel pipe back through the borehole care shall be taken not to damage the coating.
- 9.3.4 Additional length of pipe shall be pulled back through the entrance pit, exposed, cleaned and examined for scratches, scores, gouges, cuts, damaged coating and other forms of damage.
1. If damage has occurred additional investigation is required to determine extent of damage.

2. Depending on the nature of damage, contact Gas Tech Engineering and/or Corrosion Control personnel to determine extent of investigation, procedures to be utilized and required repairs if needed. See [CORR 2.3](#) for coating repairs.
- 9.3.5 Observe the bore head, back reamer and leading end of pipe as they pass through the potholes to ensure adequate clearance between the pipe and other buried facilities. See [Subsection 4.3](#) for pothole depth requirements.

End of Instructions

AIC Field Safety Manual, Section 33.4 Work Within the Tolerance Zone

Document Rescission

BORE 2.1 Boring – Boring Operations and Pipe Installation, May 15, 2022

Revision Notes

Location of Changes	Summary of Changes
Paragraph 4.2.3 – Item 5	Revised - All personnel working in the vicinity of the boring operations, who may be exposed to subsurface electrical hazards, shall wear boots meeting the most current edition of ASTM Standards F2412 and F2413 Electrical Hazard (EH) rating. During work in muddy or wet conditions, rubber insulated EH-rated boots (either over-boots or safety-toed boots) shall be worn
Paragraph 4.3.2	Revised – the tolerance zone shall be exposed in accordance with the Subsurface Utility Protection section of the AIC Field Safety Manual

UNCONTROLLED IF PRINTED

Subsection 7.7 Directional Boring	Revised – Begin boring by drilling the pilot hole, mark the bore head progression with spray paint.
Subsection 7.13	Added NOTE: The terms and conditions listed in a required boring permit may limit the back-reamer size.

BORE 2.2 Boring Across or Near Sewer Lines

1.0 Purpose

This document provides information for boring across or near sewer lines in accordance with minimum requirements of 49 CFR §192.325.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General Requirements](#)

[5.0 Pre-Construction Steps](#)

[6.0 Camera Inspection of High-Risk Sewer Laterals](#)

[7.0 Construction Steps](#)

[8.0 Sewer Cleaning Notification](#)

[9.0 Response to Inquiries](#)

Appendices

[Appendix A - Typical Sewer Installations](#)

[Appendix B - Sample Door Tag](#)

[Appendix C - Sample Cross Bore Brochure](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialists
- Gas Construction Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 General Requirements

The operation of various trenchless technologies in close proximity to sewer lines must be done cautiously to avoid installing a gas line through a sewer line or sewer lateral.

- 4.1 Pre-construction and construction steps must be taken to identify the location of sewer lines or sewer laterals that are within the proposed bore path. Refer to [BORE 2.1 Section 4.3](#).

5.0 Pre-Construction Steps

5.1 The following pre-construction steps should be used to determine if sewer lines are located in the proposed construction area:

5.1.1 Contact the:

1. City
2. Building owners
3. Local plumbers
4. Other persons that can provide assistance with identifying the existence and location of sewer lines.

5.1.2 Obtain maps and drawings of the sewer system from the city or other entity.

Maps can provide location and approximate original installation depth of the sewer lines and other valuable information that can assist in determining if location of the sewer lines is within the proposed bore path.

5.1.3 Visually check the job site for:

1. Sewer cleanouts
2. Manhole covers
3. High-risk sewer laterals.
4. Indication of forced sewer.

5.2 Once it has been determined that sewer lines are located in the proposed construction area the following steps are required to identify the location and depth of the sewer lines:

5.2.1 If location of the line is known, excavate sufficient depth below the proposed bore path to verify the sewer line is deep enough that it will not be damaged by the drill head and/or back reamer. Refer to [MAIN 1 Section 10](#) and [SERV 1 Section 6.0](#) for minimum clearances.

5.2.2 Access available outside or inside clean-outs and measure the depth of the sewer line lateral.

Use of steel sewer tape or similar item and a pipe locator may assist in determining location of sewer lateral.

Sewer lateral may not have a consistent grade from the building to the sewer line affecting the assumptions of the sewer lateral depth.

5.2.3 Workers shall avoid direct contact with contents of the sewer line by using rubber/neoprene gloves, protective eye wear, and coveralls.

Unprotected contact with sewer line contents may present a health hazard.

- 5.2.4 Access any manhole covers and measure approximate depth to the top of the main sewer line.

On gravity flow sewer mains, it is reasonable to assume sewer line has a constant grade between manholes. The depth to the top of pipe below the surface can be determined based on that fact. **The same is not true of forced sewer system.**

- 5.2.5 If possible, obtain access to all buildings that do not have an outside clean-out and visually identify where the sewer exits the structure.

1. Determine approximate depth of the sewer lateral by identifying where the lateral exits the building versus the depth of the sewer main at the street.
2. Drawings that represent typical sewer line installations can be found at the end of this section to assist with identifying high risk installations. See [Appendix A Typical Sewer Installations](#).

- 5.2.6 The use of camera inspection for high risk sewer lateral is required unless sewer lateral is located and exposed prior to construction. See [Section 6.0](#) Camera Inspection of High-Risk Sewer Laterals.

- 5.2.7 If the estimated depth of the sewer lateral indicates a potential conflict, the location and depth of the sewer laterals shall be verified by exposing the lateral in accordance with [BORE 2.1 Subsection 4.3](#) or excavating a sufficient depth below the proposed bore path to ensure the lateral will not be damaged by the drill head and/or back reamer.

- 5.3 Forced sewer system mains and laterals shall be:

- 5.3.1 Physically exposed

or

- 5.3.2 Excavate pot holes in accordance with BORE 2.1 Subsection 4.3 to a sufficient depth below the proposed bore path to ensure the sewer line will not be damaged by the drill head and/or back reamer.

- 5.4 If the pre-construction steps do not positively identify the location of sewer lines and laterals, the following options are available:

- 5.4.1 Do not use boring or other trenchless equipment for installing the gas main or service.

- 5.4.2 Use the boring equipment and perform a post-construction camera inspection of high-risk sewer lines.

- 5.4.3 Use "sewer listening device" as described below in [Section 7.0](#).

- 5.4.4 Use boring equipment only in those areas where the location and depth of sewer lines have been determined to be safely outside the bore path.

UNCONTROLLED IF PRINTED

- 5.4.5 Use open trench equipment for areas where the sewer line conflicts have not been ruled out.

6.0 Camera Inspection of High-Risk Sewer Laterals

- 6.1 Camera inspection of sewer lines applies to new construction and replacement projects.
- 6.2 High risk sewer lateral is defined as a sewer lateral that is within two (2) feet of the proposed gas facility.
- 6.3 High risk sewer laterals that are not located and exposed prior to construction shall be inspected by camera pre and/or post installation of the gas facility.
- 6.4 Examples of high-risk sewer laterals are shown in [Appendix A](#) Typical Sewer Installations.

7.0 Construction Steps

- 7.1 Before boring, conduct a final inspection along the proposed drill path looking for:
 - 7.1.1 Unmarked sewer facilities
 - 7.1.2 Verification that the depth to the marked sewer lines are not in conflict with proposed bore path.
- 7.2 Every effort should be made to maintain the clearances shown in [MAIN 1 Section 10.0](#) or [SERV 1 Section 6.0](#) between the gas line and the sewer line.
- 7.3 Stop all boring operations if resistance or sudden movement of the boring equipment is encountered.
- 7.4 Particular care should be taken to ensure that a sewer line or lateral is not the cause of the resistance or sudden movement.
- 7.5 Continue with boring operation only after the source of the resistance or sudden movement has been identified and/or eliminated.
- 7.6 A "sewer listening device" shall be used during all boring operations where sewer lines are not physically exposed or the depth of the sewer line has not been verified to be clear of the bore path. See [BORE 3](#) Forms and Reference Materials for instruction manuals.

Field testing of these sewer listening devices has proven they will detect a bore penetration; however, the penetration noise may only be detected for a short duration if the drill bit passes through the sewer.

The ability to hear a penetration can be affected by surrounding traffic noise.

- 7.6.1 The person monitoring the sewer for a penetration shall be alert to any unusual noise and immediately communicate this information to the equipment operator.

It is possible that the bore penetration of a sewer will coincide with a resistance felt by the operator.

- 7.7 Hang a "Boring Equipment Used on Nearby Gas Main" door tag, Stock Code 37 22 236, at each home or business where or in the area where boring operations were conducted. See [Appendix B](#) for sample of door tag.

The door tag will provide resident with an Ameren Illinois phone number, 1-800-755-5000, to call if they experience a sewer problem. Resident is instructed to call Ameren Illinois before calling a sewer repair contractor.

The door tag will advise the occupants of the home or business of the recent boring operation and alert them that a bore can enter a sewer line on some rare occasions and cause a sewer problem.

- 7.8 A camera shall be used for inspection of a high risk sewer lateral, unless sewer lateral is located and exposed prior to construction. See [Section 6.0](#) Camera Inspection of High Risk Laterals.

8.0 Sewer Cleaning Notification

- 8.1 An informational Ameren Cross bore Brochure, Caution: Natural Gas and Electric Lines May Unintentionally Intersect Sewer Line (See [Appendix C](#) for a sample of the cross bore brochure), is sent annually to the following where Ameren Illinois conducts boring operations:

- 8.1.1 Local plumbers
- 8.1.2 City sewer departments
- 8.1.3 Operators of sewer cleaning businesses.

The brochure will notify them that a bore, for the installation of a gas or electric line, can enter a sewer line on some rare occasions, potentially causing a sewer problem.

- 8.2 When extensive boring operations are being conducted in a town, an additional letter which includes general location(s) of the boring activity, shall be sent before the project begins to:

- 8.2.1 Local plumbers
- 8.2.2 City sewer department
- 8.2.3 Operators of sewer cleaning businesses

9.0 Response to Inquiries

- 9.1 Ameren Illinois may receive an inquiry from a plumber, an operator of a sewer cleaning business, or an individual that suspects a gas line may be installed in a sewer line.
 - 9.1.1 When this occurs, the Gas Supervisor shall arrange a meeting for the purpose of identifying if a gas line is installed in a sewer line.
 - 9.1.2 The gas line may be newly installed or it could have been installed in previous years; therefore, the inquiry shall not be dismissed.

End of Instructions.

Operator Qualification (OQ) Required?

YES.

New sewer connected into old sewer at curb

Original Sewer Abandoned - New Sewer Connected into Old Sewer at Curb

1. A visual inspection of the basement would show that the sewer exits the sidewall at a depth of a typical gas main installation.
2. This is considered a "High Risk Sewer Lateral" if the sewer lateral can't be located and exposed.

A-4. Very Elevated Lot

Very Elevated Lot

1. A visual inspection of the basement would show that the sewer near the home is at a depth significantly greater than a typical gas main installation.
2. However, since the home is built on an elevated lot, there is the potential for conflict with boring operations.
3. This is considered a "High Risk Sewer Lateral" if the sewer lateral can't be located and exposed.

A-5. Home with Basement - Sewer Lift Pump Required

Typical Sewer Installation
Home with basement
Main sewer depth would not allow floor installation
Lift pump required

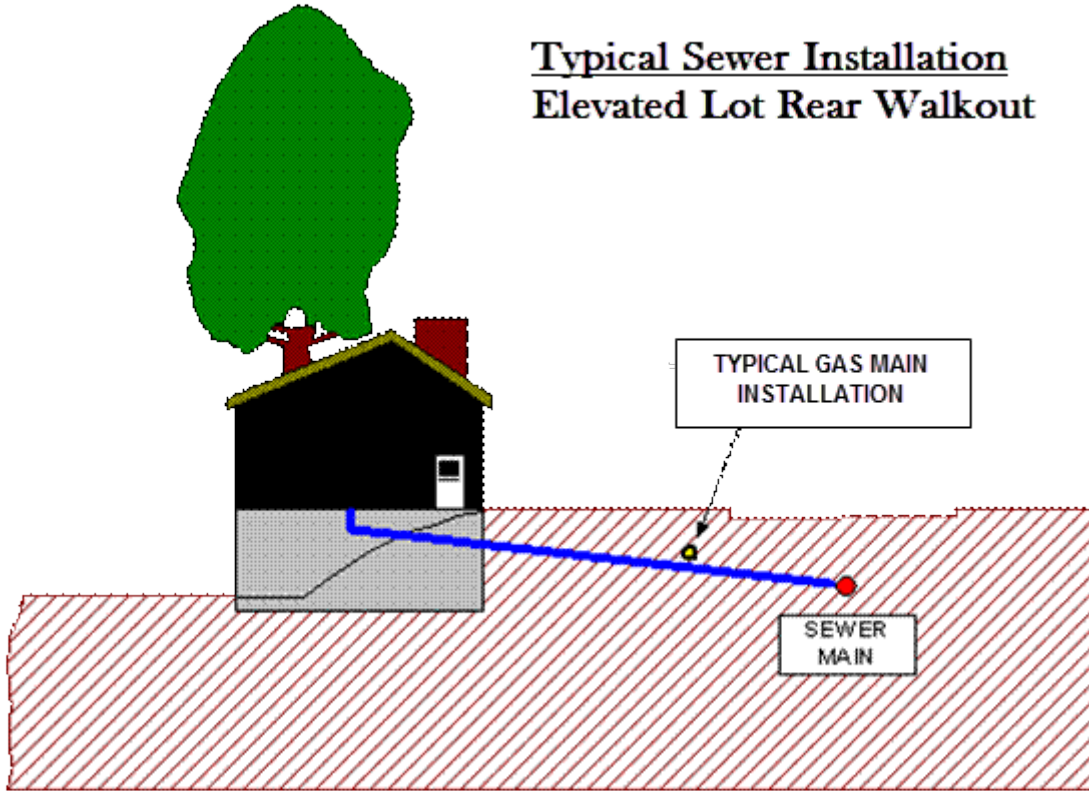

Home with Basement - Sewer Lift Pump Required

1. A visual inspection of the basement would show that the sewer utilizes a lift pump and exits the sidewall at a depth of a typical gas main installation.
2. This is considered a "High Risk Sewer Lateral" if the sewer lateral can't be located and exposed.

A-6. Elevated Lot - Rear Walkout - Sewer Exits Through Sidewall

Typical Sewer Installation Elevated Lot Rear Walkout

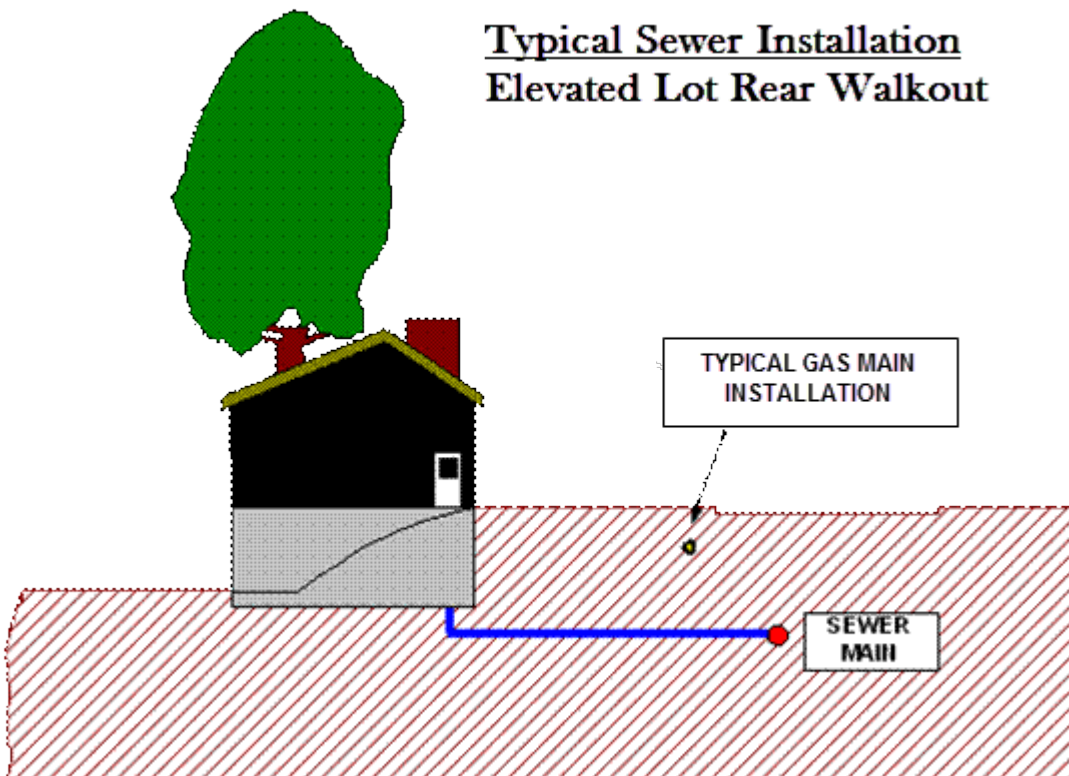

Elevated Lot - Rear Walkout - Sewer Exits Through Sidewall

1. A visual inspection of the basement would show that the sewer exits the sidewall at a depth of a typical gas main installation.
2. This is considered a "High Risk Sewer Lateral" if the sewer lateral can't be located and exposed.

A-7. Elevated Lot - Rear Walkout - Sewer Exits Through Floor

Typical Sewer Installation Elevated Lot Rear Walkout

UNCONTROLLED IF PRINTED

Elevated Lot - Rear Walkout - Sewer Exits Through Floor

1. A visual inspection of the basement would show that the sewer exits through the floor at a depth significantly greater than a typical gas main would be installed.
2. A sewer line installation as pictured below would not have to be physically located before boring.
3. This is not considered a High Risk Sewer Lateral.

A-8. Level Lot - Home on Slab - Outside Cleanout

Level Lot - Home on Slab - Outside Cleanout

1. A visual inspection would show that the home is built on a slab foundation.
2. The sewer depth would be approximately the same as a typical gas main installation.
3. This is considered a "High Risk Sewer Lateral" if the sewer lateral can't be located and exposed.

A-9. Home on Slab - Shallow Sewer Lateral - No Outside Cleanout

Home on Slab - Shallow Sewer Lateral - No Outside Cleanout

1. A visual inspection would show that the home is built on a slab foundation.
2. The sewer depth would be approximately the same as a typical gas main installation.
3. This is considered a "High Risk Sewer Lateral" if the sewer lateral can't be located and exposed.

A-10. Home on Slab - Very Elevated Lot

Home on Slab - Very Elevated Lot

1. A visual inspection would show that the home is built on a slab foundation.
2. Even though this is an elevated lot, the sewer depth would be approximately the same as a typical gas main installation.
3. This is considered a "High Risk Sewer Lateral" if the sewer lateral can't be located and exposed.

A-11. Home with Crawl Space - Shallow Sewer Lateral

Home with Crawl Space - Shallow Sewer Lateral

1. A visual inspection would show that the home is built on a crawl space.
2. The sewer depth would be approximately the same as a typical gas main installation.
3. This is considered a "High Risk Sewer Lateral" if the sewer lateral can't be located and exposed.

A-12. Home with Crawl Space - Very Elevated Lot

Home with Crawl Space - Very Elevated Lot

1. A visual inspection would show that the home is built on a crawl space.
2. Even though this is an elevated lot, the sewer depth would be approximately the same as a typical gas main installation.
3. This is considered a "High Risk Sewer Lateral" if the sewer lateral can't be located and exposed.

For Information Only:

Boring Equipment Used on Nearby Gas Main

We recently installed a new gas main near your home or business using underground boring equipment.

The use of boring equipment helps minimize property damage. However, on rare occasions—despite the precautions we take—the bore may enter a sewer line.

In the unlikely event you experience a sewer blockage at any time following the completion of our construction, please notify us at the number below before contacting a sewer repair contractor.

Thank you.

Learn to Recognize Gas Leaks

Ameren Illinois injects an odorant into natural gas to help people detect natural gas leaks. It usually smells like sulfur or rotten eggs, but in some instances, this odor may not be apparent. So also LOOK and LISTEN for natural gas leaks, and stay alert for ANY of these warning signs:

- A distinctive, sulfur-like odor
- A hissing, whistling, or roaring sound
- An unusual area of dead vegetation, blowing dirt, or bubbling water
- Exposed pipeline after an earthquake, fire, flood, or other disaster

If you suspect a gas leak, warn others, leave the area quickly, and call 911 and Ameren Illinois immediately at 800.755.5000.

Some Gas Leak Warning Signs

If you work for a public sewer agency:

- Be alert for cross bores in sewer mains and review the precautions in this brochure before attempting to clear any blockage.
- If you see a utility crew working in an area where you know there to be sewer lines, stop and discuss the cross bore issue with them.

Caution: Natural Gas and Electric Lines May Unintentionally Intersect Sewer Lines

Safety Tips For Plumbers, Sewer Cleaners and Drain Cleaners

Please review this safety brochure carefully and share these procedures with employees and coworkers. Please post in common areas such as your meeting room or work trailer. For more safety tips, visit amerenillinois.e-smartonline.net/worker.

Be Alert for "Cross Bores" in Sewer Lines!

Utility Lines May Intersect Sewer Lines

Ameren Illinois uses various boring techniques to install underground gas piping and electric lines. Despite the precautions we take, on rare occasions a bore may puncture a sewer line. As a result, a utility line can be unintentionally installed directly through a sewer line in what is known as a "cross bore."

A cross bore that intersects a sewer line will impede the flow of sewage and, eventually, lead to a blockage. Clearing the blockage can damage the utility line, creating a potentially dangerous situation. For example, a nicked or severed pipe could allow natural gas to enter a building, and a damaged electric line could allow contact with high-voltage electric current.

If you encounter a blockage in a sewer line—it could be a cross bore. If you suspect a cross bore, please suspend work activity and call Ameren Illinois at 800.755.5000. We will promptly inspect the situation and make any necessary corrections to support public safety, and the safety of your workers.

If you work with natural gas fuel lines, please take these precautions:

- Always use a combustible gas indicator (CGI) or other gas detection equipment during purging operations or when otherwise working on or around gas piping systems. Do NOT rely on your sense of smell alone to detect the presence of natural gas.
- Never purge the contents of a gas line into an enclosed space. Discharge directly to an outdoor location, per the National Fuel Gas Code (NFPA 54 8.3.1.3).

Take These Cross Bore Precautions

Take these steps before, during and after you attempt to clear a blockage in any sewer line:

- **Before Cleaning.** Call 811 so facility owners can mark the location of their underground lines at the property. If these marks cross the path of the sewer line, a cross bore may be causing the blockage. Also ask the property owner about any recent nearby utility installation work that could have created a cross bore. If you suspect a cross bore is causing the blockage, take these precautions:
 - If you own or can obtain access to an inline camera, use it to assess the blockage before attempting to clear it. If the camera view is obstructed due to the clog, vacuum it out first.
 - If a camera is not available, run a hydro-jetter through the line to clear it. Do not use a cutting tool.
- **During Cleaning.** If you cannot verify the nature of the obstruction, use the least invasive equipment possible, such as a hydro-jetter. If you sense resistance that does not resemble a tree root or other common obstruction, do not force it. Stop immediately and call Ameren Illinois at 800.755.5000.
- **After Cleaning.** Natural gas pipes are typically plastic; Electric lines may be direct buried or run through a conduit. If you have used a cutting tool, look for yellow, orange or gray plastic on the blades when you withdraw it. Watch for bubbles escaping from the entry point of the clearing equipment or toilet and/or use a combustible gas indicator or other gas detection equipment, if available. If you think you have hit a gas or electric line, act fast! Take the steps below, even if damage appears minor.

If You Hit a Gas Line:

- Immediately warn others and evacuate the area; if indoors, immediately evacuate the premises. From a safe location, call 911 and Ameren Illinois at 800.755.5000.
- Extinguish all open flames. Do not use matches or lighters and do not attempt to light an appliance.
- Do not use any phones, electric switches, thermostats or appliance controls. All of these devices, including battery-operated equipment, can cause sparks and ignite natural gas.
- Do not start or turn off vehicles or motorized equipment. Abandon any motorized equipment you may be operating.
- Do not attempt to find the source of the leak or to repair a leak.
- Do not operate underground gas valves.

If you suspect a gas leak, warn others, leave the area quickly, and call 911 and Ameren Illinois immediately at 800.755.5000.

Call 811 or contact JULIE at www.illinois1call.com at least two full business days before you dig or move earth in any way.

Know what's below. Call before you dig.

If You Hit an Electric Line:

- Call Ameren Illinois immediately for any electric line contact.
- Leave the premises and abandon tools and equipment. Equipment that remains in contact with a buried power line poses a serious electric shock hazard.
- Stay away from the area, and warn others to stay away, until Ameren Illinois personnel tell you it is safe to return.
- If someone has been shocked, call 911 immediately.

CLASS LOCATION AND CONSEQUENCE AREAS

October 1, 2021

CLAS 1 Requirements

1.0 Purpose

This procedure defines terms, measurements, and calculations used to identify and maintain Class Locations, High Consequence Areas, and Moderate Consequence Areas in accordance with 49 CFR §§ 192.5, 192.903, 192.905, and 192.921.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Class Location Unit](#)

[5.0 Class Locations](#)

[6.0 Class Location Determination](#)

[7.0 Class Location Example](#)

[8.0 High Consequence Areas](#)

[9.0 Moderate Consequence Areas](#)

[10.0 Identified Sites](#)

[11.0 Potential Impact Circle](#)

[12.0 Records](#)

3.0 Target Audience

- Gas Compliance.
- Gas Field Personnel.
- Gas Integrity Management Personnel.
- Gas Supervisors.

4.0 Class Location Unit (§192.5(a))

- 4.1 An onshore area that extends 220 yards on either side of the center line of any continuous 1-mile length of a pipeline.
- 4.2 The class location ends 220 yards from the last feature that defines the class location.
- 4.3 Each separate dwelling unit in a multiple dwelling unit building is counted as a separate building intended for human occupancy.

5.0 Class Locations (§192.5(b) and (c))

Class 1	<ul style="list-style-type: none"> • Any Class Location Unit that has 10 or less buildings intended for human occupancy.
Class 2	<ul style="list-style-type: none"> • Any Class Location Unit that has more than 10 but less than 46 buildings intended for human occupancy.

	<ul style="list-style-type: none"> • When all buildings intended for human occupancy within Class 2 or Class 3 locations are in a single cluster, the class location ends 220 yards from the nearest building in the cluster.
Class 3	<ul style="list-style-type: none"> • Any Class Location Unit that has 46 or more buildings intended for human occupancy; or an area where the pipeline lies within 100 yards of either a building or a small, well-defined area (such as a playground, recreation area, outdoor theater, or other place of public assembly) that is occupied by 20 or more persons on at least 5 days a week for 10 weeks in any 12-month period (the days and weeks need not be consecutive). • When all buildings intended for human occupancy within a Class 2 or Class 3 location are in a single cluster, the class location ends 220 yards from the nearest building in the cluster.
Class 4	<ul style="list-style-type: none"> • Any Class Location Unit where buildings of 4 or more stories above ground are prevalent. • A Class 4 location ends 220 yards from the nearest building with 4 or more stories above ground.

6.0 Class Location Determination

- 6.1 Use the Sliding Mile method to determine the class locations of Ameren Illinois' (AIC's) gas pipelines.
 - 6.1.1 Count the number of structures within 660 feet or 220 yards of the centerline of the pipeline along a continuous mile of pipe.
- 6.2 Pipeline Integrity Management staff utilizes the following process for determining class location:
 - 6.2.1 AIC's GIS mapping system is used to determine the 660 feet (220 yards) buffer on either side of the transmission line.
 - 6.2.2 Integrity Management staff annually field verifies the number of dwellings within the 660 feet (220 yards) class location boundary and updates the information in AIC's GIS mapping system.
 - 1. Aerial Imagery may be used to facilitate the count.
 - 6.2.3 Pipeline Integrity Management staff utilizes software to simulate the sliding mile to determine class locations.

7.0 Class Location Example

- 7.1 The diagram below shows the class locations determined for the pipeline using the Sliding Mile Method.
 - 7.1.1 The house counts within the various sections of the pipeline are shown on the diagram.
 - 7.1.2 Use the most restrictive class location to determine the class location for any section.

Each separate dwelling unit in a multiple dwelling unit building is counted as a separate building intended for human occupancy.

7.1.3 See the following notes for Class 2 and Class 3 determinations.

When a cluster of buildings intended for human occupancy requires a Class 2 or Class 3 location, the class location boundary ends 660 feet or 220 yards from the nearest building in the cluster.

Do not count structures that are outside the cluster that created the Class 2 or Class 3 location.

7.1.4 See [Section 12.0](#) for record keeping.

8.0 High Consequence Areas (§192.903(2))

8.1 A High Consequence Area (HCA) is a transmission line segment that AIC has determined meets one of the following requirements:

8.1.1 The Potential Impact Circle (PIC) touches or contains an Identified Site. See:

1. [Section 10.0](#).
2. [Section 11.0](#).

- 8.1.2 Has 20 or more buildings intended for human occupancy within the potential impact circle.

9.0 Moderate Consequence Areas (§192.3)

9.1 A Moderate Consequence Area (MCA) is an onshore area that is within a PIC containing either:

9.1.1 Five or more buildings intended for human occupancy; or

9.1.2 Any portion of the paved surface, including shoulders, of a:

1. Designated interstate, or
2. Other freeway, or
3. Expressway, or
4. Any other principal arterial roadway with 4 or more lanes (As defined in the Federal Highway Administration's Highway Functional Classification Concepts, Criteria and Procedures, Section 3.1).
5. And that does not meet the definition of HCA.

9.2 The length of the MCA extends axially along the length of the pipeline from the outermost edge of the first PIC containing:

9.2.1 Five or more buildings intended for human occupancy, or

9.2.2 Any portion of the paved surface, including shoulders, or:

1. Any designated interstate, or
2. Freeway, or
3. Expressway, or
4. Other principal arterial roadway with 4 or more lanes

To the outermost edge of the last contiguous PIC containing any of the items listed in 9.2 above.

10.0 Identified Sites (§192.903 (a), (b), and (c))

10.1 An outside area or open structure that is occupied by 20 or more persons on at least 50 days in any 12-month period. The days need not be consecutive.

10.1.1 Examples include:

- Beaches,
- Areas outside a rural building such as a religious facility,
- Recreational areas near a body of water,
- Stadiums,
- Outdoor theaters,
- Camping grounds,
- Recreational facilities, or
- Playgrounds,

OR

10.2 A building that is occupied by 20 or more persons on at least 5 days a week for 10 weeks in any 12-month period. The days and weeks need not be consecutive.

10.2.1 Examples include:

- Religious facilities,
- Roller-skating rinks.
- 4-H facilities,
- General stores,
- Community centers, or
- Office buildings,

OR

10.3 A facility occupied by persons who are confined, are of impaired mobility, or would be difficult to evacuate.

10.3.1 Examples include:

- Hospitals,
- Assisted-living facilities.
- Retirement facilities,
- Day-care facilities,
- Schools, or
- Prisons,

11.0 Potential Impact Circle (§192.903)

11.1 A Potential Impact Circle (PIC) has a radius within which the potential failure of a pipeline could have significant impact on people or property. The Potential Impact Radius (PIR) is the radius of a PIC and is calculated for a transmission line using the following formula:

$$PIR = 0.69\sqrt{PD^2}$$

Where: PIR is expressed in feet

P = MAOP of the line in pounds per square inch (PSI)

D = actual outside diameter of the transmission line in inches

PIR Example:

P = 720 psi

D = 12.75 inches

$PIR = 0.69\sqrt{720(12.75)^2} = 236.06$ feet

11.2 AIC adds a 10% buffer to the PIR.

AIC Buffer Example:

$PIRAIC = 1.1(PIR)$

$PIRAIC = 1.1(236.06) = 259.67$

PIRAIC = 260 feet

12.0 Records (§§ 192.905, 192.921(f))

12.1 Gas Integrity Management Personnel are responsible for:

UNCONTROLLED IF PRINTED

12.1.1 Demonstrating how each class location is determined.

12.1.2 Identifying, maintaining, and documenting the class location, HCAs, and MCAs on all transmission lines.

12.1.3 Identifying any changes in class location and changes in HCAs and MCAs.

12.1.4 Notifying the Gas Supervisor of changes that affect leak surveys and patrols.

12.1.5 Working with Compliance to update leak surveys and patrol frequency.

End of Instructions.

[7.0 Records](#)

3.0 Target Audience

- Gas Compliance.
- Gas Engineers.
- Gas Field Personnel.
- Gas Integrity Management Personnel.
- Gas Supervisors.

4.0 General (§192.911(k))

CLAS 2 supports the management of change required by Ameren Illinois' Integrity Management Plan. Information for CLAS 2 activities is provided by the Continuing Surveillance ([CNTS](#)) and Pipeline Patrol ([PTRL](#)) sections.

- 4.1 The Pipeline Integrity staff shall conduct an annual pipeline review and record areas and locations of possible changes in class locations, HCAs, and MCAs.

Changes in class location:

1. Can affect the patrol and leak survey requirements for the pipeline.
2. May change the operating parameters for the pipeline.

Changes in HCA or MCA can affect:

1. The Integrity Management Plan.

UNCONTROLLED IF PRINTED

2. The pipeline integrity inspection requirements for that area of the pipeline.

- 4.2 The Pipeline Integrity staff shall complete a field review in the vicinity of the transmission pipeline when a new potential HCA/MCA is identified or an existing HCA/MCA changes.
- 4.3 Indications of possible changes in class location and HCA include the following:
- 4.3.1 Changes in the number of buildings intended for human occupancy.
- 4.3.2 New buildings, or changes in use for existing buildings.
- 4.3.3 Changes in land use such as new:
- Playgrounds.
 - Recreational areas.
 - Camps and campgrounds.

5.0 Action Required for Review of a Class Location Change (§§ 192.609, 192.611)

- 5.1 The Pipeline Integrity staff shall immediately perform a Class Location Study and review whenever there is an indication of a class location change for a segment of existing steel transmission pipeline operating at or above 40% of SMYS to determine:
- 5.1.1 The present class location for the segment involved.
- 5.1.2 The design, construction and testing procedures followed in the original construction, and a comparison of these procedures with those required for the present class location.
- 5.1.3 The physical condition of the segment to the extent it can be ascertained from available records.
- 5.1.4 The operating and maintenance history of the segment.
- 5.1.5 The maximum actual operating pressure and the corresponding operating hoop stress for the pipeline segment involved.
- 5.1.6 The actual area affected by the population density increase.
- 5.2 The Pipeline Integrity Management staff shall confirm or revise the MAOP of the affected pipeline after the Class Location Study and review are completed.
- 5.2.1 Complete the confirmation or revision of the MAOP within 24 months of the change in class location.
- 5.2.2 Actions required for pipelines operating at less than 40% of SMYS are:
1. Identify any additional survey and/or patrol requirements.
 2. Update the class location records, electronic mapping, and Integrity Management records.
- 5.2.3 Actions required for pipelines operating at or above forty percent (40%) of SMYS are:
1. If the segment involved has been previously tested in place for a period of not less than 8 hours, the MAOP must be confirmed or reduced so that the MAOP and its corresponding hoop stress will not exceed the following:

UNCONTROLLED IF PRINTED

- 1 a. In Class 2 locations: 0.8 times the test pressure and 72% of SMYS.
- 1 b. In Class 3 locations: 0.667 times the test pressure and 60% of SMYS.
- 1 c. In Class 4 locations: 0.555 times the test pressure and 50% of SMYS.

5.2.4 Identify any additional survey and/or patrol requirements and update the class location records, electronic mapping, and Integrity Management records.

6.0 Action Required for an HCA or MCA Change (§§ 192.905, 192.921)

6.1 The Pipeline Integrity staff shall conduct a study of the affected HCA or MCA corridor and update Ameren Illinois' Integrity Management Plan to reflect any necessary changes within 12 months of completion of an HCA/MCA field review of a potential HCA/MCA change.

7.0 Records

7.1 See [CLAS 1 Section 12.0](#) Records for record keeping.

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

1.0 Purpose

This procedure outlines Ameren Illinois' (AIC's) continuing surveillance program in accordance with 49 CFR §192.613.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Surveillance Responsibilities of Gas Field Personnel](#)

[6.0 Surveillance Responsibilities of Non-Gas Field Personnel](#)

[7.0 Corrective Action Responsibilities of Gas Supervisors](#)

[8.0 System Review Responsibilities of Gas Supervisors](#)

[9.0 System Review Responsibilities of Gas Operations and Services Supervisors](#)

[10.0 System Review Report Responsibilities of Gas Superintendents](#)

Attachments

[Attachment 1 - System Review Form.](#)

3.0 Target Audience

- Contract Locators.
- Corrosion Control Supervisor.
- Electric Personnel.
- Gas Compliance/Training Manager.
- Gas Engineers.
- Gas Field Personnel.
- Gas Supervisors.
- Gas Tech Services Supervisor.
- Pipeline Integrity Management Personnel
- Summer Painters
- Meter Specialist

4.0 General

4.1 Continuing surveillance is:

4.1.1 The periodic visual inspection of facilities is an ongoing process conducted any-time gas and non-gas field personnel are performing routine work activities in and around AIC's facilities.

4.1.2 The review and analysis of records to identify any pipeline facilities experiencing abnormal or unusual operating or maintenance conditions.

4.2 The System Review of an Operating Center is:

4.2.1 The analysis of the data collected from the surveys, patrols, and inspections completed for an Operating Center's transmission and distribution facilities.

4.2.2 Conducted to ensure that changes to facilities do not go undetected.

4.2.3 Recorded on the System Review form at [Attachment 1](#).

4.3 The System Review Report for an Operating Center consists of the System Review forms completed by the Gas Supervisor and Gas Operations and Services for the Operating Center's transmission and distribution facilities.

Gas Operations and Services may include personnel from Corrosion Control, Gas Tech Services, Gas Tech Engineering and Pipeline Integrity Management who have responsibilities for AIC facilities within the Operating Center and Region.

4.4 The System Review Report for a Region consists of the System Review forms for each of their respective Operating Centers.

5.0 Surveillance Responsibilities of Gas Field Personnel

5.1 See [LEAK 2.2](#) Outdoor Investigations when a gas odor or gas leak is discovered.

5.2 Visually inspect for and report to their Gas Supervisor whenever any of the following are discovered.

5.2.1 Indications of unreported excavation activities at or near pipeline facilities.

5.2.2 Possible structures or encroachment located over or adjacent to the gas pipeline.

5.2.3 Evidence of tampering, vandalism, or damage.

5.2.4 Changes in topography that may have an effect on pipeline facilities may include:

1. Subsidence. See [CNTS 2](#) Surface Subsidence Areas.
2. Reduction of cover over transmission and distribution lines resulting from:
 - Wind and water erosion.
 - Drainage and irrigation grading.
 - Vehicular activity.

5.2.5 Failed or defective material.

Collect and submit failed or defective gas material or equipment. See [INVE 2.3](#).

6.0 Surveillance Responsibilities of Non-Gas Field Personnel

6.1 Non-Gas Field Personnel include:

- Contract Locators
- Electric Personnel
- Meter Specialist
- Summer Painters

6.2 Non-gas field personnel shall immediately call AIC's emergency phone number 1.800.755.5000 when a gas odor or a gas leak is discovered.

- 6.3 Meter specialist shall report to their supervisor or code into their processor for further investigation the discovery of evidence related to:
 - 6.3.1 Tampering, vandalism, or damage.
 - 6.3.2 Overbuilding, obstruction, or deterioration of a meter set.
- 6.4 Non-gas field personnel may continue their work after reporting.

7.0 Corrective Action Responsibilities of Gas Supervisors

- 7.1 Ensure that the following actions are taken by the Operating Center:
 - 7.1.1 Correct immediately any condition found and considered to be hazardous.
 - 7.1.2 Correct as soon as practicable any condition found and considered to be unsatisfactory, but which poses no immediate hazard.

8.0 System Review Responsibilities of Gas Supervisors

- 8.1 Perform a System Review of the records and items included below that cover the respective responsibilities for each Operating Center under the Gas Supervisor's jurisdiction.

Record findings on the System Review form at [Attachment 1](#).

- 8.1.1 Leak History
- 8.1.2 Corrosion Deficiencies
- 8.1.3 Class Location/HCA/MCA Changes
- 8.1.4 Odorant Intensity Survey Locations
- 8.1.5 System Maps Updates
- 8.1.6 Inaccessible Facilities Leak Surveys
- 8.1.7 Inside Meters Leak Surveys
- 8.1.8 Facilities That Need Paint
- 8.1.9 Inactive Services (services inactive for 10 or more consecutive years). See [SERV 2.5](#) Inactive Services.
- 8.1.10 Inspect the bulletin board at each gas operating center and/or gas personnel reporting site to ensure current copies AIC's Alcohol and Illegal Drugs Policy and Employee Assistance Program documents are posted.

Post the Alcohol and Illegal Drugs Policy and the Employee Assistance Program documents close together.

- 8.1.11 Submit any failed material. See [INVE 2.3](#) Investigation of Failures.
- 8.1.12 Record any pipeline facilities experiencing abnormal or unusual operating and maintenance conditions.

- 8.2 See [Section 7.0](#) if, at any time during the System Review, a hazardous condition is discovered.
- 8.3 Complete the System Review by March 31 each year.
- 8.4 Forward or e-mail a copy of each System Review form to the appropriate Gas Superintendent.

9.0 System Review Responsibilities of Gas Operations and Services Supervisors

- 9.1 Perform a System Review of the records and items under [Subsection 8.1](#) covering the respective department's responsibilities for the facilities in each Operating Center and Region.

Record findings on the System Review form at [Attachment 1](#).

- 9.2 See [Section 7.0](#) if, at any time during the System Review, a hazardous condition is discovered.
- 9.3 Complete the System Reviews by March 31 each year.
- 9.4 Forward a copy of each System Review form to the appropriate Gas Superintendent.

10.0 System Review Report Responsibilities of Gas Superintendents

- 10.1 Ensure that a System Review form has been completed for each Operating Center within the Region.
- 10.2 Match-up the System Review forms prepared by the Gas Supervisors and the Gas Operations and Services Supervisors for each Operating Center and Region.
- 10.3 Upon completion, e-mail or forward the System Review Reports (see [Subsection 4.3](#) for definition) to:

Manager, Pipeline Safety Compliance
2125 E. State Route 104
Pawnee, IL 62558.

The individual System Review Reports can be submitted and do not have to be consolidated into a Region report.

End of Instructions.

CONTINUING SURVEILLANCE

April 1, 2021

CNTS 2 Surface Subsidence Areas

1.0 Purpose

This procedure outlines Ameren Illinois' (AIC's) response to subsidence in accordance with 49 CFR §192.613.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Inspection of Possible Surface Subsidence](#)

[6.0 Active Surface Subsidence Area](#)

[7.0 Active Mining Operations](#)

[8.0 Landfills](#)

[9.0 Embankments](#)

[10.0 Records](#)

3.0 Target Audience

- Gas Engineers.
- Gas Field Personnel.
- Gas Superintendents.
- Gas Supervisors.
- Gas Tech Services Supervisor.
- Pipeline Integrity Management Personnel.

4.0 General

- 4.1 Surface subsidence may cause the movement of buried and above ground gas pipeline facilities which may adversely affect their integrity and serviceability.
- 4.2 The Gas Supervisor shall notify Pipeline Integrity of all suspected subsidence that may affect gas pipeline facilities.

5.0 Inspection of Possible Surface Subsidence

- 5.1 Inspect any suspected or reported area of possible subsidence for damage to gas facilities.
- 5.2 The inspection shall include:
 - 5.2.1 Leak surveying the affected and surrounding area. See [LEAK 2.2](#) Outdoor Investigations.
 - 5.2.2 Visually inspecting all above ground facilities for potential damage and undue stress or strain on piping.

UNCONTROLLED IF PRINTED

- 5.2.3 Checking all structures, in and adjacent to the affected area, for the presence of natural gas.
- 5.2.4 Reviewing gas construction job files for any compression couplings and fittings installed in the affected area.
 1. Give particular attention to the possibility of compression couplings and fittings installed on service lines.
 2. If compression couplings and fittings are present, consider uncovering the fittings to ensure movement has not caused the pipe to pull out of the fittings.
- 5.2.5 Evaluating the possibility that buried gas pipeline has been displaced or subjected to strains that could affect its integrity and serviceability.

The evaluation may include uncovering and visually inspecting the pipe and associated fittings.

- 5.2.6 Evaluating the possibility that there is active subsidence in the reported area.
- 5.3 Corrective action shall include:
- 5.3.1 Investigating, identifying, and classifying any gas leak. See [LEAK 1 Section 5.0](#) Leak Detection and Classification.
 - 5.3.2 Repairing leaks. See [REPR 1](#).
 - 5.3.3 Replacing or realigning above ground piping subjected to undue stress or strain.
 - 5.3.4 Determining if the pipeline should be taken out of service, replaced, or uncovered to relieve the stress based on its integrity and serviceability.

6.0 Active Surface Subsidence Area

- 6.1 If subsidence is due to inactive mining operations:
 - 6.1.1 Determine if the subsidence is expected to continue or if it is a one-time occurrence by consulting with the Illinois Department of Mines and Minerals and local officials such as:
 - City engineers.
 - Water departments.
 - Street departments.
 - County engineers.
 - 6.1.2 Access the Illinois State Geological Survey's map showing where mines are or have been operated. (www.isgs.illinois.edu/ilmines)
- 6.2 Set up a special leak survey for the subsidence area within Maximo.

Contact a Compliance Specialist for assistance in setting up the special leak survey in Maximo.

- 6.2.1 The special leak survey shall be, at a minimum, an annual survey, once each calendar year, not to exceed 15 months.

1. The Gas Supervisor or Gas Engineering has the discretion to leak survey the area more often depending on the nature and frequency of the subsidence activity.
2. All special leak survey activity shall be completed within ClickMobile and recorded in Maximo.

6.2.2 After 2 years without any further indication of new subsidence in the affected area:

1. Conduct a final leak survey.
2. Retire the special leak survey in Maximo.
3. Return the affected area to its original leak survey and normal survey cycle.

6.3 Take corrective action that may include the steps below to minimize the adverse effects or stresses on gas facilities.

- 6.3.1 Take the gas pipeline temporarily out of service.
- 6.3.2 Install a by-pass line or a replacement pipeline either outside of subsidence area or in an open trench within the subsidence area.
- 6.3.3 Uncover buried gas facilities to relieve pressure from soil movement.
- 6.3.4 Support above ground gas facilities and provide a means for adjusting its supports as the ground moves.
- 6.3.5 Install gas approved flex connector lines at meter sets, if and when appropriate. See Table 1.

Table 1: Approved Flex Braided Connectors

Flex Braided Connectors	
Stock Code	Size
62 54 329	¾ inches x 4 feet long, MNPT
19 66 173	1-inch x 2 feet long, MNPT
62 54 330	1-inch x 3 feet long, MNPT
62 54 331	1-inch x 4 feet long, MNPT

7.0 Active Mining Operations

7.1 If subsidence is due to active mining operations:

7.1.1 Consult with the mining operator about:

1. The mining method being used, such as:
 - Long-wall
 - Room & pillar
2. The anticipated extent of subsidence activity

7.1.2 Identify gas facilities within and adjacent to:

- The active mining operation area.
- The anticipated subsidence area.

- 7.1.3 Conduct an engineering analysis concerning the potential effect of subsidence on existing gas facilities within and adjacent to the proposed subsidence area.
- 7.1.4 Take corrective action to minimize adverse effects or stresses on gas facilities that may include those actions listed under [Subsection 6.3](#).

8.0 Landfills

- 8.1 Subsidence in landfills is due to factors such as the physical and chemical properties of the landfill material and the landfill's setting, construction, operation, and post-operation maintenance.
 - 8.1.1 Avoid placement of gas pipeline facilities under or through a landfill because:
 - The majority of landfill deposits are non-soil materials - making excavation in landfills difficult.
 - Many landfills generate methane gas as waste material decomposes - making natural gas leaks extremely difficult to locate.
 - The weight and chemical composition of landfill material may affect the integrity and serviceability of the pipeline facilities.
 - 8.1.2 Consider relocating the gas pipeline facilities outside of the landfill area if subsidence occurs that could potentially affect the integrity and serviceability of the gas facilities.

9.0 Embankments

- 9.1 A gas pipeline installed within an embankment may experience movement affecting the pipeline's integrity and serviceability due to:
 - 9.1.1 Exterior settlement or erosion of the embankment.
 - 9.1.2 Interior settlement or erosion of the embankment.
 - 9.1.3 Failure of the embankment.
- 9.2 Gas Supervisor, Gas Engineering, or Gas Tech Engineering shall review existing gas construction job files to ascertain:
 - 9.2.1 If any compression couplings and fittings are installed in the affected area.
 - 9.2.2 The type and size of pipeline.
 - 9.2.3 The method of joining the pipe.
 - 9.2.4 The approximate depth of burial.
- 9.3 Gas Supervisor shall consult with the individual responsible for repairing the embankment to determine how and when repairs will be made and if an existing gas pipeline is in conflict with the repair operations.
- 9.4 Appropriate corrective action shall be taken to minimize any adverse effect on the buried gas pipeline. Corrective action could include:
 - 9.4.1 Taking the affected section of pipeline out of service.
 - 9.4.2 Relocating or replacing the pipeline.
 - 9.4.3 Monitoring periodically for leaks.
 - 9.4.4 Encapsulating or removing any compression couplings and fittings.

10.0 Records

- 10.1 The Gas Supervisor shall ensure that activities, leak surveys, patrols, repairs, temporary provisions made or taken are documented within ClickMobile.
- 10.2 Written reports describing activities performed, dates performed, employees performing activities, findings, and corrective action taken shall be retained by the Gas Supervisor, Gas Superintendent, or the Engineer/Supervisor of the group overseeing the activities.
- 10.3 DOJM plans for replacing or relocating gas pipeline facilities.

End of Instructions.

Operator Qualification (OQ) Required?

YES.

- 1231: Inside Gas Leak Investigation.
- 1241: Outside Gas Leak Investigation.
- 1261: Walking Gas Leakage Survey.
- 1271: Mobile Gas Leakage Survey - Flame Ionization.
- 1281: Mobile Gas Leakage Survey - Optical Methane.
- 1291: Locate Underground Pipelines.
- 1311: Inspect Pipeline Surface Conditions - Patrol Right of Way or Easement.
- 1351: Vault Inspection and Maintenance.

CONFINED SPACE

October 1, 2022

CONF 1 Requirements

1.0 Purpose

This document provides the definition and procedure for Confined Spaces. Confined space entry requirements and procedures are regulated by the Occupational Safety and Health Administration (OSHA). Ameren Illinois (AIC) Safety Department is responsible for administering the OSHA regulations. AIC's Safety Supervisors should be contacted with any questions or concerns regarding confined spaces or confined space entry.

- 1.1 Confined spaces containing gas equipment such as vaults/pits and excavations are regulated by PHMSA, and those requirements are addressed in other O&M sections such as [EXCV 2.9](#) and [VALT 2.1](#).
- 1.2 Before entering a confined space, the employee must assess the environment of the confined space for hazards.
 - 1.2.1 If hazards are identified and cannot be cleared, the "confined space" shall be treated as a "permit required confined space".
- 1.3 This policy will define a "confined space", a "permit required confined space", and outline the measures an employee must follow to avoid potential injury when working in such spaces.
- 1.4 Entry into crawl spaces or attics should be minimized and only performed when other options for lighting appliances are not available.
 - 1.4.1 Workers shall not enter crawl spaces or attics to investigate gas leaks. Shut-in tests should be used to investigate gas leaks on piping in crawl spaces or attics.

2.0 Scope

[Section 3.0 – Target Audience](#)

[Section 4.0 - Definitions](#)

[Section 5.0 - Types of Confined Spaces](#)

[Section 6.0 – Atmospheric Measurements Prior to Entering a Confined Space](#)

[Section 7.0 - Identifying Other Hazards](#)

3.0 Target Audience

- Gas Engineers
- Gas Superintendents
- Gas Supervisors
- Gas Field Personnel

4.0 Definitions

UNCONTROLLED IF PRINTED

4.1 Confined Space:

- 4.1.1 A space large enough and configured so that an employee can bodily enter and perform assigned work; and
- 4.1.2 Has limited or restricted means for entry or exit; and
- 4.1.3 Is not designed for continuous employee occupancy.

4.2 Permit-Required Confined Space (PRCS):

- 4.2.1 Contains or has a potential to contain a hazardous environment that can not be made safe by means of ventilation.
 - 1. Items to check for include proper oxygen (O₂) content
 - 2. Presence of carbon monoxide (CO)
 - 3. Presence of natural gas.
- 4.2.2 Contains a material that has the potential for engulfing an entrant.
- 4.2.3 Has an internal configuration such that an entrant could be trapped or asphyxiated by inwardly converging walls or by a floor which slopes downward to a smaller cross-section.
- 4.2.4 Contains any other recognized serious safety and health hazard.

5.0 Types of Confined Spaces

5.1 The types of typical confined spaces a gas employee may be required to work in include:

- 5.1.1 Crawl Spaces
- 5.1.2 Attics
- 5.1.3 Vaults

6.0 Atmospheric Measurements Prior to Entering a Confined Space

6.1 Check Environment of Confined Space:

- 6.1.1 Check oxygen content (> 19.5 % < 23.5 %.)
- 6.1.2 The oxygen content of the confined space that is being tested should be in the range of 19.5% to 23.5%.
 - 1. If the oxygen content is not in this range, ventilation will be required until the 19.5% to 23.5% level is achieved.
 - 1 a. If, after ventilation, the proper oxygen level cannot be achieved, do not enter the confined space.
- 6.1.3 Check CO level (< 30 ppm)
- 6.1.4 The CO content of the confined space that is being tested should be less than 30 ppm.
 - 1. If the CO content is not less than 30 ppm, ventilation will be required.
 - 1 a. If, after ventilation, a CO level less than 30 ppm cannot be achieved, do not enter the confined space.
- 6.1.5 Check % gas in air (< 10% L.E.L).

6.1.6 The gas in air concentration of the confined space should be less than 10% L.E.L.

1. If the gas in air concentration is not less than 10% L.E.L., ventilation will be required.

1 a. If, after ventilation, a gas in air concentration of less than 10% L.E.L. cannot be achieved, do not enter the confined space.

6.1.7 While working in a confined space, the environment shall be constantly monitored. If at any time the environment falls outside the limits described in this policy, the confined space shall be immediately vacated.

7.0 Identifying Other Hazards

7.1 Excessive water or sewage in a confined space may present a hazard.

7.1.1 If the water/sewage cannot be removed, the confined space should not be entered.

7.2 Damaged electrical wires may cause a shock hazard.

7.2.1 If present the confined space should not be entered.

7.3 If, after the proper evaluation of the confined space, it is determined that no hazards exist, the confined space is safe for gas field personnel to enter.

CORR 1 Requirements

1.0 Purpose

This document provides the requirements for corrosion control and monitoring per 49 CFR Part 192 Subpart I, Subpart M, and [ICC Waiver #05-0113](#).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Cathodic Protection Requirements](#)

[5.0 Cathodic Protection Monitoring](#)

[6.0 Remedial Action for Sub-Standard or Abnormal Cathodic Readings](#)

[7.0 Requirements for Cathodic Protection of New and Replacement Pipeline Facilities](#)

[8.0 Cathodic Protection Structures](#)

[9.0 External Corrosion Visual Inspection and Repair](#)

[10.0 Internal Corrosion Inspection](#)

[11.0 Test Stations](#)

[12.0 Test Lead Connections](#)

[13.0 Electrical Isolation](#)

[14.0 Cathodically Unprotected Pipelines](#)

[15.0 Atmospheric Corrosion](#)

[16.0 Painting Pipeline Facilities](#)

[17.0 Qualifications](#)

[18.0 Records](#)

Appendices

[Appendix A - Buried Pipe Examination Form](#)

[Appendix B - Corrosion and Steel Damage Evaluation Form](#)

Attachments

[Attachment 1 - ICC Final Order 05-0113.](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Corrosion Control Supervisor
- Corrosion Control Specialists
- Gas Construction Services Supervisors
- Gas Construction Contractor Supervisors
- Gas Construction Services Inspectors
- Gas Storage Engineering

UNCONTROLLED IF PRINTED

- Pipeline Integrity Management Personnel
- Gas Storage Field Supervisors
- Gas Field Personnel
- Gas Storage Field Operators
- Gas Supervisors

4.0 Cathodic Protection Requirements (Appendix D to Part 192)

- 4.1 The standard criteria for achieving adequate cathodic protection of underground piping shall include one or all of the following criteria:
- 4.1.1 A pipe to soil potential of -0.850 volts with CP applied, measured with reference to a saturated copper-copper sulfate half-cell on a cathodically protected facility.
 - 4.1.2 A polarized potential of -0.850 volts measured immediately after the interruption of all current sources with reference to a saturated copper-copper sulfate half-cell.
 - 4.1.3 A minimum of 100 millivolts polarization shift measured with reference to a saturated copper-copper sulfate half-cell.
- 4.2 Cathodic protection pipe to soil potentials are to be measured with a voltmeter having a minimum input impedance of 10 mega ohms and a copper-copper sulfate reference cell. See Figure 1 and Figure 2.

Figure 1 Voltmeter

Figure 2 Copper-copper Sulfate reference cell

5.0 Cathodic Protection Monitoring

- 5.1 Mains

5.1.1 Mains that are cathodically protected by anodes or a rectifier shall be monitored once each calendar year at an interval not exceeding 15 months. The test shall include a P/S reading.

5.2 Isolated Structures

5.2.1 Isolated structures that are cathodically protected shall be monitored on a sampling basis. At least 10% of the isolated structures in a community shall be monitored each year so that all services are tested in each 10 year period. The test shall include a P/S reading.

5.2.2 Isolated structures include:

1. Isolated service lines
2. Isolated distribution and transmission mains less than 100 feet
3. Isolated fittings

5.3 See Table 1 below for examples of how isolated structures are to be tested for each system or location.

Table 1 - Sample Testing Schedule of Isolated Structures

Community 1			Community 2				Community 3	
14 Structures	Year Read	Year Read	4 Structures	Year Read	Year Read	Year Read	10 Structures	Year Read
A	2010	2017	A	2010	2014	2018	A	2010
B	2010	2017	B	2011	2015	2019	B	2011
C	2011	2018	C	2012	2016	---	C	2012
D	2011	2018	D	2013	2017	---	D	2013
E	2012	2019	Community 2 has 4 isolated structures and at least 1 is read each year.				E	2014
F	2012	2019					F	2015
G	2013	---	Community 1 has 14 isolated structures and 2 structures are read each year because there are more than 10 services but less than 21 in the community.				G	2016
H	2013	---					H	2017
I	2014	---					I	2018
J	2014	---					J	2019
K	2015	---					Community 3 has 10 isolated structures and 1 structure is read each year.	
L	2015	---						
M	2016	---						
N	2016	---						

5.4 Critical Interference and Non-Critical Bonds

5.4.1 A critical interference bond whose failure would jeopardize the cathodic protection of a main shall be electrically checked 6 times per calendar year at an interval not exceeding 2-½ months. See 49 CFR §192.465(c).

5.4.2 Other bonds not critical to the cathodic protection of a main shall be electrically checked once each calendar year at an interval not exceeding 15 months. See 49 CFR §192.465(c).

5.4.3 The test shall include the current flow across the bond and a P/S reading.

5.5 Rectifiers

5.5.1 A rectifier system that is used for cathodic protection shall be inspected six (6) times per calendar year at an interval not exceeding 2-½ months. See 49 CFR §192.465(b).

5.5.2 Inspection shall include the current and voltage output of the rectifier and be recorded in Maximo.

5.5.3 Remotely monitoring of current and voltage output is an acceptable inspection method.

5.6 Casings

Cased crossings with plastic mains do not need to be monitored for electrical isolation.

5.6.1 Casings shall be electrically isolated from cathodically protected main, unless the casing is filled with dielectric filler.

5.6.2 Electrical isolation testing shall be completed once each calendar year not to exceed 15 months, unless the casing is filled with dielectric filler.

5.6.3 Casings with less than 25 mV difference between pipe-to-soil readings shall have an additional test for isolation performed and be reported to the Gas Supervisor for further analysis, unless the casing is filled with dielectric filler.

1. If the half-cell has to be moved to perform both potential tests, casings with less than 200 mV difference between the pipe-to-soil and casing-to-soil readings shall have at least one additional test performed and be reported to the Corrosion Supervisor for additional analysis.

5.6.4 If the casing is documented as shorted and is filled with dielectric filler, only a pipe-to-soil reading is required.

5.6.5 If a casing does not have a monitoring station or vent utilized for testing it is assumed to be shorted and a shorted casing leak survey shall be performed over the casing area until it can be tested for electrical isolation.

5.6.6 Frequencies for shorted casing leak surveys are as shown in Table 2.

Table 2. Shorted Casing Leak Survey Frequency

Facility	Location	Frequency
Transmission	Class 1 & 2 locations	Biannually
Transmission	Class 3 locations	Quarterly
Distribution or High Pressure Distribution	In Business Districts	Quarterly
Distribution or High Pressure Distribution	Outside Business Districts	Biannually

5.7 Stray Current Testing

A major pipeline is a pipeline or other structure protected with an impressed current system.

5.7.1 Each major pipeline crossing will be monitored annually not to exceed 15 months.

6.0 Remedial Action for Sub-Standard or Abnormal Cathodic Reading

When a deficient reading below Ameren Illinois' (AIC) requirements of -0.950 volt is reported in the Pipe Examination form within ClickMobile:

1. Maximo sends a report to the Corrosion Control Supervisor and Technician.
2. Two work orders are generated in ClickMobile for the technician to:
 - a. Follow-up on an Investigation
 - b. Take a Reread.
3. The required corrective measures will be identified, performed and entered in ClickMobile or scheduled.

AIC requirement of P/S reading of -0.950 volts is more restrictive than the -0.850 volts required by 49 CFR Part 192 Appendix D.

6.1 Corrective action for deficient or abnormal corrosion measurement conditions requiring are detailed in Table 3 below.

Table 3. Deficient or Abnormal Corrosion Measurements

Abnormal Condition	Remedial Action	Compliance Time
"On" Pipe-to-Soil measurements (P/S) less negative than -0.950 volts	Correct condition	Within 1 year
Rectifiers and critical interference bonds	Correct condition	Within 2 months
Discovered unmonitored steel mains meeting AIC P/S criteria	Add test points and record the potentials	Within 1 year
Discovered unmonitored steel mains that do not meet AIC P/S criteria	Create integrity leak survey in Maximo and perform two leak surveys	First survey - within 30 days of discovery.
		Second Survey - with 6 months not to exceed 7½ months.
	Cathodic protection	Within 30 days of the initial leak survey and completed within one (1) year.

7.0 Requirements for Cathodic Protection of New and Replacement Pipeline Facilities

- 7.1 The following new underground facilities shall be coated with an approved external coating and cathodically protected (see 49 CFR §192.455):
 - 7.1.1 Steel transmission lines
 - 7.1.2 Steel distribution lines
 - 7.1.3 Steel service lines
 - 7.1.4 Related pipeline facilities
- 7.2 Pipe coating shall be inspected prior to installation and steps taken to minimize damage to coating during and after installation. See 49 CFR §192.461 (c) & (d).
- 7.3 All new and replacement steel pipeline facilities shall have a measured cathodic protection level of -0.950 volts or more within 1 year after completion of construction. See 49 CFR §192.455 (a)(2).

Communicate with Gas Supervisor and/or Corrosion Control group any changes made to system that may affect cathodic protection of system.

- 7.4 Cathodic protection is not required for electrically isolated, metal alloy fittings in buried or submerged plastic pipelines if:
 - 7.4.1 Tests, investigation or experience shows that adequate corrosion control is provided by the alloy composition.
and
 - 7.4.2 The fitting is designed to prevent leakage caused by corrosion pitting.
 - 7.4.3 However, an electrically isolated metal alloy fitting installed in a buried or submerged plastic pipeline after January 22, 2019 that does not meet the above requirements shall be cathodically protected and maintained in accordance with AIC integrity management plan. See 49 CFR §192.455 (f) & (g).
 - 1. If there is a situation where a metal alloy *fitting is needed*, Corrosion Control personnel shall be notified *prior to installation*.
 - 2. Corrosion Control will determine:
 - 2 a. If fitting requires cathodic protection.
 - 2 b. The method of protection.
 - 2 c. The means to monitor the protection.
 - 3. Location of the metal alloy fitting should be entered on AIC electronic mapping system.

Ameren doesn't install metal alloy fittings in buried or submerged plastic services and mains. Existing fittings are legacy fittings.

8.0 Cathodic Protection Structures

A cathodic protection structure or cathodic protection system is an electrically continuous piece of pipe including all electrically continuous fittings monitored as a unit. A cathodic protection structure can be feet or miles in length.

- 8.1 Cathodic protection structures shall be established to provide a method for identifying, maintaining, and monitoring cathodic protection on sections of buried steel pipe. See [CORR 2.1](#) Corrosion Control: Cathodic Protection Design.
- 8.2 All new underground steel gas facilities shall be designated as an independent cathodic protection structure or become part of an existing cathodic protection structure.
- 8.3 Cathodic protection systems shall be designed to minimize stray current to other structures.

9.0 External Corrosion Visual Inspection and Repair

- 9.1 When any portion of a buried steel main or service is exposed, an examination of the exposed portion shall be conducted and recorded on the Buried Pipe Examination form within ClickMobile with the information retained in Maximo. See [Appendix A](#) for a sample Buried Pipe Examination form. See 49 CFR §192.459.

Pipe Examination forms are required when either steel or plastic mains or services are exposed.

- 9.1.1 Pipe exposed in washouts can be treated as an atmospheric inspection on pipeline patrol.
- 9.2 The condition of the coating shall be documented and when the surface of the pipe is exposed it shall be examined for evidence of external corrosion and a P/S reading taken. See [Section 6.0](#), Remedial Action for Sub-Standard or Abnormal Cathodic Reading.
 - 9.2.1 If there is evidence of corrosion, the surface of the pipe shall be investigated beyond the excavation to determine the extent of the corrosion requiring corrective action.
- 9.3 A steel main or service with localized corrosion pitting to a degree where leakage might result shall be replaced or repaired. See [REPR 1](#).
- 9.4 Distribution piping, with an MAOP of 60 PSIG or less, shall be repaired or replaced if it is found to have corrosion resulting in:
 - 9.4.1 A remaining wall thickness less than that required for the MAOP of the pipeline.
or
 - 9.4.2 A remaining wall thickness less than 30 percent of the nominal wall thickness.

Refer to [CORR 2.9](#) for procedures on evaluating corrosion on distribution piping with an MAOP of 60 PSIG or less. See 49 CFR §192.487.

- 9.5 Transmission or high-pressure distribution piping, with an MAOP greater than 60 PSIG, is found to have corrosion resulting in a remaining wall thickness less than that required for the MAOP of the pipeline shall be:
- 9.5.1 Repaired or replaced to restore the serviceability of the piping.
 - or
 - 9.5.2 The operating pressure reduced commensurate with the strength of the pipe based on actual remaining wall thickness.

Refer to [CORR 2.9](#) for procedures on evaluating corrosion on transmission or high-pressure distribution piping with an MAOP over 60 PSIG. See 49 CFR §192.485.

10.0 Internal Corrosion Inspection

- 10.1 All tapping coupons are to be inspected for evidence of internal corrosion and documented on the Buried Pipe Examination form within ClickMobile. See [Appendix A](#).
- 10.2 Sections of pipe abandoned or removed for any reason shall be inspected for evidence of internal corrosion.
- 10.3 If evidence of internal corrosion is found in any steel pipe contact, the Corrosion Control person for that operating area or qualified Gas Engineer.
- 10.4 Corrosion Control person or qualified Gas Engineer will complete a Corrosion and Steel Damage Evaluation form within ClickMobile. See [Appendix B](#).
- 10.5 Mains that transport corrosive gas shall be monitored for internal corrosion.
- 10.6 See Gas Storage O&M [Section GSIC](#) for Internal Corrosion Monitoring procedures in the gas storage fields.

11.0 Test Stations

- 11.1 The following shall be designated as structure cathodic protection test stations and shall be equipped to facilitate monitoring:
 - 11.1.1 All cased crossings (except those filled) to verify electrical isolation.
 - 11.1.2 All major foreign pipeline crossings will be tested for stray current. Those crossings under roads or bodies of water require special considerations for testing.
 - 11.1.3 Other test stations as required.

12.0 Test Lead Connection

- 12.1 Test lead connections to pipelines must be mechanically secure, electrically conductive, minimize stress concentrations on the pipe. See [CORR 2.8 Appendix B](#).
- 12.2 Test lead connections are to be coated with an approved coating. See [CORR 2.8 Appendix B](#).

13.0 Electrical Isolation

- 13.1 Electrical isolation between protected pipelines and other underground structures shall be installed and maintained to facilitate cathodic protection and prevent damage to the pipeline or other facilities.

- 13.2 Protected facilities shall be isolated from unprotected facilities.
- 13.3 Insulators shall not be installed in areas where a combustible environment is anticipated.
- 13.4 Acceptable insulating materials are specified in [CORR 2.1, Section 8.0](#).

14.0 Cathodically Unprotected Pipelines (49 CFR §192.465)

- 14.1 Once every 3 years at intervals not exceeding 39 months, unprotected pipelines will be reevaluated for active corrosion. See 49 CFR. §192.465.
- 14.2 The following factors should be considered when determining areas of active corrosion:
 - 14.2.1 Leak frequency
 - 14.2.2 Operating pressure
 - 14.2.3 Location of the piping
 - 14.2.4 Proximity of other structures and dwellings
 - 14.2.5 Gas venting characteristics of the area
- 14.3 Corrosion should be considered active if maintenance resulting from leak surveys does not control a condition that could become detrimental to public safety.
- 14.4 Area determined active - consider the following actions:
 - 14.4.1 Cathodically protect and/or coat the pipe.
 - 14.4.2 Replace with coated and cathodically protected steel pipe.
 - 14.4.3 Replace with plastic pipe.
 - 14.4.4 Abandonment of pipe.
- 14.5 Area determined not active - reevaluate within 3 years.

15.0 Atmospheric Corrosion (49 CFR §192.479)

Atmospheric corrosion is defined as actual loss of metal that results in pitting. Light surface oxidation of metal (rust) is not considered atmospheric corrosion. Facilities with light surface oxidation can be recorded as "Needs Paint" within ClickMobile.

- 15.1 All above ground portions of transmission lines and distribution mains and service lines shall be cleaned and coated with a material to prevent atmospheric corrosion. See 49 CFR §192.479.
- 15.2 All new above grade facilities must be coated with an approved coating within 1 year of construction.
- 15.3 Monitoring of Atmospheric Corrosion

Atmospheric corrosion monitoring frequency is set by ICC through Waiver 05-0113 to 49 CFR §§ 192.481 and 192.723. See [Attachment 1](#) for a copy of the waiver.

15.3.1 The following are inspected for atmospheric corrosion at least once each calendar year not to exceed 15 months:

1. Above grade transmission facilities including farm taps connected to transmission mains
2. Regulator stations
3. Odorizers
4. Above grade emergency valves
5. Exposed facilities of a Critical Area Patrol
6. Commercial or industrial gas meters sets that require annual pressure check verifications.
7. Commercial or industrial gas meters sets that require annual calibration of electronic pressure and/or temperate correcting devices.
8. Above grade Gas Storage Field facilities
 - 8 a. At locations where insulation is installed around gas piping, removable windows shall be cut in the insulation at locations where there is good expectation for moisture to collect.
 - 8 b. Inspection of the piping under these windows should be done in conjunction with the Storage Field leak surveys.
 - 8 c. Inspection shall be documented on a Storage Field Insulation Port Inspection Form which is maintained at the specific storage field.

15.3.2 The following are inspected for atmospheric corrosion at least one time every 4 calendar years not to exceed 51 months (see [Attachment 1](#) - Final Order 05-0113 for Waiver from 49 CFR §192.481):

1. Above grade high pressure distribution and distribution facilities associated with designated leak surveys.
2. Farm taps connected to high pressure distribution mains.
3. Residential gas meter sets.
4. Commercial or industrial gas meter sets operating at 7 inches water column, 0.25 psig, metering pressure.

15.3.3 Areas identified to have atmospheric contaminants that result in accelerated atmospheric corrosion shall be identified and inspected annually.

15.3.4 During the inspections, particular attention must be given to the pipe:

1. Soil-to-air interfaces
2. Under disbonded coatings.
3. Pipe supports

3a. Where preformed FRP spacers are present, pay attention to the presence of cracks in the epoxy or air gaps between the epoxy and the pipe.

3b. If rust stains are present, the spacer should be removed and the pipe inspected for corrosion.

4. Splash zones
5. Deck penetration
6. Spans over water

15.3.5 The results of the inspections should identify sites where there is:

1. Disbonded coating
2. Atmospheric corrosion
3. Pipeline facilities that need to be painted

15.4 Corrective Action

15.4.1 When atmospheric corrosion or disbonded coating is found, corrective action must be completed within 12 months.

15.4.2 Atmospheric corrosion or disbonded coating reported during compliance inspections shall be tracked in Maximo for corrective action.

15.5 Disbonded Coating at the Soil to Air Interface (factory applied coatings or field applied tapes)

15.5.1 Disbonded coatings reported at the soil to air interface on above ground pipeline facilities shall be recoated with approved materials.

15.5.2 To correct these pipeline facilities, the piping must first be cleaned to remove all loose coating, rust, and scale that may inhibit the adhesion of a newly applied coating.

15.5.3 Once cleaned and dry, the pipeline facilities shall be recoated with an approved coating found in [CORR 2.3](#).

15.6 Atmospheric corrosion reported on above ground pipeline facilities shall be recoated with approved materials.

See [CORR 2.7 Subsection 12.2](#) for additional measures to be taken when pipe is on pipe supports.

15.7 To correct these pipeline facilities, the piping and components must be cleaned to remove:

15.7.1 Oxidation

15.7.2 Surface rust

15.7.3 Grease

15.7.4 Oils

15.7.5 Other contaminants that might inhibit the ability of the coating to adhere to the metallic surface.

15.8 Atmospheric corrosion shall be inspected to ensure that the pit depth is:

UNCONTROLLED IF PRINTED

15.8.1 Not greater than 10% of the original wall thickness on transmission and high-pressure distribution pipeline facilities.

15.8.2 A wall thickness that's 70% of the original on distribution pipeline facilities.

15.9 This inspection will be documented on the Corrosion and Steel Damage Evaluation form within ClickMobile.

15.10 Once cleaned and inspected the pipeline facilities shall be coated with an approved coating. See [CORR 2.3](#).

16.0 Painting Pipeline Facilities (49 CFR §192.479)

16.1 New Facilities

16.1.1 All **uncoated** new above grade facilities **should** be **cleaned and** coated with an approved coating at the time of installation. If not possible, **Gas Supervisor or Operations Coordinator should schedule it to be done. See [CORR 2.3 Section 10.0](#) Approved Paint Specification and [Appendix J](#).**

16.2 Facilities Maintenance

16.2.1 Corrective action for above ground pipeline facilities that are reported as needing to be painted should be completed within the next calendar year.

16.2.2 Facilities needing paint reported during leak surveys shall be grouped by the survey ID and documented within ClickMobile for corrective action.

Maximo will maintain a list of facilities that need paint and tracking corrective actions by specific address or location.

Gas Supervisors can continue to use spreadsheets that list locations where deficiencies were discovered prior to December 1, 2014.

16.2.3 Annually, the Supervisor shall provide a summary report to the Manager, Gas Safety Compliance at the Pawnee Gas Training Center on facilities that need paint associated with leak surveys.

This is being done to support the reporting requirements of ICC Waiver #05-0113.

16.2.4 Above-ground pipeline facilities that are disassembled by AIC gas field personnel for maintenance activities such as a meter, regulator or valve change shall have the above-ground piping and components cleaned and painted.

16.2.5 Corrective action shall be taken while on site or documented within ClickMobile whenever gas field personnel are on site for other activities and identify:

1. Disbonded coating
2. Atmospheric corrosion

3. Pipeline facilities that need to be painted.

16.3 Painting of Facilities Exposed to the Atmosphere

16.3.1 When painting pipeline facilities, the piping and components must be cleaned to remove:

1. Loose paint
2. Surface rust
3. Grease
4. Oils
5. Dirt
6. Other contaminants that might inhibit the ability of the coating to adhere to the metallic surface.

16.3.2 Do not paint:

1. Meter index
2. Remote meter reading device
3. Meter badge
4. Name plate
5. Regulator data plates
6. Relief vent
7. Screens
8. Stainless steel control lines, fittings or valves

16.3.3 Once cleaned, the pipeline facilities shall be coated with approved coating in accordance with [CORR 2.3, Section 9.0](#).

1. When coating residential meter sets, up to 3 feet of customer piping may also be coated.

17.0 Qualifications

17.1 All corrosion activities including those for the design, installation, operation and maintenance of cathodic protection systems, must be carried out by, or under the direction of a person qualified in pipeline corrosion control methods.

AIC OQ program will form the basis for this qualification but other things such as external training, NACE certifications and years of experience will also be considered. See Operator Qualifications (OQ) required section at the end of this document.

18.0 Records

18.1 All cathodic protection (CP) records shall be maintained for the life of the facility.

18.2 All information shall be maintained in Maximo and the electronic mapping system.

18.3 Cathodic protection structure maps shall be created and maintained for all cathodically protected structures.

18.3.1 The maps shall include the location of:

1. Cathodically protected mains.
2. Electrical isolating devices.
3. Interference bonds with adjacent structures.
4. Anode bank.
5. Rectifiers and associated ground bed.
6. CP test points.
7. 5# and 17# anodes attached to CP structures.

NOTE:	Location of 5# anode connected to tracer wire for a PE main installation should be mapped
--------------	---

18.4 Cathodic protection monitoring records shall include each:

- 18.4.1 Test
- 18.4.2 Survey
- 18.4.3 Examination
and
- 18.4.4 Remedial action that is conducted

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Revision Notes

Location of Changes	Summary of Changes
Subsection 16.1 – Painting Pipeline Facilities	Revised – All uncoated new above grade facilities should be cleaned and coated with an approved coating at the time of installation. If not possible, Gas Supervisor or Operations Coordinator should schedule it to be done. See CORR 2.3 Section 10.0 Approved Paint Specification and Appendix J.
Appendix A-2 Buried Pipe Examination Form	Added – Pipe installed in a vault or pit to the list of examples of when Buried Pipe Examination should not be performed.

Appendix A - Buried Pipe Examination Form

A-1. Sample Buried Pipe Examination Form

A-2. Completion of Buried Pipe Examination Form

1. Buried Pipe Examination

- A. The Buried Pipe Examination shall be completed by gas field personnel or Damage Prevention's Watch and Protect personnel, construction inspectors, engineering personnel, or others any time existing buried plastic or steel gas carrying pipe is exposed by an excavation.
- B. An examination of the exposed portion must be conducted and recorded on the Buried Pipe Examination form within ClickMobile.
- C. A Buried Pipe Examination form shall be completed within ClickMobile any time existing main or service pipe, plastic or steel, is exposed and the existing pipe is planned to remain in service.
- D. A Buried Pipe Examination form is required for each pipe segment and should be completed within ClickMobile.
- E. If the examination of the pipe indicates the presence of corrosion or damage to the pipe, then a Corrosion and Steel Damage Form should be completed within ClickMobile.
- F. A Buried Pipe Examination form *should not be performed* when:
 - (1) New pipe being installed.
 - (2) The exposed pipe is found during a pipeline or critical area patrol. However, the exposed pipe should be reported to the Gas Supervisor for a follow-up inspection.
 - (3) **Reminder:**
 - a) A Pipe Examination *should not be performed* on retired pipe, retired sections of pipe or facilities.
 - b) Do not enter pipe-to-soil readings on Pipe Examination:

- For pipe classified as Unprotected Main.
 - On a rectified protected pipe when the rectifier is turned off.
 - Field Engineering Representatives
 - When an active replacement project will retire the existing section of pipe within the next twelve (12) months. If the pipe coating is not disturbed.
- c) When an anode has been installed, do not take pipe-to-soil reading until the anode has been activated if possible.
- (4) **Pipe located in a vault or pit.**
- G. The following list identifies the most common instances when a Buried Pipe Examination form should be completed:
- (1) **Replacement** of a gas service or main - partial or total replacements - the form should be completed for any exposed existing pipe that will remain in service after the DOJM/WO project has been finalized. This typically will be the main or the service at the tie-in point.
 - (2) **Relocation** of a gas service or main - the form should be completed for the exposed existing pipe that will remain in service after the DOJM/WO project has been finalized. This typically will be the main or the service at the tie-in point
 - (3) **Leak Repair** of a gas service or main - the form should be completed for the exposed existing pipe that will remain in service after the job has been finished.
 - (4) **Installation of a gas service or main** - the form should be completed for the exposed existing pipe that will remain in service after the DOJM/WO project has been finalized. For new construction, this is typically the main or service at the tie-in point.
 - (5) **Retirement of a gas main or service** - the form should be filled out for:
 - The main remaining in service after the retirement
 - The main and service stub after the service line has been abandoned
 - If there is bare metal exposed on the steel main or if a steel service off the steel main is retired, a pipe-to-soil potential shall be taken on either the main remaining in service or on the steel service stub.
 - For pipe classified as Unprotected Main.
 - On a rectified protected pipe when the rectifier is turned off.
 - If the pipe coating is not disturbed.
 - When an active replacement project will retire the existing section of pipe within the next twelve (12) months.
 - (6) **Stand-by** for third party excavation when existing gas pipe is exposed.
- H. The internal surface of the abandoned pipe must be inspected for evidence of corrosion as stated in this document. A corrosion control person for the area should be notified if there is an indication of internal corrosion. Any internal corrosion found will be documented on a Corrosion and Steel Damage Evaluation with-

in ClickMobile stating where the internal corrosion was found; on the pipe remaining in service or the abandoned pipe.

Note: If a corrosion control person or qualified gas engineer is not available at time of discovery, a representative section of the pipe with internal corrosion can be removed and retained for evaluation.

- I. Information from Buried Pipe Examination forms is maintained in Maximo.
 - J. Information will be used by Corrosion, Operations, Engineering, Corrosion Control, DIMP, and TIMP personnel for evaluation, maintenance and risk analysis.
2. *Distribution*
- A. Buried Pipe Examination will be completed within ClickMobile. The information will be maintained in Maximo. Refer to [CORR 2.2 Section 4.8](#) - Anode Requirements if the Buried Pipe Examination is being completed following the installation of an anode and the pipe-to-soil reading is still deficient.
 - B. Maximo will generate a Task and send it to Corrosion Control, Gas Tech Engineering or the Pipeline Integrity Group when corrective action is required. Maximo will track and maintain corrective action taken.
3. *Completion Instructions*
- A. The Buried Pipe Examination Form will be completed within ClickMobile.
 - B. The required information field are indicated in Red. However, it is good practice to record all information that is known.
 - C. It is important that the accurate pipe information be entered in ClickMobile:
4. *Records*
- A. Information from Buried Pipe Examination forms is maintained in Maximo.
 - B. Maximo tracks and maintains corrective action taken and reported within ClickMobile.
 - C. Tasks and queries can be generated and submitted to the appropriate work groups.

Appendix B - Corrosion and Steel Damage Evaluation Form

B-1. Sample Corrosion and Steel Damage Evaluation Form

The screenshot shows a web-based form titled "Corrosion and Steel Damage Evaluation". The form is divided into several sections: Location Information, Pipe Information, Corrosion Evaluation, Steel Damage Evaluation, Action Taken, and Work Order Follow Thru. Red callout boxes provide the following instructions:

- "This is the original exam database number and will be the same." (points to the Exam Database Number field)
- "Enter information exactly as it is filled out on hard copy." (points to the Location Information section)
- "Pitting" or "No Pitting" must be selected before evaluation is saved." (points to the Corrosion Type dropdown)
- Do not "Create New Pitting" or "Create New Damage" until all other fields are filled out and evaluation is saved." (points to the "Create New Pitting" and "Create New Damage" buttons)
- Save evaluation after page is filled out but before entering pitting and damage info and before leaving the page." (points to the "Save Evaluation" button)
- Evaluation Database System Number will be provided after exam is saved. This number is written in the bottom right corner of evaluation hard copy." (points to the Evaluation Database System Number field)
- Employee ID is automatically displayed (points to the Employee ID field)
- Refreshes info and changes on screen." (points to the Refresh button)
- This button directs you back to the home page (the search page). This button does not save changes." (points to the "Go Home Without Saving" button)
- This button directs back to original buried pipe examination page." (points to the "Go to Buried Pipe" button)
- This button clears form." (points to the Clear button)
- Fill this section out when outstanding issue is complete." (points to the Work Order Follow Thru section)

B-2. Completion of Corrosion and Steel Damage Evaluation Form

1. General

- A. This form is to be used to record evaluations performed on steel pipe for corrosion or pipe damage found in the field as well as documents and tracks corrective actions taken.
- B. Corrosion and Steel Damage Evaluation will be completed by individuals designated by the Company as being qualified to evaluate steel pipe damage and/or corrosion. This may include Corrosion Control personnel, Gas Engineers, Gas field personnel, IMP personnel or others.
- C. Gas field personnel are responsible for completing a Corrosion and Steel Damage form, when required, on distribution pipe.
- D. Corrosion Control personnel, Gas Engineer, or other qualified personnel designated by the Company will be responsible for completing a Corrosion and Steel Damage Evaluation form on transmission or high pressure distribution pipe.

2. Distribution

- A. Corrosion and Steel Damage Evaluation form will be completed within ClickMobile. The information will be transferred and maintained in Maximo.
- B. Maximo will generate a Task and send it to Corrosion Control when corrective action is required. Maximo will track and maintain corrective action taken.

3. Completion Instructions

- A. The Corrosion and Steel Damage Evaluation Form will be completed within Click-Mobile.

- B. The required information field are indicated in **Red**. However, it is good practice to record all information that is known.
- C. It is important that accurate pipe information be entered in ClickMobile.

4. *Records*

- A. Information from Corrosion and Steel Damage Evaluation forms is maintained in Maximo.
- B. Maximo tracks and maintains corrective action taken and reported within Click-Mobile.
- C. Tasks and queries can be generated and submitted to the appropriate work groups.

CORROSION CONTROL

October 1, 2022

CORR 2.1 Cathodic Protection Design

1.0 Purpose

This document provides the requirements for cathodic protection design in compliance with 49 CFR §§ 192.467, 192.469, 192.471, and 192.473.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 CP Structures](#)

[6.0 Electrical Isolation](#)

[7.0 Insulating Points](#)

[8.0 Insulating Materials](#)

Appendices:

[Appendix A - Insulation Kits for Flanges](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Corrosion Control Supervisor
- Corrosion Control Specialists
- Pipeline Integrity Management Personnel
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Supervisors
- Gas Construction Contractor Supervisors
- Gas Construction Services Inspectors
- Gas Storage Engineering
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 General

- 4.1 Whenever a steel main is involved in a gas project, cathodic protection design must be accounted for in the final project design. Examples include:
- 4.1.1 Extending a new plastic main from an existing steel main.
 - 4.1.2 Installing a new station for a new plastic distribution system.
 - 4.1.3 Replacing sections of steel distribution pipe to facilitate road or other facility construction.
 - 4.1.4 Relocating existing steel main with new steel.
 - 4.1.5 Installing a new steel pipeline.
 - 4.1.6 Extending new steel main from an existing steel main.
- 4.2 Consult with the person responsible for cathodic protection in the Region where the work is being performed prior to finalizing the design.

UNCONTROLLED IF PRINTED

5.0 CP Structures

- 5.1 Cathodic protection structures provide a method for identifying, maintaining, and monitoring corrosion protection on sections of buried steel piping.
- 5.2 A cathodic protection structure is the buried pipeline section which includes:
 - 5.2.1 Electrically continuous welded or bonded sections of pipeline.
 - 5.2.2 Isolated from unprotected structures or other structures not designated as a part of the intended structure.
 - 5.2.3 Pipe protected by either magnesium anodes and/or an impressed current system.

The plastic piping systems currently installed have no steel gas carrying components (plastic main, service tubing, and casing style risers). For tracing purposes, these systems are buried with tracer wire, and the pipe does not need to be designated as part of any cathodic protection structure.

- 5.3 Consult the person responsible for cathodic protection in the Region where the work is being performed when installing the following to determine whether insulation is required:
 - 5.3.1 Emergency valves.
 - 5.3.2 Lowering steel main.
 - 5.3.3 Rerouting steel main.

6.0 Electrical Isolation

- 6.1 Obtaining Electrical Isolation
 - 6.1.1 Electrical isolation is obtained by using insulating devices and maintaining proper clearance to foreign utilities.
 - 6.1.2 An insulating device may not be installed in an area where a combustible atmosphere is anticipated unless precautions are taken to prevent arcing.
 - 6.1.3 Solid State Decouplers (SSD)(stock code 40 89 716) installation can be considered where lightning and voltage surges are anticipated. See [CORR 2.6](#) and Figure 1.

Figure 1. Solid State Decouplers (SSD)

6.1.4 SSDs should be used across insulation points inside buildings where a combustible environment is anticipated.

6.2 Maintaining Electrical Isolation

6.2.1 Electrical isolation is required:

1. Between a cathodically protected pipeline and other underground structures unless protected as a single unit.
2. Between a cathodically protected pipeline and a casing unless the casing is filled with a dielectric material.
3. Where necessary to facilitate cathodic protection.

7.0 Insulating Points

7.1 Insulation shall be provided in accordance with Table 1.

Table 1. Insulation Requirements

New Steel Mains	Insulate from	Unprotected steel
New Steel Services	Insulate from	Unprotected steel and Customer piping
Existing Protected Steel Mains	Insulate from	Unprotected steel
Existing Protected Steel Services	Insulate from	Customer piping

Avoid installing insulators inside buildings unless lightning protection is used or a combustible environment is not anticipated.

7.2 Typical insulating points include the following:

7.2.1 All customer meters.

7.2.2 Pressure control stations when required.

UNCONTROLLED IF PRINTED

7.2.3 Valves when required.

7.3 Insulating Regulator Stations

7.3.1 The following diagrams illustrate typical situations where insulation and bonding may be required.

1. Distribution Station (New Plastic Outlet System). See Figure 2.

Figure 2. Distribution Station - New Plastic Outlet System

2. Large Distribution Station or Town Border Station with Steel Outlet System. See Figure 3.

- 2 a. Consult with Corrosion Control personnel to determine if a Lightning Arrestor needs to be installed.

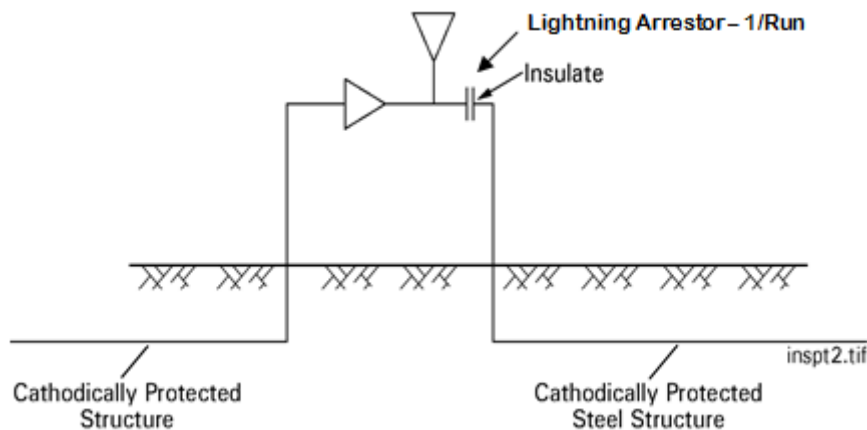

Figure 3. Large Distribution Station or Town Border Station with Steel Outlet System

3. Delivery Station. See Figure 4.

- 3 a. Consult with Corrosion Control personnel to determine if a Lightning Arrestor needs to be installed.

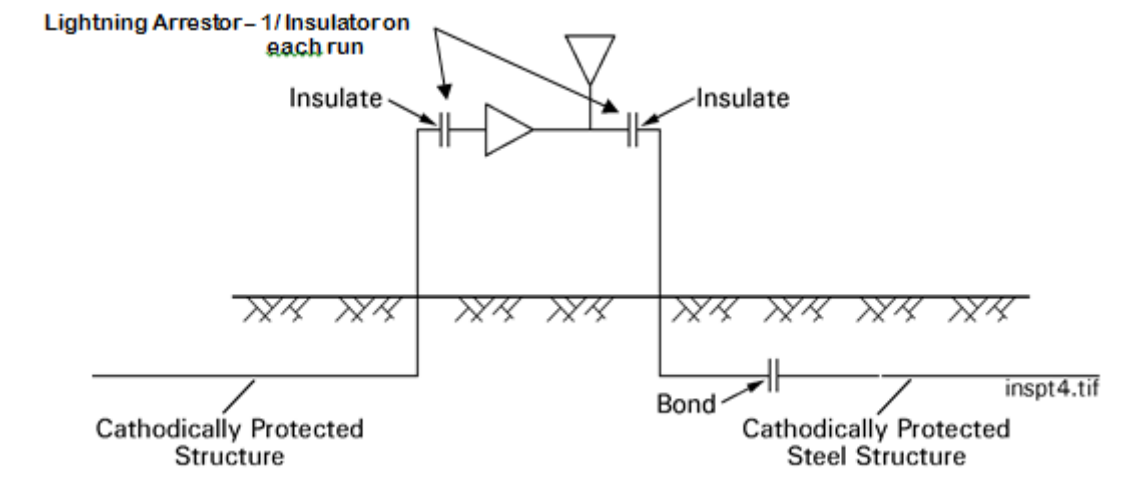

Figure 4. Delivery Station

7.4 Bonding

7.4.1 Extending New Steel from Existing Steel. See Figure 5.

Figure 5. Extending New Steel from Existing Steel.

7.4.2 Creating a System Loop - Steel. See Figure 6.

Figure 6. Steel System Loop

Do not create electrically continuous piping loops. Install insulation points in any loop created.

7.4.3 Extending New Plastic Lateral from Existing Steel. See Figure 8.

UNCONTROLLED IF PRINTED

1. Consideration shall be taken for attaching and bringing a #8 wire off of the steel pipe to identify it separately from the #12 tracer wire that is installed with the PE main.

Figure 8. Extending New Plastic Lateral from Existing Steel.

7.4.4 Extending New Plastic from End of Existing Steel. See Figure 9.

1. Consideration shall be taken for attaching and bringing a #8 wire off of the steel pipe to identify it separately from the #12 tracer wire that is installed with the PE main.

Figure 9. Extending New Plastic from End of Existing Steel.

7.4.5 New Plastic Installed Between Two Sections of Existing Steel. See Figure 10.

1. Consideration shall be taken for attaching and bringing a #8 wire off of the steel pipe to identify it separately from the #12 tracer wire that is installed with the PE main.
2. The use of plastic pipe between two sections of steel shall be reviewed by engineering and corrosion control personnel. Consideration should be given to using steel pipe.

Figure 10. New Plastic Installed Between Two Sections of Existing Steel

7.4.6 Relocating Existing Steel with Plastic. See Figure 11.

1. Consideration should be taken for attaching and bringing a #8 wire off of the steel pipe to identify it separately from the #12 tracer wire that is installed with the PE main.

2. The use of plastic pipe between two sections of steel should be reviewed by engineering and corrosion control personnel. Consideration should be given to using steel pipe.

Figure 11. Relocating Existing Steel with Plastic

8.0 Insulating Materials

8.1 Stainless Steel Tubing Insulators

Stainless steel tubing insulators can be used to insulate control lines within pressure control stations and at other locations. See Table 2 and Figure 12.

Dielectric Tubing Stainless Steel Fittings	
Tubing Size	Stock No.
1/4"	19 66 164
3/8"	19 66 147
1/2"	19 66 168

Table 2. Stainless Steel Tubing Insulators

Figure 12. Stainless Tubing Insulator

8.2 Flange Insulation

8.2.1 Flange insulation is recommended for above ground flange joints. See [Appendix A](#) Insulation Kits for Flanges.

1. Flange insulation is not recommended for underground installations.

Double-bolt insulators are recommended for all new or replacement flange insulating kits. See Figure 13.

Figure 13. Double-bolt Insulators

8.3 Weld End Insulators

8.3.1 Weld End Insulators can be used in new construction or existing pipelines and are recommended for underground installations. See [STLP 3.1](#) for weld end insulators.

8.4 Insulator Unions

8.4.1 Insulating Unions can be used in pressure control stations, meter sets or other installations where electrical isolation of threaded pipe is required. See Table 3 for approved insulating unions.

Table 3. Insulating Unions

Size	Class 150	Class 3000
3/4"	19 73 066	19 73 941
1"	19 73 069	19 73 948
1 1/4"	19 62 454	19 73 951
2"	19 73 072	49 22 403

Table 4. Pressure – Temperature Ratings

Pressure – Temperature ratings for Class 150 Malleable Iron Threaded Fittings (psi)		
-20°F - 150°F	200°F	250°F
300	265	225

End of Instructions.

Operator Qualification (OQ) Required?

NO.

CORROSION CONTROL

April 1, 2021

CORR 2.2 Anode Requirements and Installation

1.0 Purpose

This document provides the requirements for anode installations and record per 49 CFR Part 192 Subpart I.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Anode Specifications](#)

[6.0 Anode Requirements](#)

[7.0 Anode Bank Installations](#)

Appendices:

[Appendix A - Anode Installations](#)

[Appendix B - Anode Test Stations](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering (GTE)
- Corrosion Control Supervisor
- Corrosion Control Specialists
- Pipeline Integrity Management Personnel
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Supervisors
- Gas Construction Contractor Supervisors
- Gas Construction Services Inspectors
- Gas Storage Engineering
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 General

- 4.1 Galvanic anodes may be installed individually, in pairs, or in banks of 5.
- 4.2 When 5 or more anodes are required on new construction or replacement of existing systems, anode banks shall be used in place of individual anodes.
- 4.3 Anode banks may be placed perpendicular or parallel to the gas main. See Appendix [A-2](#) Parallel Bank and [A-3](#) Perpendicular Bank.
- 4.4 Anode can be placed vertically or horizontally and a minimum of 6 inches below the bottom of the steel pipe. See Figures [1](#) and [2](#) for typical vertical and horizontal installations.
 - 4.4.1 Anodes may be installed in multiple groupings.
 - 4.4.2 No more than 2 anodes shall be installed in an excavation unless 10 feet of spacing can be maintained between the anodes.

UNCONTROLLED IF PRINTED

- 4.4.3 If multiple connections are made on the pipe, the connections should be at least 6 inches apart.

Figure 1. Typical Vertical Installation

Figure 2. Typical Horizontal Installation

- 4.5 Install 17 lb. anodes in the main piping to protect coated steel systems not protected by a rectifier.
- 4.6 Anode should be placed as far away from the pipe as the excavation safely allows up to the length of the anode lead wire.
- 4.7 When the addition of an anode(s) is necessary, the Pipe to Soil (P/S) reading needs to be taken after the anode is activated.
- 4.7.1 If the P/S reading on the pipe does not increase immediately after attaching the anode(s), add water and allow time for the anode to activate.

When installing anodes, it is advisable to take water to the jobsite to wet the anode.

- 4.8 If after activation, the P/S reading is below -0.950 volts (more positive such as -0.900 volts), contact the Corrosion Control personnel for your area before backfilling the anode and entering the deficient reading in the Pipe Examination form within ClickMobile.

Anode life is expected to be 20 years or more on magnesium anode systems.

4.9 All anodes installed on mains shall be mapped in Ameren’s electronic system. Refer to 49 CFR §192.491.

5.0 Anode Specifications

5.1 See Figure 3 for a diagram of AIC approved anode and Table 1 for stock codes of AIC approved anodes.

Figure 3 AIC Approved Anode

Table 1. Stock Codes for AIC Approved Anodes

Stock No.	Description
62 05 082	Anode, Magnesium, 5 lb., Packaged, with #12 TW Wire
62 05 058	Anode, Magnesium, High Potential, 17 lb., Packaged, with #12 TW Wire
62 05 067	Anode, Magnesium, 32 lb., Packaged, with #12 TW Wire
62 05 069	Anode, magnesium, 1 ½ lb., drivable, with #12 TW wire

6.0 Anode Requirements

6.1 Anodes shall be installed in accordance with the Tables 2, 3, 4, and 5 unless an actual field current test has been performed.

Do not install anodes on rectified systems unless recommended by Gas Operations and Services - Corrosion Control Group.

Table 2. New Steel Mains

Pipe Size		Length
1 ¼"	Install one 17 lb. anode per	1,500' of main
2"	Install one 17 lb. anode per	1,200' of main
3"	Install one 17 lb. anode per	1,100' of main
4"	Install one 17 lb. anode per	1,000' of main
6"	Install one 17 lb. anode per	800' of main
8"	Install one 17 lb. anode per	700' of main
10"	Install one 17 lb. anode per	500' of main

UNCONTROLLED IF PRINTED

12"	Install one 17 lb. anode per	450' of main
14"	Install one 17 lb. anode per	400' of main
16"	Install one 17 lb. anode per	350' of main
18"	Install one 17 lb. anode per	300' of main

To determine the number of anodes to be installed, divide the total number of feet of main by the length of main per anode corresponding to the pipe size from the table above. An allowance has been made for connected service lines.

Example: How many 17 lb. anodes are required for 5000 ft. of new 6 in. coated steel pipe?

$5000\text{ft.} / 800 = 6.25$ or 7 anodes required

Table 3. Service lines, repaired steel mains and services

	Pipe-to-Soil equal to or more negative than -1.00 V (ex. -1.25V)	Pipe-to-Soil less negative than -1.00 V (ex. -0.850V)
New Service Line - Steel	No Anode needed	Install anode
Repairs on Steel Mains or Services	No Anode needed	Install anode unless it is a transmission main

Table 4. Isolated risers

Plastic Service Riser	Install 1½ lb. drivable anode when isolated steel riser is a gas carrier. No anode is necessary on anodeless risers (self-protected).
-----------------------	---

Table 5. Isolated services

Existing Isolated Service Lines	Pipe-to-Soil reading less negative than -0.950 V - Install an anode
New Isolated Service Lines	Install a 5 lb. anode on isolated ¾" steel service lines. Install a 17 lb. anode on 1" and larger steel isolated service lines.

7.0 Anode Bank Installations

- 7.1 When choosing bank sites, give consideration to the geometry and current requirements of the system to be protected.
- 7.2 Review plans and confirm location with Corrosion Control person for the area.
- 7.3 Make sure cathodic protection shorts are eliminated.
- 7.4 Determine anodes required, and install anode bank(s). See [Section 6.0](#) for anode bank requirement.
- 7.5 Measure current drain on connector cable (main +) and recheck pipe-to-soil potentials with anodes connected (wait until anodes are activated).

UNCONTROLLED IF PRINTED

- 7.5.1 If system is below design potential, perform a new current requirement test with anodes connected.
- 7.6 With the current on, measure the anode current drain and use this value to calculate the number of additional anodes required.
- 7.7 For maximum anode bank efficiency, install 17 lb. anodes in groups of up to 5.
- 7.8 Where possible, place the anode bank perpendicular to system being protected. See [Appendix A-3](#) - Perpendicular Anode Bank.
 - 7.8.1 Maintain 10 feet minimum clearance from any buried foreign metallic system.

An alley with no buried facilities is an excellent location for a perpendicular anode bank.
 - 7.8.2 If the anode bank must be parallel to the protected system, maintain 10ft. separation between the main and foreign structures. See [Appendix A-2](#) - Parallel Anode Bank.
- 7.9 Bury the anodes at least 6 inches below the protected main.
- 7.10 Attach the collector wire to main, and coat connections. See [CORR 2.8 Appendix B](#) - Test Lead Wire Attachment.
- 7.11 Show all anode banks in Ameren's electronic mapping system. Refer to 49 CFR §192.491.
- 7.12 Install stations on those banks which supply sufficient data for the maintenance of the cathodic protection system. The anode test station should: (refer to 49 CFR §192.469)
 - 7.12.1 Provide a test lead to the main.
 - 7.12.2 Allow evaluation of the anodes by measuring the current output.
 - 7.12.3 Provide check for shorts (current high, potential down, etc.).
 - 7.12.4 Provide connection for short location, current requirement, continuity, and insulation tests. (Open bond and use anode cable for ground.)
- 7.13 An above ground test station is preferred. Anchor the station to a permanent structure, if possible, such as a utility pole, post, or building.

End of Instructions.

Operator Qualification (OQ) Required?

YES

0001: Measure Structure- to-Electrolyte Potential

0011: Conduct Close Interval Survey

0021: Measure Soil Resistivity

0031: Inspect and monitor Galvanic Ground Beds/Anodes

0041: Installation and Maintenance of Mechanical Electrical Connections

0051: Installation of Exothermic Electrical Connections

UNCONTROLLED IF PRINTED

0091: Troubleshoot In- Service Cathodic Protection System

Revision Notes

Location of Changes	Summary of Changes
Section 6.0 Anode Requirements - Table 3	Changed threshold for installing anode on New Steel Service Lines and Repaired Steel Mains and Service Lines to -1.00 v

Appendix A - Anode Installations

A-1. Direct Connection

Installation:

1. This standard can be used for single anode installations for new facilities during initial construction or existing facilities when single anodes are needed and test facilities are not desired or required.
2. Install anode in convenient location, as near as practical to that shown on construction drawing and record installation. Installation dimensions are recommended.
3. Anode can be placed vertically or horizontally and a minimum of 6 inches below the bottom of the steel pipe. Anodes may be installed in multiple groupings. No more than 2 anodes shall be installed in an excavation unless 10 feet of spacing can be maintained between the anodes. If multiple connections are made on the pipe, the connections should be at least 6 inches apart.
4. Anode should be placed as far away from the pipe as the excavation safely allows up to the length of the anode lead wire.
5. Carefully lower anode to bottom of hole and center it. Do not lower anode using lead wire.
6. If the Pipe to Soil reading does not change after installation of anode(s), add water to activate.
7. Backfill with fine earth (not sandy or rocky soil) around anode to about 4" above top of bag. Complete backfill with tamped earth.
8. Leave sufficient slack in wire to avoid damage when back-filling.
9. Attach wire in accordance with [CORR 2.8 Appendix B](#) Test Lead Wire Connection.
10. Coat each connection according to the methods described in [CORR 2.8 Appendix B](#).

UNCONTROLLED IF PRINTED

Item	Stock No.	Description	Quantity	
			01	02
1	62 05 082	Anode, Magnesium, 5 #, Packaged, With #12 TW Wire	1*	
	62 05 058	Anode, Magnesium, 17 #, Packaged, With #12 TW Wire		1*
2	22 02 552	Thermite Cad Weld	1	1

* Anodes may be installed in multiple groupings. No more than 2 anodes shall be installed in an excavation unless 10 feet of spacing can be maintained between the anodes.

A-2. Parallel Anode Bank

Note: Perpendicular installations are preferred.

Installation

1. Anodes can be installed in banks when adding anodes to existing mains or when a single point of current control is desired for new main installations.
2. Install anodes in convenient location, as near as practical to that shown on construction drawing, and record installation.
3. Anodes can be placed vertically or horizontally and a minimum of 6 inches below the bottom of the steel pipe.
4. Carefully lower or place anode in the hole or excavation and center it. Do not lower anode using lead wire.
5. Connect anode lead wire to collector cable with #8 split bolt (17 54 002).
6. Insulate connections with a splice box (49 62 001) or 4 inch vinyl tape (25 53 225).
7. If the Pipe to Soil reading does not change after installation of anode(s), add water to activate. See [Section 4.7.1](#) in the body of this document.
8. Backfill with fine earth (not sandy or rocky soil) around anode to about 4 inches above top of bag. Complete backfill with tamped earth.
9. Leave sufficient slack in wire to avoid damage when back-filling.

10. Attach wire in accordance with [CORR 2.8 Appendix B](#).
11. Coat connection according to the methods described in [CORR 2.8 Appendix B](#).
12. Terminate wires as shown on construction drawing or neatly in test station box.

Item	Stock No.	Description	Quantity

A-3. Perpendicular Anode Bank

Installation

1. Anodes can be installed in banks when adding anodes to existing mains or when a single point of current control is desired for new main installations.
2. Install anode in convenient location, as near as practical to that shown on construction drawing, and record installation.
3. Anodes can be placed vertically or horizontally and a minimum of six (6) inches below the bottom of the steel pipe.
4. Carefully lower or place anode in the hole or excavation and center it. Do not lower anode using lead wire.

UNCONTROLLED IF PRINTED

5. Connect anode lead wire to collector cable with #8 split bolt (17 54 002).
6. Insulate connections with a splice box (49 62 001) or 4 inch vinyl tape (25 53 225).
7. If Pipe to Soil readings do not change after installation of anode(s), add water to activate. See [Section 4.7.1](#).
8. Backfill with fine earth (not sandy or rocky soil) around anode to about 4 inches above top of bag. Complete backfill with tamped earth.
9. Leave sufficient slack in wire to avoid damage when back-filling.
10. Attach wire in accordance with [CORR 2.8 Appendix B](#).
11. Coat connection according to the methods described in [CORR 2.8 Appendix B](#).
12. Terminate wires as shown on construction drawing or neatly in test station box.

Item	Stock No.	Description	Quantity	
			01	02

5	17 54 948	Connector, #14-#4 Wire	2	2
6	17 54 002	Connector, Split Bolt, #8	5	5

X - Number of feet required for specific installation.

A-4. Drive-in Anode

Installation

1. Use only on isolated gas carrying risers on PE services.

2. Clean ¼ inch diameter area to bare metal on riser where point on clamp will make contact.
3. Apply thin film of wax tape primer over area where clamp will make contact.
4. Install clamp on riser to ensure that the point makes direct contact with the riser on clean area.
5. A grounding clamp can be used in place of the clamp that comes with the drive-in anode. The riser will have to be cleaned down to bare metal where the grounding clamp makes contact.
 - Grounding clamp for 1/2 and 1 inch risers is Stock Code 40 59 319
 - Grounding clamp for 1-1/4 and 2 inch risers is Stock Code 40 59 318
6. Coat riser and clamp with wax tape primer from ground line to bottom of meter stop valve.
7. Apply wax tape to primed areas. Leave tape loose over clamp initially, and wrap riser tightly above clamp. Apply tape up to bottom of meter stop. Rub and press tape until it is firmly in place and all seams are smooth. Wax tape should be applied over the anode wire from the ground to the clamp.
8. The preferred method of handling the excess anode wire is to wrap the excess wire around the anode. However, if conditions do not allow for that, the excess wire can be wrapped around the riser
9. Typically place anode approximately 12 to 18 inches from the riser and drive with hammer until head is below grade.
10. If the Pipe to Soil reading does not change after installation of anode, add water to activate. See [Section 4.7.1](#).

Item	Stock No.	Description	Quantity
1	62 05 069	1 1/2# Drive in Anode	1
2	30 58 149	Wax Tape Primer	X
3	25 53 206	Wax Tape	X

X - Number of feet required for specific installation.

A-5. Isolated Steel Service Line

Installation

1. This installation should only be used on isolated steel service lines.
2. The anode may be installed in the main bell hole or at the building wall for most individual services.

UNCONTROLLED IF PRINTED

3. Typically keep anode a minimum of 24 inches from main toward meter.
4. Typically install top of anode a minimum of 6" below service. The anode can be placed vertically or horizontally.
5. Attach wire in accordance with [CORR 2.8 Appendix B](#).
6. Coat each connection according to the methods described in [CORR 2.8 Appendix B](#).
7. If the Pipe to Soil reading does not change after installation of anode(s), add water to activate. See [Section 4.7.1](#).

Item	Stock No.	Description	Quantity

	62 05 058	17# Magnesium Anode		1
2	22 02 552	Thermite Cad Weld	1	1

Appendix B - Anode Test Station

Installation

1. This standard can also be used when an access point to the pipe is desired for a purpose such as locating.
2. Install anode in convenient location, as near as practical to that shown on construction drawing, and record installation.
3. Anode can be placed vertically or horizontally and a minimum of 6 inches below the bottom of the steel pipe. Anodes may be installed in multiple groupings. No more than 2 anodes shall be installed in an excavation unless 10 feet of spacing can be maintained between the anodes. If multiple connections are made on the pipe, the connections should be at least 6 inches apart.
4. Anode should be placed as far away from the pipe as the excavation safely allows up to the length of the anode lead wire.
5. Carefully lower anode to bottom of hole and center it. Do not lower anode using lead wire.

6. If the Pipe to Soil reading does not change after installation of anode(s), add water to activate. See [Section 4.7.1](#).
7. Backfill with fine earth (not sandy or rocky soil) around anode to about 4 inches above top of bag. Complete backfill with tamped earth.
8. Leave sufficient slack in wire to avoid damage when back-filling.
9. Attach wire, in accordance with [CORR 2.8 Appendix B](#).
10. Coat each connection according to the methods described in [CORR 2.8 Appendix B](#).
11. Terminate wires as shown on construction drawing or neatly in test station box.
12. Record measurements and provide a sketch or place the information on a copy of Ameren Map Viewer map and submit to a Poster for recording in the electronic mapping system.

Item	Stock No.	Description	Quantity	
			01	02
1	62 05 082	Anode, Magnesium, 5 #, Packaged, With #12 TW Wire	1	
	62 05 058	Anode, Magnesium, 17 #, Packaged, With #12 TW Wire		1
2	19 12 703	Box, CP Test 4 in ID x 18 in Lgh, Plastic w/Cast Iron Lockable Lid, 5 terminals, Marked "GAS TEST"	1	1
3	18 66 208	Wire, Detector, #12 AWG,TW CU, Insulated - 500 feet spool	X	X
	18 66 369	Wire, Detector, #12 AWG,TW CU, Insulated - 1500 feet spool		
4	22 02 552	Thermite Cad Weld	1	1

X - Number of feet required for specific installation.

Notes:

1. Use 5# Anode on Isolated 3/4 inch steel service lines
2. Use 17# Anode on Isolated 1 inch and larger steel service lines
3. Use 17# Anode on steel mains

CORROSION CONTROL

April 1, 2023

CORR 2.3 Coatings

1.0 Purpose

This document provides for the requirements of pipeline facility coating selection, installation, repair, and inspection meeting the minimum requirements of 49 CFR §§ 192.112, 192.307, 192.328, 192.455, 192.461.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Approved Coatings](#)

[5.0 Approved Hot Applied Tapes](#)

[6.0 Approved Cold Applied Tapes](#)

[7.0 Approved Field Applied Epoxy Coatings](#)

[8.0 Approved Cold Applied Wax Tapes](#)

[9.0 Moisture Cured Wrap](#)

[10.0 Approved Paint Specification](#)

[11.0 Coating Inspection](#)

[12.0 Approved Epoxy Coating for Submerged Facilities](#)

Appendices:

[Appendix A - Approved Coating Types for Installations](#)

[Appendix B - Coating Repair](#)

[Appendix C - Approved Hot Applied Tapes](#)

[Appendix D - Approved Cold Applied Tapes](#)

[Appendix E - Approved Field Applied Epoxy Coatings](#)

[Appendix F - Applied Cold Wax Tapes](#)

[Appendix G - Moisture Cured Wraps \(MCW\)](#)

[Appendix H - General Wrapping Instructions](#)

[Appendix I - Specific Coatings](#)

[Appendix J - Approved Paints for Pipeline Facility Coating](#)

[Appendix K - Coating Inspection](#)

[Appendix L - Protal Applications](#)

[Appendix M Epoxy Coating for Submerged Facilities](#)

3.0 Target Audience

- Gas Engineering
- Gas Construction Services Supervisors

UNCONTROLLED IF PRINTED

- Gas Tech Engineering (GTE)
- Corrosion Control Supervisors
- Corrosion Control Specialists
- Pipeline Integrity Management Personnel
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Contractor Supervisors
- Gas Construction Services Inspectors
- Gas Storage Engineering
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 Approved Coatings

- 4.1 New Pipe Installation: The tables listed in [Appendix A](#) lists the approved coatings for girth welds on various steel pipe sizes and installation processes.

These coating requirements are for distribution, high pressure distribution and transmission pipe.

4.1.1 Direct Bury Installation

1. Ameren Illinois' (AIC) standard mill coated pipe shall be coated with fusion bond epoxy (FBE), approximately 16 mils thick (minimum 12 mil/ maximum 28 mil), in accordance with the current coating specification.
2. Girth weld joints shall be coated in accordance with [Appendix A-1](#).
3. Installation Instructions:
 - 3 a. Field Applied Liquid Epoxy. See [Appendix L](#) - Protal Applications.
 - 3 b. Hot applied tape:
 - (i) Tapecoat 20 - See [Appendix I-1](#).
 - (ii) Densotherm - See [Appendix I-2](#).
 - 3 c. Cold applied tape:
 - (i) Tapecoat H35 - See [Appendix I-3](#).
 - (ii) Denso Butyl 35 - See [Appendix I-4](#)

4.1.2 Directional Drilling Installation

1. All steel pipe 2 inches and larger in diameter to be installed by directional drilling shall be dual coated with:
 - 1 a. An initial layer of FBE, approximately 16 mils thick (minimum 12 mil/ maximum 28 mil).And
 - 1 b. A second layer of an abrasive resistant overcoating (ARO), minimum 20 mils thick. (Industry standard for ARO is 30 mil)
2. Steel pipe smaller than 2 inches does not require an ARO over the FBE since the bore hole diameter is significantly larger than the pipe being installed.
3. Girth weld joints shall be coated in accordance [Appendix A-2](#).
4. Installation instructions:

- 4 a. See [Section 4.1.1 \(3\)](#) for Field Applied Liquid Epoxy, Hot Applied Tape, and Cold Applied Tape.
- 4 b. Moisture Cured Wrap (MCW)
 - (i) Trenton MC110 Outerwrap or Denso Glass Outerwrap - See [Appendix I-5](#).

4.2 Joint Coating

- 4.2.1 Girth weld joint coating shall comply with Appendix [A-1](#) or [A-2](#), whichever is applicable. Coasting on other joints on steel pipe shall normally be made with hot applied tape or liquid epoxy coating.
- 4.2.2 Where the joint is near plastic pipe, the wrapping shall be made with cold applied tape or liquid epoxy coatings.

4.3 Coating Repair

- 4.3.1 For pipe coating repair see [Appendix B-1](#).
- 4.3.2 For fitting coating repair see [Appendix B-2](#).

4.4 Service Line Tees

- 4.4.1 Service tees connecting steel services to steel mains shall be coated with a hot applied tape or wax tape.
- 4.4.2 Service tees connecting plastic services to steel mains should be coated with a wax tape.

4.5 Fittings

- 4.5.1 All below ground fittings such as valves, line stopper fittings, bolted couplings, weld end fittings, etc., shall be coated with one of the following:
 - 1. Fusion bonded epoxy (FBE)
 - 2. Field applied epoxy coating
 - 3. Wax tape
 - 4. Cold applied tape
 - 5. Hot applied tape
 - 6. Coal tar epoxy (Bitumastic)
- 4.5.2 Coating on below grade valves provided by the valve manufacturer, valve supplier, or fabricating shop can be used in-lieu of AIC approved coating if approved by the Superintendent of Corrosion Control.
- 4.5.3 Below ground leak clamps shall be coated with wax tape.
- 4.5.4 Irregular shaped fittings and those with bolts should be coated with wax tape in accordance with [Section 8.0](#). These fittings may require the application of profiling material prior to coating with the wax tape.

4.6 Soil to Air Interface Zone

- 4.6.1 Disbonded coating shall be repaired using wax tapes or cold applied tapes in the soil to air interface zone.
 - 1. Refer to [CORR 1 Section 15.5](#) for repair procedures.

2. The wax or cold applied wrap shall terminate with a good tight seal near the bottom of the meter valve
- 4.6.2 For anodeless risers do not wrap the PE to steel transition area. The pipe above the transition should be painted
- 4.6.3 Non-wax based cold applied tapes or moisture cured wrap shall be used on gas carrying risers for new construction where significant settling of adjacent soil is expected.
- 4.6.4 All approved underground coatings that extend above grade on newly installed risers shall be over coated with a UV resistant coating, such as:
 1. Cold applied tape
 2. Cold applied wax tape
 3. Moisture cured wrap
- 4.6.5 The UV resistant coating should extend from approximately 12 inches below grade to above final grade.
- 4.6.6 The UV resistant coating should be applied using a continuous application method.

Paint is not an approved UV resistant coating.

Moisture cured wrap can be applied as a protective overcoat over all of the other approved coating materials when there is a need to provide additional protection from abrasive action or mechanical damage to the pipe coating. **MCW should extend a minimum of 2 inches passed the other coating material per Trenton MCO 110 Outerwrap Application Procedures. See CORR 3.**

4.7 Above Ground Facilities

- 4.7.1 All above ground facilities shall be coated with an approved coating (i.e. cold applied tape, cold applied wax tape, or paints).
- 4.7.2 The surface must be clean, dry, and in sound condition.
- 4.7.3 All oil, dust, grease, dirt, loose rust, and other foreign material shall be removed to ensure adequate adhesion.

5.0 Approved Hot Applied Tapes

- 5.1 The stock codes listed in [Appendix C](#) for hot applied tapes are approved for below ground use only.

6.0 Approved Cold Applied Tapes

- 6.1 No wrinkles in the cold applied tape shall be left. All wrinkles must be cut out and re-taped.
- 6.2 The stock codes listed in [Appendix D](#) for cold applied tapes are approved for above and below ground use.

7.0 Approved Field Applied Epoxy Coatings

- 7.1 The stock codes for field applied epoxy coatings listed in [Appendix E](#) are approved for above and below ground use.
- 7.2 Repair cartridges are for repairing coating damages.

8.0 Approved Cold Applied Wax Tapes

- 8.1 Wax tape is a coating used for coating irregular shaped fittings which cannot be wrapped with the more durable hot or cold-applied tape.
- 8.2 Irregular fittings should have the irregular surfaces coated with profiling material to create a smooth surface prior to applying the wax tape.
- 8.3 Care should be taken during backfill operations to prevent damage to the wax coating. A mesh outer wrap can be used to protect the wax tape during backfilling.
- 8.4 The stock codes listed in [Appendix F](#) for waxed tapes are approved for above and below ground use.

9.0 Moisture Cured Wrap

- 9.1 See [Appendix G](#) for approved moisture cured wrap.

10.0 Approved Paint Specification

10.1 Approved Paints

- 10.1.1 Gas meter sets shall be coated with a brush applied gray paint. See [Appendix J](#).
- 10.1.2 First cut farm taps and small regulator stations shall be coated with brush applied paint. See [Appendix J](#).

Shop fabricated farm taps and small regulator stations can be coated with any of the approved paints listed in [Appendix J](#). Application shall be in accordance with manufacturer's specifications and instructions. Refer to [CORR 3](#).

- 10.1.3 The following facilities shall be coated with one of the approved paints or two part paints listed in [Appendix J](#) and in accordance with manufacturer's instructions:
 - 1. Pipeline delivery station.
 - 2. Transmission regulator station.
 - 3. Town border station.
 - 4. Large distribution regulator station.
 - 5. Gas storage field piping
- 10.1.4 Regulator stations that are annually inspected can be touched up with an aerosol spray paint until a total repaint is necessary. See [Appendix J](#).

Use care to protect other facilities from over spray.

10.1.5 Surface Preparation

1. Surface must be clean, dry, and in sound condition.
2. Remove all oil, dust, grease, dirt, loose rust, and other foreign material to ensure adequate adhesion.

10.1.6 Temperature limitations

1. Application temperature limits are listed on the Manufacturer's paint specification sheets.
2. The temperature limits are for the temperature of the pipe not necessarily the ambient temperature. See [CORR 3](#) Forms and Reference Materials.

11.0 Coating Inspection (49 CFR §192.461 (c))

11.1 Coated steel pipe shall be tested for holidays and overall coating integrity prior to installation.

11.2 Inspection Requirements

11.2.1 All pipe coating shall be visually inspected at the time of delivery. Prior to installation, all pipe coating shall be inspected in accordance with [Appendix K-1](#) and [Appendix K-2](#).

1. Inspection Methods. See [Appendix K-1](#).
2. Inspection Voltage. See [Appendix K-2](#).
 - 2 a. Inspect coating using an approved holiday detector with appropriate voltage range. If the voltage output of a holiday detector does not match the indicated voltage in the chart below, use the next lower setting.
 - 2 b. Inspect coating on pipe that does not require the use of holiday detector, per [Appendix K-1](#), by sliding hands along the pipe feeling rough spots then visually inspect those locations.
 - 2 c. Average total mil thickness 12 mil thru 28 mil would be FBE coating only.
 - 2 d. Average total mil thickness 32 mil thru 58 mil would be for FBE with ARO
 - 2 e. If the average total thickness is not shown on the chart, contact Superintendent Corrosion Control for the proper test voltages. See [Appendix K-2](#).

11.3 Equipment

- 11.3.1 Holiday detectors should be field tested or tested by the manufacturer to insure proper operation.
- 11.3.2 Field testing may be either testing the unit on a known holiday or testing with the proper volt meter for the unit.
- 11.3.3 Perform all required equipment checks and calibrations in accordance with manufacturer's recommendations.

UNCONTROLLED IF PRINTED

11.3.4 Equipment Check

1. Test battery for proper voltage output.
2. Inspect the roller spring for damage or deformation.
3. Connect exploring electrode and grounding cable to terminal of detector.
4. Switch detector to "on" position.
5. Touch exploring electrode to ground cable alligator clip. Instrument signal should be heard.
6. If instrument signal is heard, instrument is ready for use. If signal fails, consider instrument defective.

11.3.5 Inspection Procedure

1. Pipe to be inspected shall be grounded from bare end of pipe to the earth.

When joints of pipe are being tested, individually ground each joint.

2. If moisture exists on coating surface, dry the surface before conducting test.

Moisture on the coating surface can cause incorrect indications.

3. Make contact with the detector electrode on bare pipe end to verify that the instrument is properly grounded.
 - 3 a. Repeat this procedure each time a different section of coated pipe is tested.
 - 3 b. If the unit is not grounded, reground the equipment by cleaning the pipe wall at the ground connection and retest.
4. For applications requiring a spring-type electrode, use a single pass, moving electrode over surface at a rate of approximately 1 foot per second.
5. For applications requiring a brush-type or half-circle electrode, a pass on each side of the pipe, 180° apart is required.
6. As defects are identified, mark the locations so repairs can be made prior to installation.

11.3.6 Coating Repairs

1. Clean the area of dirt, scale, and damaged coating.
2. See [Section 4.1.1 \(3\)](#) for coating repair requirements for both line pipe and fittings.

11.3.7 Re-inspection

Solvents retained in the coating film can produce incorrect results, as well as a hazardous environment.

1. Allow the repaired coating areas sufficient time to cool, dry, and cure prior to retesting.
2. Retest the repaired areas in accordance with approved testing procedures.

11.3.8 Calibration

1. Return holiday detectors to the manufacturer for calibration on an annual basis unless a high voltage meter for the particular detector indicates it is functioning properly.

12.0 Approved Applied Epoxy Coatings for Submerged Facilities

12.1 These epoxy coating are only approved for use on facilities that are either routinely subjected to being submerged or permanently submerged in water.

12.2 SeaShield 525 Epoxy is designed to be:

12.2.1 Applied primarily to facilities that are routinely subjected to being submerged in water.

12.2.2 Applied to dry, damp or wet steel, concrete or wood to provide corrosion protection and sealing.

12.2.3 Applied with brush, gloved hand, applicator pad or roller.

12.3 SeaShield 526 Epoxy is designed to be:

12.3.1 Applied primarily to facilities that are underwater but can also be applied to above ground facilities susceptible to being submerged.

12.3.2 Applied to dry, damp or wet steel, concrete or wood structures for corrosion protection or sealing.

12.3.3 Applied with trowel, putty knife, gloved hand or applicator pad.

12.4 SeaShield 525 Epoxy and SeaShield 526 Epoxy shall be applied in accordance with Denso's instructions. See [CORR 3](#) for manufacturer's instructions.

12.5 The stock codes for these specialized epoxy coatings are listed in [Appendix M](#).

End of Instructions.

Operator Qualification (OQ) Required?

YES.

Revision Notes

Location of Changes	Summary of Changes
---------------------	--------------------

Paragraph 4.1.2 – Item 4 b. (i) – Moisture Cured Wrap	Updated Trenton MC110 Outerwrap
Paragraph 4.5.2 – Precoat-ed below grade valves	New – Coating on below grade valves provided by the valve manufacturer, valve supplier, or fabricating shop can be used in-lieu of AIC approved coating if approved by Superintendent of Corrosion Control.
Paragraph 4.6.6 NOTE	Added – MCW shall extend a minimum of 2 inches passed the other coating material per Trenton MC110 Outerwrap Application Instructions. See CORR 3.
Subsection 6.1 – Cold Ap-plied Tape	Revised – No wrinkles in the cold applied tape shall be left. All wrinkles must be cut out and retaped Removed exposed to soil language.
Appendix B-1 & B-2 – Coat-ing Repair	Grammatical – "inches" replaced inch
Appendix G Moisture Cured Wrap	Updated Trenton MC110 Outerwrap
Appendix H - 3.A.through 3. C. – General Wrapping Instructions	Grammatical – "inches" replaced inch
Appendix H – 4. A.	Grammatical – Added "cold applied" to wax tape. Clari-fy cold applied tape and cold applied wax tape are two separate products.
Appendix I-1, 2. C. – Tapecoat 20	Grammatical – "inches" replaced inch
Appendix I-3 Tapecoat H35 – 1. B.	Revised – No wrinkles in the cold applied tape shall be left. All wrinkles must be cut out and retaped Removed exposed to soil language.
Appendix I-3 Tapecoat H35 – 3. A.	Grammatical – "inches" replaced inch
Appendix I-4 Denso Butyl 35 – 1. B.	Revised – No wrinkles in the cold applied tape shall be left. All wrinkles must be cut out and retaped Removed exposed to soil language.
Appendix I-5 Moisture Cured Wrap – 1. C. & 2. A.	Grammatical – "inches" replaced inch
Appendix I-5 Moisture Cured Wrap – 2. Application Procedures for Girth Weld	Grammatical – Rearranged some of the steps and split some of original steps into individual line items.
Appendix I-5 Moisture Cured Wrap – 3. Comple-tion and Curing of MCW Wrap	Grammatical – A. (1) – Capitalized "OR" C. – Moved 1 st sentence into a NOTE

Appendix I-5 Moisture Cured Wrap – 4. Application Procedures at Soil Air Interface Zone	4. B. – Reformatted, split into individual steps. H.- separated from G. L - separated from K M – removed "as stated above"
Appendix I-5 Moisture Cured Wrap – 5. Moisture Cured Wrap Coverage Table	Note below Table – "inches" replaced "inch"
Appendix I-6 Tapecoat TC Color Coat – 3. A. Table, Note	Grammatical – "inches" replaced inch
Appendix I-7 Trenton #2 Wax Tape – 3. A.	Grammatical – "inches" replaced inch
Appendix I-7 Trenton #2 Wax Tape – 3. B.	Grammatical – "lbs." replaced lb.
Appendix J - Approved Paint	Added – Tnemec Series 1095

Appendix A - Approved Coating Types for Installations

A-1. Direct Bury Installations

	Girth Weld Coating
Pipe Size (inches)	Initial Coating
12" and Larger	Field Applied Liquid Epoxy
2" to Less than 12"	Field Applied Liquid Epoxy Or Hot Applied Tape
Less than 2"	Field Applied Liquid Epoxy Or Hot Applied Tape Or Cold Applied Tape (1)
(1) Wax tape is not an acceptable coating	

A-2. Directional Drilling Installation

	Girth Weld Coating	
Pipe Size (inches)	Initial Coating	Sacrificial Overcoating
6" and Larger	Field Applied Liquid Epoxy	Moisture Cured Wrap
2" to Less than 6"	Field Applied Liquid Epoxy Or Hot Applied Tape	Moisture Cured Wrap
Less than 2"	Field Applied Liquid Epoxy Or Hot Applied Tape Or Cold Applied Tape (1)	Not Required
(1) Wax tape is not an acceptable coating		

Appendix B - Coating Repair

B-1. Pipe Coating Repair

Line Pipe coating	Repair coating	Diame-ter	Repair Requirements
Coal tar	Hot applied tape	< 6"	Full encirclement
Coal tar	Hot applied tape	>= 6"	Extend at least 6 inches beyond the edge of a defect no larger than 1/4 of the pipe circumference
Coal tar	2 part Liquid Epoxy	All	Extend at least minimum of 1 inch beyond the edge of the defect or full encirclement
Coal tar	Cold applied Butyl 35 or H35	All	Full encirclement
XTRU	Hot applied tape	< 6"	Full encirclement
XTRU	Hot applied tape	>= 6"	Extend at least 6 inches beyond the edge of a defect no larger than 1/4 of the pipe circumference
XTRU	Cold applied Butyl 35 or H35	All	Full encirclement

FBE	Hot applied tape	< 6"	Full encirclement
FBE	Hot applied tape	>= 6"	Extend at least 6 inches beyond the edge of a defect no larger than 1/4 of the pipe circumference
FBE	2 part Liquid Epoxy	All	Extend at least minimum of 1 inch beyond the edge of a defect no larger than 1/4 of the pipe circumference or full encirclement
FBE	Cold applied Butyl 35 or H35	All	Full encirclement
Wax tape is not acceptable for coating repair.			

B-2. Fitting Coating Repair

Fitting coating	Repair coating	Diameter	Repair requirements
FBE	Hot applied tape	< 6"	Full encirclement
FBE	Hot applied tape	>= 6"	Extend at least 6 inches beyond the edge of a defect no larger than 1/4 of the pipe circumference
FBE	2 part Liquid Epoxy	All	Extend at least minimum of 1 inch beyond the edge of a defect no larger than 1/4 of the pipe circumference or full encirclement
FBE	Any Cold Applied Tape	All	Full encirclement
Hot Applied Taps	Hot Applied Tape	< 6"	Full encirclement
Hot Applied Taps	Hot Applied Tape	>= 6"	Extend at least 6 inches beyond the edge of the defect or full encirclement
Liquid Epoxy	2 part Liquid Epoxy	All	Extend at least minimum of 1 inch beyond the edge of a defect no larger than 1/4 of the pipe circumference or full encirclement
Liquid Epoxy	Hot Applied Tape	< 6"	Full encirclement
Liquid Epoxy	Hot Applied Tape	>= 6"	Extend at least 6 inches beyond the edge of the defect or full encirclement
Liquid Epoxy	Any Cold Applied Tape	All	Full encirclement

Wax Tape	Wax Tape	All	Full encirclement
Cold Applied Butyl 35 or H35	Any Cold Applied Tape	All	Full encirclement

Appendix C - Approved Hot Applied Tapes

Denso Glass Outerwrap 4" x 30'	49 22 436
Trenton MC Outerwrap 9" x 40'	49 22 438
Denso Glass Outerwrap 8" x 40'	49 22 439
Polyethylene/Stretch Wrap 5" x 200'	49 22 492

Appendix H - General Wrapping Instructions

1. General

- A. All surfaces to be wrapped must be cleaned and free of oils, dirt, moisture, or other contaminants that would interfere with the adhesion to the pipe.
- B. Allow hot welds to air cool normally until comfortable to the touch before priming in order to avoid burning the primer.
- C. CAUTION, do not use hot applied tape on or near plastic pipe. The heat from either the torch or the hot tape may damage the plastic pipe.
- D. Epoxy coatings require the surface to be cleaned to a near white finish. Small repair areas shall be roughened using sandpaper then wiped clean with isopropyl alcohol. For large areas or many small areas, sandblasting should be considered.
- E. Both hot and cold applied tapes should overlap existing coatings by at least 2 inches at each end of the area wrapped.

2. Hot Tape Application

- A. Clean off pipe and coating charred by heat of welding on both sides of joint and dry pipe surface with torch. Clean area to be coated as necessary. When cool to touch, apply a thin uniform coating of primer to all areas where tape is to be applied. Let primer dry to a tacky consistency before applying tape. Do not use torch to dry primer.

- B. Flash torch flame lightly on top surface of unrolled end of wrap to bleed coating and assure good bond on pipe at start of wrapping.

- C. Start wrapping on mill coating. Spiral wrap with a minimum of 1 inch overlap. Flash edge of overlap as wrap progresses and keep enough heat and tension on tape to force coal tar to ooze out at the overlap. Flash torch flame lightly on top surface of unrolled end of wrap to bleed coating and assure good bond on pipe at start of wrapping.

- D. Finish wrapping on mill coating. *Do not flash finished wrap on the Tapecoat 20* because the Mylar surface should remain intact to provide barrier against soil adhesion. *Flash the finished wrap on the Densotherm Tape* to obtain the glossy finish.

Note: For pipe to be pulled into a directional bore hole, wrap joints with spiral towards the leading edge of pull.

3. Service Tee Hot Applied Tape

- A. When a service tee or small fitting is installed on a 6 inches diameter or larger FBE or coal tar coated steel pipe, hot wrap or liquid epoxy shall be used to cover the exposed bare pipe created where the pipe coating was removed so the service tee or small fitting could be welded to the pipe. Small area should be no larger than approximately 1/4 of the pipe diameter. Care must be taken to ensure the hot wrap or liquid epoxy is extended at least 6 inches beyond the bare area and the edges of the hot wrap are sealed tightly to the existing coating such that the edges will not come loose and roll-back as the pipe moves. Existing pipe coating does not have to be completely removed from around the pipe.
- B. When a service tee or fittings is installed on steel pipe smaller than 6 inch diameter, the hot wrap shall be installed in accordance the instructions below.
- (1) Priming Preparation
- Remove coating from the line pipe.
 - Clean surface immediately adjacent to the tee location to bare metal and weld on tee.
 - Brush off weld slag and charred coating remaining.
 - Prime all surfaces to be taped with a thin uniform coating of primer (pre-heat surfaces to remove any moisture).
 - Extend primer a minimum of 2 inches onto the undisturbed mill coating.
 - Let primer dry to a tacky consistency before applying tape.

C. Application of Hot Applied Tape

(1) Typical application for all standard coatings. Rip off 5 lengths of 2 inches wrap about 6 inches long and apply wrap to primed surfaces as follows:

(a) Flash tape #1 and pull down into Figure U over base weld. Repeat from opposite side with tape #2. Tapes will crisscross and cover base weld.

(b) Repeat Step 1 application at tee outlet with tapes #3 and #4. Press tapes firmly against the metal where they crisscross.

(c) Flash tape #5 and pull down over cap. Center properly so that top edge of cap is completely covered.

(d) Starting with straight wrap around tee cap, spiral wrap tee and extend at least 2 inches onto undisturbed mill coating. Heat tape so that tar oozes out at overlaps.

Note: For 6 inches and larger pipe, see [3. A.](#) above for wrapping instructions.

4. *Service Tee Cold Applied Tape:*

- A. Service tees and small fittings can be wrapped with cold applied tape or cold applied wax tape.
- B. The cold applied tapes shall be molded tightly around the fitting so no voids that could collect water remains.
- C. The exposed bare pipe created where the coating was removed to weld the small fitting on to the pipe will require a full encirclement spiral wrap with the cold applied tape.
- D. The cold applied tape shall extend a minimum of 6 inches on to the undisturbed protective coating of the pipe.
- E. When cold applied wax tape is used, care shall be taken when backfilling to prevent the wax tape from being displaced.
- F. Mesh outer wrap can be used to protect the wax tape during backfilling operations.

Appendix I - Specific Coatings

I-1. Tapecoat 20

1. *General*

- A. Tapecoat 20 is a hot-applied 58 mil coal tar tape for ambient temperature below grade application.
- B. Tapecoat 20 consists of a specially formulated pliable coal tar coating completely saturated into and bonded to both sides of a high tensile strength fabric. It has a polyester film adhering to the coating which facilitates unwinding of the roll and acts as an outer wrap providing additional mechanical strength against backfill and soil stress.
- C. Tapecoat 20 should be kept clean and dry prior to application.

2. *Application*

- A. Surface must be clean and dry. Moisture, dust, dirt, rust, or other foreign matter should be removed by scraping or wire brushing. Oil and grease should be removed with a suitable solvent. On previously coated surfaces, remove all loose or incompatible coatings. Use torch to warm the surface and remove moisture prior to priming.
- B. TC Omniprime is the compatible primer for use with Tapecoat 20. Slight stirring of the product may be required prior to use. Apply primer to the prepared surface with a brush, roller, or pad. TC Omniprime should be applied about 3" beyond the area to be wrapped with tape. Let primer dry before applying Tapecoat 20. Allow primer to dry naturally do not use a torch to dry primer. TC Omniprime can also be used on stainless steel.
- C. There are two recommended methods for applying Tapecoat 20 to a properly prepared and primed surface.
 - (1) Spiral Wrap: Flash flame of torch onto the side of the coating without the polyester film (outside of roll) until a smooth and glossy finish is obtained. Apply properly heated coating with tension to the surface of the pipe. Alternately heat and spiral wrap in a single thickness with a continuous overlap of at least 1" of tape.
 - (2) Cigarette Wrap: Precut strips of Tapecoat 20 to a length equal to the circumference of the pipe plus a minimum of about 3 inches for overlap. Follow general tape application instructions described above.

3. Coverage

- A. The following table provides the estimated footage of pipe coated per roll of Tapecoat 20 tape. All rolls are 75 feet in length.

Pipe Size	2" Width 12 Rolls Per Car-ton	4" Width 8 Rolls Per Car-ton	6" Width 4 Rolls Per Car-ton
¾"	39.8'		
1"	31.8'		
1 ½"	22.0'		
2"	17.6'		
3"	11.9'	25.6'	
4"	9.3'	19.9'	
6"		13.5'	
8"		10.4'	15.9'
10"		8.3'	12.8'
12"		7.0'	10.8'

Note: See Appendix [A-1](#) and [A-2](#) for girth weld coating requirements.

- B. TC Omniprime (49 22 084) coverage is approximately 300 sq. ft. per gallon..

I-2. Densotherm Tape

1. General

- A. Densotherm Tape is a hot applied 79 mils bituminous tape. It is comprised of a non-woven synthetic fabric fully impregnated and coated with a flexible, high melting point bitumen compound.

2. Application

- A. Clean all bare steel minimally removing all disbonded foreign matter such as dirt, rust, scale, etc. A suitable solvent clean may be necessary where foreign matter exists.
- B. If moisture exists, heat the surface with a propane torch so as to remove all moisture from the steel. When working on operating gas pipeline in warmer temperatures, wiping with rags may become more practical when removing moisture from the pipe surface.
- C. Apply a uniform coat of Denso Primer D to the pipe surface extending about 3 inches onto the coating on both sides of the weld area. Allow the primer to get tacky and/or dry to the touch. Heating of the pipe should be done before the application of primer. It is not necessary to apply additional heat over the primer. Continuous brushing of the surface, without adding additional primer to the brush, will help with the drying process. Given that the steel surface is warmed initially, primer should only take 3-5 minutes to get tacky or dry to the touch.
- D. Generously heat one side of the Densotherm Tape with a wide-mouthed propane torch, so as to create a glossy, wet, drippy look surface of bitumen.
- E. Wrap the Densotherm hot applied tape over the pipe with the heated side placed against the pipe surface. In cold weather application, heat over the outside portions of the tape where overlaps occur. Apply the tape with a certain degree of tension leaving no mislaps or unbonded areas during the application. A spiral-wrap application is pre-

ferred; however, on larger pipe a cigarette wrap of strips may be more practical. A bead of bitumen should be in place where overlaps in tape occur, thus assuring for good application.

- F. Make sure that the tape extends over the area being wrapped and onto the mill coating a minimum of about 3 inches on either side of the area being wrapped. At least a 1 inch overlap of tape is preferred.
- G. Once applied to the pipe, flash the exterior of the tape surface with plenty of heat so as to witness the lap seams fusing together. Apply a significant amount of heat when glossing over the product with heat. Backfill can occur immediately after the tape has cooled.
- H. On directional drilled bores, it is best to wrap towards the direction with which the pipe will be pulled. Follow the procedure outlined in steps (a)-(d) above, with the one exception of heating and seaming the lead edge until it is flush with the pipe surface. A sacrificial piece of tape may be applied over the lead edge to help prevent any roll-back of the tape.

3. Coverage

- A. The following table provides the estimated footage of pipe coated per roll of Densotherm Tape. All rolls are 50 feet in length.

Tape Width	Rolls/Case	With 1" Overlap
2"	12	45 sqft/case
4"	6	75 sqft/case
6"	4	82 sqft/case

Note: See Appendix [A-1](#) and [A-2](#) for girth weld coating requirements.

- B. Denso Primer D (49 17 762) coverage is approximately 592 sq. ft. per 1.3 gallon container.

I-3. Tapecoat H35

1. General

- A. Tapecoat H35 is a 35 mil cold-applied tape for above and below grade application with an integrated primer. Tapecoat H35 is composed of a gray specially formulated MAF® backing with a synthetic elastomeric adhesive.

- B. No wrinkles in cold tape shall be left. All wrinkles must be cut out and re-taped.

2. Application

- A. Prepare Surface - Surface must be clean and dry. Loose rust, scale, dirt or dust must be removed. A "Tack Cloth" for removal of fine dust particles is provided in each carton. Oil, grease and all other residue should be removed with a suitable solvent.

- B. Apply Primer - Brush apply TC Omniprime and allow primer to dry to a tacky consistency before applying tape.

- C. Apply Tape - There are two recommended methods for applying Tapecoat H35 to a properly prepared surface.

- (1) Spiral Wrap: Tapecoat H35 is hand applied by removing the release liner and spirally wrapping in a single thickness with a continuous 1 inch overlap of tape. Apply enough tension to obtain conformity to surface being wrapped. Apply final wrap without tension.

- (2) Cigarette Wrap: Precut strips of Tapecoat H35 to a length equal to the circumference of the pipe plus a minimum of 4". Follow general tape application instructions described above.

3. Coverage

- A. The following table provides the estimated footage of pipe coated per roll of Tapecoat H35 tape. The 2 inches and 4 inches wide rolls are 75 feet in length. The 6 inches rolls are 50 feet in length.

Footage of Pipe Wrapped per Roll of Tapecoat H35			
Pipe Size	2" Width 12 Rolls Per Carton	4" Width 8 Rolls Per Carton	6" Width 4 Rolls Per Carton
3/4"	24.8 ft		
1"	19.8 ft		
1-1/4"	15.7 ft		
1- 1/2"	13.7 ft		
2"	11.0 ft	32.9 ft	
3"	7.4 ft	22.3 ft	
4"	5.8 ft	17.3 ft	18.5 ft
6"	3.9 ft	11.8 ft	12.5 ft
8"	3.0 ft	9.1 ft	9.6 ft
10"		7.3 ft	7.7 ft
12"		6.1 ft	6.5 ft

- B. TC Omniprime (49 22 084) coverage is approximately 300 sq. ft. per gallon.

I-4. Denso Butyl 35

1. General

- A. Denso Butyl 35 is a heavy duty polyethylene backed tape with a butyl rubber adhesive.
- B. No wrinkles in cold tape shall be left. All wrinkles must be cut out and re-taped.

2. Application

- A. Prepare Surface - Prepare surfaces by removing all loose scale, rust or other foreign matter. Surface must be clean, dry and free of grease.
- B. Apply Primer - Apply a thin uniform coat of Denso Butyl Primer to clean dry surfaces to be wrapped and allow to tack dry. Prime only areas to be wrapped the same day. Reapply primer if the area becomes dirty or wet.
- C. Apply Tape - Peel back interleaving and apply adhesive side of the tape to the surface and press down. Apply the tape spirally with enough tension to make it conform. Remove interleaving as wrapping proceeds. Overlap each turn by at least 1 inch. (Note: When proper surface prep is not achievable or when applying to pitted pipe, apply a thin film of Denso Butyl Primer to all surfaces to be wrapped and allow to dry.) Irregular surfaces such as valves, flanges, etc. may require use of Denso Profiling Mastic.

3. Coverage

- A. The following table provides the estimated footage of pipe coated per roll of Densotherm Tape. All rolls are 50 feet in length.

Footage of Pipe Wrapped per Roll of Denso Butyl 35			
Pipe Size	2" Width 24 Rolls Per Case	4" Width 12 Rolls Per Case	6" Width 8 Rolls Per Case
3/4"	16.5 ft		
1"	13.2 ft		
1-1/4"	10.5 ft		
1-1/2"	9.1 ft		
2"	7.3 ft	21.9 ft	
3"	5.0 ft	14.9 ft	
4"	3.9 ft	11.6 ft	18.5 ft
6"	2.6 ft	7.9 ft	12.5 ft
8"	2.0 ft	6.0 ft	9.6 ft
10"		4.8 ft	7.7 ft
12"		4.1 ft	6.5 ft

- B. Denso Butyl Primer (49 22 393) coverage is approximately 61 sq. ft. per quart

I-5. Moisture Cured Wrap

1. General

- A. Moisture cured wrap (MCW) is a fiberglass cloth impregnated with water activated resins which, when cured, provides a protective outer layer over fusion bonded epoxy (FBE), field applied epoxy coating, hot applied tape or cold applied tape.
- B. The MCW is UV stable so it is not degraded when exposed to sunlight.
- C. The primary use of MCW is to provide an abrasive resistant overcoat on girth weld joints on pipe that is being installed by directional drilling or conventional boring operations where the steel pipe 2 inches nominal diameter and larger is being pulled back through the bore hole. See [Appendix A-2](#) for directional drilling installation
- D. Since MCW is UV stable, it can also be used as a protective overcoat over all of the other approved coating materials at the soil to air interface zone on steel pipe risers. See [Section 4.6](#) Soil to Air Interface Zone

2. Application Procedures for Girth Welds

- A. Prior to the application of MCW, the girth weld joint area on steel pipe 2 inches nominal diameter and larger must be coated with liquid epoxy coating or hot applied tape as shown in Appendix A-1 and A-2.
- B. The coated area shall be inspected to ensure there has been no damage to the coating and the coating is free of dirt, debris or other contaminants.
- C. Roughen the factory FBE or Abrasive Resistant Overcoat (ARO) outer surface adjacent to the girth weld area where the MCW will be applied. A wire brush, sandpaper or similar item can be used to roughen the FBE or ARO surface.

Care must be taken not to remove the FBE coating completely.

- D. See the MCW Coverage Table below for an estimate of the number of rolls required for each pipe size.
- E. Protective gloves, such as nitrile glove (stock code 49 04 553) or latex, should be worn during the installation of MCW.
- F. The roll of MCW should be submerged in water for approximately thirty (30) seconds.
- G. Begin the wrapping immediately after the MCW is removed from the water.
- H. Start the wrapping approximately 12 inches from the girth weld joint, toward the end of the pipe that will enter the bore hole first.
- I. Start by making one complete wrap around the pipe before starting the spiral wrap.
- J. Maintain tension on the wrap so that the MCW is tight against the pipe.
- K. Wet the tape between layers.

A misting of water with a spray bottle is a good method for evenly wetting the tape between layers **as wrapping progresses**.

- L. Following the one complete wrap, begin spiral wrapping the MCW across the girth weld area.
- M. Each spiral wrap should have an approximate 50% overlap.
- N. Stop the spiral wrap approximately 12 inches from the girth weld joint and change the direction of the spiral wrap.
- O. The spiral wrap should progress back across the first spiral wrap layer, again with an approximate 50% overlap, ending at the starting point of the first MCW layer.
- P. **Make** a complete wrap around the pipe with an approximate 100% overlap.
- Q. The end result of the two spiral passes, at an approximate 50% overlap, is a protective coating of 4 full layers of MCW.

3. *Completion and Curing of MCW Wrap*

- A. Following the MCW wrap process, there are 2 completion procedure options available:
 - (1) A polyethylene/stretch wrap can be applied over the just applied MCW wrap resulting in smooth/shiny surface of the complete MCW wrap. With a wire brush or other tool puncture the stretch wrap approximately every square inch and leave until the MCW has cured. **OR**
 - (2) Utilizing the Protal liquid epoxy or the supplied end adhesive packet, coat each end of the wrap to prevent any unraveling of the MCW overcoat until the MCW has cured.
- B. If the polyethylene/stretch wrap was used It shall be removed after the MCW has cured.

- C. Curing time is usually around 45 minutes but this is dependent on the weather temperature. The cure time may be longer when the weather is cold or shorter in extremely high temperatures.

The MCW should be allowed to fully harden before the pipe is pulled into the bore hole.

4. *Application Procedures at Soil Air Interface Zone*

- A. MCW can be installed as UV resistant coating over an approved underground coating that extends above grade. The MCW coating should extend approximately 12 inches below grade to above grade.
- B. Prior to installation:
 - a. The area to be coated with MCW should be cleaned and be free of dirt, debris or contaminants.
 - b. The existing coating should be inspected and repaired if necessary.
 - c. Roughen the factory FBE outer surface where the MCW will be applied. Care must be taken not to remove the FBE coating completely.
- C. Select the correct roll size to allow for a complete application with a single roll. See the MCW Coverage Table below.
- D. Protective gloves, such as nitrile glove (stock code 49 04 553) or latex, should be worn during the installation of MCW.
- E. The roll of MCW should be submerged in water for approximately 30 seconds.
- F. Begin the wrapping immediately after the MCW is removed from the water.
- G. Start the wrapping above grade. Make one complete wrap around the pipe before starting the spiral wrap.
- H. If an above grade valve is less than 12 inches above grade, start the wrap just below the valve making sure there is a good seal between the MCW and the pipe.
- I. Maintain tension on the wrap so that the MCW is tight against the pipe.
- J. Wet the tape between layers. A misting of water with a spray bottle is a good method for evenly wetting the tape between layers.
- K. Following the one complete wrap, begin spiral wrapping the MCW downward. Each spiral wrap should have an approximate 50% overlap.
- L. Stop the spiral wrap approximately 12 inches below grade and change the direction of the spiral wrap.
- M. The spiral wrap should progress back across the first spiral wrap layer, again with an approximate 50% overlap, ending at the starting point of the first MCW layer with a complete wrap around the pipe with an approximate 100% overlap.
- N. Follow the procedures in 3. Completion and Curing of MCW Wrap once the wrapping has been completed.

5. *Moisture Cured Wrap (MCW) Coverage Table:*

Length of MCW Area	Pipe Diameter	Material Required for 50% Overlap and 2 Passes (ends up with 4 layers)	Rolls Per Joint	Roll Size
18" - 24"	2	780 in ²	<1	4" x 27' 4" x 30;
18" - 24"	3	1,144 in ²	<1	4" x 27' 4" x 30;
18" - 24"	4	1,206 in ²	1	4" x 27' 4" x 30;
18" - 24"	6	1,810 in ²	2	4" x 27' 4" x 30;
18" - 24"	8	2,413 in ²	2	4" x 27' 4" x 30;'
18" - 24"	12	3,619 in ²	3	4" x 27' 4" x 30'
			1	8' x 40' 9" x 40'
18" - 24"	14	4,222 in ²	4	4" x 27' 4" x 30'
			1	8" x 40' 9" x 40'
18" - 24"	16	4,825 in ²	4	4" x 27' 4" x 30'
			2	8" x 40' 9" x 40'
18" - 24"	18	5,428 in ²	5	4" x 27' 4" x 30'
			2	8" x 40'

UNCONTROLLED IF PRINTED

				9" x 40'
18" - 24"	20	6,031 in ²	5	4" x 27' 4" x 30'
			2	8" x 40' 9" x 40'
18" - 24"	24	7,238 in ²	6	4" x 27' 4" x 30'
			2	8" x 40' 9" x 40'
18" - 24"	30	10,179 in ²	8	4" x 27' 4" x 30"
			3	8" x 40' 9" x 40'

Note: Estimated MCW material required is based on 24 inches length.

A. Coverage per Roll:

Roll Size	Coverage Square Inches (in ²)
4" x 27'	1,296
6" x 27'	1,944
9" x 40'	4,320

I-6. Tapecoat TC Color Coat - (Not approved for Girth Weld Coating or Pipe Coating Repair)

1. General

A. Tapecoat TC Color Tape, 60 mil, is composed of a fully impregnated fiber carrier saturated with a special formulated blend of waxes and plasticizers that make up this versatile, non-toxic, environmentally safe, easily to apply, protective coating.

2. Application

A. Prepare Surface - Prepare surfaces by removing all loose or non-bonding material, rust scale, dirt, burrs, sharp edges or other foreign matter. Remove excess moisture whenever practical.

B. Apply Primer - Apply a thin uniform coat of TC Color Coat Primer to entire surface with gloved hand, brush, rag, or mechanical mean to a minimum thickness of 2 to 4 mils.

C. Apply Tape - Spirally wrap the tape, a 50 % overlap is preferred, but with a minimum 1" overlap or 20 percent of tape width, whichever is greater, is acceptable if conditions allow. While wrapping, press air pockets out and smooth all lap seams. The cig-

arete wrap method of application may also be used. Irregular surfaces such as valves, flanges, etc. may require the use of profiling material prior to applying tape.

3. Coverage

A. The following table provides the estimated footage of pipe coated per roll of TC Color Coat, with a 50% overlap.

Footage of Pipe Wrapped per Roll of TC Color Coat			
Pipe Size	2" Width 12.5 Feet per Roll	4" Width 25 Feet per Roll	6" Width 25 Feet per Roll
3/4"	4.1 ft		
1"	3.3 ft		
1-1/4"	2.6 ft		
1-1/2"	2.3 ft		
2"	1.8 ft	8.0 ft	
3"	1.2 ft	5.5 ft	
4"	1.0 ft	4.2 ft	7.1 ft
6"		2.9 ft	4.8 ft
8"		2.2 ft	3.7 ft
10"		1.8 ft	3.0 ft
12"		1.5 ft	2.5 ft

Note: 2 inches Roll - 24 rolls/case; 4 inches Roll - 6 rolls/case; 6 inches Roll - 4 rolls/case

I-7. Trenton #2A Wax Tape - (Not approved for Girth Weld Coating or Pipe Coating Repair)

1. General

A. Trenton #2A Wax Tape is a 70 to 90 mil non-woven, non-stitch synthetic fabric, saturated with a blend of microcrystalline wax, solvents and corrosion inhibitors, forming a tape wrapper that firms up and is suitable for painting. The tape is aluminum colored.

2. Application

A. Prepare Surface - Wire brush and wipe surface clean of any loose coating, rust, scale and foreign matter.

B. Apply a thin film of Temcoat Primer by hand directly to the surface.

(1) Temcoat Primer can be applied to wet or cold surfaces.

(2) At higher temperatures, Temcoat can be applied by brush.

(3) In order to displace moisture and ensure adhesion, rub and press firmly on the primer.

(4) After application of the primer Wax-Tape may be applied immediately.

C. Apply Wrap Wax-Tape using a 1 inch overlap.

(1) On straight pipe apply slight tension to ensure contact to the surface.

(2) On irregular surfaces, allow slack so the tape can be molded into conformity.

(3) While wrapping either surface, press and form the tape so there are no air pockets or voids and so that the tape is in intimate contact with the surface.

- (4) Press and smooth out lap seams to ensure that they are sealed.
 - (5) Mesh outer wrap can be used to protect the tape during backfilling operations.
 - (6) Wax-Tape does not require dry time, so it can be backfilled immediately.
 - (7) If the tape is going to be painted, allow a few days for it to firm up.
 - (8) Mesh outer wrap can be used to protect the tape during backfilling operations.
- D. Applying Trenton Fill-Putty (profiling material) - Wire brush or and wipe the surfaces clean of dirt, loose rust or old coating and other foreign materials.
- (1) Apply a thin film of Temcoat Primer by hand directly to the surface. Refer to 2. B. above, except profiling material will be applied to the primer.
 - (2) Apply Fill-Putty directly by hand, working the material onto the metal surface ensuring that the putty is “wetting” and adhering to the surface.
 - (3) Continue applying the material in and around the voids, contours and crevices so as to build up an even surface all around the fitting or structure.
 - (4) Overlap the entire application with Trenton’s Wax-Tape.
 - (5) Mesh outer wrap can be used to protect the tape during backfilling operations.

3. Coverage

A. The following table provides the number of rolls of Trenton #2A Wax Tape and gallons of Wax-Tape primer per 100 inches of pipe. The 4 inches and 6 inches rolls are 9 feet in length.

Pipe Diameter	Tape Width	Lineal Footage per Roll		Gallons of Primer/100ft.
		1" overlap	50% overlap	
2"	4"	3.6	2.4	0.5
	6"	6	3.6	
4"	4"	1.9	1.3	1
	6"	3.2	1.9	
6"	4"	1.3	0.9	1.5
	6"	2.2	1.3	
8"	4"	1	0.7	2
	6"	1.7	1	

B. The following table provides the estimated quantity of Trenton Fill-Putty needed for different sized fittings. It is issues in 2 lbs. blocks.

Pipe Diameter	Flanged Joint	Flanged Valve & Dresser Coupling
4"	3.25 lbs.	9.75 lbs.
6"	4.25 lbs.	12.75 lbs.
8"	5.5 lbs.	16.5 lbs.
10"	7 lbs.	21 lbs.
12"	8.5 lbs.	25.5 lbs.
14"	9.5 lbs.	28.5 lbs.
16"	10.5 lbs.	31.5 lbs.

18"	12 lbs.	36 lbs.
20"	13 lbs.	39 lbs.
24"	16 lbs.	48 lbs.
30"	19 lbs.	57 lbs.

Appendix J - Approved Paints for Pipeline Facility Coating.

Paint Type	Stock Code Number	Farm Tap	Small Regulator Station	Pipeline Delivery Station	Transmission Regulator Stations	Town Border Station	L
Sherwin - Williams "Industrial Yellow" ^{2, 3}	30-59-124	X	X	X	X	X

58 - 60	4000	4100

Note: For average thicknesses more than 2 mils thicker or thinner than indicated in the table above contact the Superintendent of Corrosion Control for proper testing voltages.

Appendix L - Protal Applications

1. General

- A. Ameren Illinois Company (AIC) stocks three (3) Denso field applied liquid epoxy coatings; Protal 7125, 7200 and 7300.

- B. These products are used to coat girth welds, weld joint areas, damaged coating areas and below grade fittings.
- C. Application of these products is to be done in accordance with Denso's instructions. See [CORR 3](#) for manufacturer's instructions:
 - (1) Denso Protal 7125 Instructions
 - (2) Denso Protal 7200 Instructions
 - (3) Denso Protal 7300 Instructions
 - (4) Denso Protal Air Cartridge Gun 1000 Setup

2. *Protal 7125*

- A. Specially formulated for use when ambient and pipe surface temperatures are below 50°F.
- B. Should not be applied when pipe temperature is above 68 °F. Protal will not have sufficient time to adhere to pipe.
- C. Apply with any size brush, roller or pad. Cannot be sprayed applied
- D. Shelf Life
 - (1) One year from the manufactured date when stored in original containers.
 - (2) Tubs and pails have a use by date which would be the last day of the month shown.
- E. Target Application Thickness:
 - (1) Final wet film and dry film target thickness is approximately 30 mils with a minimum of 20 mils and maximum of approximately 60 mils.

3. *Protal 7200*

- A. Should only be applied when ambient and pipe surface temperature is 50°F or above.
- B. Apply with any size brush, roller or pad. Can be spray applied in the field or shop.
- C. Shelf Life
 - (1) Two years from the manufactured date when stored in original containers.
 - (2) Tubs and pails have a use by date which would be the last day of the month shown.
 - (3) Should not be allowed to freeze
- D. Target Application Thickness:
 - (1) Final wet film and dry film target thickness is approximately 30 mils with a minimum of 20 mils and maximum of approximately 70 mils.

4. *Protal 7300*

- A. Can be applied to dry, damp or wet pipe surfaces when pipe surface temperature is at or above 32°F
- B. Apply with any size brush, roller or pad.
- C. Shelf Life
 - (1) Two years from the manufactured date when stored in original containers.

(2) Tubs and pails have a use by date which would be the last day of the month shown.

(3) Should not be allowed to freeze

D. Target Application Thickness

(1) Final wet film and dry film target thickness is approximately 30 mils with a minimum of 20 mils and maximum of approximately 60 mils.

5. Protal Coverage Tables

A. Tables below were taken from Denso Protal Liquid Coatings Quantity Estimate Sheet (VER 1608.08).

B. Weld Joints

WELD JOINT COVERAGE (Applied at 25 mils to 30 mils)		
Pipe Diameter	Joints per Liter 2" to 3" Cut Back	Joints per Liter 6" to 8" Cut Back
4"	9	4.5
6"	6	3
8"	4.5	2.5
10"	3.6	2
12"	3	1.5
16"	2.25	1.25
20"	1.8	1
24"	1.5	0.75
30"	1.2	0.625
36"	1	0.5
42"	0.86	0.43
48"	0.75	0.375

C. Bore Joints

C. Bore Joints BORE JOINT COVERAGE (Applied at 45 mils to 60 mils)		
Pipe Diameter	Joints per Liter 2" to 3" Cut Back	Joints per Liter 6" to 8" Cut Back
4"	4.5	2.25
6"	3	1.5
8"	2.25	1.25
10"	1.8	1

CORR 2.4 Corrosion Protection Criteria

1.0 Purpose

This document provides the criteria for the measurement of the effectiveness of the cathodic protection on Ameren Illinois (AIC) pipelines and facilities. This document meets the requirements of 49 CFR Part 192 Appendix D.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 CP Criteria](#)

[6.0 IR Drop Measurement](#)

[7.0 IR Drop Testing Methods](#)

[8.0 Conducting the IR Drop Survey](#)

[9.0 Hydrogen Generation Under Coatings](#)

Appendices:

[Appendix A - Measuring Cathodic Protection Potentials](#)

3.0 Target Audience

- Corrosion Control Supervisors
- Corrosion Control Specialists

4.0 General

A "go" or "no go" decision for cathodic protection adequacy cannot be made based solely on the pipe-to-soil value measured.

4.1 Interpreting pipe-to-soil measurements from a pipeline system requires:

4.1.1 Knowing how and where the reading was obtained.

4.1.2 Selecting the appropriate criteria, obtaining the measurement using proper techniques, and properly evaluating the measurement by corrosion personnel are dictated by economics and safety.

4.1.3 Pipe-to-soil measurements with protective current applied may be appropriate for distribution systems with galvanic anode systems.

4.1.4 A poorly coated structure with an impressed current system is often a good candidate for the 100 mV polarization shift criteria.

4.2 The appropriate criterion must be selected, acceptable test methods must be used, and the measurements must be evaluated properly by trained personnel.

UNCONTROLLED IF PRINTED

4.3 The accuracy of the measurement and the economics of obtaining the data must be weighed when selecting a criterion.

5.0 CP Criteria (49 CFR Part 192 Appendix D)

5.1 -850 mV (-0.85 V) Pipe-to-Soil Potential (49 CFR Part 192 Appendix D subsection I A (1))

5.1.1 A negative cathodic protection potential of at least -850 mV is considered adequate for protection of mains and services.

5.1.2 Voltage (IR) drops other than those across the structure electrolyte boundary must be considered for valid interpretation of the voltage measurement.

5.2 -850 mV (-0.85 V) Polarized Potential

5.2.1 A negative polarized potential of at least -850 mV with the interruption of the cathodic protection current is considered adequate. Potentials are measured on regular cycles to identify a minimum "on" potential required to maintain the "instant off" potential of at least -850 mV.

Use of polarized potential criteria requires that all sources of cathodic protection current must be simultaneously interrupted.

5.3 100 mV Polarization Shift (49 CFR Part 192 Appendix D subsection I A (3))

5.3.1 A minimum of 100 mV of cathodic polarization is considered adequate. To determine polarization:

1. A potential of the native potential must be measured.

A native potential is defined as the potential measured prior to activation of the cathodic protection system.

2. After CP current is applied and the pipe is allowed time to polarize, the CP current is interrupted and an instant off potential is measured.

3. If the instant off potential is more than 100 mV less negative than the native potential then cathodic protection is adequate.

1. This method can be used on systems with coating degradation, bare pipe, or insufficient current between rectifiers.
2. This method can only be used on a system where all current sources can be disconnected and interrupted.

Example:

Instant off Potential	-780 mV
Native Potential	-650 mV

Difference -130 mV (Cathodic Protection Adequate)

5.4 100 mV Polarization Decay

5.4.1 A minimum of 100 mV polarized decay is considered adequate. To determine polarized decay:

1. An "instant off" measurement is captured within 0.1 to 0.4 seconds after the current is switched off. See "[Monitoring and Maintenance of Conductive Coating Anode Cathodic Protection Systems](#)" in the Reference Documents section and [Figure 1](#).
2. Then the CP current is interrupted for an extended period of time of 8 to 24 hours.
3. If the polarized decay potential is more than 100 mV less negative than the "instant off" potential then the cathodic protection is adequate. See note in [Section 5.3.1](#).

Example:

Instant off Potential	-780 mV
Depolarized Potential	-620 mV
Difference	-160 mV (Cathodic Protection Adequate)

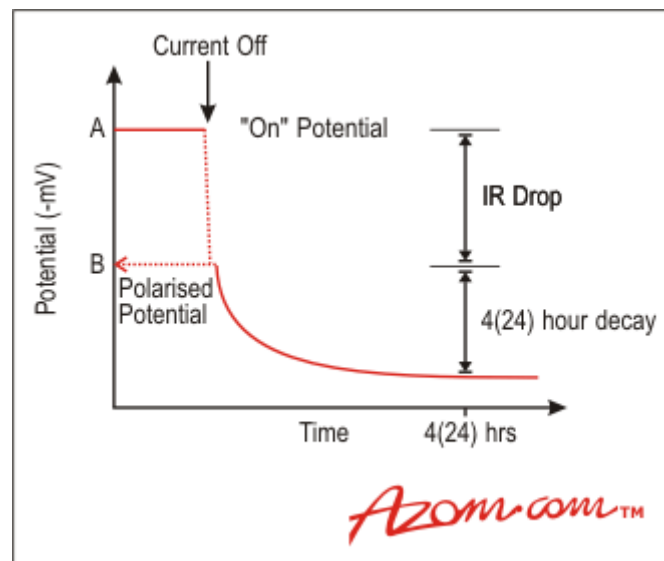

Figure1. Potential Decay Curve

5.5 Other Criteria for Protection of Steel

5.5.1 A voltage at least as negative (cathodic) as that established at the beginning of the Tafel segment of the E-log-I curve. See 49 CFR 192 Appendix D subsection I A (4) and Figure 2.

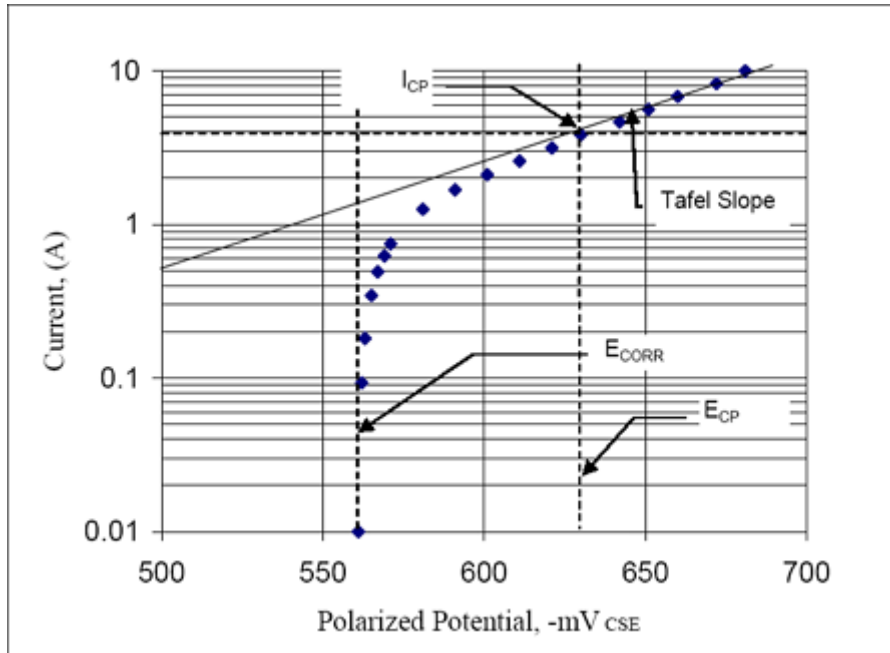

Figure 2. E-log-I Curve showing Tafel Slope

5.5.2 A net protective current from the electrolyte into the structure surface measured by an earth current technique applied at predetermined current discharge (anodic) points of the structure.

6.0 IR Drop Measurement

6.1 Each potential measured has several components which include:

- 6.1.1 Potential of the pipe
- 6.1.2 IR drop in the metallic circuit
- 6.1.3 IR drop in the soil/pipe circuit

6.2 Two of the three potential components, 6.1.2 and 6.1.3, are caused by current flow from the cathodic protection system. See [Figure 3](#) for a Cathodic Protection Current Flow Diagram.

In such cases, the IR drop consists of a resistance (pipe or earth) and a current from the cathodic protection system. If the current becomes zero, additions to the potential should each read zero and not affect the measurement. When current flow is small, the error is small.

Figure 3. Cathodic Protection Current Flow Diagram

UNCONTROLLED IF PRINTED

6.3 Methods for Considering IR Drop Error

- 6.3.1 Review leakage caused by corrosion on protected mains and services annually and document.
- 6.3.2 Use a more negative "on" criterion.
- 6.3.3 Interrupt current flow and measure the pipe-to-soil potential before the structure begins to depolarize.
- 6.3.4 Measure the potential as close as possible to the pipe and soil interface. See [Appendix A](#) - Measuring Cathodic Protection Potentials.
- 6.3.5 Remote earth potentials.
- 6.3.6 Extrapolation (using mathematical formulas to calculate the potential at the pipe and soil interface).
- 6.3.7 Ignore if error is not significant.

7.0 IR Drop Testing Methods

7.1 Galvanic Anode Systems or Impressed Current Systems

- 7.1.1 When possible, measure potentials at pipe and soil interface remote to anode installations. Installations include:
 - 1. Service risers
 - 2. Pressure control station risers

7.2 Interrupted survey process for Impressed Current Systems

- 7.2.1 Use synchronized interrupters at current sources to perform current interruptions when pipe exam data or leak data indicates that -0.85 V "on" is not adequate. See Figure 4.

Figure 4. Current Interrupter

- 7.2.2 Measure the "instant off" potential. An "instant off" is considered to be a potential measured between 200 milliseconds and 3 seconds after the current flow has been interrupted. Set the interrupter open time to closed time at a ratio of 1 to 3.
- 7.2.3 Capture the potential. Use a recording multimeter and set the record feature at the 100-millisecond recording rate. Measure the "on" potential with the handheld data collection device and the "off" potential with the recording in the record mode.

7.3 Using the recording multimeter

UNCONTROLLED IF PRINTED

7.3.1 Connect the meter to half-cell and pipeline test station.

7.3.2 Push the min/max button. See Figure 5.

Figure 5. Recording Multimeter

7.3.3 Record for at least 2 interrupter cycles.

7.3.4 Push the min/max button to retrieve minimum and maximum potentials.

7.3.5 After the initial interruption, the recording meter shall measure at least 9 potentials during the first second after the interruption, missing the anodic spike.

7.3.6 Check the potentials to verify that the spike has been missed. See [Figure 6](#) for typical pipe-to-soil potential after current interruption.

7.3.7 The recording meter shall record data for at least 2 complete interrupter cycles.

The min/max button on the meter recalls the minimum, the maximum, and the average potentials.

7.3.8 The maximum potential is the "instant off" (red lead is to the pipe and the black lead to the half cell). The potential should be within -0.85 V and -1.5 V.

Figure 6. Typical Pipe-to-Soil Potential after Current Interruption

8.0 Conducting the IR Drop Survey

8.1 Identify the current sources to interrupt such as:

8.1.1 Rectifiers

8.1.2 Anode beds

8.1.3 Bonds

8.1.4 Foreign rectifiers.

8.2 Test or estimate the extent of each sources influence.

8.3 Synchronize the necessary number of interrupters and place them at the current source.

On rectifiers, it may be easier to remove a tap bar and interrupt between the center tap and the operating tap on the AC side of the rectifier.

Be aware of the drift of the type of interrupter used. For quartz crystal-controlled interrupters, if using a 1 or 2 second open, reset the interrupters every day. If using a 3 second open, reset them every other day.

Generally, the batteries in the interrupters last at least 2 days.

8.4 Proceed to each test station and measure an "on" potential and an "off" potential.

8.5 Remove the interrupters from the current sources.

9.0 Hydrogen Generation Under Coatings

- 9.1 On well-coated pipelines, hydrogen can be generated at polarized potentials above -1.2 V after considering IR drop and may disbond coatings in the area around holidays. Some coatings are more susceptible to damage than others.
- 9.2 When coating damage is discovered that involves blistering or severely disbanded coating centered on a small holiday, over-voltage shall be investigated.
- 9.3 All current sources shall be interrupted to determine the over-voltage potential at a given test station.
 - 9.3.1 For example, if shorted through a regulator station to a galvanic anode system, the "instant off" may be above -1.2 V and not have an over-voltage condition.

It is not uncommon to encounter an "instant off" potential more negative than -1.2 V since voltage gradients from other facilities or unknown current sources can affect the potentials measured when the target line CP systems are interrupted.

- 9.4 No current shall be applied that will increase the 'on' potential more negative than -3.00 V without performing an over-voltage investigation.

End of Instructions.

Operator Qualification (OQ) Required?

Yes.

- 0001: Measure Structure- to-Electrolyte Potential
- 0011: Conduct Close Interval Survey
- 0021: Measure Soil Resistivity
- 0031: Inspect and monitor Galvanic Ground Beds/Anodes
- 0041: Installation and Maintenance of Mechanical Electrical Connections
- 0051: Installation of Exothermic Electrical Connections
- 0061: Inspect or Test Cathodic Protection Bonds
- 0071: Inspect or Test Cathodic Electrical Isolation Devices
- 0081: Install Cathodic Protection Electrical Isolation Devices
- 0091: Troubleshoot In- Service Cathodic Protection System
- 0101: Inspect Rectifier and Obtain Readings

CORR 2.4 Corrosion Control: Cathodic Protection Criteria, October 1, 2020

Revision Notes

Location of Changes	Summary of Changes
Paragraph 4.1.2	Grammatical – "properly evaluating the measurement"
Appendix A – Measuring Cathodic Protection Potentials	3. C. – Spelling correction – half-cell 3. C. (2) – Grammatical – In case of dry soil, add water to the half-cell placement site 4. B. – Added – Figure 2. Copper Sulfate Reference Cell 4. B. – Added – For M.C. Miller Half-Cell

Appendix A - Measuring Cathodic Protection Potentials

1. General

- A. Adequate cathodic protection levels are required by 192 Subpart I section of the federal pipeline safety regulations and extend the life of pipeline assets.
- B. Tests are performed on steel pipeline systems to determine whether cathodic protection levels are adequate to mitigate external corrosion.

2. Measuring Cathodic Protection Potentials

- A. Cathodic protection potentials are measured with a direct current (DC) voltmeter and referenced to a copper/copper sulfate half-cell electrode.
- B. The voltmeter should be connected as follows:
 - (1) Negative (-) lead to the reference electrode.
 - (2) Positive (+) lead to the pipe or test lead.
- C. Measuring a pipe-to-soil (P/S) potential requires two connections, one to the pipe and one to the soil.
 - a. Both connections require meter test leads which are in good condition.
 - b. The connection to the pipe requires a good contact to clean metal. The connection to the soil requires a properly filled and maintained half-cell plus some moisture in the soil to complete the contact.
 - c. The soil surface also needs to clear of foreign materials and the half-cell should be placed as closely as possible to directly over the pipe.

UNCONTROLLED IF PRINTED

- d. There are some conditions that make this half-cell connection difficult. Some examples of these conditions are: frozen soil, dry soil, concrete, asphalt and landscaping materials.
- e. Measurements taken on any of these surfaces without special precautions may have errors in them.

3. *Procedures for Measuring Cathodic Protection Potentials*

A. *AC Voltage Sensing Device*

- (1) Ensure that the AC voltage sensing device is functioning properly.
- (2) Test structure for AC voltage prior to touching it.

B. *Digital Multimeter with Half-Cell*

- (1) Connect leads from voltmeter.
 - (a) Red lead to volt/ohm terminal.
 - (b) Black lead to common terminal.
- (2) Select VDC (volts DC) choice on voltmeter
- (3) Connect the clip end of the red lead to the pipe or structure to be tested.
- (4) Connect the clip end of the black lead to the half-cell.
- (5) Remove the orange protective cap from the reference electrode.
- (6) Place the porous plug of the electrode into moist soil.
- (7) Observe and record the reading to at least 2 decimal places.

C. Proper half-cell placement is critical to gathering high quality pipe to soil measurements in the field. Taking special precautions during the placement of the half-cell will minimize errors introduced at this connection point. Special precautions for obtaining P/S readings for:

(1) *Frozen soils*

Frozen soil does not allow the half-cell to make good contact with the soil and has very high resistance compared to unfrozen soil. During the times of year when there is frost (frozen soil) in the ground, it is often still possible to find frost free soil next to home or business foundations where good contact can be made with the half-cell. However, if frozen soil is encountered at any location where a pipe to soil is required, a hole must be made through the frozen soil and water added to the hole before the measurement is taken. If the top layer of soil is melted, but the soil still frozen underneath, a hole through the frozen soil and the addition of water is still required for taking pipe-to-soil measurements.

(2) *Dry soil*

In case of dry soil, add water to the half-cell placement site. It may be necessary to break a dry crust prior to adding water.

(3) *Asphalt*

Pipe-to-soil measurements cannot be taken on unbroken asphalt. If there are cracks with vegetation, this indicates that the crack is open to the soil below and the half-cell may be placed on the crack to obtain the measurement. Sometimes the addition of water to the crack will facilitate good contact between the half-cell and the soil below.

(4) **Concrete**

Pipe-to-soil measurements should not be taken on unbroken concrete. If there are cracks with vegetation, this indicates that the crack is open to the soil below and the half-cell may be placed on the crack to obtain the measurement. Sometimes the addition of water to the crack will facilitate good contact between the half-cell and the soil below. In extreme cases, a water saturated sponge may be used to facilitate half-cell contact with the concrete but in these cases it is recommended to contact the Corrosion Control Supervisor to determine if a more negative potential is required to allow for error that is often introduced by the alkalinity of the concrete.

(5) **Landscaping materials such as rock or bark**

These materials prevent good half-cell contact and there is often an isolating barrier of polyethylene sheet. To make good half-cell contact, the polyethylene barrier must be breached and the half-cell placed on soil.

4. **Equipment**

A. **Multimeter**

- (1) The Multimeter has a range of applications which include voltage, current, and resistance measurements.
- (2) Meter requirements
 - (a) Minimum of 10 mega ohm input resistance
 - (b) Measures AC and DC voltage
 - (c) Measures DC mV
 - (d) Measures resistance
 - (e) Ability to test diodes

Figure 1 -Typical Multimeter

(3) **Measurements**

Follow manufacturer's instructions for performing testing. Always use insulated probes and clips and check for AC prior to connecting.

(4) **Care and Maintenance**

- (a) Regularly inspect leads

- (b) Change battery
- (c) Consult manufacturer's instructions

B. Copper Sulfate Reference Electrode

Figure 2. Copper Sulfate Reference Cell

Item	Stock Code	
Complete Half-Cell	84 28 040	M.C. Miller RE-5
Porous Plug	19 15 859	For M.C. Miller Half-Cell
Copper Sulfate Crystals	31 53 202	For M.C. Miller Half-Cell
Anti-freeze	14 12 292	For M.C. Miller Half-Cell

- (1) The copper sulfate reference electrode as received contains no liquid. Blue copper sulfate crystals are in the plastic tube.
- (2) To prepare the electrode for use, remove plastic cap and copper rod.
 - (a) Fill the electrode tube to the top with distilled water.
 - (b) Replace copper rod assembly and tighten plastic cap firmly to effectively seal the tube.
Note: Avoid crystals on threaded portion of the tube.
 - (c) Shake electrode a few times to quickly obtain a saturated solution. Note: The solution will be blue and some excess copper sulfate crystals should be at the bottom of the tube.
 - (d) After initial filling, allow at least 5 minutes for the porous plug to become saturated before using the electrode.
- (3) The porous plug may leak a few drops of copper sulfate solution until pressure within the tube is equalized with atmospheric pressure. Leave the protective cap off for 2 hours after water has been added. Do not allow leakage, which is corrosive to many metals, to seep into the test equipment. Keep the protective cap on the porous plug when not in use.
- (4) There is also a stop leak anti-freeze gel that is available that could be substituted for the copper sulfate crystals and distilled water.
Warning: Copper sulfate is a POISON. It may be fatal if swallowed. Wash hands thoroughly after handling.
- (5) Low Temperature Precautions

If the temperature is below 32°F, the solution may freeze. If frozen, the internal resistance of the electrode becomes very high, and a correct reading is impossible. If frozen, the plastic tube or porous plug may split. It is recommended that

the cell be filled with antifreeze solution for copper sulfate electrodes during cold weather.

(6) Maintenance

- (a) Maintenance of the electrode consists of adding distilled water to make up for evaporation and ensuring there are excess crystals at the bottom of the tube. Always use high purity, finely divided copper sulfate crystals.
 - (b) After prolonged use, the copper sulfate solution may become contaminated, which causes measurement errors.
-
- Half-cells used sporadically throughout the year should be cleaned and refilled annually.
 - Half-cells used daily should be cleaned and refilled quarterly or when needed.
 - The copper sulfate solution may become cloudy with use. This does not mean the solution has become seriously contaminated.

NOTE:	<i>Use only high-purity finely divided copper sulfate crystals obtained from a reputable supplier such as MC Miller.</i>

CORR 2.5 CP System Troubleshooting

1.0 Purpose

The purpose of this document is to provide guidance in troubleshooting cathodic protection on the Ameren Illinois (AIC) pipeline system.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Information Needed to Maintain CP Systems](#)

[6.0 General Troubleshooting Steps](#)

[7.0 Equipment Needed](#)

[8.0 Structure Limit Verification](#)

[9.0 Performing Verification](#)

[10.0 Structure Size](#)

[11.0 Current Requirements](#)

[12.0 Current Requirement Calculation](#)

[13.0 Establishing Required Current](#)

[14.0 Current Interrupters](#)

3.0 Target Audience

- Corrosion Control Supervisors
- Corrosion Control Specialists

4.0 General

- 4.1 CP systems for distribution and transmission pipelines are unique electrical circuits with characteristics based on:
 - 4.1.1 Geometry
 - 4.1.2 Coating quality
 - 4.1.3 Soils
 - 4.1.4 Current source locations
- 4.2 This uniqueness defies simple specific troubleshooting approaches when problems are encountered.
- 4.3 This document contains general approaches that are applied to specific situations to determine the cause and corrective action for the problem.

5.0 Information Needed to Maintain CP Systems

UNCONTROLLED IF PRINTED

5.1 The following information is important in maintaining CP systems:

5.1.1 Type and condition of coating

5.1.2 Type of protection

5.1.3 Points of insulation:

1. Location of insulation and bond wires between protected systems.
2. Status of bond wires (open or closed).
3. Current interchanges where appropriate.
4. Location of any underground structure which crosses or closely parallels the protected system such as water mains, bare steel or cast iron gas mains, and metal culverts.

6.0 General Troubleshooting Steps

6.1 The following approach will work for most CP system problems:

6.1.1 Identify the structure limits.

6.1.2 Perform pipe-to-soil tests across the structure to develop a profile of the system.

6.1.3 Perform a current requirement test and compare to estimated current requirement.

6.1.4 If the current requirement test indicates more current is required than the structure should require, perform short finding investigation using appropriate locating equipment.

6.1.5 Initiate corrective action to eliminate the problem.

6.1.6 Retest the CP structure after the corrective actions are completed.

7.0 Equipment Needed

7.1 Most technicians will need the following items to perform routine cathodic protection troubleshooting and testing work:

7.1.1 Multimeter

Figure 1 Multimeter

7.1.2 AC voltage sensor

Figure 2 AC voltage sensor

- 7.1.3 Spare test leads
- 7.1.4 Insulated clips for the multimeter
- 7.1.5 30" extension rod for the half cell

Figure 3 Extension rod for the half cell - 30 inches

- 7.1.6 Field half cell
- 7.1.7 Low frequency locator
- 7.1.8 12-volt battery
- 7.1.9 Interrupter
- 7.1.10 Rheostat (some interrupters such as the T&R CS 10 combine the interrupter and rheostat)

Or

Figure 4 T&R CS-10 Power Supply with Rheostat

- 7.1.11 Wire leads to connect equipment
- 7.1.12 Pit gauge

Figure 5 Pit Gauge

- 7.1.13 Wire reel with 1500'-2000' of #22 wire (optional, recommended if available)
- 7.1.14 Wire reel with 300' of #18 wire
- 7.1.15 Maps of pipelines to be worked on
- 7.1.16 Basic hand tools that include wire cutters, small wrenches, pliers and screw drivers
- 7.1.17 Soil resistivity instrument

Figure 6 Soil resistivity instrument

- 7.1.18 Spare parts for rectifiers and bonds
- 7.1.19 Copper sulfate antifreeze
- 7.1.20 High-purity finely divided copper sulfate crystals (Stock Code 31 53 202)
- 7.1.21 Sandpaper
- 7.1.22 Wire brush
- 7.1.23 Spare battery style clips with insulating boots

8.0 Structure Limit Verification

- 8.1 A cathodic protection structure is the buried pipeline section which includes:
 - 8.1.1 Electrically continuous welded or bonded sections of pipeline.
 - 8.1.2 Isolated from unprotected structures or other structures not designated as a part of the intended structure.
 - 8.1.3 Pipe protected by either galvanic anodes and/or an impressed current system.

UNCONTROLLED IF PRINTED

Cathodic protection structures are established to provide a method for identifying, maintaining, and monitoring corrosion protection on sections of buried steel piping.

Verification of a structure is testing the continuity in piping to determine structure limits.

8.2 Perform verification to determine:

- 8.2.1 Limits of structures
- 8.2.2 Proper test point placement
- 8.2.3 Number of test points needed
- 8.2.4 If piping is monitored properly

8.3 Verify the structures when discrepancies are found or additional test points are required. Discrepancies include:

- 8.3.1 Services on a structure read substantially different.
- 8.3.2 Maps show insulators where structures indicate continuity.

9.0 Performing Verification

9.1 Use a current interrupter to apply current (or short-out system) and make spot checks along the main at test leads or services for shift in potential.

Potential shift at spot check locations should approximate potential shift at the interrupter. There will be some attenuation (lessening in magnitude) in the readings as the distance from the current source increases.

9.1.1 Document these readings and check all endpoints and insulation points.

9.1.2 Check the entire structure and follow-up on any differences with existing records.

1. A low frequency locator can also be used because the signal will fade at ends or insulators.
2. A short can be created at a meter set anywhere along the structure to draw the signal current to that point.
3. The signal can only go to the short if the pipe is continuous with the pipe where the transmitter is located.

9.1.3 Record:

1. The verification date.

2. Structure footage.
3. Make appropriate changes to maps.
4. Add test points as needed.

10.0 Structure Size

10.1 Distribution structures should be approximately 5,000 - 10,000 lineal feet.

Larger structures are acceptable if no problems are encountered.

10.2 Structures may be broken into smaller components when short location is impeded by structure size or existing piping loops.

10.3 If necessary, reduce structure size by insulating 1-¼ inch and 2 inch taps. On larger diameter mains, such as 4 inch or 6 inch, insulate as a last resort. Insulate electrically continuous loops when possible.

10.4 There is no limit on structure size on transmission or high pressure distribution mains.

11.0 Current Requirements

11.1 Current requirement testing is a diagnostic tool used to determine the amount of current necessary to bring a given structure from an unprotected level to a protected level.

11.2 A current requirement test can be used to determine if a structure is shorted. If applied current is more than calculated current, the system is either shorted or has significant coating problems. The most common cause for a high current requirement is a short.

11.3 Current requirement tests are also performed because coatings deteriorate and anodes deplete as systems age. If the current requirement is reasonable for the structure size, additional protection can be added and short investigating avoided. If the current requirement is too high for the structure, a short is indicated.

11.4 Perform current requirement tests when a structure has inadequate protection for reasons other than an obvious short.

11.4.1 For example, an obvious short may exist when the previous pipe-to-soil readings were -1.35 V and are now -0.68 V, (though this could be due to the anodes being cut off or a bond opened).

11.5 To perform a current requirement test, use a current interrupter and apply current until the pipe-to-soil measurements are raised to a protected level.

11.6 Make spot checks along the main at test leads or services for potential shift. The protection level should rise uniformly over the entire structure. There may be some attenuation away from the current source.

11.7 Record the amount of current flowing onto the structure, from the ammeter on the interrupter, or read the voltage drop on an in-line shunt.

11.8 Compare the reading to the calculated current for the structure. The Corrosion Worksheet can be used to calculate the current requirement. For the purpose of calculating the surface area, the structure footage may be scaled.

12.0 Current Requirement Calculation

12.1 Use the Corrosion Worksheet or a map to record the potentials and current level.

12.1.1 Current Estimates

1. Bare pipe requires a current of 1 mA/sqft. to 3mA/sqft. for protection.
2. New pipe, if the coating is 98% effective, 2% of pipe is bare and requires protection.
 - 2 a. Therefore, 2% of 1 mA/sqft. is 0.02mA/sqft. and should protect new pipe with good coating.
3. Existing pipe
 - 3 a. Coating on existing deteriorates as a result of moisture absorption or mechanical damage.
 - 3 b. Poorly coated service tees also affect the amount of bare metal to be protected.
 - 3 c. For example, if the coating 96% effective, 4% of pipe is bare and requires protection.
 - 3 d. Therefore, 4% of 1 mA/sqft is 0.04mA/sqft and should protect the existing pipe.

$$4. \text{ Surface Area} = \frac{\text{OD inches}}{12 \text{ inches}} \times \pi \times \text{length} \quad (\text{also, add all steel service surface area})$$

5. Surface area of the structure x 0.02mA = approximate current required for new structure.
6. A 17# anode provides approximately 15 mA to 30 mA of current per anode. See [Table 3](#).
7. Example:
 - 7 a. Example 1 - New Structure
 - (i) 2300' of 2" (scaled from map)
 - (ii) 3000' of 4" (scaled from map) of X-tru coated pipe
 - (iii) 105 sections of 3/4" steel service with an estimated average length of 60 ft.
 - (iv) .02 mA/sqft required to protect these sections of pipe.
 - (v) Current requirements as determined by field measurements is 142 mA.
 - (vi) See Table 1 for results

Table 1. Cathodic Protection current requirement for a new structure

Length	OD in Inches	OD in Feet	π	Surface Area - sq ft
Length X OD (in ft) X π = Surface Area

Current requirement from the field =				142
Number of 17# anodes in 3000 Ohm-cm soil = Total Current (mA)/30 mA per 17# anode=				4.73
Note: Use 5 Anodes				

13.0 Establishing Required Current

13.1 Current Testing Instructions

13.1.1 See Figure 7 for schematic of current test set up.

Figure 7 Schematic of Typical Current Application (See specific instructions for T&R CS 10 connections)

DO NOT apply current without using a rheostat.

13.1.2 Set interrupter cycle for X seconds on and Y seconds off. See [Figure 8](#).

Usually time on is longer than the time off.

Figure 8 Power Supply Interrupter Setting

13.1.3 The ground connection, shown in figure 7, may be a chain link fence, steel culvert, insulated down guy, galvanic anode, or driven (portable) ground.

13.1.4 #8 or heavier wire shall be used for current carrying test leads.

UNCONTROLLED IF PRINTED

Beware of "ground bed effect" when measuring potentials. (The soil potential near the current ground becomes more positive causing the pipeline to appear more negative than it actually is.)

13.1.5 After all the connections are made and voltmeter and half-cell are in place, reduce the circuit resistance with the rheostat.

13.1.6 Note potential and current rise.

1. When pipe-to-soil measurements reach -1.20 to -1.40 V, turn the interrupter on and take a pipe-to-soil measurement at least one block away in two directions noting voltage shift.

If the pipe-to-soil measurement was -1.15 V 'off' to -1.40 V 'on' at the point of application, voltage shift a block away may be approximately -1.15 V 'off' to -1.35 V 'on', provided there are no shorts and coating is good.

2. After these initial tests, leave the applied current on for a period of time to observe whether the pipe begins to polarize.

When the pipe polarizes, the pipe-to-soil measurements may increase and current requirement may drop.

3. If the pipe is shorted the pipe will not polarize.
4. If there are shorts, current required should be well above the maximum calculated current requirement.

The indicated current is a measure of how much current is to be added.

5. Divide the additional current requirement by the current output of one anode and determine the number of anodes to be added.

13.1.7 Anode outputs. See table 3.

Table 3 Anode current outputs

Soil Resistivity	17 Hi-Potential magnesium anode current output
Less than 9,000 ohm-cm	30 mA
9,000 to 15,000 ohm-cm	15 mA
over 15,000 ohm-cm	Contact Gas Technical Support

Typical Illinois soil will be less than 9,000 ohm-cm while sandy or rocky areas can be over 15,000 ohm-cm.

14.0 Current Interrupters

- 14.1 The ability to interrupt cathodic protection current is an important technique that is used in cathodic protection testing.
- 14.2 The current interrupter can be used individually or simultaneously with multiple synchronizable units to create an 'instant off' potential for the pipeline.
- 14.3 The interrupter is set to stop the flow of current momentarily and reconnect it at a pre-set interval. This allows a technician to verify that the potentials measured are on a particular structure and to minimize IR drop.
- 14.4 Current interrupters that can be synchronized are either quartz clock controlled or GPS controlled. See [Figure 9](#).

Most quartz clock interrupters drift about 1 second per 24 hours and will be out of sync after 48 hours.

Figure 9 GPS Controlled Current Interrupter

End of Instructions.

Operator Qualification (OQ) Required?

Yes.

- 0001: Measure Structure- to-Electrolyte Potential
- 0011: Conduct Close Interval Survey
- 0021: Measure Soil Resistivity
- 0031: Inspect and monitor Galvanic Ground Beds/Anodes
- 0041: Installation and Maintenance of Mechanical Electrical Connections
- 0051: Installation of Exothermic Electrical Connections

UNCONTROLLED IF PRINTED

0061: Inspect or Test Cathodic Protection Bonds

0071: Inspect or Test Cathodic Electrical Isolation Devices

0081: Install Cathodic Protection Electrical Isolation Devices

0091: Troubleshoot In- Service Cathodic Protection System

0101: Inspect Rectifier and Obtain Readings

0111: Maintain Rectifier

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Types of AC Interference](#)

[6.0 Investigating AC Voltages on Pipelines](#)

[7.0 Stray Current](#)

3.0 Target Audience

- Corrosion Control Supervisors
- Corrosion Control Specialists

4.0 General

4.1 AC Interference

- 4.1.1 When both gas and electric lines are in the same utility corridor there can be an induction of an AC voltage onto the pipeline or a short-term introduction of voltage and current caused by lightning or a ground fault.
- 4.1.2 Under certain conditions, the induced voltage can be a hazard to pipeline personnel and in the long term could lead to pipe corrosion if current densities are high.
- 4.1.3 Pipelines subject to significant induced AC voltages with high AC current densities must have a grounding system that will pass AC current to ground while maintaining the DC voltage of the cathodic protection system.
- 4.1.4 AC investigations should only be performed by or under the direction of a person trained and experienced in cathodic protection and the implications of AC voltage on pipeline facilities.

4.2 Stray Current

- 4.2.1 Stray current is any current induced on a pipeline from a foreign source. This may be caused at a pipeline crossing, near gas stations, tank farms or refineries with rectifiers or close to DC transit systems.
1. Whenever direct current is used in industrial or commercial processes, the current must flow from the generator to the process and back to the generator to complete the circuit and permit the current flow.
 2. If there is a pipeline near the return path of the current it is possible that it will serve as an additional path for the return of the current to the generator.

UNCONTROLLED IF PRINTED

3. No damage is done to the pipe where the current enters it, but at the point where the current leaves the pipe to return to the generator, that area is anodic and the pipe will corrode.
 - 3 a. Such areas are called "hot spots" or "positive areas" and current causing such corrosion is called 'stray current'.
 - 3 b. This current can be hundreds and thousands of times as great as current from local corrosion cells and corrosion can be very severe.
- 4.2.2 Stray current from foreign pipelines operating near our gas lines is the most common source of stray current.
- 4.2.3 Testing for stray DC current interference from CP systems is reasonably straight forward.
 1. An operator of the foreign pipeline should always be contacted prior to performing any tests to ensure no damage is done to their system.
 2. An automatic current interrupter may be installed in the output of the rectifier.
 3. The interrupter will cycle the unit on and off to show what affect the foreign pipeline has on our pipeline. See Figure 1 for typical current interrupted.

Figure 1 GPS Controlled Current Interrupter

4. Potential measurements should be taken at each pipeline crossing.

5.0 Types of AC Interference

5.1 Electrostatic or Capacitive Interference

- 5.1.1 This type of interference occurs in the immediate vicinity of the overhead power lines. The pipeline picks up a voltage relative to the soil, which is proportional to the voltage in the transmission line. This is usually observed during construction of the pipeline when the pipe is on skids prior to burial.

5.2 Resistive or Ohmic Interference

- 5.2.1 This occurs when lightning strikes an electric transmission structure, when the load at a 3-phase transformer bank is unbalanced, when a neutral is lost, or when there is a phase to ground fault. If a pipeline is located within this area, the AC potential of the pipeline can rise.

5.3 Electromagnetic or Inductive Interference

- 5.3.1 This occurs when there is extended and close parallel routing with three-phase high voltage AC transmission lines.
 1. The induced voltage is due to any phase imbalance in the lines.

UNCONTROLLED IF PRINTED

2. The likelihood of interference increases with rising operating currents in the overhead lines, with increasing quality of the coating on the pipeline, and with the length of line parallel to and close to the high voltage AC (HVAC) transmission lines.
 3. Voltage is induced in the pipeline by magnetic coupling with the high-voltage lines, and results in current flowing in the pipeline. This current results in a voltage difference between the pipeline and the surrounding soil.
 4. Voltages tend to be the highest where the pipeline enters and leaves the electric transmission right of way (ROW).
- 5.3.2 When a long-term induced AC voltage exists on the pipeline resulting from long sections of the two lines in parallel, it may not be safe to touch the pipeline or appurtenances.
1. This "contact" voltage, or the difference between the line and the earth, can cause AC current to flow to ground through a person touching the line.

When a metal structure, such as a pipeline, is under the influence of electrical fields and a person touches it, current can pass through their body to the earth because the person becomes the shortest path to ground.

2. The amount of that current depends upon the electrical resistance through their body and resistance to earth.

6.0 Investigating AC Voltages on Pipelines

6.1 Although each situation will be unique, general pre-planning should include the following:

6.1.1 Notifications

1. Depending on the situation, notification may be needed to the following:
 - 1 a. The local land owner.
 - 1 b. The local gas operations supervision.
 - 1 c. The local electric operations supervision (if the investigative work will involve the electric facilities).
 - 1 d. Other pipeline facility owners (if their facilities will be involved).
 - 1 e. Other gas crews working in the same area.

6.1.2 Safety Precautions

1. Use proper gloving (voltages over 50 volts AC).
2. Use AC sensing device. See [Figure 2](#) for typical device.
3. Use required PPE.

Treat every line as though it were electrically charged until proven otherwise and wear the protective gear!

UNCONTROLLED IF PRINTED

Figure 2 AC voltage sensor

6.2 Gathering Information

6.2.1 Information gathering is the most important step in investigating an AC problem. The desired information for the investigation can be summarized as follows:

1. The physical locations of pipeline and transmission line routes are needed as well as accurate distances.
2. Top view scale drawing or map of the entire geographical area of interest, showing all conductors (pipelines) under study in sufficient details, along with major installations which could provide grounding.
3. Electric transmission line and pipeline details:
 - 3 a. Diameters of all pipelines that are in the vicinity or crossing the electric transmission line ROW.
 - 3 b. Pipelines running parallel to the existing or proposed transmission lines.
 - 3 c. Pipeline coating quality.
 - 3 d. The resistivity of the earth along the pipeline.
 - 3 e. Depth of pipelines.
 - 3 f. Transmission line tower configuration, height, and horizontal separation between all parallel conductors.
 - 3 g. Distance of the pipeline from the center of the electric line path.
 - 3 h. Electric transmission voltages and current flows.

6.3 Select the proper tools

6.3.1 The selection of the proper tool depends on the situation needed. Various tools used throughout the industry (not an all-inclusive list):

1. Multi-meter - used to take DC and AC voltage readings off of target pipe.
2. Data logger - used to log variances in voltage or current flow from target pipe. (Ameren typically uses a Elecsys Watchdog set in data logger mode.)
3. Portable AC non-contact ammeter. See Figure 3.

UNCONTROLLED IF PRINTED

Figure 3 Typical non-contact ammeter.

4. Soil resistivity tool. See Figure 4.

Figure 4 Soil resistivity instrument

6.4 Conduct the Investigation

6.4.1 A thorough information gathering process will usually reveal the necessary clues to effectively narrow down the possible causes of the source of an AC problem.

1. For example, starting at the target pipe entrance and exit perform a few simple measurements using one or more of the above-mentioned tools.
2. This can help determine the probable cause of the problem and determine the primary type of interference involved.
3. Assumptions made when conducting an evaluation should be made based on the information gathered previously.

6.4.2 It is also important that information, such as the bonding of the transmission pipeline to distribution systems, location of insulating flanges and the proximity of neutrals and wiring grounds are documented.

6.5 Analyze the Data and Locate the Source

6.5.1 After completing the investigation, assemble the data and look for patterns.

6.5.2 Even if the source is determined during an investigation, taking some time to review the data to learn more about the problem will lead to possible solutions.

UNCONTROLLED IF PRINTED

6.6 Select a Solution

6.6.1 Consider the following:

1. Facility's operations
2. Electromagnetic environment
3. Operation of the affected equipment

6.6.2 Evaluate the

1. Safety
2. Cost
3. Installation
4. Maintenance
5. Aesthetics
6. Performance record of each possible solution

6.6.3 Review the chosen solution with involved individuals before procurement of materials and installation to ensure that any effects on facility operations and equipment performance are known and kept to a minimum.

6.6.4 The most common solutions to AC problems include:

1. Shields
2. Filters
3. Anodes
4. Enhanced grounding techniques.

6.6.5 Possible solutions to protect the pipeline include:

1. Galvanic Anodes
 - 1 a. The use of galvanic anodes is a cost effective and practical means to address AC interference on a target line.
 - 1 b. Install banks of anodes where voltages are highest to safely ground the pipeline.
2. Solid State Decouplers (SSD)
 - 2 a. The SSD is a solid-state device designed to simultaneously provide DC decoupling and AC continuity/grounding when used with cathodically protected structures, such as pipelines, tanks and grounding systems. See [Figure 5](#).
 - (i) Use a MTF to attach the SSD to the flange. See [Figure 6](#).

Figure 5 Decoupling Device (Stock Code 40 89 716)

Figure 6 MTF SSD Mounting Kit.

- 2 b. The SSD is used for:
 - (i) insulated joint protection
 - (ii) AC mitigation
 - (iii) DC isolation/AC grounding of electrical equipment on pipelines and tanks.
3. Bare Copper Cables for AC mitigation.
 - 3 a. Advances in interference control have resulted in the gradient control wire method.
 - 3 b. This method consists of one or more bare copper cables buried parallel to and near the pipeline and regularly connected to it through decoupling device(s).

UNCONTROLLED IF PRINTED

- 3 c. Gradient control wires used in this way is very effective in mitigating excessive pipeline potentials due to both inductive and conductive interference.
- 3 d. For inductive interference, gradient control wires provide additional grounding for the pipeline and decrease the induced pipe potential rise. At the same time, they raise local ground potentials, thus sharply reducing touch potentials and coating stress voltages.
- 3 e. For conductive interference, gradient control wires dampen the soil potential rise close to the pipe while raising pipe potentials, thus providing reduced touch voltages and decreasing coating stress voltages. See Figure 7.

Figure 7 Copper Cables Used for AC mitigation

- 3 f. Bare copper cables can be used when overhead high voltage transmission lines share a corridor with an underground pipeline.
- 3 g. Bare copper cables, buried parallel to a pipeline and regularly connected to it through decoupling device(s), are effective in mitigating pipeline potentials due to inductive and conductive interference.

6.7 Verify Solution Performance

- 6.7.1 Follow up verification shall take place after the solution has been implemented and facility operations have returned to normal.
- 6.7.2 Watch the performance of the installed solution and repeat emissions measurements at the affected equipment. Document procedures, equipment installation, and performance results as required.

- 1. All information found in these guidelines should only be considered as guiding principles as to what could be done when power lines interact with metallic buried pipelines.
- 2. It is assumed that individuals performing such test have received proper cathodic protection training.

7.0 Stray Current

UNCONTROLLED IF PRINTED

7.1 When to test

- 7.1.1 Perform testing when a low potential is observed at a pipeline crossing, near gas stations, tank farms, or refineries with rectifiers, DC transit systems, coal mines, or when rectifier installations are discovered near AIC facilities. Low or high potentials can indicate the presence of stray current

7.2 Tests to Perform

- 7.2.1 Take potentials along the Ameren pipeline at 5 feet or 10 feet intervals (close interval survey) from the crossing in both directions and document the measurements. If the lowest potential is at the crossing and other potentials increase as the distance from the crossing increases, stray current is suspected.
- 7.2.2 Call the foreign operator and arrange to interrupt the nearby rectifiers.
- 7.2.3 When interrupting foreign rectifiers, note the AIC potential at the crossing. If the potential returns to normal during the "off" cycle, interference is verified.
- 7.2.4 A permanent bond can be installed to restore the AIC 'on' potential to the level noted during the 'off' cycle of the foreign rectifier.
 1. The bond connects the AIC system and the foreign system together allowing the current picked up by Ameren to return through the bond wires.
 2. The foreign company may want to limit the current draw from their system by installing resistance in the bond. This installation becomes a critical bond and must be monitored every 2 months not to exceed 2 ½ months.
- 7.2.5 Other corrective measures may include installing galvanic anodes or reducing output of the interfering rectifier.

7.3 Other Situations Involving Rectifiers

- 7.3.1 Survey the affected area to find the pickup and discharge points.
- 7.3.2 Call the foreign operator and arrange to interrupt the nearby rectifiers.
- 7.3.3 When interrupting foreign rectifiers, note the AIC potential at the location of the lowest potential. If the potential returns to normal during the 'off' cycle, interference is verified.
- 7.3.4 If a bond is installed, return the AIC 'on' potential to the level noted during the 'off' cycle of the foreign rectifier.
- 7.3.5 Other corrective measures may include installing galvanic anodes or reducing output of the interfering rectifier.

7.4 Transit Systems, Coal Mines, Telluric Currents

- 7.4.1 Perform 24-hour data recording at sites with suspected interference.
- 7.4.2 Solutions depend upon the situation and may include:
 1. Auto potential rectifiers
 2. Current shields
 3. Bonds
 4. Galvanic anode beds

End of Instructions.

CORR 2.7 Short Investigation and Clearing Shorted Pipelines

1.0 Purpose

The purpose of this procedure to provide guidance in investigating, locating, and eliminating electrical shorts which cause low cathodic potentials on structures.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Localizing the Shorted Area](#)[6.0 Null Method](#)[7.0 Peak Method](#)[8.0 Parallel Mains](#)[9.0 Shorting Locating Tips](#)[10.0 Casings](#)[11.0 Isolated Services](#)[12.0 Clearing Shorted Pipelines](#)

Appendices:

[Appendix A - Short Detection Diagrams](#)[Appendix B - Cased Crossing Monitoring](#)[Appendix C - Equipment](#)

3.0 Target Audience

- Corrosion Control Supervisors
- Corrosion Control Specialists

4.0 General

4.1 A common cause of low potentials on cathodically protected gas distribution systems is a "short".

4.1.1 A short is an undesirable contact or connection to an unprotected structure.

4.1.2 Contacts or shorts overburden the protection system, causing increased current output and lower potentials.

4.1.3 Change in resistance results in most protective current being diverted to the unprotected structure, causing the intended structure to be inadequately protected.

4.2 Shorts are frequently caused by one or more of the following:

4.2.1 Direct contact with services and/or mains at underground crossings with an unprotected structure.

UNCONTROLLED IF PRINTED

4.2.2 Regulator vent lines contacting:

1. Aluminum siding
2. Termite shields
3. Inside piping
4. Furnace ducts
5. Electric conduit on inside meter sets

4.2.3 Shorted flange installations on large meter sets through bolts, gaskets, control lines and bypass lines.

4.2.4 Shorted or omitted insulators at service risers.

4.2.5 Shorted flange installations below grade between structures and unprotected mains or services.

4.2.6 Foreign utility's grounding to Ameren Illinois' gas facilities.

4.3 Reasons for low potentials other than shorts include:

4.3.1 Additional pipe being added without additional protection.

4.3.2 Anode depletion or loss of anode connection(s).

4.3.3 Rectifier malfunctions.

4.3.4 Interference current discharge area.

4.3.5 Anode output down due to unusually dry conditions.

4.3.6 High resistance soil.

4.3.7 High resistance in the measuring circuit caused by the half-cell, or dry soil.

4.3.8 Deteriorated or damaged coating.

4.4 Personnel should be able to determine whether shorts are present by taking sample readings throughout a system.

4.4.1 Drastic drops do not usually occur at or near a particular test point on a shorted galvanic anode structure.

4.4.2 Checking the history of a particular structure on a galvanic anode system will also help determine whether a shorted condition exists.

1. For instance, if a structure was reading in the -1,200 mV range last year and the annual survey indicates readings from the -600 through -850 mV range this year, experience will show that on a galvanic anode system, a shorted condition exists unless bond wires to another source of current has been broken.

4.4.3 On a rectified system, pipe-to-soil measurements may drop more drastically at or near a foreign contact or stray current situation but may recover to some extent past the problem area.

5.0 Localizing the Shorted Area

5.1 Applied Current

5.1.1 Applied current can be used to locate the vicinity of the short by taking pipe-to-soil measurements throughout the system while interrupted current is applied.

1. Areas near the short should show low shift between 'on' and 'off'.
2. The difference between "on" and "off" potentials is called delta voltage.
3. For example, if the 'off' reading is -1.15 V and the 'on' reading is -1.40 V, delta V is 0.25 V. Delta V will decrease near a short. Current attenuation also causes a gradual decrease in delta V as the distance from the current source increases.

5.2 Open Bonds

5.2.1 Another method to localize the shorted area is to open any bond on the structure and take a pipe-to-soil measurement on each side of the insulator.

1. If the pipe-to-soil measurement on one side is higher and the other side is lower than the initial structure pipe-to-soil measurement, the short is probably located on the structure with the lower pipe-to-soil measurement.

5.3 Check Insulation Integrity

5.3.1 Applied interrupted current can also be used to check insulation integrity between structures.

1. If the insulation is good, there should be good voltage shift on the current applied side, and little or no shift on the opposite side.
2. With poor insulation, the voltage shift will be noted on both sides of the insulation.

5.4 Equipment

5.4.1 Several instruments can be used to locate contacts between protected and unprotected facilities. See [Appendix C](#).

Do not use a pipe and cable locator which has an "inductive" mode of operation.

Best results are obtained with outputs in the audio range below 800 cycles per second (CPS).

5.4.2 The basic short locator consists of the following:

1. Transmitter (See [Appendix C-2](#))
 - 1 a. The transmitter must have direct connection to the pipe and a good ground to function.
 - 1 b. In order for maximum signal to be applied the transmitter settings are used to match load (structure) impedance.
2. Receiver (See [Appendix C-2](#))
 - 2 a. The receiver is equipped with search coil, resonate filters, amplifier with speaker, output jack for head set, and a gain control.
3. Head phones (optional)

5.5 Tracing with the Locator

UNCONTROLLED IF PRINTED

5.5.1 The operating principle of the short locator is based on the signal, an audio electric current, seeking the least resistant path to ground.

1. The signal strength is dependent on the amount of bare metal allowing the current to return to ground.
2. Some signal may be lost through coating holidays and at anodes, but generally it is not enough to interfere with short location.
3. Normally, the signal should leave coated pipe at a short.

5.6 Instrument Connection

5.6.1 Proper instrument connection is essential to good short location, instrument performance, and instrument care.

5.6.2 Take the following precautions for both safety and instrument care:

1. Be sure of polarity when making connections to an external battery.

Improper polarity will damage the transmitter.

The output leads may cause shock if the transmitter is on and both leads are held by the operator, or if one lead is held and the operator is well grounded.

The pipe and/or ground leads can produce arcing if connected or disconnected with the transmitter on.

2. Always ensure the transmitter is off when connecting or disconnecting the leads.
3. Selection of a ground is important.
 - 3 a. Do not use water systems or anything connected to the AC ground system.
 - 3 b. Use:

Use caution when making connections in enclosed areas such as regulator pits and meter houses.

- (i) Chain link fences
- (ii) Steel culverts
- (iii) Steel basement window wells
- (iv) Galvanic anode banks,

UNCONTROLLED IF PRINTED

- (v) Utility pole down guys that are insulated from the AC ground system
- (vi) Other cathodic protection structure for grounds.

5.7 Adjusting the Instrument

- 5.7.1 After connections are made, turn the transmitter on and adjust output. Low output can be caused by:
1. Poor ground
 2. Poor connections at pipe or ground
 3. Weak battery
 4. Small isolated structure

If the gain is turned too high on the receiver, it may be impossible to note when a null occurs, particularly on small diameter pipe.

- 5.7.2 With the transmitter properly adjusted and receiver tuned to receive a signal level of from 60% to 80%, trace the line by denoting the null. See [Section 6.0](#) and [Appendix A-1.1](#).

6.0 Null Method

- 6.1 Trace the pipe by nulling out with the receiver.
- 6.1.1 The null should occur when the receiver is directly above the pipe, and no signal is heard. See [Appendix A-1.1](#).
- 6.1.2 Often a null over a bare line can be distinguished from a null over a coated line.
- 6.1.3 Generally, signal over a coated line is sharp and distinct; whereas, signal over a bare line is flat and mushy with signal strength rapidly diminishing.
- 6.2 At a tee, such as the service tee shown in [Appendix A-1.1](#), signal should drop abruptly beyond it.
- 6.2.1 From the point of signal loss, go back 4 feet or 5 feet and begin a 360° trace around the point, noting where nulls occur.
- 6.2.2 The best or sharpest nulls should be noticed over the connected service, and over the piece of main toward the short. See [Appendix A-1.1](#).
- 6.2.3 If the system is a closed loop, signal can travel in each direction with equal intensity.
- 6.3 After determining which direction the signal is traveling, walk the main until reaching a point or area of signal disturbance. If there is a water line, or another bare structure between the line traced and the receiver, signal reception will be poor.
- 6.4 As the main is being traced, cross it periodically, noting if the null location is where it should be relative to the gas main location.
- 6.4.1 When a gas and water line are on the same side of the street and relatively close, it is possible to go past a point of signal transfer at a short.
- 6.4.2 The closer the mains lie, the more difficult it is to locate the short.

- 6.5 From the point of signal disturbance, go back until a clear signal is again received. Make a 360° trace around the point, and note where nulls occur. The figure in [Appendix A-1.2](#) shows a water service shorted to the gas main. The signal may go either toward the building and/or toward the water main via the water service.

Signal will not always cross over to the water main. Many times, it will go toward the house, and sometimes in both directions.

- 6.6 After determining where the contact is, move the transmitter to the other side of the short.
- 6.6.1 If the conclusions are the same after tracing back from the opposite direction, the short has been proven.
- 6.6.2 Dig up the short and make necessary corrections.
- 6.7 Do not assume a water service is shorted because it can be traced with the short locator.
- 6.7.1 It is possible to have an excellent signal on the water service, with no underground contact.
- 6.7.2 In such cases, the actual short may be at the meter installation.
- 6.7.3 Note, in the figure in [Appendix A-1.3](#), that the signal goes through the shorted meter set, through the hot water heater, and into the water system.
- 6.7.4 Gas services are usually not detectable unless shorted.
- 6.7.5 A service at or near the end of a main can be detected if there is an anode on the riser.
- 6.7.6 Signal on the service is lost as soon as the anode is disconnected.

Notice that in this case the water service can be picked up before the gas, showing the necessity of determining whether signal goes beyond the water service.

- 6.8 There are several ways a gas service can be shorted other than through or bypassing insulation. To verify the short is at the insulation, trace the signal up to and through the meter. If the signal cannot be traced, the service may be shorted due to the following:
- 6.8.1 Underground contact to water service.
- 6.8.2 Underground contact to water main or another bare structure.
- 6.8.3 Underground contact to television antenna tower footing.
- 6.8.4 Underground contact to building electric ground.

7.0 Peak Method

- 7.1 In the peak method, the transmitter is set up in the same way as the null method.
- 7.1.1 Position the receiver with the antenna upright and parallel to the pipe or set the receiver to peak mode.

- 7.1.2 The loudest signal should be heard when the receiver is directly over the pipe.
- 7.2 Walk the main 50 feet to 100 feet. in each direction from the transmitter connection to determine the signal strength (loudest tone). See [Appendix A-2.1](#).
- 7.3 Walk the main in the direction of the strongest signal.
 - 7.3.1 The signal will drop when the receiver is taken past the short.
 - 7.3.2 When the tone drops sharply, circle the area to find new direction on the signal.
- 7.4 In figure in [Appendix A-2.2](#), the signal peaks sharply until the point of contact is passed indicating a possible contact.
 - 7.4.1 The null method may be used to pinpoint the point of contact.
 - 7.4.2 In this case the signal may go to the water main or the house.
- 7.5 In [Appendix A-2.3](#), the gas service is traced to the house, which usually indicates a failed insulator at the meter set.

Signal will not always cross over to the water main. Many times, it will go toward the house, and sometimes in both directions.

In [Appendix A-2.3](#) the water service can be picked up before the gas, showing the necessity of determining whether signal goes beyond the water.

8.0 Parallel Mains

- 8.1 In this context, parallel mains are on the same side of a street, separated by a few inches to a few feet.
- 8.2 The closer the two pipelines are, the more difficult it is to locate a short between them.
 - 8.2.1 The best way to locate such shorts is to find the general area of the short by using interrupted supplied current then set up the short locator in the area and move across the pipeline.
 - 8.2.2 Nulling should be done carefully.
 - 8.2.3 Hold the receiver level during lateral movement to ensure precise location.
- 8.3 When trying to locate shorts between parallel mains, a null may be detected at the contact point.
 - 8.3.1 There may only be a change in the tone of the receiver or a difference in the null over the line.
 - 8.3.2 The positive indication to look for is an offset in the line by carefully tracing and marking the location.
 - 8.3.3 The line may be 6 inches or more to the left or right.
 - 8.3.4 When an offset is found, hold the receiver so that the coil is between the traced lines.

8.3.5 Move across the pipeline between them until a null is found at the cross-over; this is where to dig.

8.4 As a final check, set up the transmitter using the foreign structure suspected to be in contact with the pipe for the ground.

8.4.1 The signal should go out and come back to the transmitter.

8.4.2 Dig 1 to 2 feet beyond where the signal changes direction.

9.0 Shorting Locating Tips

9.1 If the locator is near a short, it is possible to push a signal through it. Moving the transmitter farther away may make a difference.

9.2 At 90° elbows, a null may be detected along an imaginary line bisecting the elbow. The signal strength determines how far the null can be traced.

9.3 At crosses, a signal can cancel itself out and may not be detected in any direction. In such cases, it may be necessary to move beyond the cross a few feet to again detect signal, or change the location of the transmitter.

9.4 In large, complex systems, it may be necessary to make several set ups throughout the system before a short is found.

9.5 Rarely more than one short at a time can be found in a specific system. It is best to clear the first short, recheck, and search for others.

9.6 If possible, always verify a short from 2 directions.

10.0 Casings

10.1 Refer to [Figure 1](#) for the most common casing to carrier pipe shorts.

10.2 Refer to [Appendix B](#) for typical casing installation and monitoring

10.3 If a casing is full of water and does not have a metal to metal short, the pipeline's CP system passes current through the casing wall and through the water to provide cathodic protection.

When a casing has a metal to metal short, the casing shields the pipeline inside from the protective CP current leaving the pipe inside the casing unprotected.

10.4 Testing

10.4.1 The most common method of testing casings is by comparing the pipe to soil potential of the carrier pipe and the casing-to-soil potential of the casing pipe in the same soil taken with the half cell at the same spot.

1. Perform additional tests if the difference in the potentials is less than 25 mV (0.025 V).

10.4.2 If a pipe-to-soil measurement remote to the casing is used for the comparison, perform additional tests if the difference in the potentials is less than 200 mV (0.200 V).

Figure 1 Common Shorts Found on Casings

10.5 Casing Short Tests

10.5.1 To verify whether a casing that fails the P/S and C/S potential comparison is actually shorted. Use the Reverse Current Method.

1. This method can be used to readily check the presence of an electrical short.
 - 1 a. The carrier pipe-to-casing potential is measured while increasing the reverse current to the casing.

Reverse current is accomplished by applying current to the carrier pipe while using the casing for ground.

- 1 b. If there is electrical isolation, the casing potential can be driven more positive while the carrier pipe becomes more negative.
- 1 c. Measuring the potential between the carrier pipe and casing will reflect an increase in the potential difference as current flow is increased.
- 1 d. If a low resistance short is present, increased current will not change the potential difference.
- 1 e. Casing condition can also be checked by observing the pipe-to soil potential of the carrier pipe to the pipe-to-soil potential of the casing as current is applied and increased.
- 1 f. If the casing is clear, the carrier pipe will become more negative and the casing will become more positive.
- 1 g. If there is a short, the potentials will either stay the same or both go the same direction.

10.5.2 Location of Short

1. Once a short has been determined, it may be possible to determine the approximate location of the contact with a T&R locator. See [Appendix C-2](#).

UNCONTROLLED IF PRINTED

- 1 a. Clip the transmitter's pipe lead to the test lead and the transmitter's ground lead to a reel of test wire and clip to the casing vent.
- 1 b. With the transmitter output set to 2.5, turn the transmitter on and trace signal around the casing with the receiver.
 - (i) If the signal goes to the opposite end and then quickly fades, the short may be at that end.
 - (ii) If no signal can be traced except at the end with the equipment hook up, that may be the location of the short.
 - (iii) These two situations can be checked by moving the equipment to the opposite end and checking to see whether the signal fades at about the same place.
 - (iv) On casings with only one test lead, it is NOT possible to perform the previous test.
 - (v) Use of the T&R locator in this manner does not guarantee the exact short location. It is intended to provide a means of determining which end should be excavated first.
 - (vi) If the signal fades in the middle, excavate each end and inspect for contact.

10.5.3 Clearing a Shorted Casing

1. Use the following alternatives to clear a shorted casing:
 - 1 a. If possible, remove the casing.
 - 1 b. Abandon casing and reroute with approved piping.
 - 1 c. Excavate the casing ends
 - (i) Clear shorts between casing vents and carrier pipe.
 - (ii) Remove the test leads shorted to casing.
 - (iii) Install vents as necessary.
 - (iv) Install new end seals only after the carrier pipe is centered.
 - (v) If end seals will not fit, install FRP insulators and seal the end of the casing with wax tape.
 - (vi) Install test leads as necessary.
 - (vii) As a last resort, fill casing with dielectric casing filler.

11.0 Isolated Services

- 11.1 If the cathodic protection level is unsatisfactory (less than -0.85 V pipe-to-soil) on isolated services, a current requirement test can be performed to determine whether an additional anode will correct the protection level.

Figure 2

If Customer's Fuel Line Is grounded

Figure 3

If Customer's Fuel Line Is Not Grounded

11.2 Instructions

- 11.2.1 Attach clip to fuel line side of insulated meter valve to check house piping with potential meter. If any reading is indicated, the house piping is probably sufficiently grounded.
- 11.2.2 Attach potential meter clip to gas service side of meter valve insulator.
- 11.2.3 Attach negative current source clip to gas service side of meter valve.
- 11.2.4 Turn on batteries to current source (see [Appendix C-5](#)) and touch house piping on opposite side of the insulator with positive side of the current source, while reading pipe-to-soil potential.

UNCONTROLLED IF PRINTED

- 11.2.5 If protection level increases to satisfactory level (typically 1.6V or greater) an anode may be installed to reestablish cathodic protection.
- 11.2.6 If protection level does not increase, repeat with current source in contact with an electric ground.
- 11.2.7 If protection level still does not increase, investigate for a bad insulator or underground short. (The addition of an anode will NOT raise protection level if shorted.)
- 11.2.8 Verify if a service is actually isolated or part of a deficient structure.
- 11.2.9 Limited tests can be run at any test lead provided a good ground is available. Current spread will approximate that of an anode. Little or no raise in protection level should occur if the structure is shorted.

A current source may be created using a 1.5 V battery in series with a 1000 ohm resistor to test risers and a 1.5 V battery with a 100 ohm resistor may be used for isolated steel services. Connect the negative lead to the pipe and the positive lead to a ground. A Tinkor & Razor CS-1 may also be used ([Appendix C-5](#)).

12.0 Clearing Shorted Pipelines

- 12.1 Electrical shorts occur when a foreign metallic structure and a steel pipeline are in contact with each other. Pre-shaped insulators, such as fiberglass-reinforced plastic (FRP) insulators or FRP insulator squares, I-Rods, or NuBolts can be used to prevent or separate and electrically isolate mains and service lines from other unprotected structures.

Do not use items such as wood, rubber tires, or split PE pipe to insulate pipelines from other metallic structures.

- 12.2 For above grade applications, I-Rod spacers, [Subsection 12.6](#), or Nu-Bolt, [Subsection 12.7](#), should be used as the preferred method of pipe support insulation. However if I-Rod spacers or Nu-Bolts will not work for the application, then FRP spacers may be used instead.

I-Rod spacers, Nu-Bolt and FRP spacers are also used to prevent or minimize atmospheric corrosion on pipe installed on pipe supports. [CORR 1 Paragraph 15.3.4](#)

12.3 Insulator Squares

- 12.3.1 Insulator squares are FRP sheets which can be used for miscellaneous short clearing applications. See Figure 4.

Figure 4: 6 inch x 6 inch Insulator Square (Stock Number 25 59 128)

12.4 Preformed FRP Spacers - Type 120 - Stocked

12.4.1 For preventing or correcting electrical shorts, caused by contact between steel pipes, use Type 120 FRP Spacers (refer to [Figure 5](#)). Spacers are 12" in length. See stock codes in [Table 1](#) for pipe sizes 2 inch to 12 inch. For sizes over 12 inch contact Gas Operations Support for purchasing assistance.

12.4.2 Installation:

1. Install insulator by placing on the pipe such that contact with the foreign line is eliminated. The insulator should be taped in place to prevent shifting during backfilling of the excavation. See [Figure 5](#).
2. If an FRP insulator is installed on a pipe support for above grade piping operating at over 60 psig and larger than 4 inch diameter, install the FRP insulator between pipe support(s) and the pipe as follows:
 - 2 a. The FRP should be cut to the approximate width of the saddle.
 - 2 b. Coat the FRP with Protal, see [CORR 2.3](#), ensuring 100% coverage prior to being adhered to the pipe.
 - 2 c. Adhere and press the FRP spacer against the pipe.
 - 2 d. Wipe off excess Protal and smooth out around the edges of the FRP to create a clean transition.
 - 2 e. Install pipe support under the FRP before the Protal cures.
 - 2 f. The FRP may be coated or painted with any approved method in [CORR 2.3](#).

Figure 5 Spacer Installation

FRP Type 120 Pipe Size (inch)	Stock No.
2	49 62 008
3	49 62 009
4	49 62 010
6	49 62 011
8	49 62 012

12	49 62 014

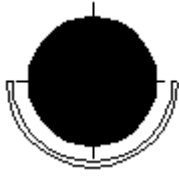

Table 1 Type 120 FRP Spacers

12.5 FRP Insulators - Non-stock

12.5.1 These other types of FRP insulators for specific applications are available. Contact Gas Operations Support for purchasing assistance. Refer to Table 2.

Table 2 FRP Insulator Specific Application

	Type FRP Insulator	Application
	FPR Roll-on Shields Type 240	At hanger and support of overhead and pylon-supported pipes (Non-stock coded)

	<p>FRP Casing Insulators Type 220 & 240</p>	<p>Casing Insulator (Non-stock coded)</p>
	<p>FRP Pipe Saddles Type 180</p>	<p>Overhead hangers and supports (Non-stock coded)</p>

12.6 I-Rod Clips

12.6.1 I-Rod Clips are half cylinder spacers, designed to fit over the surface of a pipe support. They are designed to stick on new or existing cradle and clamp style pipe supports.

1. An adhesive strip on the bottom side, along with the weight of the pipe, holds the clip in place on the support. This effectively eliminates contact between the two metallic surfaces of the pipe and support.

Figure 6: I-Rod Clip

12.6.2 Installation:

1. Choose the correct clip for the application.
 - 1 a. Each clip can support 4,000 lbs.
 - 1 b. Standard clips are rated for up to 180°F, while the High Temperature (HT) clips can be used for applications up to 340°F.
 - 1 c. Ensure the notch length of the clip is sufficient for the width of the pipe supports surface.
2. Determine how many clips will be required.

Table 3: I-Rod Clips Required

Nominal Pipe Size (IN)	No. Clips Required (Cradle)	No. Clips Required (Clamp)
4	2	4
6	2	6
8	4	8
10	4	8
12	4	8
14	4	8
16	6	10
18	6	10
20	6	10
24	6	12
28	8	14
30	8	16

3. Clean the pipe support surface if using double sided tape on the bottom of the I-Rod clips .
4. Install the correct number of clips on the support in an approximate evenly spaced arrangement .

12.6.3 I-Rod Stock Codes

Stock Code	Descriptions	Use
49 62 053	3-1/2" Long with Adhesive Strip	2-1/2" – 12" Pipe Supports
49 62 054	1" x 5' Long Strip	Cut to Lengths Needed

12.7 Nu-Bolts

12.7.1 Nu-Bolts are a combination of a half cylinder spacer, with a polyshrink coated U-bolt. These fittings can be used to secure pipe on flat surface pipe supports.

Figure 7: Nu-Bolts

12.7.2 Installation:

1. Use the correct size:
 - 1 a. Diameter of I-Rod (three sizes available)
 - (i) 3/4" – No maximum loading information available. (Recommended to use either 1" or 1-1/2")
 - (ii) 1" – The maximum loading for each rod is 8,000 lbs.
 - (iii) 1-1/2" – The maximum loading for each rod is 10,000 lbs.
 - 1 b. Width of U-Bolt.
2. Use the correct I-Rod material:
 - 2 a. Standard clips as rated to 180°F.
 - 2 b. High Temperature (HT) can be used for applications up to 340°F
3. There may be a need to use additional I-Rod strips to achieve the proper weight loading .
4. Clean the metal surface if using double sided tape on the bottom of the I-Rod strip(s).
5. Place the I-Rod strip(s) on the flat metal surface instead of directly on concrete for even weight loading .
6. Set the pipe on the I-Rod strip(s) and secure with the coated U-bolt, tightening down the nuts to hold the fitting and pipe in place .

12.7.3 Nu-Bolt Stock Codes

Stock Code	Fits Pipe Size (Inches IPS)	Description
21 96 288	2	Coated 3/8" U bolt, half-round I-Rod clip, 4 Hex Nuts
21 96 291	4	Coated 1/2" U bolt, half-round I-Rod clip, 4 Hex Nuts
21 96 292	6	Coated 5/8" U bolt, half-round I-Rod clip, 4 Hex Nuts

UNCONTROLLED IF PRINTED

21 96 293	8	Coated 5/8" U bolt, half-round I-Rod clip, 4 Hex Nuts
21 96 294	10	Coated 3/4" U bolt, half-round I-Rod clip, 4 Hex Nuts
21 96 295	12	Coated 7/8" U bolt, half-round I-Rod clip, 4 Hex Nuts

End of Instructions.

Appendix B - Cased Crossing Monitoring

Typical Casing Installation

1. General

- A. This standard details the requirements for cathodic protection monitoring of cased crossings.
- B. Casings for the purpose of this standard involve a steel carrier pipe and a steel casing pipe.
- C. For the purposes of cathodic protection monitoring, each casing needs an electrically continuous connection to the carrier pipe and to the casing.
- D. Only one set of connections are required per cased crossing.
- E. The main connection may be any electrically continuous facility such as a test lead, farm tap, service, or riser pipe.
- F. The casing connection can be either a vent pipe or test lead connected to the casing. Vent pipes shall be welded or if couplings are used, couplings will be strapped for continuity.

2. Typical Casing Installation

Appendix C - Equipment

UNCONTROLLED IF PRINTED

C-1. Radiodetection Pipeline Current Mapper (PCM)

PCM with short finding frequencies: 512Hz and 4 Hz

1. The Pipeline Current Mapper system enables the pipeline industry to map the current flow for cathodically protected pipes without installation of span test stations. This technology also is extremely useful in finding shorts caused by contact with other metallic structures.
2. The PCM system consists of a portable transmitter and a hand held receiver.
3. The transmitter applies a DC current to the pipeline.
4. The receiver locates this signal on the pipeline and displays the signal's current magnitude and direction without connection to the pipeline.
5. It provides a profile of the current and the current direction even in congested areas, as well as providing an accurate evaluation of the condition of the coating of the section of pipe.
6. An AC power source is required to operate the transmitter.

C-2. Tinker and Rasor Locator

Tinker and Rasor Short Locator with short finding frequency of 750 Hz.

1. The search coil is contained within the receiver. Although earphones are furnished for operator's optional use, the loudspeaker offers advantages related to safety, convenience, and comfort.
2. A signal of 750 Hz is generated by using a power transistor switching circuit.
3. In order that a maximum of energy can be transferred from the transmitter to the pipe, the output of the transmitter is provided with taps so that voltages of 2.5, 5, 7.5, 15, 50, and 100 volts are available to match the load.
4. An interrupter is provided to make the signal more easily recognized.

C-3. vLocPro Pipe Locator

UNCONTROLLED IF PRINTED

vLocPro with short finding frequency of 512 Hz and signal direction

1. The vLocPro is intended for use by field technicians to locate, trace and the position of buried utility pipes and cables.
2. Features
 - a. Digital receiver with interference filters.
 - b. Fast, clear, positive response even in congested areas.
 - c. Multiple active frequencies and modes provide sophisticated location tools.
 - d. Peak, null and single antenna modes.
 - e. Position and depth measurement.
 - f. Current measurement to identify individual networks.
 - g. High output Transmitter.
 - h. Current direction which helps distinguish target lines from foreign facilities and can be used to find shorts in loops.

C-4. Radiodetection RD4000 Pipe Locator

Radiodetection RD4000 with short finding frequency of 512 Hz and signal direction

1. The Radiodetection RD4000 cable and pipe locator has multiple locate modes for locating utilities, marking for construction, mapping or fault (short) finding
2. Features
 - a. Digital receiver with interference filters.
 - b. Fast, clear, positive response even in congested areas.
 - c. Multiple active frequencies and modes provide sophisticated location tools.
 - d. Peak, null and single antenna modes.

UNCONTROLLED IF PRINTED

- e. Position and depth measurement.
- f. Current measurement to identify individual networks.
- g. High output Transmitter.
- h. Current direction which helps distinguish target lines from foreign facilities and can be used to find shorts in loops.

C-5. Tinker and Razor CS-1 Current Source

Tinker and Razor CS-1

1. The CS-1 portable Magnesium Anode Simulator is a DC current source that will allow the user to see what the addition of a magnesium anode on their system will do to Pipe to Soil measurements and other C.P. tests.
2. Features
 - a. 1.7 Amps adjustable output
 - b. LCD Display Shows Amps and Voltage
 - c. 1 milliamp resolution
 - d. Simulates a standard Mag. Anode
 - e. Internal replacement battery
 - f. Provides "What If" on pipeline
 - g. MIL-SPEC Instrument case
 - h. Adjustable Current

CORROSION CONTROL

October 1, 2022

CORR 2.8 Cathodic Protection Testing

1.0 Purpose

The purpose of this document is to provide guidance in how to test the adequacy of cathodic protection to Ameren's pipeline system in compliance with 49 CFR §§ 192.473, 192.469, and 192.471.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Close Interval Survey](#)

[5.0 Soil Resistivity Testing](#)

[6.0 Monitor Galvanic Anode Bed Output](#)

[7.0 Install and Maintain Mechanical Electrical Connections](#)

[8.0 Test Electrical Isolation Devices](#)

[9.0 Test Points](#)

[10.0 Bonds](#)

[11.0 Cased Crossings](#)

[12.0 Major Foreign Pipeline Crossing](#)

[13.0 Test Point Verification](#)

Appendices

[Appendix A - Cathodic Test Stations](#)

[Appendix B - Test Lead Wire Attachment](#)

[Appendix C - Equipment](#)

3.0 Target Audience

- Corrosion Control Supervisors
- Corrosion Control Specialists

4.0 Close Interval Survey

4.1 A Close Interval Survey is a series of pipe-to-soil potentials taken over a section of pipeline that can be used as a diagnostic tool to identify insufficient cathodic protection (cp), damaged coatings, foreign contacts or stray current interference.

4.1.1 Ensure that the AC voltage sensing device is functioning properly.

4.1.2 Test structure for AC voltage prior to touching it.

4.1.3 Locate pipeline for length to be surveyed.

4.1.4 Connect survey wire to pipeline.

UNCONTROLLED IF PRINTED

4.1.5 At the prescribed intervals (usually 3 to 10 feet) perform a pipe-to-soil test as described below

4.2 Digital Multimeter with Half-Cell

4.2.1 Connect leads from voltmeter.

1. Red lead to volt/ohm terminal.
2. (Black lead to common terminal.

4.2.2 Select VDC (volts direct current) choice on voltmeter

4.2.3 Connect the clip end of the red lead to the survey wire and the survey wire to the pipe or structure to be tested.

4.2.4 Connect the clip end of the black lead to the half-cell.

4.2.5 Remove the orange protective cap from the reference electrode.

4.2.6 Place the porous plug of the electrode into moist soil.

4.2.7 Observe and record the reading to at least 2 decimal places.

5.0 Soil Resistivity Testing

5.1 Soil resistivity testing tests the property of the soil that resists current flow. There are 3 primary techniques: Four pin, single pin and soil box.

5.1.1 Four pin

1. The pin spacing is equal to the depth of the soil resistivity measurement taken. See [Figure 1](#).
2. Pins should be placed at least 15 feet away from any other buried structure.

Figure 1 Four Pin Method Schematic

5.1.2 Single pin

1. Resistivity measured is of the soil in a sphere around the point of the probe. See Figure 2.

Figure 2 Single Pin Method Schematic

5.1.3 Soil box

1. Soil must be excavated and placed in the box.
2. Test can be performed with a 4 pin meter. See Figure 3 and [Appendix C-3](#).

Figure 3 Soil Box Resistivity Measurements

5.2 Four Pin Method (See [Figure 1](#) and [Appendix C-1](#))

- 5.2.1 Test the meter's battery
- 5.2.2 Find a suitable location for testing soil resistivity. The soil should be of the same type along the entire path of the pins C1, P1, P2 and C2.
- 5.2.3 Place the pins perpendicular to the path of the survey. The distance between each pin should be identical. The distance between each pin (Pin Separation) is equal to the depth that the soil resistance is desired. Pins should be inserted into the ground no deeper than about 2 inches per 3 feet of distance between the pins.
- 5.2.4 Connect cables between each pin and the corresponding terminal on the meter panel.
 1. Connect C1 on the meter panel to the first pin, closest to the instrument.
 2. Connect C2 on the meter panel to the last pin, farthest from the instrument.
 3. P1 should be connected to the second pin from the instrument, and

UNCONTROLLED IF PRINTED

4. Connect P2 to the third pin from the instrument.
- 5.2.5 Move the RANGE SELECTOR on the meter panel to the lowest level. Refer to [Appendix C-1](#).
- 5.2.6 Activate the meter. (Nilson meter must be "nulled" to obtain the resistance measurement)
- 5.2.7 If the resistance measurement exceeds meter range, move the range selector to the next level and repeat until a resistance reading can be measured.
- 5.2.8 Calculate the resistivity: Resistivity (ohm-cm) = (resistance reading measured) X (range selector position (1, 10, 100, etc.)) X (pin spacing) X (191.5).
- 5.3 Single Probe Method (See [Figure 2](#) and [Appendix C-2](#))
 - 5.3.1 Test Device
 1. Disconnect leads from soil rod.
 2. Turn power switch to "ON".
 3. Push & hold test switch "UP".
 4. While holding, move dial pointer until tone "NULLS". Reading on dial should match test position value, if not, reset pointer.
 5. Push & hold test switch "DOWN".
 6. Repeat item "4" above.
 - 5.3.2 Test Soil Resistivity
 1. Insert soil rod in soil to depth to be tested,
 2. Connect leads to soil rod and binding posts on Model 54-A marked "LEADS". See [Appendix C-2](#).
 3. Plug ear set into jack marked "PHONES"
 4. Flip toggle switch to "ON" position, bring tone to "NULL" by means of dial pointer.
 5. The resistance of the soil will be the dial reading in Ohms-cm.
- 5.4 Soil Box Method (See [Figure 3](#) and [Appendix C-3](#))
 - 5.4.1 Place soil in soil box
 - 5.4.2 Use a 4 pin meter to measure the soil resistivity
 - 5.4.3 Connect C1 lead to left end of box and C2 to the right end
 - 5.4.4 Connect P1 to the left pin on the front of the box and P2 to the right pin
 - 5.4.5 The soil boxes are designed such that the cross-sectional area of the sample, with the box filled level, divided by the separation between the interior pins is equal to 1cm.
 - 5.4.6 The resistance measured equals the resistivity in ohm-cm.

6.0 Monitor Galvanic Anode Bed Output

- 6.1 There are 2 methods to measure current output from galvanic anode installations.
 - 6.1.1 Measure current output using a calibrated shunt and a multimeter.

6.1.2 Measure current by placing an ammeter or multimeter in the circuit.

1. Both methods require leads be brought above ground.
2. Zero output usually means a wire is broken.
3. Low output could be caused by dry soil conditions or depleted anodes.

6.2 Calibrated Shunt and Multimeter Method

6.2.1 Check connections in test station to ensure connections are clean and tight.

6.2.2 Locate the calibrated shunt in the test station.

6.2.3 Place the positive lead on the pipe side of the shunt and the negative lead on the anode side of the shunt. See Figure 4.

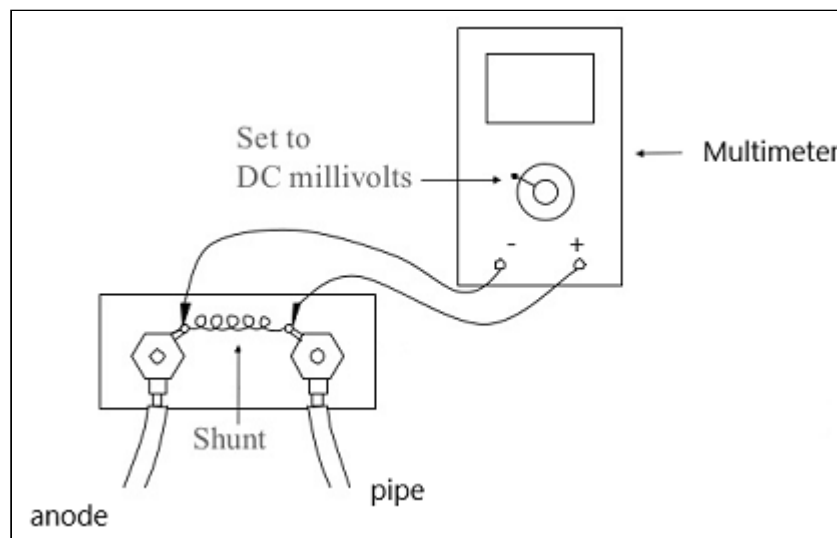

Figure 4 Shunt and Multimeter Methods

6.2.4 Set the multimeter to mV.

6.2.5 Observe and record the reading.

6.2.6 A positive reading indicates anode output.

6.2.7 Calculate the current flow. $\text{Current (amps)} = (\text{mV reading} / 1000) / (\text{shunt resistance})$.

6.2.8 Document the reading.

6.3 Multimeter in circuit method

6.3.1 Check connections in test station to ensure connections are clean and tight.

6.3.2 Disconnect wire to pipe and wire to anodes.

6.3.3 Connect the positive side of the meter to the pipe wire and the negative side of the meter to the anode wire. See Figure 5.

Figure 5 Multimeter in circuit Method

- 6.3.4 Set the meter on DC amps or milli-amps.
- 6.3.5 Observe and record the reading.
- 6.3.6 A positive reading indicates anode output.
- 6.3.7 Disconnect the meter and reconnect the pipe and the anodes.
- 6.3.8 Document the reading.

If the current output exceeds the amp rating of the multimeter setting, an internal fuse will blow and need to be replaced.

7.0 Install and Maintain Mechanical Electrical Connections

- 7.1 Mechanical electrical connections, i.e. tracer wire, test leads, bonding wires may be joined with a split bolt connector (Kearney) or terminated with a loop connector. See [Figure 6](#) and [Figure 7](#).

These connections are required to maintain CP and measure the CP system performance.

Figure 6 Kearney Connector

Figure 7 Loop/Ring Connector

- 7.1.1 Wire connections may be required for continuity bonds, critical bonds, tracer wire connections, or anode connections.
- 7.1.2 Connections must be clean, tight and protected from moisture.
- 7.1.3 Twisting of wire is not an acceptable connection.
- 7.1.4 Approved materials must be used.
- 7.1.5 Ensure leads are not stressed during backfill operations.
- 7.1.6 Buried connections must be coated.
- 7.1.7 Ensure that all test lead and anode installations are mapped.
- 7.2 Make mechanical wire connection.
 - 7.2.1 Strip wire.
 - 7.2.2 Tighten connector.
 - 7.2.3 Test the integrity of connection.
 - 7.2.4 Continuity test if applicable.
 - 7.2.5 Seal the connection.

8.0 Test Electrical Isolation Devices

- 8.1 A pipeline electrical isolation device may be tested by the following methods:

UNCONTROLLED IF PRINTED

- 8.1.1 Application of current to the structure using an interrupter. Check for potential shift on each side of the insulator.
- 8.1.2 Connect a low frequency locator (less than 800 hz) to the structure. Locating signal (less than 800 hz) will not pass through a fully functioning isolation device.
- 8.1.3 Use an RF insulation checking device designed to check pipeline insulators. See [Appendix C-4](#).
- 8.1.4 Place a half cell at a location. Without moving the half cell test the pipe-to-soil potential of the pipe on both sides of the insulator. If the potentials are more than 20mV different then the insulation is good. Less than 20mv requires additional testing.

9.0 Test Points (49 CFR 192.469 and 192.471)

- 9.1 Refer to [Appendix A](#) for different types of cathodic test stations.
- 9.2 To determine protective levels of cathodically protected structures:
 - 9.2.1 Establish at least 1 test point on each cathodically protected structure.
 - 9.2.2 Locate test points to represent the potential of adjacent piping.

There should typically at least 1 test point in each quarter section.

- 9.2.3 Every ½ mile to 1 mile on cross-country pipelines unless terrain or land use requires farther spacing.
- 9.2.4 Test point spacing should not exceed 1-½ miles without data that proves protection between test points.
- 9.2.5 Establish additional test points if the gas system geometry, pipe surface area, or history of the structure indicates need for closer monitoring.
- 9.2.6 The following are recommended for use as annual test points:
 - 1. System pressure control stations (inlet and outlet).
 - 2. Major river crossings (read on both sides of the crossing).
 - 3. Gas storage wells (current drains on impressed current systems and pipe-to-soil potentials on magnesium anode systems).
 - 4. Farm taps.
 - 5. Test leads.
 - 6. Steel services.
 - 7. Service tracer wire bonded to a steel main

10.0 Bonds

- 10.1 Measuring current using a shunt with a multimeter.
 - 10.1.1 Connect the red lead to Ameren Illinois' side and the black lead to foreign side of the shunt on the "ears" provided.
 - 10.1.2 Set the multimeter to DC mV scale.
 - 10.1.3 Record the DC mV reading.

UNCONTROLLED IF PRINTED

- 10.1.4 To convert to amps, divide the DC mV reading by 1000 and divide results by the resistance of the shunt.

Example: $\left(\frac{50 \text{ DC mV}}{1000}\right) \div 0.01 \text{ ohm} = 5 \text{ amps}$

For 0.01 ohm shunts, move the decimal point of the mV reading 1 place to the left to convert to amps.

10.2 Interpretation

- 10.2.1 When the reading is positive, Ameren Illinois is returning current to the foreign line. When the reading is negative, the foreign line is returning current to Ameren Illinois.

11.0 Cased Crossings

- 11.1 Comparison between pipe-to-soil potential and casing-to-soil potential.

11.1.1 Both potentials should be measured with the half-cell in the same location for a valid comparison.

11.1.2 If the difference in potentials is less than 25 mV additional tests for isolation shall be performed. See [CORR 2.7](#).

- 11.2 If it is necessary to perform pipe-to-soil readings at different nearby locations, additional testing for isolation shall be performed if the difference in potentials is less than 200 mV.

1. If the casing is documented as shorted and is filled with dielectric filler, only a pipe-to-soil potential for the pipeline is required.
2. Cased crossings with plastic mains do not need to be monitored for electrical isolation.

12.0 Major Foreign Pipeline Crossing

- 12.1 Measure the pipeline's potential as near to directly over the actual point of crossing, as possible. Refer to [Figure 8](#).

12.1.1 If the crossing is under pavement or water, measure a baseline potential at the crossing and another at the nearest assessable point.

12.1.2 The future potentials at the accessible point can be compared to the baseline crossing potential and further testing can be done whenever the accessible test point potential becomes less negative.

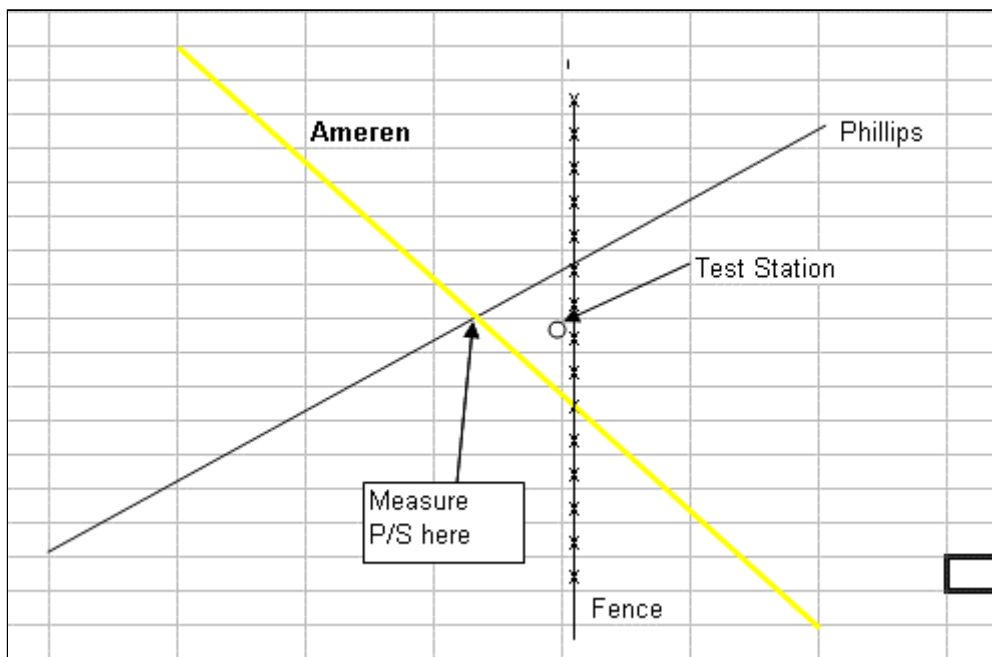

Figure 8 Foreign Pipeline Crossing Diagram

13.0 Test Point Verification

13.1 Use a current interrupter to apply current (or short out system) at another location on the structure and check the proposed test point for potential shift.

If the potential at the proposed test point shifts at a similar magnitude as the interrupter set up point, continuity is verified.

13.2 An alternative to the interrupter is a low frequency (below 800 Hz) locator. Connect the locator to the structure at a remote location and create a short at the test point of interest. If the test point can be located, continuity is verified.

Do not use a high frequency locator to prove test point continuity!

13.3 A welded steel service on a welded steel main can be assumed continuous with the main.

End of Instructions.

Operator Qualification (OQ) Required?

YES

0001: Measure Structure- to-Electrolyte Potential

0011: Conduct Close Interval Survey

UNCONTROLLED IF PRINTED

- 0021: Measure Soil Resistivity
- 0031: Inspect and monitor Galvanic Ground Beds/Anodes
- 0041: Installation and Maintenance of Mechanical Electrical Connections
- 0051: Installation of Exothermic Electrical Connections
- 0061: Inspect or Test Cathodic Protection Bonds
- 0071: Inspect or Test Cathodic Electrical Isolation Devices
- 0081: Install Cathodic Protection Electrical Isolation Devices
- 0091: Troubleshoot In- Service Cathodic Protection System
- 0101: Inspect Rectifier and Obtain Readings

Revision Notes

Location of Changes	Summary of Changes
Appendix B – Test Lead Wire Attachment - 7. C.	Removes Handy Cap as a Test Lead Attachment Coating. Product replaced by Viscotaq Coating Patch several years back.

Appendix A - Cathodic Test Stations

A-1. Single Test Lead - Flush to Grade Test Station

Installation

1. Test stations should be installed often enough to perform required operation and maintenance activities such as locating and cathodic protection testing.
2. Attach wire in accordance with [Appendix B](#).
3. Coat each connection according to the methods described in [Appendix B](#).
4. Loop wire around pipe outside of recoating area.
5. Terminate the test lead wire on a terminal in the test station.

Item	Stock No.	Description	Quantity
1	19 12 703	Box, CP Test 4 in ID x 18 in Lgh, Plastic w/Cast Iron Lockable Lid, 5 terminals, Marked "GAS TEST"	1
	19 12 696	Finklet	1
2	18 66 208	#12 Solid Copper Wire	X Feet
3	22 02 552	Thermite Cad Weld	1

A-2. Single Test Lead - Above Grade Test Station.

Finklet

Installation

1. Test stations should be installed often enough to perform required operation and maintenance activities such as locating and cathodic protection testing.
2. If using Finklet test station, install against existing pole, post, or marker.
3. Attach wire in accordance with [Appendix B](#).
4. Coat each connection according to the methods described in [Appendix B](#).
5. Loop wire around pipe outside of recoating area.
6. Terminate the test lead wire on a terminal in the test station.

Item	Stock No.	Description	Quantity
1	16 02 628	Pipeline marker, 3" diameter, 6 ft. long with Finklet Test Station on top.	1
	19 12 696	Finklet	1
2	18 66 208	#12 Solid Copper Wire	X Feet
3	22 02 552	Thermite Cad Weld	1

A-3. Foreign Pipeline Crossing Test Station

Installation

1. Attach 1 #8 and 2 #12 AWG - TW solid copper single conductor to Ameren's main.

2. Attachment of wires to foreign pipeline should be done by personnel from Pipeline Company.
3. Attach wires in accordance with [Appendix B](#).
4. Coat each connection according to the methods described in [Appendix B](#).
5. Terminate the test wires on terminals in the test station.
6. Consideration should be given to identifying test wire/lead connections.

Item	Stock No.	Description	Quantity
1	16 02 629	Pipeline marker, 3" diameter, 6 ft. long with bonding strap and a Big Finklet Test Station on top.	1
2	18 66 624	#8 Stranded Copper Wire	X Feet
3	18 66 208	#12 Solid Copper Wire	X Feet
4	22 02 552	Thermite Cad Weld	2
5	17 54 948	Connector, #14-#4 Wire	1

A-4. Inline Insulator - Above Grade Test Station

Installation

1. Attach wire in accordance with [Appendix B](#).
2. Coat each connection according to the methods described in [Appendix B](#).
3. Loop wire around pipe outside of recoating area.
4. Consideration should be given to identifying test lead/wire direction at insulators.
5. Terminate the test lead wire on a terminal in the test station.

Item	Stock No.	Description	Quantity
1	18 66 624	#8 Stranded Copper Wire	X Feet
2	16 02 629	Pipeline marker, 3" diameter, 6 ft. long with bonding strap and a Big Finklet Test Station on top.	1
3	22 02 552	Thermite Cad Weld	2
4	17 54 948	Connectors, #14-#4 Wire	2

UNCONTROLLED IF PRINTED

A-5. Inline Insulator - Flush to Grade Test Station

Installation

1. Attach wire in accordance with [Appendix B](#).
2. Coat each connection according to the methods described in [Appendix B](#).
3. Loop wire around pipe outside of recoating area.
4. Terminate the test wires on the terminals in the test station.
5. Consideration should be given to identifying test lead/wire direction at insulators.

Item	Stock No.	Description	Quantity
1	19 12 703	Box, CP Test 4 in ID x 18 in Lgh, Plastic w/Cast Iron Lockable Lid, 5 terminals, Marked "GAS TEST"	1
2	18 66 624	#8 Stranded Copper Wire	X Feet
3	22 02 552	Thermite Cad Weld	2

A-6. Insulated Valve - Underground

Installation

1. Attach wire in accordance with [Appendix B](#).
2. Coat each connection according to the methods described in [Appendix B](#).

UNCONTROLLED IF PRINTED

3. Loop wire around pipe outside of recoating area.
4. Run test lead up or outside of the box. Enter through hole near the top.
5. Cut wire and leave 12 inch slack wire inside valve box.
6. Install FPR insulators between a metal valve box and the protected main.
7. Terminate wires as show in construction drawing or neatly in valve box.
8. Consideration should be given to identifying test lead/wire direction at insulators.

A-7. Flange Fink Test Station - Test Leads Attached to Pipe

Installation

1. Attach wire in accordance with [Appendix B](#).
2. Coat each connection according to the methods described in [Appendix B](#).
3. Terminate the test leads on the terminals in the test station.

Item	Stock No.	Description	Quantity
1	19 12 699	Flange Fink	1
2	18 66 624	#8 Stranded Copper Wire	X Feet
3	17 54 948	Connector, #14-#4 Wire	2
4	22 02 552	Thermite Cad Weld	2
	or	or	
	21 76 626	Bolt, Hex, Head, 5/16" Dia. x 3/4" Long x 1/2" Head	1
	21 61 408	Nut, Hex, 5/16"	1
	23 66 187	Washer, Flat, 5/16"	2

A-8. Flange Fink Test Station - Test Leads Attached to Flanges

Installation

1. Attach wire to the outside edge of the flanges with either thermite weld or welded 5/16 inch bolt as described in [Appendix B](#). A 5/16 inch bolt can be welded on the edge of flange that is operating at any pressure.
2. Cover or protect the flange gasket from slag resulting from either the thermite weld or welding on a bolt.
3. Coat each connection according to the methods described in [Appendix B](#).
4. Terminate the test leads on the terminals in the test station.

Item	Stock No.	Description	Quantity
1	19 12 699	Flange Fink	1
2	18 66 624	#8 Stranded Copper Wire	X Feet
3	17 54 948	Connector, #14-#4 Wire	2
4	22 02 552	Thermite Cad Weld	2
		or	
	21 76 626	Bolt, Hex, Head, 5/16" Dia. x 3/4" Long x 1/2" Head Nut	1
	21 61 408	Nut, Hex, 5/16"	1
	23 66 187	Washer, Flat, 5/16"	2

A-9. AC Stray Current Test Station

UNCONTROLLED IF PRINTED

Installation

1. Connect # 8 AWG - Stranded copper wire to Ameren's main with Thermite Cad Weld or Pin Brazing and connect other end to the Pipeline Terminal 1 in Test Station.
2. Connect # 12 AWG - Tracer Wire, Solid Copper to Ameren's main with Thermite Cad Weld or Pin Brazing and connect other end to the Pipeline Terminal 2 in Test Station.
3. Locate the Reference Cell with Coupon housing approximately 12 inches away from the Ameren pipeline and near the 3 o'clock position.
4. Connect Reference Cell #14 AWG, RHH, RHW cable to the REF ELCTRODE Terminal in the Test Station.
5. Coupon housing contains three (3) coupons each has a #14 AWG, RHH, RHW cable.
 - A. Connect the Green colored cable to the NATIVE COUPON Terminal in the Test Station
 - B. Connect the Purple colored cable to the PROTECTED COUPON Terminal in the Test Station
 - C. Connect the White colored cable to the AC COUPON Terminal in the Test Station
6. Coat each thermite weld or Pin Brazing connection according to the methods described in [Appendix B](#).
7. Consideration should be given to identifying test wire/lead connections.

Item	Stock No.	Description	Quantity
1	19 12 710	Riser Pipe, HDPE, UV Resistant, 3.5 Inches OD, for use with Model T-3 Test Station, Earthlock anchor bar	1
2	18 66 624	#8 Stranded Copper Wire	X Feet

UNCONTROLLED IF PRINTED

3	18 66 208	#12 AWG, Tracer Wire, Solid Copper Wire, 500 Ft. Spool	X Feet
4	22 02 552	Thermite Cad Weld or Optional Pin Brazing	2
5	19 12 711	Model T-3 Custom Test Station, Engraved Terminal Board, 9 Rapid Connect Binding Posts, ShockGuard Cover and Toggle On/Off Switch, (Honeywell 1TL1-4), Yellow Cap	1
6	22 42 220	Stelth 7 REF CELL in Coupon Housing, C20IR, Free Reference Electrode, SRE-024-CIY-AC20	1

Appendix B - Test Lead Wire Attachment

1. General

- A. This standard prescribes the requirements for attaching wires to steel pipelines.
- B. The Cadweld thermite welding process using a #15 thermite cartridge, Cadweld Plus using a CA15PLUSF33 cartridge or Pin Brazing are the only approved methods of attaching lead wires to steel transmission mains or high pressure distribution main (MAOP > 100 psig).
- C. For distribution mains operating at or below 100 psig, test lead wires can be attached to the steel pipe by use of a welded bolt to the main, Cadweld thermite weld, Cadweld Plus or Pin Brazing processes.
- D. If multiple connections are made on the pipe, the connections should be at least six (6) inches apart.
- E. Do not attach wire within 2 inches of nearest girth weld.

2. Cadweld Thermite Welding Process

Typical Thermite Weld Configuration

A. Installation

- (1) Check environment with CGI if the presence of natural gas is possible.
- (2) Strip conductor insulation. Crimp sleeve to #12 and #14 wire. Sleeve is not required for #8 wire.
- (3) Remove coating down to bare metal in the proposed attachment location
- (4) Use a file, wire wheel, scraper, power brushes or grinder, or commercial blasting on the pipe until the bare metal is bright and shiny in the attachment location. If commercial blasting is used clean the grit or shot off the pipe after blasting.
- (5) Clean and dry pipe thoroughly before starting to weld.
- (6) Heat surface with torch to remove moisture from the pipe

UNCONTROLLED IF PRINTED

- (a) Be cautious not to damage the existing pipe coating during this step by keeping the torch moving.
 - (b) If there is PE pipe connected to the steel pipe, keep the torch flame away from the PE pipe or protect the PE pipe from the torch flame. Protection methods can be such as; covering PE pipe with backfill material, covering with non-combustible material, or placing a shield between the torch and PE Pipe, etc.
- (7) Tie wire around pipe.
 - (8) Leave sufficient slack to avoid stress on wire and connection when backfilling.
 - (9) Set clean and dry mold onto pipe.
 - (10) Place metal disk in the mold prior to pouring in powder.
 - (11) *Dump, do not pour*, container of welding powder into mold. Sprinkle some starting powder on the lip of the mold where the lid opening will be. Be sure all starting powder is removed from container. Never use a charge larger than 15 grams for steel pipe.
 - (12) Close lid and ignite with flint gun.
 - (13) Remove mold after about 10 seconds.
 - (14) Clean mold for next use.
 - (15) Clean slag off completed weld and test weld by pulling wire parallel to pipe.
 - (16) Coat connection in accordance with the Test Lead Attachment Coating section.

Notes:

- (a) *Ensure all surfaces are clean and dry.*

Caution: A wet mold or pipe may produce porous welds, splatter, or explosion during the welding process. Always wear approved eye protection and long gloves.

- (b) *Strike weld sharply to test for a good bond.*
- (c) *Molds should be replaced after 50 - 100 operations. A worn mold will not make adequate connections.*
- (d) *A torch may be used to dry a mold or pipe before use.*

3. CadWeld Plus Process

A. Installation

- (1) Check environment with CGI if the presence of natural gas is possible
- (2) Strip conductor insulation. Crimp sleeve to #12 wire.
- (3) Remove coating down to bare metal in the proposed attachment location
- (4) Use a file, wire wheel, scraper, power brushes or grinder, or commercial blasting on the pipe until the bare metal is bright and shiny in the attachment location. If commercial blasting is used clean the grit or shot off the pipe after blasting.
- (5) Clean and dry pipe thoroughly before starting to weld.
- (6) Heat surface with torch to remove moisture from the pipe
 - (a) Be cautious not to damage the existing pipe coating during this step by keeping the torch moving.

UNCONTROLLED IF PRINTED

- (b) If there is PE pipe is connected to the steel pipe, keep the torch flame away from the PE pipe or protect the PE pipe from the torch flame. Protection methods can be such as; covering PE pipe with backfill material, covering with noncombustible material, or placing a shield between the torch and PE Pipe, etc.
- (7) Tie wire around pipe.
- (8) Leave sufficient slack to avoid stress on wire and connection when backfilling.
- (9) Set clean and dry mold onto pipe.
- (10) Insert CADWELD PLUS, CA15PLUSF33 package into mold.
- (11) Attach Control Unit termination clip to ignition strip. Place baffle onto mold.
- (12) Press and hold Control Unit switch and wait for ignition.
- (13) Remove mold after about 10 seconds.
- (14) Clean mold for next use.
- (15) Clean slag off completed weld and test weld by pulling wire parallel to pipe.
- (16) Coat connection in accordance with the Test Lead Attachment Coating section.

Notes:

(a) *Ensure all surfaces are clean and dry.*

Caution: A wet mold or pipe may produce porous welds, splatter, or explosion during the welding process. Always wear approved eye protection and long gloves.

(b) *Strike weld sharply to test for a good bond.*

(c) *Molds should be replaced after 50 - 100 operations. A worn mold will not make adequate connections.*

(d) *A torch may be used to dry a mold or pipe before use.*

Control Unit					Non Stock

5. Pin Brazing

Pin Brazing Equipment

A. Surface Preparation

- (1) Remove the pipe coating and grind or clean the area of connection onto the pipe to a clean bright metal finish. Also grind or clean an area nearby for the magnetic ground connection.
- (2) Degrease both cleaned areas and lightly abrade the area with a tool, i.e. hammer, to prepare for the lug attachment.

B. Loading the Pin Into the Brazing Gun

- (1) Load the gun with a brazing pin and ceramic ferrule individually by hand.
- (2) Ensure that they are both fully inserted and tight with the palm of your hand. **DO NOT STRAIGHTEN THE KINKED END OF THE PIN FUSE WIRE.**
- (3) The legs of the pin holder must be adjusted as necessary to ensure a firm grip of the pin while maintaining concentricity with the ferrule holder. *Important: Under no circumstances should a brazing pin which has been inserted and then removed from the gun be re-inserted and used for brazing without checking the kinked end profile and fuse wire connection to pin for damage.*

C. Adjustment of the Brazing Gun

- (1) Before connecting the ground device to the steel, adjust the brazing pin "Lift Height" as follows:

UNCONTROLLED IF PRINTED

- (a) Hold the cable lug or stinger flat on the steel surface (for direct pin connection).
- (b) Insert a loaded brazing pin into the hole in the lug and press the gun/ferrule against the surface of the lug evenly to overcome the internal spring.
- (c) Turn the ferrule holder until the white adjustment indicator tube is flush with the gun's rear face.
- (d) The brazing gun should now be correctly set. When using threaded brazing pins, i.e. M8 brazing pin, the ceramic ferrule must be flat against the steel surface when checking the white adjustment indicator tube.
- (e) Check the ceramic ferrule for damage and cracks prior to brazing as this could result in a malfunction of the braze connection.

D. Pin Brazing

- (1) Check environment with CGI if the presence of natural gas is possible. *Always wear approved eye protection and long gloves.*
- (2) The magnetic ground device must be applied to the cleaned surface of the pipe to ensure a sound electrical circuit.
- (3) The brazing gun must be correctly adjusted with the correct pin and ferrule fitted (see chart below).
- (4) Locate the brazing pin so that the pin is in the center of the hole in the cable lug. For vertical surfaces, the pin must be at the upper part of the hole in the cable lug.
- (5) Apply sustained pressure on the brazing gun so that full contact is made between the ferrule and the bond attachment (or the steel surface when using threaded pins).
- (6) The operator should look to one side to protect his eyes from glare and should use a face shield while operating the gun. The operator's stance should be stable to enable this movement to be made without altering the critical positioning of the gun. Hold the gun firmly and close the circuit by squeezing the trigger. **KEEP THE TRIGGER DEPRESSED UNTIL THE BRAZE IS COMPLETE.**
- (7) After about 2 seconds, the fuse wire should rupture, disconnecting the circuit. The arc will extinguish and the pin or stud will be shot forward into the molten filler. *(In the event of a fuse not rupturing after the normal time, the gun must be withdrawn completely from the work, keeping the trigger depressed.)*
- (8) After the fuse has ruptured, the gun must be held in place for another 3 seconds to allow the braze to set.
- (9) Remove the gun by pulling it straight off of the pipe in line with the brazed pin, then break out the ferrule if there is some remaining in the ferrule holder.
- (10) Hold the gun in a vertical position then depress the ejector button to expel the remaining fuse wire. Ensure the wire has been completely ejected.

E. Testing a Completed Bond

- (1) Threaded pin attachments should be tested by a torque device. For an M8 pin, the torque device should be set to 10 Nm. The threads will fail at 25 Nm so do not use excessive force.
- (2) Direct braze pin attachments must be tested as follows: The shank of the plain pin must be carefully broken off with a hammer taking care not to damage the lug. This must be done before another pin braze is made to the bond. After breaking

UNCONTROLLED IF PRINTED

off the shank, the broken surface should be level or thereabouts with the outer surface of the lug.

F. Coating

Use an approved liquid coating or Viscotaq coating patch to coat the pin brazed and ground connection areas.

G. Pin Brazing Consumables

BRAZING PINS & Ferrules

6. *Welded Bolt Anode Wire or Test Lead Connections to Steel Pipe*

UNCONTROLLED IF PRINTED

A. This method shall only be used on steel pipe with MAOP of 100 psig or less.

Welded Bolt Connection

B. Installation

- (1) Clean pipe thoroughly before welding bolt to pipe.
- (2) Weld one pass around the circumference of the 5/16 inch bolt head to the pipe.
- (3) Place washers on bolt and attach wire between washers. Use caution not to damage, flatten, kink, or nick the wire while removing the insulation.
- (4) Tighten the hex nut on the bolt to hold the wire securely in place.
- (5) See Test Lead Attachment Coating section for coating of connection.

C. Material List

Item	Stock No.	Description	Quantity
1	21 76 626	Bolt, Hex Head, 5/16" Dia. x 3/4" Long x 1/2" Head	1
2	21 61 408	Nut, Hex, 5/16"	1
3	23 66 187	Washer, Flat, 5/16"	2

7. Test Lead Attachment Coating

A. Hot Applied or Cold Applied Butyl 35 or H35 Tape

The following 4-step process should be utilized to wrap attached lead with hot applied or cold applied Butyl tapes. This process applies to attachments made with Cadweld thermite weld, Cadweld Plus, Pin Brazing or welded bolt.

1. Apply primer.
2. Rip length of tape halfway through, heat (if hot applied) and slide under wire, and snug against connection.

3. Rip second length of tape halfway through, heat (if hot applied) and slide to snug fit on opposite side of attachment.

4. Spiral wrap over attachment area with tape, overlapping disturbed pipe coating about 2" (typical).

B. Viscotaq Coating Patch (30-10-165)

Viscotaq coating patch is used to seal test lead wire attachment connections on steel pipe. The Viscotaq patch is UV resistant.

Viscotaq Coating Patch

(1) Installation

- (a) Clean the area to be coated with sandpaper supplied with the kit.
- (b) Wipe the area down with the wipe supplied in the kit to remove any grease, debris or moisture
- (c) Ensure the area to be coated is clean and dry.
- (d) Remove a small piece of the Viscotaq material and place it under the wire to ensure that the area between the wire and the pipe is sealed when the patch is applied.
- (e) Peel off the release liner.
- (f) Place the coating patch over the cleaned area, ensuring the connection and all of the bare pipe is covered.
- (g) Press the patch into place ensuring the entire underside of the patch is firmly adhered to the pipe.

CORROSION CONTROL

October 1, 2020

CORR 2.9 Evaluation of Corrosion

1.0 Purpose

The procedure provides instruction on how to evaluate corrosion pitting and resulting pipeline integrity. This document uses guidelines provided in ASME/ANSI B31G.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Distribution Piping \(60 psig and Below\)](#)

[6.0 Transmission or High Pressure Distribution Piping \(Over 60 psig\)](#)

[7.0 Allowable Pit Length Tables](#)

[Appendix C - Allowable Pit Length Tables](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Engineering
- Gas Integrity Management Personnel
- Gas Supervisors
- Gas Field Personnel
- Corrosion Control Supervisors
- Corrosion Control Specialists
- Gas Tech Services Supervisors
- Gas Tech Services Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Construction Services Supervisors
- Gas Construction Inspectors

4.0 General

4.1 Measuring pipeline corrosion is an important task that requires careful attention to detail and following the appropriate process to ensure that the appropriate repair decision is made and documented.

5.0 Distribution Piping (60 psig and Below)

If corrosion has reduced the remaining wall thickness to less than required for the maximum allowable operating pressure or less than 30% of the nominal wall thickness, the corroded piping must

UNCONTROLLED IF PRINTED

be repaired or replaced. The maximum allowable pit depth on distribution piping is 70% of the original wall thickness.

5.1 Measuring Pitted Areas (Underground or Atmospheric Corrosion)

5.1.1 Wire brush corroded area to bare metal.

Use caution when cleaning corroded areas on active pipelines as severity of corrosion may not be apparent due to corrosion products remaining in pits.

5.1.2 Measure deepest pit or loss of pipe wall.

5.1.3 Compare pit depth to the maximum allowable pit depth indicated in [Appendix B-1](#).

5.1.4 Pit depths less than or equal to those in [Appendix B-1](#) require recoating only.

5.1.5 If pit depths exceed the allowable depths in [Appendix B-1](#), contact the Region Gas Engineer or Corrosion Control Tech for further evaluation and proper corrective action.

5.1.6 Document on Corrosion and Steel Damage Evaluation form within ClickMobile. Refer to [CORR 1 Appendix B](#).

6.0 Transmission or High Pressure Distribution Piping (Over 60 psig)

If corrosion has reduced the remaining wall thickness to less than required for the maximum allowable operating pressure or to less than 90% of the nominal wall thickness:

1. The corroded pipe must be repaired or replaced to restore the serviceability of the piping
or
2. The operating pressure reduced commensurate with the strength of the pipe based on actual remaining wall thickness.

6.1 The maximum allowable pit depth on Transmission and High-Pressure Distribution piping is 10% of the original wall thickness.

6.2 If corrosion has reduced the wall thickness by more than 10%, Corrosion Control shall be contacted before any corrective action is taken.

6.2.1 Corrosion Control along with Gas Tech Engineering will determine the appropriate corrective action to be taken.

6.3 Measuring Pitted Areas (Underground or Atmospheric Corrosion)

6.3.1 Wire brush corroded area to bare metal.

Use caution when cleaning corroded areas on active pipelines as severity of corrosion may not be apparent due to corrosion products remaining in pits.

- 6.3.2 Measure deepest pit or loss of pipe wall and measure length of each group of overlapping pits (see [Figure 1](#)).
- 6.3.3 Compare pit depth to the maximum allowable pit depth indicated in [Appendix B-2](#).

When using the Allowable Loss Tables, if the pipe wall thickness for the pipe diameter that is being assessed is not available, use the values for the next thinnest wall thickness in the table.

Figure 1 Pit Measurement Criteria

- 6.3.4 Pit depths less than or equal to those in [Appendix B-2](#) require recoating only.
- 6.3.5 If pit depths exceed the allowable depths in [Appendix B-2](#), contact Corrosion Control Tech or Gas Technical Services who will follow the Analytical Method Flowchart in [Appendix A](#) for further evaluation and proper corrective action.

Where the flowchart has contact Gas Technical Services this would include Corrosion Control personnel.

6.3.6 Document on Corrosion and Steel Damage Evaluation form within ClickMobile.

7.0 Allowable Pit Length Tables

7.1 See [Appendix C](#) for Allowable Pit Length Tables

7.2 Instructions

7.2.1 The tables in [Appendix C](#) are not valid for steel pipe with yield strength specifications less than 35,000 psig.

1. Contact Corrosion Control personnel for allowable pit lengths if pipe is less than 35,000 psig.
2. If the yield strength of the pipe is not known, allowable pit lengths should be based on a pipe with yield strength of 24,000 psig.

7.2.2 Select the table applicable to the pipe diameter to be analyzed.

7.2.3 Find the pit depth on the left hand side.

7.2.4 Follow the row over to the column with the appropriate wall thickness at the top. If the wall thickness is not in the table, use the next thinnest wall.

7.2.5 The length at the intersection of the row and column selected is the maximum length allowed for that pit depth.

7.2.6 If the actual pit length exceeds this value, a pipe strength calculation must be performed or the pipe must be repaired or replaced.

8.0 Pipe Pit Gauge

8.1 The Pipe Pit Gauge, Figure 2, is used to measure the depth of external pitting.

Figure 2 Pipe Pit Gauge (AG-1151, Stock Code 61 12 168)

8.2 Instructions

8.2.1 Clean adjoining pipe to bare metal.

8.2.2 Place gauge lengthwise on the pipe and align gauge with the center of the pipe.

UNCONTROLLED IF PRINTED

- 8.2.3 Push the arm down until the stylus touches the pipe.
- 8.2.4 Read the pit depth indicated by the top of the indicator arm.
- 8.2.5 Measure pitted area until deepest pit is found.
- 8.2.6 Measure length of pitted area by placing the gauge lengthwise on the pipe.
- 8.2.7 Record data on Corrosion and Steel Damage Evaluation form within ClickMobile.

9.0 Pipe Thickness Gauge

9.1 The Pipe Thickness Gauge, Figure 3, is used to measure the depth of internal pitting.

Figure 3 Pipe Thickness Gauge (AG-1153, Stock Code 85 20 170)

9.2 Instructions

- 9.2.1 Clean outside and inside of pipe to bare metal.
- 9.2.2 Cut pipe so thickness gauge can reach pitting.
- 9.2.3 Insert tool and move stylus until it touches the pipe.
- 9.2.4 Read the pipe thickness indicated by the top of the indicator arm.
- 9.2.5 Measure the area until the thinnest wall is found.
- 9.2.6 Record data on Corrosion and Steel Damage Evaluation form within ClickMobile. Refer to [CORR 1 Appendix B](#).

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0141: Visual Inspection of Atmospheric Corrosion
- 0151: Visual Inspection of Buried Pipe and Components when Exposed
- 0161: Visual Inspection for Internal Corrosion
- 0171: Measure External Corrosion
- 0181: Measure Internal Corrosion
- 0191: Measure Atmospheric Corrosion

UNCONTROLLED IF PRINTED

CORROSION CONTROL

October 1, 2022

CORR 2.10 Rectifier Maintenance and Troubleshooting

1.0 Purpose

The purpose of this document is to provide guidance in maintaining and troubleshooting cathodic protection rectifiers. Instructions on installing rectifiers are also included in the document.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Rectifier Installation](#)

[5.0 Rectifier Maintenance](#)

[6.0 Rectifier Troubleshooting](#)

Appendices:

[Appendix A - Rectifier Installation](#)

3.0 Target Audience

- Gas Tech Engineering
- Corrosion Control Supervisors
- Corrosion Control Specialists

4.0 Rectifier Installation

4.1 See [Appendix A](#) for rectifier installation instructions.

5.0 Rectifier Maintenance

5.1 General

5.1.1 Rectifiers require little periodic maintenance, but there are some maintenance checks that should be performed annually.

5.2 Rectifier Definition

5.2.1 A rectifier changes the AC to DC by inverting alternate halves of the AC waveform, making all portions electrically unidirectional.

5.2.2 Types of rectifiers

1. Selenium & Silicon
2. Air cooled/Oil cooled
3. Half wave/Full wave
4. Single phase/Three phase
5. Automatic adjustment/Manual adjustment.

5.3 Rectifier Safety

UNCONTROLLED IF PRINTED

- 5.3.1 Never approach a rectifier or electrical equipment until observing the surroundings.
- 5.3.2 Do a visual check of any loose wires on or around the service pole.
- 5.3.3 Do a visual check of any line fuses / transformers feeding the service pole. Note anything unusual.
- 5.3.4 Approach rectifier with proper safety equipment.
 - 1. Voltage tester to test rectifier cabinet/components
 - 2. Gloves
 - 3. Safety glasses
 - 4. Proper protective head gear
- 5.4 General Maintenance Instructions for Most Rectifiers
 - 5.4.1 Voltage, current and ambient temperature ratings of unit should not exceed specifications.
 - 5.4.2 Cleanliness inside and outside of rectifier should be maintained.
 - 5.4.3 Adequate ventilation must be maintained. All air vents and screens should not be obstructed. Remove all rodent, insect and bird nests from inside and around rectifier.
 - 5.4.4 Check the casing ground (ensure that rectifier case and all associated components are grounded correctly).
 - 5.4.5 Turn AC power off and check all electrical connections.
 - 5.4.6 Check for heat dispersion or burn marks on selenium rectifier stacks.
 - 5.4.7 An indication of excessive heat or burn marks is a precursor to rectifier failure.
 - 5.4.8 Oil cooled rectifiers should be free of any obstructions. Change the oil or replace with an air-cooled unit if the oil is contaminated.
 - 5.4.9 Check for hot fuses, breakers, (loose or under/oversized fuses).
 - 5.4.10 Verify rectifier readings/calibration settings.
 - 5.4.11 Ensure that rectifier is properly secured.
- 5.5 Rectifier Testing
 - 5.5.1 Required measurements
 - 1. DC Volts
 - 2. DC Amps
 - 5.5.2 Optional measurements
 - 1. Pipe to soil. Always place the half cell directly over the pipe.
 - 2. Electric meter reading
 - 3. Efficiency (calculated and usually of limited value for low output units below 30 or 40 amps)
- 5.6 Testing Procedures
 - 5.6.1 Test the case for AC voltage with a voltage indicator

UNCONTROLLED IF PRINTED

- 5.6.2 If voltage is indicated turn power off to the rectifier
- 5.6.3 If no voltage is indicated open the door of the unit
- 5.6.4 Check the volt meter and the ammeter for readings
- 5.6.5 Verify the volt reading using a portable multimeter
 - 1. Connect the positive lead to the positive output terminal
 - 2. Connect the negative lead to the negative output terminal
 - 3. Set the multimeter to DC Volts
 - 4. Observe and record the reading
- 5.6.6 Verify the ammeter reading using a portable multimeter
 - 1. Connect the positive lead to one side of the shunt
 - 2. Connect the negative lead to the other side of the shunt
 - 3. Set the multimeter to DC mV
 - 4. Observe and record the reading
 - 5. Locate the amp rating for the shunt
 - 6. Calculate the current output
 - 6 a. $\text{Current Output (Amps)} = \text{mV reading/mV rating} \times \text{shunt Amp rating}$
- 5.6.7 Visually check inside the case for debris that could block airflow, wires with missing insulation, scorch or burn marks, loose connections

6.0 Rectifier Troubleshooting

6.1 General

- 6.1.1 To troubleshoot a rectifier and return it to operation.

6.2 Rectifier Safety

- 6.2.1 Never approach a rectifier or electrical equipment until observing the surroundings.
- 6.2.2 Do a visual check of any loose wires on or around the service pole.
- 6.2.3 Do a visual check of any line fuses/transformers feeding the service pole. Note anything unusual.
- 6.2.4 Approach rectifier with proper safety equipment.
 - 1. Voltage tester to test rectifier cabinet/components
 - 2. Gloves
 - 3. Safety glasses
 - 4. Proper protective head gear

6.3 Rectifier Components

- 6.3.1 Cabinet -protects the rectifier components from the elements
- 6.3.2 Circuit Breaker -serves as an on-off switch and overload protection
- 6.3.3 Transformer -reduces the line voltage to a useable level for the cathodic protection system and isolates the CP system from the incoming power

UNCONTROLLED IF PRINTED

- 6.3.4 Rectifier Stack to change A.C. to D.C. (Silicon) or (Selenium)
- 6.3.5 Fuses to protect the more expensive components (like Diodes, ACSS, etc.)
- 6.3.6 Meters to indicate D.C. Voltage and D.C. Current
- 6.3.7 Shunts to accurately measure circuit current
- 6.3.8 Arrestors to protect the rectifier from voltage and lightning surges

6.4 Troubleshooting Basics

6.4.1 An adequate inspection and maintenance program will greatly reduce the possibility of rectifier failure. Rectifier failures do occur, however, and the field technician must know how to find and repair troubles quickly to reduce rectifier down time.

6.4.2 Major causes of rectifier failures:

1. Neglect
2. Age
3. Lightning

6.5 Troubleshooting Precautions

6.5.1 Turn the RECTIFIER and the MAIN DISCONNECT OFF

6.5.2 Be careful when testing a rectifier which is in operation. Safety first!

6.5.3 Consult the rectifier wiring diagram before troubleshooting

6.5.4 Correct polarity must be observed when using DC instruments

6.5.5 Rectifier should be in the OFF position before using an OHMMETER

6.6 Troubleshooting Procedures

6.6.1 Most rectifier troubles are simple and do not require extensive detailed troubleshooting procedures. It is usually better to systematically isolate the rectifier components until the defective part is found. The most common problems are:

1. Faulty meters
2. Loose terminals
3. Blown Fuses
4. Open ground bed leads
5. Lightning damage

6.6.2 Troubleshooting Procedures. See [Figure 1](#) "Typical Rectifier Circuit" for reference testing points.

1. Rubber gloves rated for 600 V are required to test live circuits over 50V.
2. Voltages inside the rectifier cabinet on some components exceed 50V.
3. Test the AC voltage across line side of the rectifier circuit breaker. (Points A - A)
4. Test the AC voltage across load side of the rectifier circuit breaker. This voltage should be the same as the line side. (Points B - B)
5. If no voltage is present at the breaker, check for voltage in the disconnect box.

UNCONTROLLED IF PRINTED

6. If there is no voltage at the line side disconnect, call the power supplier.
7. If there is no voltage on the load side of the disconnect, check fuses or breakers.
8. Check the input change taps for loose connections. Clean bars and nuts until bright before re-installing. (Point C)
9. Adjust for the correct input voltage.
10. Test the transformer secondary tap link bars for the presence of voltage. Voltage should be measured between the center taps of the high and low taps. (Points D - E)
11. If the circuit breaker trips, indicating a short circuit, the transformer can be isolated by removing the link bars. If the circuit breaker continues to trip, the transformer is shorted. If the circuit breaker holds, the short is not in the transformer.
12. If the circuit breaker trips after checking the transformer, isolate the stack by removing the DC leads. (Points H and J)
13. If the circuit breaker continues to trip when the DC leads on the stack are removed, a short circuit is probably in the stack.
14. If the circuit breaker does not trip when the DC leads on the stack are removed, but does when the leads are connected, a short circuit is probably the external ground-bed or structure leads.
15. Test the AC voltage supplied to the rectifier stack. This voltage should be the same as the voltage measured across the taps. (Points F - G)
16. If AC voltage is supplied to the stack, check the DC output voltage. If DC voltage is present but is less than expected, stack may have an open circuit and is half-waving. (Points H - J)
17. If DC voltage is present at the stack, but not at the rectifier output check for loose connections or open leads. (Points J - L and J - K)
18. Meters may cause the rectifier to appear defective. Check meter with portable meters known to be accurate.
19. If DC voltage is present at the rectifier output terminals, but no current is flowing, there is an open in one of the external DC leads.
20. Turn rectifier off and check by connecting positive output terminal to a temporary ground. If current output is present when the rectifier is re-energized, there is an open on the positive cable.
21. Lightning arrestors in rectifier may be isolated by removing them from the circuit.
22. If it is suspected that the choke is defective, it may be effectively taken from the circuit by placing a heavy jumper lead across the chock leads.

6.7 Troubleshooting More Difficult Problems

- 6.7.1 When troubleshooting more difficult problems it is usually better to systematically isolate the rectifier components until the defective part is found.

6.8 Troubleshooting Tips

- 6.8.1 Many rectifier problems are relatively obvious to the experienced technicians upon physical examination. The obvious should never be overlooked. Loose connections, signs of arcing, strange odors, etc., indicate troubles, which do not require elaborate test procedure to uncover.
- 6.8.2 Helpful Troubleshooting Tips to Follow:
1. No output voltage or current present.
 - 1 a. Breaker tripped (or fuse blown)
 - (i) ~Steady overload, reduce output slightly.
 - (ii) Short circuit in some component.
 - 1 b. No AC line voltage
 - 1 c. Open circuit
 - (i) Check all connections
 - (ii) Check all diodes in silicon stacks
 - 1 d. Defective meters or meter switches
 - 1 e. Defective transformer, good primary input, but no secondary output.
 - (i) Secondary probably open.
 - (ii) Check DC resistance of windings with an ohmmeter.
 - a. Secondary should have less than 1 Ω resistance.
 - b. Primary should have 1-10 Ω resistance
 - c. An open circuit is possible if resistance is extremely high.
 - 1 f. Circuit Breaker (or thermal overload protectors). If contacts do not close, repair or replace breaker.
 2. If maximum DC output amps at rated DC volts is half output.
 - 2 a. Check for proper AC input voltage.
 - 2 b. Check stacks for plates open circuit, this would make unit operate as a half-wave rectifier.
 - 2 c. Badly aged stacks.
 - 2 d. For 3-phase rectifiers in addition to the above single-phase rectifiers.
 - (i) Open circuit if, one AC line is considerably less than the other two.
 - (ii) One of three stacks is more aged than the other two.
 - 2 e. Low line voltage.
 3. Variable Transformer Control
 - 3 a. Some rectifiers may be equipped with a variable transformer in lieu of the standard tap and link bar arrangement. The variable transformer will provide step-less, infinite control of the output of the rectifier.
 - 3 b. (Troubleshooting the variable transformer will be the same as the procedure for the main transformer.
 - (i) AC input voltage should be checked across terminals one and four.

UNCONTROLLED IF PRINTED

- (ii) Output AC voltage can be checked across terminals one and three. (Control knob should be at maximum rotation.)
- (iii) Output voltage should be the same as input voltage.
- (iv) If no AC voltage is present on the output terminals of the variable transformer, check for open winding, dirty or worn wiper brush.

CORR 2.10 Corrosion Control: Rectifier Maintenance and Troubleshooting, October 1, 2020

Location of Changes	Summary of Changes
Appendix A – Rectifier Installation, 3.3 Material List	Anode Splice Box, Dryconn VisiLock with Smart Gel, 4922428, replaced #90-B-1 Epoxy Spice Kit
Appendix A – 4.1.1 Rectifier Ground Bed Header Lead Connection	Grammatical - The Dryconn splice box does not have shelf life or temperature restraints whereas the 3M A Scotchcast Resin Kit does.

Appendix A - Rectifier Installation

1.0 General

1.1 Rectifier and anode bed installations should be designed by Gas Operations Support personnel with the training or experience to design impressed current cathodic protection systems.

2.0 Typical Rectifier and Ground Bed Layout

2.1 Detail

The number of anodes varies from installation to installation.

2.2 Installation

2.2.1 A 20 feet x 500 feet easement is typically required for the rectifier installation.

UNCONTROLLED IF PRINTED

2.2.2 Corrosion Control personnel designing the rectifier installation will determine and specify anode spacing and installation methods.

3.0 Rectifier Ground Bed Anode Installation

3.1 Detail

Note: Overall canister length is 7 feet

3.2 Installation

3.2.1 Do not use wire lead to lower anode.

3.2.2 Backfill anode with clean backfill and tamp firmly. Loose coke breeze is an optional backfill material

3.2.3 Recommended depth of hole is a minimum of 10 feet.

3.2.4 Recommended cable depth is 3 feet.

3.3 Material List

Item	Stock No.	Description	Quantity
			01
1	49 22 404	Anode, 3" x 60", Silicon iron Packaged with coke breeze, total length of package is 84" (7 feet)	1
2	49 22 428	Anode Splice Box, Dryconn Vislock with Smart Gel	1
3	49 22 405	Conductor, #4, Stranded, 600V, CU	1
4	17 54 373	Connector, Electrical, Split Bolt, 2 AWG Stranded, 4 CWC	1

4.0 Rectifier Ground Bed Header Lead Connection

4.1 Each anode lead wire connection in a rectifier anode ground bed shall be protected with a Dryconn VisiLock with Smart Gel Anode Splice Box or Anode Splice Box 3M A Scotchcast Resin Kit (90-B1).

4.1.1 The Dryconn splice box does not have a shelf life or temperature restraints where as the 3M A Scotchcast Resin Kit does

Dryconn VisiLock with Smart Gel Anode Splice Box

Stock Code 49 22 428

Anode Splice Box 3M A Scotchcast Resin Kit (90-B1)

Stock Code 62 55 100

4.1.2 General

1. Install the ground bed for a rectifier, as shown in Section 2. Splice the Dur-iron anodes with 6 feet of #8 7-strand cable to the #4 7-strand CP cable. Attachment is made with a split-bolt connector. Insulate and protect with a Dryconn VisiLock with Smart Gel Anode Splice Box or 3M's Scotchcast resin splicing kit.

4.2 Description

- 4.2.1 Dryconn VisiLock with Smart Gel is a one piece waterproof and corrosion proof box that contains a Smart Gel.
 1. Box is pre-filled with a non-toxic gel
 2. Box is re-enterable, semi-transparent, encapsulated splice box allows for visible splice examination
 3. Locking mechanism centers splice in box
 4. No shelf life with Smart Gel
 5. Designed to protect cathodic splices from corrosion

UNCONTROLLED IF PRINTED

6. Used to make tap or branch splices on insulated cables rated up to 100v
- 4.2.2 3M's Scotchcast resin splicing kit contains the material required to make the splice, except the split-bolt connector (17-54-373). The kit includes:
1. Two-piece snap together mold body
 2. Tape for sealing the ends
 3. Funnel
 4. Insulating and sealing compound (Scotchcast Brand 4 Resin) in Unipak container.

Note: This kit will accommodate the following connector and conductor sizes.

3M Scotchcast Resin Splice Kit (60-3500)			
Kit No.	Cable OD	Conductor Size	Sheath Opening
90-B1	Feeder Cable 1/2" to 13/16"	Split bolt 1/0 AWG (max.)	3" (max.)
	Branch Cable 3/8" (max.)	Crimped 2/0 AWG (max.)	

90-b1.tbl

4.3 Instructions

4.3.1 Dryconn VisiLock with Smart Gel Anode Splice Box

1. Install electrical connection per connector manufacturer's instructions
2. Lay main conductor into conductor cradles centering electrical connector as shown in Figure A
3. Position tap conductor in the box as shown in Figure A., Tap conductor be positioned to exit either side of housing.
4. Install wire ties tightly around the main conductor. Cut remaining length of wire tie and discard.
5. Close housing verifying it is securely latched.

Figure A

4.3.2 3M's Scotchcast resin splicing kit

1. Prepare cable ends by removing insulation required for connector used.
2. Scrape insulation 5 inches back, adjacent to connection, to remove all wax and dirt.
3. Snap the transparent mold bodies over the splice.
4. Insert funnel in upright position.

UNCONTROLLED IF PRINTED

5. Seal ends with tape to form a resin-tight envelope. An extra wrap of electrical tape to hold the mold is recommended.
6. Squeeze the Unipak container to mix resin thoroughly. The resin mix pours best when temperature is 60°F to 90°F. On colder days, keep the kits in truck cab.
7. Open the pack and pour resin until mold and funnel are completely filled. Re-fill funnel after air escapes.
8. Note: Curing time for the resin is approximately 30 minutes. Resin may be kept in truck cab or in a sunny location to get a faster cure in cold weather.
9. Place cable in ditch after resin has cured. Time can be saved if splices are made in the ditch.
10. Backfill the ditch.

Figure 1 - Top Pour

Figure 2 - Side Pour

Figure 3

Note: The preferred pouring position is from the top as shown in Figures 1 and 3. If necessary, the kit can be poured from either side. Cut thin membrane from boss at

top of desired pouring position. Insert pouring spout and plug remaining hole with small plastic plug provided in kit. (See [Figure 2.](#))

5.0 Connection of Rectifier Lead to Transmission Main

5.1 Detail

5.2 Installation

- 5.2.1 Do not attach wire within 2 inches of nearest girth weld.
- 5.2.2 The connection should be at least 6 inches apart.
- 5.2.3 Leave sufficient slack in wire to avoid damage by backfilling.
- 5.2.4 Attach wire to pipe with #15 thermite weld.
- 5.2.5 Coat each connection according to the methods described in [CORR 2.8 Appendix B.](#)

5.3 Material List

Item	Stock No.	Description	Quantity
			02
1	18 66 624	#8 Stranded Copper	X
2	62 55 100	Epoxy Splice Kit	1
3	22 02 552	Thermite Cad Weld	2

CORROSION CONTROL

October 1, 2021

CORR 2.11 Records

1.0 Purpose

This section provides instructions on how construction orders are to be reviewed by an individual qualified in corrosion control both during the design and following construction.

Instructions are provided for furnishing detail test point information, and performing other cathodic protection record activities.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Construction Order Review Processes](#)

[5.0 Additional Detail Information for Test Points](#)

[6.0 Other Cathodic Protection Record Activities](#)

Appendices:

[Appendix A - Cathodic Protection Review Responsibility Table](#)

[Appendix B - Cathodic Protection Review Stamp](#)

[Appendix C - Cathodic Protection Design Checklist](#)

3.0 Target Audience

- Gas Engineering
- Distribution Design Center Supervisors
- Gas Tech Engineering
- Corrosion Control Supervisors
- Corrosion Control Specialists

4.0 Construction Order Review Processes

4.1 General

4.1.1 The purpose of Construction Order Review processes is to ensure that a person qualified in pipeline corrosion control methods reviews construction orders for changes made to the pipelines that affect the protection and monitoring systems for the new and existing piping.

4.1.2 A person qualified in pipeline corrosion methods shall review proposed gas designs in order to ensure that cathodic protection (CP) systems are optimized for the protection and monitoring of facilities and that CP records are kept up to date.

4.1.3 To achieve these goals, each qualified person should work with the following to ensure each understands their responsibility in maintaining cathodically protected gas facilities:

1. Gas Supervisors
2. Distribution Design Engineers
3. Field Engineering Representatives

UNCONTROLLED IF PRINTED

4. Region Engineering
5. Gas Tech Engineering.

4.1.4 The qualified person is designated by position within the processes below. The Supervisor - Corrosion Control or designee shall provide the review if the specified person is unable to do so.

4.2 Distribution Design Center (DDC)/Peoria Design Center (PDC)

4.2.1 Design Center Orders and Service Orders Impacting Steel Gas Facilities:

1. Preconstruction - Proposed Work

- 1 a. The person providing field notes to a Design Center shall provide a copy of the field notes to the Corrosion Technician or local engineer responsible for cathodic protection of the facilities whenever steel mains or services with steel components are impacted by the work, except when installing new farm tap services.

A design for modification of an existing farm tap does need to be sent for review.

- 1 b. When field notes are provided, the Corrosion Technician or the local engineer responsible for cathodic protection design in that area shall review the proposed work and provide direction related to cathodic protection requirements. See [Appendix A](#) Cathodic Protection Review Responsibility Table for person to contact.

2. Preconstruction - Final Design

The Design Center Supervisor is responsible to ensure that the Designer sends an email with a PDF file of the final construction print to the Corrosion Technician or local engineer responsible for cathodic protection of the facilities whenever steel mains or services with steel components are impacted by the work, except when installing new farm tap services.

A design for modification of an existing farm tap does need to be sent for review.

- 2 a. A hold will be placed on the DOJM by the Designer until the review is complete. See [Appendix A](#) Cathodic Protection Review Responsibility Table for person to contact.
- 2 b. The Corrosion Technician or engineer responsible for cathodic protection of the facilities shall review the proposed work and provide direction related to cathodic protection requirements and email the Designer with any changes needed in a timely manner.
- 2 c. The review will be documented when the hold on the DOJM has been cleared by the Corrosion Technician or the local engineer responsible for cathodic protection of the facilities.

3. Post Construction - As Built

- 3 a. As built work can be reviewed in Ameren Map Viewer (AMV) for changes from the final design.
- 3 b. The Corrosion Technician will add, delete, or change test points based on how the "as built" job may have changed a structure.
- 4. Gas Engineering Work (Work designed by Gas Tech Engineering or Consultant)
 - 4 a. Preconstruction - Proposed Work
 - (i) The Designer will send an email with a location map and a description of the proposed work.
 - (ii) The Corrosion Technician will review job for cathodic protection (CP) issues and communicate any necessary changes in a timely manner.
 - 4 b. Preconstruction - Final Design
 - (i) Corrosion Technicians need to review the final design prior to construction start.
 - (ii) The Designer will send a print of the final job to Corrosion Technician prior to issuing final packet.
 - (iii) The Corrosion Technician will review final design in a timely manner. Gas Engineering will include a bullet on their Design Checklist, see [Appendix C](#), for this step. The review will be documented on the Cathodic Protection Review stamp, shown in [Appendix B](#), included on the print.

When electronic copies of prints are reviewed, the title block can be filled out and attached to an email to document the review.

- (iv) The Corrosion Technician will e-mail Designer with any changes or approval of CP related design.
- 4 c. Post Construction - As BUILTS
 - (i) Corrosion Technicians need to review the "as built" print for field changes.
 - (ii) The DDC/PDC Poster will give a copy of the "as built" print to the Corrosion Technician if field changes were made.
 - a. If the facility is built as designed, the engineer will send an email stating no changes were made.

The Corrosion Technician will be contacted for input on any field changes that arise during construction.

- (iii) The Corrosion Technician will add, delete, or change test points based on how the "as built" job may have changed a structure.

- a. The Corrosion Technician will send mapping changes to the DDC/PDC for posting as needed.

Prints may be sent electronically or on paper.

4.3 Cathodic Protection Design Review Checklist

- 4.3.1 The checklist in [Appendix C](#) is intended to assist the Corrosion Technician in reviewing gas orders for cathodic protection related items.
- 4.3.2 This form is not required for each review but can be used and amended as necessary.

5.0 Additional Detail Information for Test Points

- 5.1 Some test point installations need additional information in order to locate the test point location or to place the half cell in the correct location. Examples of these test points are pipeline crossings and test points located in urban areas or in off the road locations.
- 5.2 Test Point Detail Sketch
 - 5.2.1 Each test point detail sketch may be attached to the asset within Maximo. See [Figure 1](#) & [2](#).

6.0 Other Cathodic Protection Record Activities

6.1 Pipe Exam Review Process

- 6.1.1 Transmission, high pressure distribution and distribution pipe Buried Pipe Examinations are completed within ClickMobile and stored in Maximo. See [CORR 1 Appendix A](#) Buried Pipe Examination Form.
- 6.1.2 For deficient pipe-to-soil potentials the review and investigation should consider:

UNCONTROLLED IF PRINTED

1. Are the annual test points for the structure also deficient?
2. If the deficient potential is at a service, is the service isolated?
3. If not, continuity must be verified for the pipe in question
4. If the pipe is continuous, test point locations must be reviewed to determine where additional test points need to be added to reflect the potential of the location of this deficiency.
5. The source of the deficiency must be determined and a corrective order prepared.

6.1.3 For corrosion found the review and investigation should consider:

1. The current cathodic protection potentials in the area.
2. The history of cathodic protection potentials in the area
3. The history of repaired leaks in the area and their cause.
4. Any deficient pipe-to soils need to be investigated as indicated above.

6.1.4 Corrective orders for deficient pipe-to-soil potentials not related to annual test points can be tracked in Maximo.

6.2 Annual Tasks

6.2.1 Each year the Corrosion Tech should review the testing and facility records for any updates or improvements that need to be made.

6.2.2 These are records related tasks that need to be performed on an annual basis:

1. Before December 31 check 10% of isolated read status. Refer to 49 CFR §192.465(a)
2. As needed, review routing for surveys
3. As needed, review structures and maps
4. As needed, perform T.P. Additions/Retirements/Changes
5. As needed, review electronics added to stations
6. As needed, review of voltage shifts at test points
7. Review rectified ground bed resistances
8. Review pipeline crossings as needed
9. As needed, review casing drawings or permits for casing details to be added as test point detail sketches in Maximo.

End of Instructions.

GAS CONSTRUCTION OVERSIGHT

October 1, 2021

CONS 1 Requirements

1.0 Purpose

This document is to ensure that all gas construction, including that performed by outside contractors, meets the requirements of 49 CFR Part 192 and Title 83 of the ICC Code, plus the O&M Plan.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Records, Maps, and Operating History](#)[5.0 Coordinating Construction](#)[6.0 Responsibilities](#)[7.0 Construction Inspection](#)[8.0 Major Focus Areas for Contractor Activities](#)**3.0 Target Audience**

- Gas Supervisor
- Construction Services Supervisor
- Construction Inspector
- Gas Control

4.0 Records, Maps, and Operating History

- 4.1 Construction records, maps, and operating history are available to field personnel, requesting such through the local Operating Center.
- 4.2 Gas system maps are accessed through the Ameren Illinois (AIC) map viewer.
- 4.3 Construction records and operating history are typically located based on the facility type and operating area. Portions of the operating history are typically maintained in Maximo.

5.0 Coordinating Construction

- 5.1 When construction (by AIC or contractor) might affect system operations or SCADA (or an ERX), the following shall communicate with Gas Control prior to beginning project and at completion:
 - 5.1.1 Gas Engineer,
 - 5.1.2 Gas Supervisor,
 - 5.1.3 Gas Tech Engineer,
 - 5.1.4 Construction Services Supervisor, or
 - 5.1.5 Construction Inspector.
- 5.2 Those construction activities might include

UNCONTROLLED IF PRINTED

- 5.2.1 Installing control fittings and shutting-off gas to a section of main.
- 5.2.2 Connecting two mains that could be at different pressures.
- 5.2.3 Isolating or temporarily by-passing a pressure control station/gas system.
- 5.2.4 Activating a new, rebuilt, or relocated pressure control station.
- 5.2.5 Upgrading a system or section.
- 5.2.6 Repairing a gas main that involves lowering the operating pressure.
- 5.2.7 Activating a significant extension.

Gas Engineer or Gas Tech Engineering to determine if extension is significant.

6.0 Responsibilities

- 6.1 The Gas Supervisor, Construction Services Supervisor, or the Construction Inspector is responsible (as applicable to respective projects) to ensure or verify the following:
 - 6.1.1 Personnel are qualified to perform construction activities in accordance with O&M Plan and current OQ requirements.
 - 6.1.2 Assigned personnel are aware of the associated gas system MAOP, method of cathodic protection, and whether remotely monitored facilities will be impacted.
 - 6.1.3 Work is performed in a manner that does not endanger the public or expose AIC to unnecessary risks.
 - 6.1.4 All activities meet the requirements of the O&M Plan through observation of gas construction.
 - 6.1.5 All "As-built" records and maps documenting the completed work are thoroughly and accurately established and submitted.
- 6.2 Other Duties
 - 6.2.1 Implement immediate corrective action if any gas construction activity is found to be out of compliance with the O&M Plan, federal / state regulations, or the approved construction plans.
 - 6.2.2 When applicable,
 - 1. Maintain coordination with public officials and owners of other affected facilities.
 - 2. Contact affected private property owners regarding timing and scope of the proposed work.

7.0 Construction Inspection

- 7.1 To ensure objectives are met, AIC will assign an inspector (either specific inspector, management employee, or field employee) to oversee contractor's work typically as follows:
 - 7.1.1 Major replacement projects (e.g., main replacements, relocations): full-time inspector for each project.

- 7.1.2 New business projects: inspector present during major focus areas (see [Sub-section 8.1](#) below for example list).

Generally, these projects require less oversight due to little interaction with existing customers, and construction is being done in predominantly undeveloped area. As such, it is expected that an inspector can oversee multiple projects within a given geographical area.

- 7.1.3 Transmission or high-pressure distribution projects: will require a full-time inspector due to the on-going welding of steel facilities. Inspector shall be present during major focus activities.

Off-site fabrication does not require a full time inspector but might warrant periodic inspection.

- 7.1.4 O&M projects: inspector present during major focus activities. These projects include:

1. Tapping/stopping.
2. Lowering of "main" into ditch.
3. Installing regulator or odorizer stations.
4. Leak repairs.
5. Service cut-offs.
6. Replacing service risers.

An inspector may be assigned to multiple crews working in various locations on small maintenance projects such as service cut-offs, replace/relocate existing service risers, and anode installation.

7. The Construction Inspector, Gas Supervisor, and Quality Assurance Consultants shall make periodic inspections of small, scattered work sites to ensure O&M procedures are followed.

- 7.2 The following shall attend Gas Construction Inspector Training prior to inspection duties:

- 7.2.1 Field employees.
- 7.2.2 Management personnel.
- 7.2.3 Hired contractors.

- 7.3 Construction Inspector Training shall include:

- 7.3.1 O&M Plan procedures for construction tasks.
- 7.3.2 Gas Construction Oversight procedures.

- 7.3.3 Related forms and documentation requirements.
- 7.3.4 Review of Quality Assurance Field Inspection forms.
- 7.3.5 An exam will follow.

8.0 Major Focus Areas for Contractor Activities

- 8.1 Major focus areas for added attention are:
 - 8.1.1 Large diameter tapping (4" and larger).
 - 8.1.2 Welding/plastic fusion (when project commences and periodically thereafter).
 - 8.1.3 Applying liquid epoxy coating.
 - 8.1.4 Inspecting steel coating (e.g., "jeeping").
 - 8.1.5 Ensuring proper backfill and depth of cover.
 - 8.1.6 Pressure testing of mains.
 - 8.1.7 Purging of main.
 - 8.1.8 Pigging of main.
- 8.2 Quality assurance (QA) inspections should be performed periodically while addressing major focus areas.
- 8.3 The inspector should document the QA inspections on the Quality Assurance Form. See [QUAL](#) section of the O&M Plan. Completed forms to be forwarded to Superintendent Quality Assurance.

End of Instructions.

GAS CONSTRUCTION OVERSIGHT

October 1, 2021

CONS 2 Inspector Responsibilities

1.0 Purpose

This document outlines the responsibilities of the Construction Inspector who shall represent Ameren Illinois (AIC), ensure quality construction, and see that the work meets the requirements of 49 CFR Part 192 and Title 83 of Part 590 to ICC Code, plus the O&M Plan.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Pre-job Considerations](#)

[5.0 Existing Facilities](#)

[6.0 Safety](#)

[7.0 Routine Activity](#)

[8.0 Record Requirements](#)

[9.0 Extras](#)

3.0 Target Audience

- Construction Inspector
- Gas Supervisor
- Gas Tech Engineering
- Gas Control

4.0 Pre-job Considerations

- 4.1 Once a contractor has been selected, an inspector should be assigned to the specific job.
- 4.2 Upon receiving the work order packet, the inspector should:
- 4.2.1 Familiarize themselves with the work with packet and ensure it includes:
1. Latest project prints and bills-of-material.
 2. All permits.
 3. Necessary easements.
 4. Any special conditions or requirements.
 5. Applicable documentation forms.
- 4.2.2 Discuss with design personnel if there are any required communications with other groups such as:
1. Region Gas Operations,
 2. Gas Engineering,
 3. Gas Operations and Services - Technical Service Supervisor,

UNCONTROLLED IF PRINTED

4. Distribution Control (Dispatch), or

5. Gas Control.

4.2.3 Obtain necessary contact information and phone numbers.

4.2.4 Verify how the associated system is cathodically protected (either rectifier or sacrificial anodes) and if it contains equipment remotely monitored by Gas Control.

4.3 Inspector shall ensure all needed material is available: either on jobsite, in storeroom, or ordered and in transit.

4.4 Inspector should confirm that affected customers have been notified before beginning construction, informing them as to nature of the work.

4.5 Contractor should note condition of construction area to reduce false claims against both the contractor and AIC through such means as photographs and/or videos.

5.0 Existing Facilities

The inspector should ensure that:

5.1 Whenever necessary to interrupt customer service:

5.1.1 Be assured the customer is notified of the interruption, and

5.1.2 Arrange with appropriate operating center to restore service (if required).

5.2 Contractor is aware of all known underground facilities and has uncovered all of those which may conflict with Contractor's project.

5.3 Contractor shall notify JULIE, 811 -- the One-Call system -- and the owner of any damaged facility.

5.3.1 Replacements or repairs made by the contractor, or by anyone other than the owner of the damaged facility, are to be done to the satisfaction of that facility owner.

5.4 All damages are to be reported and properly recorded.

6.0 Safety

The Inspector shall ensure that:

6.1 All work is executed safely to prevent personal injury or property damage in accordance with the O&M Plan, local, state, and federal regulations.

6.2 Barricades, warning signals, and flagmen, when required, are provided by the contractor.

6.3 All excavations shall adhere to [EXCV](#) section of the O&M Plan.

6.4 General construction areas, material storage areas, and contractor's parking areas are kept clean, neat, orderly, and hazard-free at all times.

7.0 Routine Activity

The inspector shall:

7.1 Verify that all utility locates, permits, and easements are current.

7.2 Check status of material.

7.3 Verify that all parties are using latest drawings and specifications and are aware of the latest change orders.

- 7.4 Verify contractor employees are Operator Qualified (OQ) for work they are performing or otherwise working under direct supervision of an OQ individual. See [OQAL](#) section of the O&M Plan.
 - 7.4.1 Give specific attention to those functions involved in the respective construction scope, ensuring that all covered tasks outlined in [OQAL 2.01](#) are fully addressed and documented.
 - 7.4.2 Contractor is responsible to have a copy of individual qualifications on site.
- 7.5 Determine that all work (to include drawing details and design specifications) is done in strict accordance with O&M procedures plus all local, state, and federal regulations.
- 7.6 Coordinate contractor's construction activities (to include tapping, tie-ins, purging) with the appropriate AIC operating centers.
- 7.7 Resolve questions and conflicts with the appropriate personnel.

8.0 Record Requirements

The inspector shall ensure:

- 8.1 See [Subsection 7.4](#) for OQ records requirement.
- 8.2 Contractor submits completed daily progress reports for AIC approval.
- 8.3 As-built drawings showing accurate details and measurements are kept up to date as the job progresses to include:
 - 8.3.1 Any variations of main and service locations from those shown on the original drawings.
 - 8.3.2 Actual footage of mains and services installed are verified with the contractor.
 - 8.3.3 Complete for the following items:
 - 1. Anodes.
 - 2. Test-lead wire boxes.
 - 3. Insulators.
 - 4. Valves.
 - 5. Other fittings.

Complete details and measurements are required for recording in the electronic map

- 8.4 Documenting circumstances causing a slow-down or work-stoppage to include:
 - 8.4.1 Permit delays or violations.
 - 8.4.2 Material problems.
 - 8.4.3 Incident or accidents.
 - 8.4.4 Any other delays.
- 8.5 Paving repair orders are completed per local, state, and federal requirements.
- 8.6 When the job is completed, following records are submitted to the appropriate Gas Supervisor and/or Gas Tech Engineering for review (accuracy and completeness):

UNCONTROLLED IF PRINTED

- 8.6.1 "As-built" drawings and related tie-in sketches.
- 8.6.2 Material detail.
- 8.6.3 Field notes.
- 8.6.4 Pressure test records.
- 8.6.5 If applicable, radiographic or other non-destructive inspection records.
- 8.6.6 Any other construction details.

9.0 Extras

Extras are defined as any significant change or deviation from the original work scope.

- 9.1 The inspector should avoid extras whenever possible but resolving such promptly and not allowed to accumulate until the end of the job.
- 9.2 If a major scope change is encountered, the inspector and related supervisor should meet with the contractor before making the change to discuss potential impact, cost factor, and resolve agreement.
- 9.3 The inspector should note on the appropriate drawing and progress report the authorizing person's name and date.

End of Instructions.

DAMG 0 Damage Prevention: Table of Contents, October 1, 2020.

Revision Notes

Location of Changes	Summary of Changes
DAMG 1	Inserted new section 11.0 Back-Flagging

1.0 Purpose

This document is to ensure that a Damage Prevention Program is established by Ameren Illinois (AIC) to prevent damage to underground pipelines during excavation activities and to fully meet the requirements of 49 CFR Part 192, specifically §192.614, and Title 83 of the ICC Code. Program includes participation in the Illinois One-Call program (JULIE).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Types of Locate Requests](#)

[5.0 Illinois One-Call System - JULIE](#)

[6.0 Damage Prevention Notification to Excavators and Public](#)

[7.0 Inspection of Excavation or Construction Activities](#)

[8.0 Excavating Near a Transmission Pipeline, High-Pressure Distribution, or Steel Main 8" and Larger](#)

[9.0 Emergency Locate Requests](#)

[10.0 Facility Location Information](#)

[11.0 Back-Flagging](#)

[12.0 QA Process](#)

[13.0 Records and Reports](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Personnel
- Gas Construction Services Personnel

4.0 Types of Locate Requests

4.1 General

4.1.1 Locating (and identifying) underground gas facilities is required for all excavation activities including:

1. General excavating,
2. Blasting,
3. Boring,
4. Tunneling,

5. Backfilling.
 6. Removing aboveground structures (by either explosive or mechanical means), or
 7. Other earthmoving operations.
- 4.1.2 Illinois state law requires all excavators, whether contractors, businesses, landowners or homeowners, to contact JULIE a minimum of 48 hours or 2-business days (exclusive of Saturdays, Sundays, and holidays) before any excavation.
- 4.1.3 A locate request is submitted to JULIE through one of the following means:
1. Remote Ticket Entry (RTE) - For professional excavators. AIC utilizes RTE.
 2. On-line with E-Request for non-emergency locate requests- For homeowners and excavators. (www.illinois1call.com)
 3. One-Call number 811
- 4.1.4 The types of "Locate Requests" that excavators may make to report pending excavation and request marking of underground facilities are outlined in sections below.

4.2 Normal Locate

- 4.2.1 A typical locate request provides *advance notice* of excavation to JULIE *48 hours prior to start*. Business day begins at 8 AM and ends at 4 PM. Requests for locates received after hours will be processed the next business day.
- 4.2.2 Excavation *must start within 14 calendar days* from date of locate request (includes day of call); otherwise, ticket becomes invalid.
- 4.2.3 When excavation extends past 28 days from original notice, an extension **MUST** be requested between 20th and 28th calendar day; otherwise, ticket becomes invalid and excavation work must cease after ticket's expiration date.

4.3 Emergency Locate

- 4.3.1 An emergency locate request necessitates immediate repair or action such as the following:
1. Any condition constituting an imminent danger to life, health, or property,
 2. Repair for utility service outage.
 3. Attention to some environmental danger.
 4. Unstable condition that might result in any of the above conditions (e.g., a *hazardous* leak in any service or main).
 5. An open-cut utility locate.
- 4.3.2 All emergency locate requests must be processed immediately.
- 4.3.3 Facility owners are required to respond within 2 hours.
- 4.3.4 Excavators are required to wait the 2 hours, or the date / time requested on notice, whichever is longer. If site conditions at the site dictate an earlier start than the required wait time, it is responsibility of the excavator to demonstrate that the site warranted the early start time. Otherwise, they may be responsible for damage to unmarked facilities if starting prematurely.

4.4 Joint Meet

- 4.4.1 The Joint Meet Request is to openly discuss a large / complicated project. It is not a valid locate request, but for planning coordination only and exchange information to include:
 - 1. Maps.
 - 2. Plans.
 - 3. Schedules.
- 4.4.2 Joint meet should be held at the dig site or location in proximity.
- 4.4.3 Excavator is required to obtain respective locate request separately following the joint meeting.
- 4.4.4 A joint meet is a minimum 48-hour process.

5.0 Illinois One-Call System -- JULIE

5.1 General Notes

- 5.1.1 The following are not business days: Saturday, Sunday, and the observed day for the following holidays: New Year's Day, Memorial Day, Independence Day, Labor Day, Thanksgiving Day, Day after Thanksgiving and Christmas Day.
- 5.1.2 *Normal business hours for JULIE: 8 AM to 4 PM Central Time.* For Non-Emergency JULIE calls received after 4PM, request will be processed as if received at 8 AM on the next business day. Hence, the locator has 2 full business days to mark facilities.
- 5.1.3 AIC prohibits the use of "waive call-back" option for all generated locate requests.

5.2 Ticket Transmittal

5.2.1. Locate Tickets

- 1. When JULIE receives a locate request, the proposed dig site is located on their electronic map, which also contains approximate location of some buried facilities by the owning utility.
- 2. AIC provides JULIE monthly reports with electronic mapping of (electric and) gas buried facilities.
- 3. A polygon that surrounds AIC facilities is reflected on JULIE's mapping system. If the proposed dig site is within the polygon, a JULIE Dig Request Notice is sent to AIC and/or its representative.

5.2.2 Emergency Locate Tickets

- 1. Each Emergency Ticket is transmitted to AIC and/or its representative.
- 2. AIC to make a quick review to determine if any AIC facility is in dig site area and acts as follows.
 - 2 a. If AIC facility could be affected, ticket is forwarded to the appropriate locating contractor.
 - 2 b. If no AIC facilities involved, clear ticket and initiate notification to excavator.

5.2.3 No- Response Tickets

1. If a Locate Request is received, but no underground facilities are operated within the area, the person who initiated the Ticket must be notified unless "waived call back" (emergency requests cannot be waived).
2. AIC will provide positive response of no underground facilities by one of the following.
 - 2 a. Face-to-face communication.
 - 2 b. Phone or phone voice mail.
 - 2 c. Electronic mail (E-Mail).
 - 2 d. Facsimile (FAX).
 - 2 e. Mark the area with paint or place flags that indicate no AIC facility is present.
3. All Excavators requesting facilities to be located are required to provide phone number to JULIE where they can be reached for added communication.

5.2.4 Difficult to Locate Facilities

1. Facilities that are difficult to locate should be reported to the appropriate Gas Supervisor to ensure additional actions are taken to identify the location of the facilities.
2. Additional actions may include:
 - 2 a. Review of system maps.
 - 2 b. Review of main or service line construction records.
 - 2 c. Probe the facilities.
 - 2 d. Use of other approved locating methods such as:
 - Locatable pipe rodder, or
 - Acoustic line locator
 - 2 e. Coordinate with the excavator for such actions as:
 - AIC excavating to expose the facility. (Requires an Emergency Locate request by AIC)
 - Isolate the facility from the gas system.
 - Isolate the facility from the gas system.
 - As a last resort, gas field personnel stand-by while excavation crosses the facility
3. Gas field personnel who are standing by to observe the excavation should take the following actions once the gas facility is exposed:
 - 3 a. Take measurements that can be recorded for future locates.
 - 3 b. Record measurements on their ClickMobile maps, take a screen shot, attach to a GIS discrepancy and incomplete it within ClickMobile.

- Measurements on exposed mains should be submitted to the appropriate group for recording on the electronic gas mapping system for future reference.
- 3 c. Check for the presence and condition of trace wire when PE pipe is exposed.
- If the tracer wire is in good condition, report this to the Gas Supervisor for follow-up investigation to determine if the tracer wire has been cut and could be repaired.

6.0 Damage Prevention Notification to Excavators and Public

- 6.1 Annual notification to be sent to known excavators in AIC service area advising of Damage Prevention Program and informing how to contact JULIE for assistance in locating pipeline facilities. Maintenance and coordinating of the notification list are handled jointly by Damage Prevention and Public Awareness groups.
- 6.2 The list of excavators should include:
- Excavators, agricultural field tiling contractors.
 - Contractors, construction companies.
 - Engineering firms.
 - Telephone and cable companies.
 - Electric utilities and electric co-operatives.
 - Pipeline and natural gas companies.
 - Water and sewer utilities.
 - City governments.
 - County governments.
 - Special road districts.
 - Special water and sewer districts.
 - Highway department districts.
- 6.3 AIC will maintain a list of known excavators and field tiling contractors that could operate within AIC territory. The list will be developed from various sources including state contractor licensing boards, local associations, JULIE, and AIC operating areas. Further actions are as follows.
- 6.3.1 Update list annually.
- 6.3.2 Distribute notification annually to known excavators and field tiling contractors.
- 6.3.3 Distributes letter with copy of JULIE Farming Brochure to known field tiling contractors.
- 6.4 Semi-annual notifications will be sent to general public in AIC gas service area advising of damage prevention program and to inform how to contact JULIE for assistance in locating natural gas facilities. The notifications are scheduled / initiated by the AIC Communications / Public Relations Department. Notices will be given through:
- 6.4.1 Newspaper advertisements, and
- 6.4.2 Billing messages (customer's monthly bill).
- 6.5 When AIC becomes aware of excavators who are not utilizing the One Call system, the excavator is contacted and provided information on JULIE regulations and hazards of excavating without first locating buried utilities.

UNCONTROLLED IF PRINTED

7.0 Inspection of Excavation or Construction Activities

- 7.1 Inspection of any excavation near pipeline facilities may be necessary during excavation or construction activities where AIC has reason to believe the activity could damage pipeline facilities. For operator qualifications (OQ) applicable to inspection activity, see [OQAL 1](#), Requirements, and [OQAL 2.1](#), Covered Task List for Numbers 1321 and 1331.
- 7.2 The inspection must be done as frequently as necessary, during and after the excavation or construction, to ensure the facilities are protected and to detect and repair any damage.
- 7.3 In the case of blasting activity within 100 feet of a gas facility, the inspection must include leak survey.

8.0 Excavating Near a Transmission Pipeline, High-Pressure Distribution, or Steel Main 8" and Larger

- 8.1 AIC must take special precautions for Locate Requests in vicinity of all transmission pipelines, steel distribution mains 8-inch and larger, and other distribution facilities with 100 psig MAOP or greater.
 - 8.1.1 Locator will use flags and marking paint.
 - 8.1.2 When locator determines excavation might be within 15 feet, the locator will forward Locate Request to AIC Damage Prevention group.
- 8.2 Particular care should be taken to ensure that excavating, boring, or other trenchless technology do not accidentally contact or damage existing underground facilities.
 - 8.2.1 When excavator plans to use trenchless technology near existing gas facilities, a site survey should be conducted by the excavator to identify any potential conflicts.
 - 8.2.2 As stated in Illinois Underground Utility Facilities Damage Prevention Act (Section 4(b)), the excavator is required to plan excavation or demolition to avoid / minimize interference with underground utility facilities within the tolerance zone. They shall use precautions such as the following while excavation is in progress and until clear of the existing marked facility:
 1. Hand excavation.
 2. Vacuum excavation methods.
 3. Visually inspecting.
- 8.3 AIC personnel or qualified contractor must verify location of excavating activities, contact the excavator, and monitor the excavation by taking the following actions as appropriate.
 - 8.3.1 Where activity is *within 15 feet*, AIC Damage Prevention personnel (or qualified contractor) will contact the excavator to inform them that an additional evaluation may be required.
 - 8.3.2 Where activity is *within 15 feet*, AIC Damage Prevention personnel (or qualified contractor) shall monitor the excavation site and document activities. All documentation shall be maintained on the Damage Prevention and Monitoring SharePoint site or by local area. The location of the excavation and the condition of facility, if exposed, shall be documented on the Buried Pipe Examination form within ClickMobile (or electronic equivalent). See [CORR 1 Appendix A](#).

8.3.3 Where excavation activity is *not within 15 feet*, AIC Damage Prevention personnel (or qualified contractor) shall document findings and maintain such on the Damage Prevention and Monitoring SharePoint site or by the local area. No further action is required.

8.4 AIC personnel (or qualified contractor) must visually inspect site while excavating or boring and back reaming operations are in progress and until those operations clear the existing marked facility and facility verified not damaged. A Buried Pipe Examination form shall be completed within ClickMobile (or electronic equivalent) if the facility is exposed. See [CORR 1 Appendix A](#).

9.0 Emergency Locate Requests

9.1 Near Transmission, High Pressure Distribution, or 8" and Larger Steel Main

9.1.1 In addition to responding to the locate request, AIC must take special precautions for emergency excavation notices in the vicinity of:

1. Transmission main,
2. High pressure distribution facility with MAOP of 100 psig or greater,
or
3. Steel distribution main 8 inches and larger.

9.1.2 When excavation on an Emergency Locate Request may be *within 15 feet* of a facility listed below, Locator will notify Damage Prevention personnel of the excavation and remain at the site until relieved by a qualified AIC personnel or qualified contractor.

1. Transmission main,
2. High pressure distribution facility with MAOP of 100 psig or greater,
or
3. Steel distribution main 8 inches and larger.

9.2 Train Derailment Site

9.2.1 When there is locate request at the site of a railroad train derailment, the locator shall notify AIC Damage Prevention personnel once it is determined there is a gas line in vicinity of the derailment. If there is a gas line in the vicinity, Damage Prevention personnel or the locator will notify local Gas Supervision.

9.2.2 If there is a gas odor in the area, locator shall call the AIC Emergency number 1.800. 755.5000 to report a leak.

9.2.3 Damage Prevention personnel and/or local qualified gas personnel should meet with the railroad representative and emergency response personnel. See [EMER 2.4.8](#), Gas Field Personnel, Train Derailment near Pipeline Facilities.

10.0 Facility Location Information

10.1 Each Operating Region / Business Unit is responsible to ensure "as-built" information is submitted timely to those individuals or groups responsible for maintaining the electronic gas system maps.

10.2 Update electronic mapping system (in G/Tech) within 90 days following approval of completed job packet. See [MAIN 1](#).

- 10.3 AIC to provide updated map information monthly from the electronic mapping system to the JULIE One-Call Program.

11.0 Back-Flagging

- 11.1 Excavation damage prevention best practices have shown "back-flagging" is effective to prevent 3rd party damage to newly installed facilities. AIC and contractor crews are required to back flag all newly installed facilities.
- 11.2 Place "Yellow" locating flags or yellow headed stakes and/or yellow marking paint over the new facilities.
- 11.3 Place enough flags/stakes to ensure the facilities are clearly identified as to route and location.

12.0 QA Process

- 12.1 The Damage Prevention Group will evaluate performance of locating contractors to ensure locates are:
 - 12.1.1 Performed accurately and in a timely manner, and
 - 12.1.2 Personnel are qualified per [OQAL 1](#), specifically Covered Task Number 1291 to "Locate Underground Pipelines."
- 12.2 AIC personnel and locating contractor supervision to investigate known inaccurate locates or missed locates to determine why situation occurred.
- 12.3 The Damage Prevention Group has electronic access to locating contractor's ticket system so real-time monitoring should be performed on as-needed basis.
- 12.4 Hold periodic meetings between AIC Damage Prevention Group and locating contractor management to review performance matrix.

13.0 Records and Reports

- 13.1 Retain copies of completed excavation notices for 2 years, either by:
 - 13.1.1 AIC, or
 - 13.1.2 Locating contractors who marked facilities.
- 13.2 Retain documentation on monitoring excavation for life of facility.
- 13.3 Retain buried Pipe Examination forms as follows:
 - 13.3.1 Completed prior to November 1, 2014 -- life of facility.
 - 13.3.2 Beginning November 1, 2014, completed within ClickMobile -- maintain in Maximo for life of facility.

Otherwise, information from electronic equivalent to be maintained until procedures are available for entering Maximo.

End of Instructions.

Revision Notes

Location of Changes	Summary of Changes
2.0 Scope	Inserted new Section 11.0 Back-Flagging
Subsection 5.1	Moved Paragraph 5.1.4 language to new Section 11.0
Section 11.0 – Back-Flagging	New Section contains language previously in Paragraph 5.1.4
Subsection 13.4	Removed – The Illinois Damage Prevention Act Incident Report is completed by AIC Damage Prevention personnel and is covered in DAMG 2 – Reporting JULIE Violations

DAMAGE PREVENTION

October 1, 2022

DAMG 2 Reporting JULIE Violators**1.0 Purpose**

This document outlines the procedures for reporting excavators that violate the Illinois Underground Utility Facilities Damage Prevention Act (JULIE law). Any person can report a violation to Illinois Commerce Commission (Commission) per 83 Illinois Administrative Code, Section 265.100 Reportable Violations.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 Reportable Violations](#)****[5.0 Investigation of Reportable Violation](#)****[6.0 Reporting a Suspected Violation](#)****[7.0 Commission Review of Reported Violation](#)****[8.0 Notification of Damaged Underground Facilities](#)****3.0 Target Audience**

- Gas Engineering
- Gas Distribution Design
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Personnel
- Gas Construction Services Personnel

4.0 Reportable Violations

4.1 The following types of digging incidents that result in a gas leak on a main shall be reported:

Reference to "digging incident" is not to be confused with "Incident" as defined in 49 CFR §192.3, resulting in more serious consequences and requiring additional reporting. However, a digging incident could result in being a specific and reportable pipeline incident. See [INCD](#).

4.1.1 No JULIE dig number.

4.1.2 Expired JULIE ticket.

4.1.3 Prior to start date / time on JULIE ticket.

4.1.4 Outside the boundaries of JULIE ticket

4.1.5 Other:

1. Using power machinery without first potholing to locate the facilities.

UNCONTROLLED IF PRINTED

2. Failing to take precautions, such as hand excavation, within a tolerance zone of 18 inches on either side of the facility as defined by the markings.
3. Failing to immediately notify the utility of facility damage.

4.2 Additional types of incidents that should be reported:

- 4.2.1 Excavator that repeatedly disregards the requirement to hand excavate service lines.
- 4.2.2 Requesting emergency locate when no emergency exists.
- 4.2.3 Failure to mark underground facilities or improperly mark.
- 4.2.4 Destruction of underground facility marks by someone not involved in the excavation.
- 4.2.5 An outage to the provider of a 911 system.
- 4.2.6 A suspected violation that results in a fatality or personal injuries requiring hospitalization.

- 4.3 A contractor or utility excavator, including Ameren Illinois (AIC), that is suspected to have violated the JULIE law and damages AIC facilities that results in a gas leak on a main shall be reported to the Gas Supervisor and/or Damage Prevention personnel at the earliest practical moment.

5.0 Investigation of Reportable Violation

- 5.1 Once a violation is reported, Damage Prevention personnel shall investigate and document such on the Illinois Underground Utility Facilities Damage Prevention Act Incident Report. The investigation should be thorough and include:
 - 5.1.1 Completed report.
 - 5.1.2 Photos.
 - 5.1.3 Sketches.
 - 5.1.4 Any other supporting information.

6.0 Reporting a Suspected Violation

- 6.1 For a suspected violation, Damage Prevention personnel will prepare an Incident Report for review by Regulatory personnel. Incidents identified as suspected to have violated the JULIE law that require reporting will be sent to the Commission *within 45 days* of the suspected violation.

7.0 Commission Review of Reported Violation

- 7.1 Upon receipt of Incident Report for violation, Commission Staff will assign a JULIE Enforcement Case Number and notify all parties in writing. The review will follow the process outlined in Illinois Administrative Code, Title 83, Section 265.200.
- 7.2 If the Staff determines there is no violation, all parties will be notified in writing and the matter closed.
- 7.3 Administrative penalty may be assessed under the jurisdiction of the Commission for violation of the JULIE law.

8.0 Notification of Damaged Underground Facilities

- 8.1 When damage occurs to any underground facility, the excavator that inflicted damage is required to notify JULIE and the facility owner.

- 8.2 When JULIE receives notification that an underground facility has been damaged, they issue a "Damage" notice to all utilities that have facilities in the area. The "Damage" notice by JULIE is for information only; no action is required.
- 8.3 In event of damage to any underground utility facility (including AIC facilities damaged by AIC crews or their contract crews) that results in escape of any flammable, toxic, or corrosive gas or liquid, the person responsible for the excavation or demolition shall call 911 to notify authorities.

If AIC crew hits an AIC gas line that results in escaping gas, a 911 call is required. However, if fire or police personnel are not needed, AIC representative making the call can inform 911 operator that AIC crew is on site and has situation under control.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Revision Notes

Location of Changes	Summary of Changes
EMER 2.11	New - Gas Storage. Procedures were effective on July 22, 2022.

EMERGENCY PLAN

July 22, 2022

EMER 1 Requirements

1.0 Purpose

This document outlines Ameren Illinois' (AIC's) Emergency Plan in accordance with 49 CFR §192.615.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Procedures](#)

3.0 Target Audience

- Gas Supervisor
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Engineering
- Gas Integrity Management Personnel
- Gas Tech Engineering (GTE)
- Gas Storage Field Personnel
- Public Awareness Personnel
- Gas Control.

4.0 General (§192.615(a)(5), (a)(7), (b)(1))

- 4.1 AIC's highest priority is the safety of the general public, AIC's natural gas customers, and its employees.
- 4.2 AIC's Emergency Plan ensures that people are protected before property.
- 4.3 AIC's Emergency Plan addresses how AIC's Operator Qualified gas personnel evaluate and mitigate emergencies resulting from:
 - 4.3.1 Abnormal operating conditions.
 - 4.3.2 Malfunctions of:
 1. AIC's equipment.
 2. AIC's customer's equipment.
 - 4.3.3 Material defects.
 - 4.3.4 Third party damages.
 - 4.3.5 Natural disasters.
 - 4.3.6 Civil disobedience.
 - 4.3.7 Accidental release of gas from an underground natural gas storage facility.
- 4.4 For every natural gas emergency:
 - 4.4.1 If the caller is from the general public or is one of AIC's customers, AIC shall provide instructions for:

UNCONTROLLED IF PRINTED

1. Moving to a safe place.
 2. Contacting AIC's responder when the responder arrives.
- 4.4.2 If the caller is from a police or fire department or is a public official, AIC shall provide whatever assistance is requested.
- 4.4.3 AIC's response shall be prompt and effective.
- 4.4.4 The situation shall be evaluated professionally and thoroughly.
- 4.4.5 The cause shall be accurately identified.
- 4.4.6 The corrective action shall be thoroughly developed and performed by AIC's Operator Qualified gas personnel.
- 4.4.7 The mitigation measures shall be performed in a safe manner consistent with AIC's Operating and Maintenance Plan (O&M Plan).
- 4.4.8 Service shall be completely and reliably restored to every natural gas customer.
- 4.4.9 AIC's and the customer's gas facilities shall be returned to a safe operating condition.
- 4.4.10 The post review of the emergency action shall determine whether:
1. All safety measures to protect the general public, emergency responders, AIC's customers, and its employees were performed?
 2. Appropriate and timely action was taken?
 3. The cause was accurately identified?
 4. The corrective action was appropriate?
 5. Additional or refresher training is required?
- 4.5 The Emergency Plan is part AIC's O&M Plan. The O&M Plan is:
- 4.5.1 Provided to all supervisory gas personnel, including those responsible for emergency action.
- 4.5.2 Updated periodically and distributed electronically to each supervisor's lap top computer.

5.0 Procedures (§192.615)

Table 1: AIC Compliance with §192.615

	Description of Criteria in §192.615		AIC Procedure
5.1	a	Each operator shall establish written procedures to minimize the hazard resulting from a gas pipeline emergency. At a minimum, the procedures must provide for the following:	
5.1.1	a(1)	Receiving, identifying, and classifying notices of events which	EMER 2.1

		require immediate response by the operator.	
5.1.2	a(2)	Establishing and maintaining adequate means of communication with appropriate fire, police, and other public officials.	PUBL 2.2
5.1.3	a(3)	Prompt and effective response to a notice of each type of emergency, including the following:	
5.1.3.1	a(3)(i)	Gas or gas odors detected inside or near a building.	EMER 2.3 , 2.4
5.1.3.2	a(3)(ii)	Fire located near or directly involving a pipeline facility.	EMER 2.4
5.1.3.3	a(3)(iii)	Explosion occurring near or directly involving a pipeline facility.	EMER 2.4
5.1.3.4	a(3)(iv)	Natural disaster.	EMER 2.5
5.1.4	a(4)	The availability of personnel, equipment, tools, and materials, as needed at the scene of an emergency.	EMER 2.6
5.1.5	a(5)	Actions directed toward protecting people first and then property.	EMER 1 , 2.1 thru 2.5
5.1.6	a(6)	Emergency shutdown and pressure reduction in any section of the operator's pipeline system necessary to minimize hazards to life or property.	EMER 2.4
5.1.7	a(7)	Making safe any actual or potential hazard to life or property.	EMER 1 , 2.3 , 2.4
5.1.8	a(8)	Notifying appropriate fire, police, and other public officials of gas pipeline emergencies	EMER 2.1 , 2.2 , 2.4 PUBL 2.2

UNCONTROLLED IF PRINTED

		and coordinating with them both planned responses and actual responses during an emergency.	
5.1.9	a(9)	Safely restoring any service outage.	EMER 2.4 LEAK 2.1, 2.2 METR 2.1 PURG 2 TURN 1
5.1.10	a(10)	Beginning action under §192.617, if applicable, as soon after the end of the emergency as possible.	INVE
5.1.11	a(11)	Actions required to be taken by a controller during an emergency in accordance with §192.631.	Control Room Management Plan
5.1.12	a(12)	Actions required to be taken by UNGS facility during an emergency in accordance with §192.12.	Gas Storage Emergency Plan
5.2	b	Each operator shall:	
5.2.1	b(1)	Furnish its supervisors who are responsible for emergency action a copy of that portion of the latest edition of the emergency procedures established under paragraph (a) [5.1 - 5.1.11] as necessary for compliance with those procedures.	EMER 1
5.2.2	b(2)	Train the appropriate operating personnel to assure that they are knowledgeable of the emergency procedures and verify that the training is effective.	EMER 2.8
5.2.3	b(3)	Review employee activities to determine whether the procedures were effectively	EMER 2.7

		followed in each emergency.	
5.3	c	Each operator shall establish and maintain liaison with appropriate fire, police, and other public officials to:	
5.3.1	c(1)	Learn the responsibility and resources of each government organization that may respond to a gas pipeline emergency;	PUBL 2.2
5.3.2	c(2)	Acquaint the officials with the operator's ability in responding to a gas pipeline emergency;	PUBL 2.2
5.3.3	c(3)	Identify the types of gas pipeline emergencies of which the operator notifies the officials; and	PUBL 2.2
5.3.4	c(4)	Plan how the operator and officials can engage in mutual assistance to minimize hazards to life or property.	PUBL 2.2

End of Instructions.

May 15, 2022

EMER 2.1 Customer Care Center

1.0 Purpose

This document outlines procedures and guidance for Ameren Illinois (AIC) Customer Care Center in accordance with 49 CFR §192.615.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General \(§192.615\(a\)\(1\), \(a\)\(5\)\)](#)

[5.0 Receiving Natural Gas Odor or Leak Call](#)

[6.0 Receiving Request to Cancel Natural Gas Odor or Leak Call](#)

[7.0 Receiving Fire or Explosion Call from Emergency Agencies](#)

[8.0 Receiving Carbon Monoxide Call from Emergency Agencies](#)

[9.0 Receiving Carbon Monoxide Call from General Public or AIC Customer](#)

3.0 Target Audience

- Customer Service Representatives (CSR)

4.0 General (§192.615(a)(1), (a)(5))

4.1 AIC Customer Care Center's Customer Service Representative shall:

4.1.1 Promptly answer all calls.

1. Consider any call about a natural gas odor or leak to be an emergency to which all AIC employees shall give prompt attention.

4.1.2 Gather and record accurate and complete information to assist in a prompt and effective response.

4.1.3 Provide appropriate safety instructions based on information obtained from the caller to ensure the safety of the caller and others.

- Enter an emergency callout order into Call Entry. An emergency callout order is always issued for:
 - Fires.
 - Natural gas alarms.
 - Natural gas odors and leaks.
 - Requests from municipal or emergency response agencies.
 - Troubles with excavation barricades.

- An emergency callout order initiates the immediate dispatch of gas field personnel, an Emergency Responder, or a Gas Supervisor and notice to the appropriate operating area.

UNCONTROLLED IF PRINTED

- Call Entry is used to report, manage, and document customer complaints, gas leak investigations, and response times.

4.1.4 Never cancel a natural gas odor or leak response.

4.1.5 Never charge for an emergency call.

AIC does not want to discourage callers from reporting a possible natural gas emergency because of a possible charge.

4.2 The following sections provide guidance on the type of information the CSR's should obtain and provide when responding to various call situations.

4.3 The Customer Care Center department, with Gas Operations providing oversight, shall develop the actual script as to how CSR's communicate with a caller.

5.0 Receiving Natural Gas Odor or Leak Call

5.1 Record caller information such as:

5.1.1 Caller's name.

5.1.2 Address where problem is occurring.

5.2 Verify the address - repeat to the caller the address showing in the system (house number, street, city, zip code).

5.3 Record a phone number that is away from the location (cell phone is acceptable).

5.4 Verify from caller that property is accessible.

5.5 Ask probing questions to determine the nature of the odor. Caller may provide information such as:

5.5.1 Where gas is smelled, heard, and/or seen - indoors, outdoors, or both.

5.5.2 What is it near?

5.5.3 If gas odor or leak is outdoors:

1. Has there been an accident?
2. Any digging in the area?
3. Is it blowing?

5.6 Before submitting the order, ensure information in Call Entry is accurate and correct.

5.7 See [Subsection 5.11](#) if caller is:

- 911 Dispatcher.
- AIC Meter Reader.
- AMI Meter Installer.
- Customer Survey Agent.
- Leak Surveyor.
- Local Fire, Police.
- Summer Gas Meter Painter.

5.8 For indoor odor or leak - smell, hear, or see:

UNCONTROLLED IF PRINTED

5.8.1 Caller shall be provided with safety instructions such as:

1. Evacuate to a safe distance from the location immediately.
2. Do not operate light switches, thermostats, garage door openers, appliances, or anything that could cause a spark.
3. Do not unplug phone chargers or any other electrical equipment which could cause a spark.
4. Do not light cigarettes, E-cigarettes, matches, candles, or use anything with an open flame.
5. Do not open windows or doors to ventilate.
6. If caller is using a land line phone, set the phone down and do not hang up.
7. If caller is using a cell phone, do not hang up, carry it outdoors, and then hang up when call is finished.
8. Do not re-enter building for any reason until AIC service person announces it is safe to re-enter.
9. Do not wait right outside building but please watch for us from a safe distance either up or down the street.

5.8.2 Caller shall be provided with additional information:

1. We must have access to building for an indoor leak. If no one is present to provide access to the building:
 - 1 a. The gas meter will be turned off and locked.
 - 1 b. When called to unlock the meter, we will complete the indoor portion of a leak investigation.

5.8.3 Continue to [Subsection 5.10](#).

5.9 For outdoor odor or leak - smell, hear, or see:

5.9.1 Caller shall be provided with safety instructions such as:

1. Do not attempt to stop the flow of gas or to squeeze off, plug, or bend the pipe.
2. Do not attempt to backfill a damaged or potentially damaged gas line.
3. Do not operate any vehicle or machinery near the leak.
4. Do not use any device or equipment that could generate a spark or flame.
5. Stay away at a safe distance upwind of the leak and keep others away from source of the leak.
6. If the conditions worsens, such as an ignition or explosion, call 911.
7. If you are already in the building, stay inside and wait for us. However, if an odor is noticed inside while waiting, evacuate to a safe distance upwind of the premise.

5.10 End every call by providing the following information:

- 5.10.1 It is important that someone make contact with the service person upon arrival, or for safety reasons we may have to turn the gas off.

5.10.2 I am issuing an order immediately, please watch for and make contact with the service person who usually arrives within 60 minutes.

5.11 Contact Dispatch Center to verify they received the gas odor callout order.

5.12 If it cannot be determined that the caller is in AIC's service territory:

5.12.1 Process a Non-Customer order with a good address, directions, and phone number.

5.12.2 Contact Dispatch Center to verify they received the Non-Customer order.

6.0 Receiving Request to Cancel Natural Gas Odor or Leak Call

6.1 CSR's shall deny any request to cancel an odor/leak call.

6.2 The reasons a CSR cannot cancel order are:

6.2.1 We are obligated by Illinois Commerce Commission (ICC) rules to proceed to the location to complete an investigation.

6.2.2 Our primary concern is the safety of our customers and by completing a thorough leak investigation we can verify that natural gas is not creating a hazard.

7.0 Receiving Fire or Explosion Call from Emergency Agencies

7.1 AIC shall respond and provide assistance when the police or fire department are on the scene or in route.

7.2 If immediate assistance is requested:

7.2.1 Create a gas emergency order.

7.2.2 Process order with the same priority as a gas leak.

8.0 Receiving Carbon Monoxide Call from Emergency Agencies

8.1 AIC shall respond and provide whatever assistance is requested.

8.2 If immediate assistance is requested:

8.2.1 Create a carbon monoxide order.

8.2.2 Select "Fire/Police checkbox" so Dispatch and field personnel can view the order.

8.2.3 Process order with the priority level 8.

8.3 Enter call information in Call Entry.

8.4 Contact dispatch center to verify they received the Carbon Monoxide order.

9.0 Receiving Carbon Monoxide Call from General Public or AIC Customer

9.1 AIC normally does not respond to general public or customer calls regarding carbon monoxide.

9.2 However, it is extremely important to document calls regarding carbon monoxide.

9.2.1 Enter caller's name, address, and phone number into the system.

9.2.2 Document or record the conversation.

9.3 If call is due to someone feeling ill or a carbon monoxide alarm sounding -

9.3.1 Instruct caller to:

1. Evacuate the location and get fresh air.
2. Call 911 immediately after evacuating.
3. They may need to call a qualified HVAC professional.

9.3.2 Enter "Carbon Monoxide Request" in Call Entry and note actions and advice in remarks.

Table 1: Carbon Monoxide Symptoms

Headache	Shortness of Breath
Dizziness	Confusion
Nausea	Unconsciousness
Fatigue	

9.4 If caller is merely seeking information and has no physical symptoms, carbon monoxide alarms, or other indications of carbon monoxide symptoms -

9.4.1 Give caller advice such as:

1. AIC will mail the company's latest carbon monoxide bill insert.
2. Search the internet for "Carbon Monoxide".

9.4.2 Enter "Carbon Monoxide Request" in Call Entry and note actions and advice in remarks.

End of Instructions.

EMERGENCY PLAN

April 1, 2023

EMER 2.2 Dispatch Center

1.0 Purpose

This document outlines procedures for Ameren Illinois' (AIC's) Dispatch Center in accordance with 49 CFR §192.615.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Dispatching Gas Field Personnel to Emergency Call](#)

[6.0 Actions Required of Supervisory Personnel](#)

[7.0 Cold Weather Electrical Outages and Restoring Service](#)

3.0 Target Audience

- Gas Distribution System Operating Supervisors (GDSOS)
- Emergency Responders
- Gas Dispatch Superintendent
- Electric Distribution System Operation Supervisors
- Gas Field Personnel
- Gas Planning
- Gas Superintendents
- Gas Supervisors
- Gas Tech Services Supervisor

4.0 General (§192.615(a)(5))

- 4.1 All AIC employees shall consider any Outage Analysis System (OAS) order or call about a natural gas odor or leak to be an emergency that shall be given prompt attention.
- 4.2 Actions shall be directed toward protecting people first and then property.

5.0 Dispatching Gas Field Personnel to Emergency Call

- Per [EMER 2.1](#), a Customer Care Center Representative enters an emergency callout order into OAS. The OAS order is routed to the Gas Dispatch and the appropriate AIC operating area.
 - Upon receipt of the OAS order, a GDSOS immediately sends one of the gas field personnel, an Emergency Responder, or a Gas Supervisor to the location of the emergency and a notice to the appropriate operating area.

- 5.1 Dispatch gas field personnel, Emergency Responders, or Gas Supervisors for investigation of all OAS orders which include:

- Fires.
- Natural gas alarms.
- Troubles with excavation barricades.
- Natural gas odors and leaks.

5.2 Depending on the severity of the problem, time of day, and resources available, the GDSOS shall use one or more of the methods below to ensure a prompt and effective response.

- 5.2.1 Direct contact (radio or cell phone) with gas field personnel working at the time of the call (normal work hours or shift workers).
- 5.2.2 Gas field personnel and Emergency Responders designated for callout.
- 5.2.3 Outlying utilitymen (electric field personnel) near the location of the call.
- 5.2.4 The automated callout application (ARCOS).

ARCOS contains phone lists of gas field personnel and Emergency Responders who are available to respond to a call after normal working hours within the various operating areas.

5.3 If gas field personnel, emergency responders, or Gas Supervisors are unavailable to respond to the call, the GDSOS shall contact the appropriate local police and/or fire department to request assistance.

5.4 During normal working hours, GDSOS are provided with a daily listing of gas field personnel working in the various service centers that should be contacted in cases of emergency.

5.4.1 GDSOS shall attempt to make direct contact with the "assigned" gas field personnel to notify them that an OAS order has been sent to their mobile data terminal (MDT).

5.4.2 If unable to make direct contact, the GDSOS shall contact the appropriate Gas Supervisor.

5.5 GDSOS shall use ARCOS for OAS orders after hours.

5.5.1 If there has not been an acceptance within the amount of time set in ARCOS, the GDSOS shall contact the appropriate Gas Supervisor.

5.6 Once an OAS order is received, the GDSOS shall:

5.6.1 Send a qualified person to the location.

5.6.2 Never cancel an OAS order even if a cancellation is received.

Electric Control has compiled and maintains the 911 numbers for emergency agencies throughout AIC's operating areas. These numbers are used by Distribution Control's interactive phone system. The 911 numbers are reviewed and updated annually with assistance from Public Awareness.

6.0 Actions Required of Supervisory Personnel

- 6.1 When contacted by the GDSOS, supervisory personnel shall assume responsibility for the gas emergency and take prompt action to address the situation.
- 6.2 Supervisory personnel:
- 6.2.1 Shall instruct the GDSOS about additional steps to take including:
1. Continue calling qualified gas field personnel using ARCOS.
 2. Call a qualified Gas Supervisor.
 3. Call qualified Emergency Responders (gas apprentices, electric field personnel, meter changers, Gas Supervisors, etc.).
 4. Call the fire and/or police department.
- 6.2.2 May elect to drive to the site and if Operator Qualified, respond to the emergency call. See [EMER 2.4](#).

The response may include:

- Turning off the gas outside the structure.
- Electing to evacuate the structure involved or even surrounding structures if the situation warrants.
- Performing an official "gas leak investigation" only if Operator Qualified for leak investigation and the required equipment is available.

7.0 Cold Weather Electrical Outages and Restoring Service

- 7.1 Electric Distribution Controls responsible for handling any cold weather electrical outages and restoring electrical service to AIC's customers.
- 7.1.1 Cold weather restoration of electrical service after an extended outage can create a situation where instantaneous gas load can exceed the capacity of the affected gas systems.
- 7.1.2 In this situation, it is possible for the gas system to experience operating pressures well below their designated setpoints, resulting in a potential gas outage for AIC's customers.
- 7.1.3 Conditions identified that will enact the Electric Cold Load Restoration Policy, refer to [EMER 3](#) for the policy.
1. Ambient temperature: 20 °F or less at the location of outage. AND
 2. Duration of the electrical outage: in excess of 4 hours.
 3. High Risk Gas Systems have been identified for pressure monitoring and/or electric circuit segmentation during restoration efforts. These high-risk Gas Systems are located in the ElectricColdLoadPickup.xlsx file.
- 7.2 When determined by the Distribution System Operations Supervisor (DSOS) that an electric outage exists over an identified Gas System and will exceed both of the thresholds identified in the Electric Cold Load Restoration Policy, see [EMER 3](#), the DSOS will inform the appropriate Gas Tech Services (GTS) Supervisor and Gas Control of the electric outage.

- 7.2.1 Electric restoration for the affected circuits will be coordinated with GTS, based on the risk level of the affected gas system listed in the ElectricColdLoadPickup.xlsx file.
- 7.2.2 GTS shall also be notified of scheduled maintenance outages and outages involving activation of the Emergency Operation Center (EOC).

7.3 Contact Lists for Gas Tech Services (GTS) and Gas Planning Groups

EMER 2.3 Emergency Responder

1.0 Purpose

This document outlines procedures for Ameren Illinois' (AIC's) Emergency Responders in accordance with 49 CFR §192.615.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Dispatched to Indoor Odor or Leak](#)

[6.0 Dispatched to Outdoor Odor or Leak](#)

[7.0 Dispatched to Cut Main or Service](#)

3.0 Target Audience

- Dispatchers
- Emergency Responders
- Gas Apprentices
- Gas Field Personnel
- Gas Supervisors
- Gas Engineering

4.0 General (§192.615(a)(5))

4.1 When responding to an emergency, Emergency Responders shall give the safety of the public and AIC's customers and employees top priority. Actions shall be directed to protect people first, then property.

4.2 AIC trains, tests, and operator qualifies non-gas field personnel and/or gas apprentices as Emergency Responders for gas emergency calls. Non-gas field personnel may include:

- Electric Field Personnel.
- Gas Apprentices
- Gas Supervisors.
- Meter Changers.
- Meter Readers.

4.3 On occasion, a qualified Emergency Responder will be dispatched in response to gas leak/odor call to perform "make safe" procedures until qualified gas field personnel can respond and investigate the leak.

4.4 Emergency Responders shall follow the procedures below.

5.0 Dispatched to Indoor Odor or Leak (§192.615(a)(3)(i), (a)(7))

- A Customer Care Center Representative has instructed the caller to:

UNCONTROLLED IF PRINTED

- Evacuate the structure.
- Move a safe distance away from the structure.
- Make contact with the first arriving AIC service person.

5.1 Park on the street or in a safe location.

- Avoid parking directly in front of a structure involved in the emergency.
- Avoid parking over manholes as they may be within the gas leak migration pattern and could possibly be venting.
- Avoid parking over main valves if they are required for make safe action.

5.2 Approach by walking toward a corner of the structure.

5.3 Protect people:

5.3.1 Keep occupants at a safe distance until a qualified gas field person arrives and determines when it is safe to re-enter the structure.

For a safe distance, consider:

- In a town or city setting, moving 2 or 3 houses or buildings away.
- In a rural setting, moving 100 to 200 feet from the affected structure or area.

5.3.2 Ask the occupants where they smelled the gas odor.

5.3.3 If occupants have not evacuated:

1. Knock on the door (NEVER use the doorbell or intercom).
2. Show AIC identification.
3. Tell the occupants to evacuate immediately.
 - 3 a. Contact or have dispatch contact fire department and request assistance with evacuation of a:
 - Multi-family structure.
 - Structure containing a large number of people such as a:
 - School.
 - Nursing home.
 - Manufacturing facility.
 - Hospital.
 - Commercial business.
4. Tell the evacuees:

UNCONTROLLED IF PRINTED

- 4 a. Do not touch anything.
5. Direct them to a safe location (see safe distance note) away from the structure until it is safe to re-enter the structure.
6. Count the occupants as they exit and notify the Dispatcher or Gas Supervisor of the total count.
7. Leave the structure if no further indoor tasks are to be performed.

5.4 Protect property:

5.4.1 Before touching the gas meter set:

CAUTION

The flashlight on the volt stick is not intrinsically safe and shall be left off when a hazardous condition exists (e.g. during indoor or outdoor leak investigations).

1. Check meter and customer fuel line with volt stick.

Figure 1: Typical Volt Stick

- 1 a. Volt stick alarms: see [METR 2.2 Section 7.0](#) Meter Header Inspection. Then see [Subparagraph 2](#).
- 1 b. No volt stick alarm: see Subparagraph 2.
2. Check service riser with volt stick.
 - 2 a. Volt stick alarms: *do not shut-off meter valve*. See [Subsection 5.5](#).
 - 2 b. No volt stick alarm: see Paragraph 5.4.2.
- 5.4.2 Verify the meter number if customer is not present.
- 5.4.3 Observe test hand for movement.

Movement of test hand implies gas flow.

- 5.4.4 Shut off meter valve or customer valve.
- 5.5 Stay on site with the occupants at a safe distance (see [safe distance note](#)) until qualified gas field personnel arrive.
- 5.6 When qualified gas field personnel arrive, update them about the occupants, the meter, where the occupants smelled the gas odor, and any other concerns.
- 5.7 Once the qualified gas field personnel take over the situation, the Emergency Responder is released *unless* the qualified gas field personnel request their assistance.

6.0 Dispatched to Outdoor Odor or Leak (§192.615 (a)(3)(i), (a)(7))

- A Customer Care Center Representative has instructed the caller:
 - If already outdoors, stay a safe distance upwind of the odor or source of the leak and make contact with the first arriving AIC service person.
 - If already indoors, stay indoors and make contact with the first arriving AIC service person.
 - If already indoors and notice an odor INDOORS while waiting, evacuate the building, stay a safe distance upwind of the odor or source of the leak, and make contact with the first arriving AIC service person.

6.1 Park in a safe location upwind of the outdoor odor or leak. Also see [parking caution](#).

6.2 Approach the odor or leak from the upwind location.

6.3 Protect people:

6.3.1 Keep people upwind and at a safe distance away from the odor or leak. See [safe distance note](#).

6.3.2 Keep ignition sources including vehicles away from the odor or leak.

6.4 Protect property:

6.4.1 If there is a strong odor of gas at the meter, shut off the meter valve in accordance with [Subsection 5.4](#).

6.5 Follow through with Subsections [5.5](#), [5.6](#), and [5.7](#).

7.0 Dispatched to Cut Main or Service (§192.615(a)(7))

7.1 Park on the street or in a safe location upwind of the outdoor leak. Also see [parking caution](#).

7.2 Approach the leak from an upwind location.

7.3 Maintain a minimum 20-foot radius safety zone from the cut main or service in accordance with [WIGE 2.1 Subsection 6.3](#).

7.4 Keep excavators, emergency response personnel, and the general public at a safe distance upwind of the leak. See [safe distance note](#).

7.5 Stay on site until qualified gas field personnel arrive.

7.6 Update the gas field personnel about actions that have been taken.

End of Instructions.

EMER 2.4 Gas Field Personnel General

1.0 Purpose

The EMER 2.4 documents outline procedures for Ameren Illinois' (AIC's) gas field personnel responding to emergency situations in accordance with 49 CFR §192.615. This document provides general procedures supporting the EMER 2.4 documents.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

Appendices:

[Appendix A - OAS 6H Screen Shot: Meter Valve Shut Off and Red Pin](#)

3.0 Target Audience

- Gas Control Personnel
- Gas Field Personnel
- Gas Supervisors
- Gas Control
- Gas Tech Services (GTS) Supervisors
- Gas Tech Service (GTS) Personnel
- Gas Integrity Management Personnel
- Gas Engineering

4.0 General (§192.615(a)(5), (a)(7))

4.1 When responding to an emergency, gas field personnel shall give the safety of the public and AIC's customers and employees top priority. Actions shall be directed to protect people first, then property.

4.2 *Before touching the gas meter set:*

The flashlight on the volt stick is not intrinsically safe and shall be left off when a hazardous condition exists (e.g. during indoor or outdoor leak investigations).

4.2.1 Check the meter, riser and customer fuel line with volt stick.

Figure 1: Typical Volt Stick

UNCONTROLLED IF PRINTED

1. Volt stick alarms: see [METR 2.2 Section 7.3](#) AC Voltage Action Table
 2. Volt stick alarms on riser: do not shut-off meter valve.
 3. No volt stick alarm: see Paragraph 4.2.2.
- 4.2.2 Verify the meter number if customer is not present.
- 4.2.3 Observe the test hand for movement.

Movement of the test hand implies gas flow.

- 4.2.4 If there is rapid movement of the test hand, shut off meter valve or customer valve.
- 4.3 Do not use a Flame Ionization (FI) unit for indoor leak investigations.
- 4.4 Ensure the Combustible Gas Indicators (CGIs) have been calibrated and checked. See [LEAK 2.5](#).
- 4.5 Evacuate occupants of homes, buildings, and structures as follows:
- 4.5.1 Knock on the door (NEVER use the doorbell or intercom).
 - 4.5.2 Show AIC identification.
 - 4.5.3 Ask the occupants to leave immediately.
 - 4.5.4 Instruct them:
 1. Do not touch anything.
 2. Do not operate any electrical switches.
 3. Do not use any electronic devices.
 4. Do not use an elevator.
 - 4.5.5 Direct them to a location that is a safe distance away from the affected structure until it is safe to re-enter the structure.

For a safe distance, consider:

- In a town or city setting, moving 2 or 3 houses or buildings away.
- In a rural setting, moving 100 to 200 feet from the affected structure or area.

- 4.5.6 Ask the occupants where they smelled the gas odor or heard the leak.
 - 4.5.7 Count the occupants as they exit and notify the Dispatcher or Gas Supervisor of the total count.
 - 4.5.8 Leave the structure if no further indoor tasks are to be performed.
- 4.6 After the emergency has been evaluated, isolate the leak using the methods below appropriate to the extent of the emergency. See the following example, then see [Paragraph 4.6.2](#).

UNCONTROLLED IF PRINTED

- 4.6.1 Example: If gas migration is creating an immediate hazard, it may be prudent to use emergency valves rather than excavating and squeezing pipe to reduce the immediate hazard.

If a non-emergency valve is used to isolate or sectionalize gas main segments during an emergency, designate the valve as an Emergency Valve after the emergency has been resolved. See [VALV 2.1](#).

- 4.6.2 Use emergency valves, when appropriate,

Or

- 4.6.3 Squeeze plastic or steel pipe (squeezed section of steel pipe will have to be cut-out and replaced before pipeline is reinstated),

Or

- 4.6.4 Use control fittings,

Or

- 4.6.5 Construct a by-pass around damaged area and isolate damaged section.

- 4.7 Park on the street or in a safe location.

- Avoid parking directly in front of a structure involved in the emergency.
- Avoid parking over manholes as they may be within the gas leak migration pattern and could possibly be venting.
- Avoid parking over main valves if they are required for make safe action.

- 4.8 If Gas Control verifies the affected system is remotely monitored, establish a line of communications for the purposes of:

- 4.8.1 Keeping them updated on status of situation.

- 4.8.2 Requesting their assistance in monitoring.

- 4.8.3 Determining at what point Gas Control should issue a warning of potential system problem.

- 4.8.4 Notifying Gas Control when the situation has been corrected and the system should be back to normal operation. Verifying that monitored operating parameters have been restored.

- 4.9 Contact information for individuals in Gas Operations and Services, Gas Control, or Distribution Control is maintained in [FORW](#).

End of Instructions.

Operator Qualification (OQ) Required?

UNCONTROLLED IF PRINTED

YES

EMERGENCY PLAN

April 1, 2021

EMER 2.4.1 Gas Field Personnel Dispatched to Indoor Odor or Leak

1.0 Dispatched to Indoor Odor or Leak (§192.615(a)(3)(i), (a)(7), (a)(8))

- An Emergency Responder may already be onsite.
 - A Customer Care Center Representative has instructed the caller to:
 - Evacuate the structure.
 - Move a safe distance away from the structure.
 - Make contact with the first arriving AIC service person.

- 1.1 For parking considerations, see **CAUTION** under [EMER 2.4 Subsection 4.7](#).
- 1.2 Approach by walking toward a corner of the structure.
- 1.3 If an Emergency Responder is NOT onsite, see [Subsection 1.5](#).
- 1.4 Ask Emergency Responder for updates on:
 - 1.4.1 Have occupants evacuated?
 - 1.4.2 Is location of odor or leak known?
 - 1.4.3 Has the meter valve been turned off?
- 1.5 Have the occupants evacuated the structure?
 - 1.5.1 If occupants have evacuated:
 1. Ensure that occupants are a safe distance (see **NOTE** under [EMER 2.4 Paragraph 4.5.5](#)) from the structure until it is safe to re-enter the structure.
 2. Ask the occupants where they smelled the gas odor or heard the leak.
 3. See Subsection 1.6.
 - 1.5.2 If occupants have NOT evacuated, evacuate the occupants. See [EMER 2.4 Subsection 4.5](#).
- 1.6 Sample the ambient atmosphere at the entrance of and throughout the structure with CGI:
 - 1.6.1 Set on the LEL scale.
 - 1.6.2 Intake held as high as possible.
- 1.7 If CGI shows:
 - 1.7.1 10% LEL (0.5% gas in air) or greater:
 1. **A hazardous condition exists.**
 2. See [Subsection 1.8](#).
 - 1.7.2 Less than 10% LEL (less than 0.5% gas in air). See [LEAK 2.1](#).

UNCONTROLLED IF PRINTED

- 1.8 Contact AIC's Dispatcher and/or Gas Supervisor, provide an update of the situation, and request:
 - 1.8.1 Additional assistance from AIC.
 - 1.8.2 Calls be made to proper authorities such as Fire Department, Police Department, electric and other affected utilities, etc.
- 1.9 Shut off the gas from outside the structure if possible. See [EMER 2.4 Subsection 4.2](#) before touching the gas meter valve for shut off.
 - 1.9.1 Verify the meter number if customer is not present.
 - 1.9.2 Observe the test hand for movement. Movement implies gas flow.
 - 1.9.3 Note any movement of the test hand, then shut off the meter valve.
- 1.10 Evacuate surrounding structures that could be impacted in case of an explosion. See [EMER 2.4 Subsection 4.5](#).
- 1.11 Check for gas concentrations at entrances of these structures.
- 1.12 Eliminate as many ignition sources as possible without being exposed to danger.
- 1.13 Check for presence of alternative source of electricity, such as stand-by generator, solar panels, energy storage devices, or wind generators.
 1. If it can be safely done, disconnect these sources. This may require disconnecting at the device.
 2. Customers may be able to provide additional information regarding alternative sources of energy.
- 1.14 Have the electric source, telephone, and cable disconnected from their external sources.
 - 1.14.1 The electric source shall be disconnected at the power pole or transformer away from the structure.

Shutting electricity off at the Advanced Metering Infrastructure (AMI) meter does not satisfy Paragraph 1.14.1 since the switching action in the AMI meter can create a spark.

- 1.14.2 If possible, cut the telephone line at a point away from the structure.
- 1.14.3 If not possible, cut or disconnect the telephone line at the junction box:
 1. Check the junction box on the structure for possible concentration of gas.
 2. If safe, cut or disconnect the telephone line at the junction box.
 3. If not safe, ventilate until safe, then cut or disconnect the telephone line at the junction box.
- 1.15 Ventilate the structure only after external ignition sources have been disconnected.
- 1.16 While the structure is ventilating, check for gas in surrounding structures.
 - 1.16.1 Check for gas concentrations inside and under the structure.
 - 1.16.2 Bar hole test or leak survey around foundation.

UNCONTROLLED IF PRINTED

1.16.3 Check for gas concentrations inside the structure.

1.17 Bar hole test or leak survey surrounding mains and service lines.

1.17.1 If gas is found, complete the leak investigation procedures. See [LEAK 2.2](#).

1.17.2 If gas is found in sewers or conduits, have manhole covers and/or utility access covers removed. See [EMER 2.4.4](#).

1.18 Once it is determined that a hazardous condition no longer exists, complete the leak investigation procedures. See [LEAK 2.1](#).

End of Instructions.

Document Rescission

EMER 2.04 Emergency Plan: Gas Field Personnel, April 1, 2020.

Revision Notes

Location of Changes	Summary of Changes
Subsection 1.13	Added energy storage devices and wind generators as potential alternative sources of electricity. Added note that disconnect may be required at the device and customers may have additional information.

EMERGENCY PLAN

October 1, 2020

EMER 2.4.2 Gas Field Personnel Dispatched to Outdoor Odor or Leak**1.0 Dispatched to Outdoor Odor or Leak (§192.615(a)(3)(i), (a)(7), (a)(8))**

- An Emergency Responder may already be onsite.
- A Customer Care Center Representative has instructed the caller:
 - If already outdoors, stay a safe distance upwind of the odor or source of the leak and contact the first arriving AIC service person.
 - If already indoors, stay indoors and contact the first arriving AIC service person.
 - If already indoors and notice an odor INDOORS while waiting, evacuate the building, stay a safe distance upwind of the odor or source of the leak, and contact the first arriving AIC service person.

- 1.1 Park upwind of the outdoor odor or leak. For additional parking considerations, see **CAUTION** under [EMER 2.4 Subsection 4.7](#).
- 1.2 Approach the odor or leak from the upwind location.
- 1.3 If an Emergency Responder is NOT onsite, see [Subsection 1.5](#).
- 1.4 Ask Emergency Responder for updates on:
 - 1.4.1 Have occupants evacuated?
 - 1.4.2 Is location of odor or leak known?
 - 1.4.3 Has the meter valve been turned off?
- 1.5 Have the occupants evacuated the affected area?
 - 1.5.1 If occupants have evacuated:
 1. Ensure that occupants are a safe distance (see **NOTE** under [EMER 2.4 Paragraph 4.5.5](#)) from the affected area until it is safe to re-enter any structures.
 2. Ask the occupants where they smelled the gas odor or heard the leak.
 3. See [Subsection 1.6](#).
 - 1.5.2 If occupants have NOT evacuated, evacuate the occupants. See [EMER 2.4 Subsection 4.5](#).
- 1.6 Sample the open atmosphere and if CGI shows:
 - 1.6.1 30% LEL (1.5% gas in air) or greater, and:
 - 1.6.2 Gas could enter a structure, or

UNCONTROLLED IF PRINTED

1.6.3 An ignition source is in close proximity, then

1. **A hazardous condition exists.**

2. See [Subsection 1.11](#).

1.6.4 Less than 30% LEL (less than 1.5% gas in air). See [LEAK 2.2](#).

Until a blowing gas situation has been evaluated, the lone gas field person must continuously focus on the following starred (★) tasks.

★1.7 Keep the affected area evacuated.

★1.8 Continue to monitor gas concentration with CGI including surrounding buildings. Evacuate as required. If required, see [EMER 2.4 Subsection 4.5](#).

★1.9 Keep excavators, emergency response personnel, and the general public at a safe distance upwind of the affected area. For safe distance considerations, see **NOTE** under [EMER 2.4 Paragraph 4.5.5](#).

★1.10 Ensure no vehicular equipment is operated within the affected area.

★1.11 Contact AIC's Dispatcher and/or Gas Supervisor, provide an update of the situation, and request:

1.11.1 Additional assistance from AIC.

1.11.2 Calls be made to proper authorities such as Fire Department, Police Department, electric and other utilities, etc.

★1.12 Eliminate as many ignition sources as possible without being exposed to danger.

★1.13 If the leak was caused by excavation or boring damage, investigate for the possibility of multiple leaks (i.e., service pulled out of tee) and gas migration into conduits, sewer lines and adjacent structures.

★1.14 If gas is detected in sewers or conduits, have manhole covers and/or utility access covers removed. See [EMER 2.4.4](#).

★1.15 Check adjacent structures for gas migration.

1.15.1 Check for gas concentrations inside the structure(s).

1.15.2 Bar hole test or leak survey around the foundations.

1.16 After the emergency has been evaluated, see [EMER 2.4 Subsection 4.6](#) to isolate the leak.

1.17 After determining that a hazardous condition no longer exists, complete the leak investigation procedures. See [LEAK 2.2](#).

End of Instructions.

Document Rescission

EMER 2.04 Emergency Plan: Gas Field Personnel, April 1, 2020.

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

EMERGENCY PLAN

October 1, 2022

EMER 2.4.3 Gas Field Personnel Dispatched to Major Leak or Line Break

1.0 Dispatched to Major Leak or Line Break (§192.615(a)(3)(i), (a)(7), (a)(8), (a)(9))

The following steps outline the actions for AIC's first responding field gas personnel and the Gas Supervisor (see Subsection 1.12).

- 1.1 Park upwind of the incident site. For additional parking considerations, see **CAUTION** under [EMER 2.4 Subsection 4.7](#).
- 1.2 Approach the incident site from the upwind location.
- 1.3 Evaluate the situation and take appropriate measures to protect public safety and property, if necessary.
- 1.4 If local emergency response agency:
 - 1.4.1 Has already set up an Incident Command Center (ICS) at the incident site, see [Subsection 1.10](#).
 - 1.4.2 Arrives later and sets up an ICS at the incident site, see [Subsection 1.11](#).
 - 1.4.3 Has not arrived at the incident site, see Subsection 1.5.
- 1.5 AIC's first responding field gas personnel will serve as Incident Commander, and evaluate the situation beginning at Paragraph 1.5.1.
 - 1.5.1 If the leak or line break is freely blowing:
 1. Maintain a safe zone from the blowing gas in accordance with [WIGE 2.1 Section 6.0](#) Safe Zone.
 2. Secure the area with warning signs or warning tape.
 3. Evaluate if the blowing gas has the potential of:
 - 3 a. Entering a structure.
 - 3 b. Coming in contact with an ignition source such as overhead power lines, traffic.
 - 1.5.2 Determine where gas is migrating and if it is creating an immediate hazard to people or property.
 1. Check for gas migration into adjacent structures.
 - 1 a. Use a CGI for indoor gas concentrations.
 - 1 b. Bar hole test or leak survey around the foundations.
 - 1 c. Evacuate structures where indoor gas is detected. See [EMER 2.4 Subsection 4.5](#).
 2. Check for gas migration into sewer lines, catch basins, conduits, and other underground facilities.
 - 2 a. Use a CGI to check for gas concentrations.

UNCONTROLLED IF PRINTED

3. If the leak was caused by damage from excavation or boring, additional investigation is required.
 - 3 a. Check for multiple leaks (i.e., service lines pulled out of tees).
4. Bar hole test or leak survey surrounding mains and service lines.
- 1.5.3 Report the observations and information gathered in [Paragraph 1.5.2](#) to the appropriate Gas Supervisor or Dispatcher and request:
 1. Additional assistance from AIC.
 2. Calls be made to proper authorities such as Fire Department, Police Department, electric and other affected utilities, etc., if applicable.
- 1.6 Until additional help arrives:
 - 1.6.1 Continue to monitor gas concentration with the CGI.
 - 1.6.2 Keep the affected area evacuated.
 - 1.6.3 Keep excavators, emergency response personnel, and the general public at a safe distance upwind of the affected area. For additional safe distance considerations, see **NOTE** under [EMER 2.4 Paragraph 4.5.5](#).
 - 1.6.4 Ensure no vehicular equipment is operated within the affected area.
 - 1.6.5 Eliminate as many ignition sources as possible without being exposed to danger.
- 1.7 When additional gas field personnel arrive, have them:
 - 1.7.1 Assist in identifying the extent of gas migration.
 - 1.7.2 Assist with monitoring the safe zone atmosphere.
 - 1.7.3 If gas was detected in sewers or conduits, have manhole covers and/or utility access covers removed. See [EMER 2.4.4](#) Gas Field Personnel Dispatched to Gas in a Sewer Hazardous Condition.
- 1.8 When help from electric and other affected utilities arrive:
 - 1.8.1 Have the electric source, telephone, and cable disconnected from their external sources.
- 1.9 See [Subsection 1.13](#).
- 1.10 If local emergency responders have already set up an ICS at the incident site :
 - 1.10.1 AIC's first responding gas field personnel shall introduce themselves to the Incident Commander as the representative from AIC; and
 - 1.10.2 Remain the point of contact until the incident has been made safe or until relieved of that duty by another AIC representative; and
 - 1.10.3 Begin emergency response work at [Paragraph 1.5.1](#) and continue through [Subsection 1.8](#).
- 1.11 If local emergency responders arrive later and set up an ICS at the incident site :
 - 1.11.1 AIC's Incident Commander shall introduce themselves as the point of contact for AIC, brief the local Incident Commander; and
 - 1.11.2 Remain the point of contact until the incident has been made safe or until relieved of that duty by another AIC representative; and

UNCONTROLLED IF PRINTED

- 1.11.3 Begin emergency response work at [Paragraph 1.5.1](#) and continue through [Sub-section 1.8](#).
- 1.12 Gas Supervisor or designee shall:
 - 1.12.1 In conjunction with the Gas Superintendent and Gas Control,
 - 1. Determine the consequences and necessity of an immediate shutdown.
 - 2. Consider whether to implement [EMER 2.4.11](#), Gas Field Personnel Loss and Restoration of Service.
 - 3. Consider the temporary use of CNG Trailers. See [EMER 2.9](#).
 - 1.12.2 Contact Gas Control to determine or verify if the affected gas system is being remotely monitored and advise them of the situation and possible actions that may be taken.
 - 1.12.3 Contact Gas Tech Services if transmission or high-pressure distribution facilities are involved.
 - 1.12.4 Develop a communication schedule with Gas Control if Gas Control verifies they are monitoring the affected system and/or facilities through SCADA or installed ERX's. See [EMER 2.4 Subsection 4.8](#).
- 1.13 After the emergency has been evaluated, see [EMER 2.4 Subsection 4.6](#) to isolate the leak.
- 1.14 See [EMER 2.4 Subsection 4.2](#) before shutting off all individual meters in affected area while the repair is taking place.
- 1.15 After the repairs are complete, purge the system of air and relight all affected customers. See [PURG 2](#) and [TURN](#).

End of Instructions.

Document Rescission

EMER 2.4.3 Gas Field Personnel – Major Leak or Line Break, October 1, 2021

Revision Notes

Location of Changes	Summary of Changes
Paragraph 1.5.1 – Item 1.	Revised – Maintain a safe zone from the blowing gas in accordance with WIGE 2.1 Section 6.0 Safety Zone.

UNCONTROLLED IF PRINTED

EMERGENCY PLAN

April 1, 2023

EMER 2.4.4 Gas Field Personnel Dispatched to Gas in a Sewer Hazardous Condition

1.0 Dispatched to Gas in Sewer - Hazardous Condition (§192.615(a)(3)(i), (a)(7), (a)(8), (a)(9))

This section concerns gas found in sanitary and storm sewers, vaults, and underground conduits subjected to gas migration. The following steps outline the actions for AIC's gas field personnel and the Gas Supervisor (see [Subsection 1.6](#)).

1.1 Upon arrival:

- 1.1.1 Park away from and upwind of the manhole/utility access cover (manhole cover) to be investigated. For additional parking considerations, see **CAUTION** under [EMER 2.4 Subsection 4.7](#).
- 1.1.2 Secure the immediate area of the manhole cover to be investigated.
- 1.1.3 Keep excavators, emergency response personnel, and the general public at a safe distance upwind of the secure area. For additional safe distance considerations, see **NOTE** under [EMER 2.4 Paragraph 4.5.5](#).

1.2 At the manhole cover:

- 1.2.1 Remove the manhole cover.
- 1.2.2 Place a cone near the manhole opening to ensure it is visible.

1.3 Sample the environment below the rim of the manhole cover with CGI:

- 1.3.1 Assume the source is natural gas until an ethane identifier has been used to verify the source as either foreign gas or natural gas. See **LEAK 3** for ethane identifier instrument instructions.
- 1.3.2 A hazardous condition exists if CGI reads 30% LEL or greater.

1.4 Evaluate the situation by removing additional manhole covers to vent the gas and take additional readings.**1.5 Contact AIC's Dispatcher and/or Gas Supervisor, provide an update of the situation, and request:**

- 1.5.1 Additional assistance from AIC.
- 1.5.2 Calls be made to proper authorities such as Fire Department, Police Department, electric and other affected utilities, etc., if appropriate.

1.6 Gas Supervisor or designee shall:

- 1.6.1 In conjunction with the Gas Superintendent and Gas Control,
 1. Determine the consequences and necessity of an immediate shutdown.
 2. Consider whether to implement [EMER 2.4.11](#). Loss and Restoration of Service.
 3. Consider the temporary use of CNG Trailers. See [EMER 2.9](#).

UNCONTROLLED IF PRINTED

- 1.7 If the Gas Supervisor/Gas Superintendent determines there may be a potential for isolating or shutting down a section/segment of the system, contact Gas Control to verify that the affected system is remotely monitored. See [EMER 2.4 Subsection 4.8](#).
- 1.8 Check adjacent structures for hazardous conditions from gas migration by checking for gas concentrations at the entrances.
 - 1.8.1 Knock on the door (NEVER use the doorbell or intercom).
 - 1.8.2 Show AIC identification.
 - 1.8.3 If gas is detected upon first entering the structure, a reading of 10% LEL (0.5% gas-in-air) or greater is considered a hazardous condition and evacuate the structure, see [EMER 2.4 Subsection 4.5](#), and then contact AIC Dispatch, see [EMER 2.4.1 Subsection 1.8](#).
 - 1.8.4 If it is determined that there is not a hazardous condition in adjacent structures, continuously monitor the structures, checking for gas migration through sewer laterals at floor drains, sewer entry, and sump pumps.
 - 1.8.5 If gas is detected migrating into additional structures in the affected area, evacuate the structures. See [EMER 2.4 Subsection 4.5](#).
 - 1.8.6 Shut off readily accessible meter valves ensuring that no one enters the structure to shut off a meter valve. See [EMER 2.4 Subsection 4.2](#) *before touching the gas meter valve* for shut off.
 - 1.8.7 Eliminate as many ignition sources as possible without exposing oneself to danger by requesting that the electric and telephone be disconnected for the affected area.
- 1.9 As additional assistance arrives on the scene:
 - 1.9.1 Ensure that evacuated occupants have been moved to a safe distance from the structures. For additional safe distance considerations, see **NOTE** under [EMER 2.4 Paragraph 4.5.5](#).
 - 1.9.2 Remove additional manhole covers to vent the gas and determine the extent of migration.
 - 1.9.3 Continue to monitor the structures for possible gas migration.
- 1.10 After the emergency has been evaluated, see [EMER 2.4 Subsection 4.6](#) to isolate the leak.
- 1.11 Once the gas supply has been shut off, ventilate the structure after external ignition sources have been disconnected.
- 1.12 Once it is determined that a hazardous condition no longer exists:
 - 1.12.1 Ensure that all meters in the affected area have been shut off while the repairs are taking place. See [EMER 2.4 Subsection 4.2](#) *before touching the gas meter valve* for shut off.
 - 1.12.2 Complete the repairs, purge the system, and relight all affected customers.
 - 1.12.3 See [EMER 2.4.11](#), [PURG 2](#) and [TURN](#) for additional information.

End of Instructions.

Document Rescission

Revision Notes

Location of Changes	Summary of Changes
Paragraph 1.3.1	Removed "See Figure 1" and the picture of the Heath EI-4 Ethane Identifier. Added "See LEAK 3 for ethane identified instrument instructions."

EMERGENCY PLAN

October 1, 2022

EMER 2.4.5 Gas Field Personnel Dispatched to Gas Related Fire, Ignition, or Explosion**1.0 Dispatched to Gas Related Fire, Ignition, or Explosion
(§192.615(a)(3)(ii), (a)(3)(iii), (a)(7), (a)(8), (a)(9))**

The following steps outline the actions for AIC's gas field personnel and the Gas Supervisor (see [Subsection 1.5](#)).

- 1.1 Park upwind of the incident site. For additional parking considerations, see **CAUTION** under [EMER 2.4 Subsection 4.7](#).
- 1.2 Approach the incident site from the upwind location.

- Do not extinguish a gas-fed fire unless the flow of gas is controlled, or the fire is endangering the integrity of pressure control facilities and over-pressure protection.
- Be aware that extinguished gas ignition before the flow of gas is isolated may reignite or migrate into locations where levels can accumulate and potentially lead to an explosion.

- 1.3 If local emergency response agency:
 - 1.3.1 Has NOT arrived at the incident site, see [Subsection 1.4](#).
 - 1.3.2 Has already arrived at the incident site, see [Subsection 1.10](#).
 - 1.3.3 Arrives later and sets up an ICS at the incident site, see [Subsection 1.9](#).

Remember in a fire situation, the Fire Department has jurisdiction and is in charge of the scene.

- 1.4 If Fire Department not on site, AIC's gas field personnel shall:
 - 1.4.1 Keep the affected area evacuated.
 1. See [EMER 2.4 Subsection 4.5](#) if a structure needs to be evacuated.
 2. Direct other non-emergency response people to move to a safe location. For safe distance considerations, see **NOTE** under [EMER 2.4 Paragraph 4.5.5](#).
 3. Ensure only emergency vehicular equipment is operated within the affected area.
 - 1.4.2 Evaluate the situation:
 1. Determine if the fire, ignition, or explosion has created an immediate hazard to life or property.

UNCONTROLLED IF PRINTED

2. What gas facilities are involved such as: mains, services, meter sets, transmission or high-pressure distribution facilities, or other gas facilities.
- 1.4.3 Report the observations and information gathered in Paragraph 1.4.2 to the appropriate Gas Supervisor or Dispatcher and request:
 1. Additional assistance from AIC.
 2. Calls be made to proper authorities such as Fire Department, Police Department, Ambulance, electric and other affected utilities, etc.
- 1.4.4 See [Subsection 1.6](#) until help arrives.
- 1.4.5 See [Subsection 1.7](#) when additional AIC personnel arrive.
- 1.4.6 See [Subsection 1.8](#) when electric, telephone and cable utility company personnel arrive.
- 1.4.7 See [Subsection 1.9](#) when fire Department personnel arrive.
- 1.5 Gas Supervisor or designee shall:
 - 1.5.1 Notify the Gas Tech Services Supervisor if transmission or high-pressure distribution facilities are involved.
 - 1.5.2 Notify the Gas Superintendent with a brief explanation of the situation and the types of gas facilities that may be affected.
 - 1.5.3 Depending on the extent of the situation, if the Gas Supervisor/Gas Superintendent determines there may be a potential for isolating or shutting down a section/segment of the system, contact Gas Control to verify that the affected system is remotely monitored. If Gas Control verifies that the affected system is remotely monitored, see [EMER 2.4 Subsection 4.8](#).
 - 1.5.4 In conjunction with the Gas Superintendent and Gas Control,
 1. Determine the consequences and necessity of an immediate shutdown.
 2. Consider whether to implement [EMER 2.4.11](#). Loss and Restoration of Service.
 3. Consider the temporary use of CNG Trailers. See [EMER 2.9](#).
- 1.6 Until help arrives, AIC's gas field personnel shall:
 - 1.6.1 Continue the activities in [Paragraph 1.4.1](#) and as circumstances allow:
 1. Check gas meter set components for possible damage due to the fire. See [EMER 2.4 Subsection 4.2](#) before touching the meter. See [INVE](#).
 - 1 a. If there is any indication of damage, eliminate gas service to the damaged component to ensure that no gas can leak by or through that component.
 - 1 b. Do not remove component unless it is in danger of being damaged to the point of contributing to the fire or until instructed to do so by Gas Supervisor.
 2. Check adjacent structure(s) for possible gas migration.
 - 2 a. Check for gas concentrations at the entrances.
 - (i). Knock on the door (NEVER use the doorbell or intercom).
 - (ii). Show AIC identification.

UNCONTROLLED IF PRINTED

- 2 b. Evacuate the structure if a hazardous condition exists. See [EMER 2.4 Subsection 4.5](#).
 - 2 c. Bar hole test or leak survey around the foundation.
 - 2 d. If gas is found, complete the leak investigation procedures. See [LEAK 2.2](#).
 3. Check adjacent structures for possible damage to gas meter sets. See [EMER 2.4 Subsection 4.2](#) *before touching the meter*.
 - 3 a. If there is any indication of damage, eliminate gas service to the damaged component to ensure that no gas can leak by or through that component.
 - 3 b. Do not remove component unless it is in danger of being damaged to the point of contributing to the fire or until instructed to do so by Gas Supervisor.
 4. Eliminate as many ignition sources as possible without being exposed to danger.
- 1.7 When additional AIC personnel arrive, they shall:
- 1.7.1 Make contact with AIC's first responder.
 - 1.7.2 Continue work under [Paragraph 1.6.1](#) as directed by AIC's first responder.
- 1.8 When electric, telephone and cable utility personnel arrive, they shall:
- 1.8.1 Make contact with AIC's gas field personnel.
 - 1.8.2 Disconnect their respective services to the structure from its external sources.
 - 1.8.3 The electric source shall be disconnected at the power pole or transformer away from the structure.
- Shutting electricity off at the AMI meter does not satisfy Paragraph 1.8.3 since the switching action in the AMI meter can create a spark.
- 1.8.4 If possible, cut the telephone line at a point away from the structure.
 - 1.8.5 If not possible, cut or disconnect the telephone line at the junction box:
 1. Check the junction box on the structure for possible concentration of gas.
 2. If safe, cut or disconnect the telephone line at the junction box.
 3. If not safe, ventilate until safe, then cut or disconnect the telephone line at the junction box.
 - 1.8.6 Report to Fire Chief or fireman in charge if on site. Otherwise, report to AIC's gas field personnel.
- 1.9 AIC's gas field personnel shall make contact with the Fire Chief or fireman in charge, and:
- 1.9.1 Provide a status report on the work undertaken prior to the arrival of the Fire Department:

UNCONTROLLED IF PRINTED

1. By AIC's gas field personnel under Subsections [1.4](#) and [1.6](#).
 2. By the Gas Supervisor, Gas Superintendent, and Gas Control under [Sub-section 1.5](#).
 3. By AIC's additional personnel under [Paragraph 1.6.1](#).
 4. By electric, telephone, and cable utility personnel under [Subsection 1.8](#).
- 1.9.2 Ask permission to complete the activities reported upon in Paragraph 1.9.1.
1. If permission granted for all subparagraphs, proceed.
 2. If permission not granted for all, proceed where permission was granted and inform the Gas Supervisor of where permission was withheld.
- 1.10 If Fire Department is already on site, AIC's gas field personnel shall make contact with the Fire Chief or fireman in charge, and ask:
- 1.10.1 Has Fire Department shut off the gas to the burning structure?
1. If shut off done, ask for permission to inspect the meter valve.
 - 1 a. If permission granted, see [Paragraph 1.10.2](#).
 - 1 b. If permission not granted, inform the Gas Supervisor.
 - 1 c. See [Subsection 1.11](#).
 2. If shut off not done, ask for permission to shut off the meter set.
 - 2 a. If permission granted and the gas meter set can be safely approached,
 - (i). See [EMER 2.4 Subsection 4.2](#) before touching the gas meter.
 - (ii). Shut off and red pin the meter valve.
 - (iii). Complete the OAS 6H screen. See [EMER 2.4 Appendix A](#).
 - (iv). See [Subsection 1.11](#).
 - 2 b. Inform the Gas Supervisor if:
 - (i). Permission to shut off gas meter NOT granted, and/or
 - (ii). Cannot safely approach gas meter.
 - 2 c. See [Subsection 1.11](#).
- 1.10.2 Fire Department has shut off the gas and granted permission to inspect the meter set.
1. If the gas meter set can be safely approached, see [EMER 2.4 Subsection 4.2](#) before touching the gas meter.
 2. Verify position of the meter valve
 - 2 a. If valve is shut off, red pin the meter valve.
 - 2 b. If valve is NOT shut off, shut off valve and red pin the meter valve.
 3. Complete the OAS 6H screen. See [EMER 2.4 Appendix A](#).
- 1.11 If the following tasks are not already completed, complete them:
- 1.11.1 See [Paragraph 1.6.1.1](#): meter set at the burning building.
 - 1.11.2 See [Paragraph 1.6.1.2](#): possible gas migration at adjacent structures.

UNCONTROLLED IF PRINTED

1.11.3 See [Paragraph 1.6.1.3](#): possible meter damage at adjacent structures.

1.12 Once it is determined that a hazardous condition no longer exists and the proper authorities have taken control of the situation, review and if necessary, follow procedures [INCD](#) and [INVE](#).

End of Instructions

Document Rescission

EMER 2.4.5 Gas Field Personnel – Gas Related Fire, Ignition, or Explosion, October 1, 2020

Revision Notes

Location of Changes	Summary of Changes
Paragraph 1.10.1	Revised – Has Fire Department shut off gas to the burning structure?
Paragraph 1.10.1 – Item 1.	Revised – If shut off is done, ask permission to inspect the meter set.
Paragraph 1.10.2	Revised – Fire Department has shut off the gas and granted permission to inspect the meter set: 2. Verify position of the meter valve.

EMERGENCY PLAN

April 1, 2023

EMER 2.4.6 Gas Field Personnel Dispatched to Non-Gas Related Fire, Ignition, or Explosion

**1.0 Dispatched to Non-Gas Related Fire, Ignition, or Explosion
(§192.615(a)(3)(ii), (a)(3)(iii), (a)(7), (a)(8), (a)(9))**

The following steps outline the actions for AIC's gas field personnel.

- 1.1 Park upwind of the incident site. For additional parking considerations, see **CAUTION** under [EMER 2.4 Subsection 4.7](#).
- 1.2 Approach the incident site from the upwind location.
- 1.3 Evaluate the situation; determine if the fire, ignition, or explosion has created an immediate hazard to life or property and if a gas facility is involved, such as main, service, meter set, or other gas facility.

Remember in a fire situation, the Fire Department has jurisdiction and is in charge of the scene.

- 1.4 Make contact with the Fire Chief or fireman in charge to see if there has been a determination whether or not gas was the cause of the fire or explosion.

If a determination has not been made, advise your Gas Supervisor or Duty Supervisor and request guidance if follow-up action is necessary.

- 1.5 If the Fire Chief or fireman in charge has determined that gas was not the cause for the fire or explosion:
 - 1.5.1 Check if the fire department wants the gas shut-off or has already shut-off the gas.
 - 1.5.2 If the gas does not need to be shut off:
 1. The gas field person should evaluate whether the fire has damaged any of the gas appliances or piping.
 2. If there is no evidence of any damage or adverse effects on the gas facilities or appliances, the gas service can be left on.

If a damaged appliance can be isolated, the main service can be left on

3. Enter comment on OAS 63 screen that gas service did not need to be shut off.

UNCONTROLLED IF PRINTED

1.5.3 If the Fire Department has shut-off the gas or wants the gas shut-off to the structure:

1. Ask permission to inspect meter set.
2. Check to see what valves are present and which one is or can be shut-off.
 - 2a. If a customer convenience valve (CCV) is present, it can be used to shut-off the gas to the structure. **The meter valve can either be turned back on or left on.**
 - 2b. If the meter valve has to be left in the closed position, red pin the valve. Complete the OAS 6H screen. See [EMER 2.4 Appendix A](#).
 - 2c. Check components for possible damage due to the fire.
 - 2d. If there is any indication of damage, eliminate gas service to the damaged component to ensure that no gas can leak by or through that component.
 - 2e. See [INVE 2.2](#). Investigation of Fires

1.6 If the information received indicates that natural gas was not involved in the cause of the fire:

- 1.6.1 No further investigation is required.
- 1.6.2 Within one business day, AIC's gas field personnel shall notify the Gas Supervisor that they responded to a fire.

1.7 Service cannot be restored to the customer until:

- 1.7.1 Fire Department has completed their investigation, has released the scene, or has okayed restoration of service. AND
- 1.7.2 Gas field personnel have inspected the facilities for damage. AND
- 1.7.3 No damage was found, OR
- 1.7.4 Damaged facilities isolated, replaced, or repaired.

End of Instructions

EMER 2.4.7 Gas Field Personnel Dispatched to Explosion and/or Fire Near Gas Pipeline Facilities**1.0 Dispatched to Explosion and/or Fire Near Gas Pipeline Facilities (§192.615(a)(3)(ii), (a)(3)(iii), (a)(7), (a)(8), (a)(9))**

The following steps outline the actions for AIC's field gas personnel and the Gas Supervisor (see Subsection 1.6) when responding to an explosion and/or fire near a gas pipeline facility.

- 1.1 Park upwind of the incident site. For additional parking considerations, see **CAUTION** under [EMER 2.4 Subsection 4.7](#).
- 1.2 Approach the incident site from the upwind location.
- 1.3 Determine if there is concern for the safety of people or property. An initial evaluation of the situation shall include:
 - 1.3.1 Are there gas customers being affected by the fire or explosion?
 - 1.3.2 How close is AIC's pipeline to the explosion and/or fire?
 - 1.3.3 Is the explosion and/or fire contained or is there possibility of it spreading?
 - 1.3.4 What type of AIC facilities could be affected?
 - 1.3.5 Are there above ground gas facilities present in the immediate area?
 - 1.3.6 Is the associated gas system or facilities remotely monitored by Gas Control?
 - 1.3.7 Is there a valve, either emergency or non-emergency, accessible that would isolate the gas facilities?
- 1.4 Notify Gas Supervisor if there is concern that the public, AIC's customers, and gas facilities may be impacted. Report the observations and information gathered in [Subsection 1.3](#).
- 1.5 Contact the Fire Chief or fireman in charge, communicate AIC's concerns and pertinent information about AIC's facilities. Then see [Subsection 1.8](#).
- 1.6 Gas Supervisor shall notify the Gas Superintendent with a brief explanation of the situation and the types of gas facilities that may be affected.
- 1.7 Gas Supervisor or Gas Superintendent shall contact Gas Control to see if the associated gas system or facilities are being remotely monitored and if there is any indication of impact on those facilities.
- 1.8 Gas Supervisor or Gas Superintendent shall make the determination if gas facilities need to be inspected, isolated, or disconnected from the system.
 - 1.8.1 If an explosion occurred within 25 feet of AIC gas facilities, a leak survey shall be conducted over and around all gas facilities located within a minimum of 100 feet in all directions of the explosion.
 - 1.8.2 AIC's field gas personnel shall begin the walking leak survey. See [LEAK 2.6](#).
 1. Follow instructions from Gas Supervisor and see [Paragraph 1.11.2](#).
- 1.9 Gas Tech Services Supervisor or Gas Storage Supervisor and Gas Control shall be notified if any of the following are affected:

UNCONTROLLED IF PRINTED

- 1.9.1 High pressure distribution or transmission pipelines.
 - 1.9.2 Pressure control or flow control station(s).
 - 1.9.3 Above ground valve station(s).
 - 1.9.4 Storage field/compressor station facilities.
 - 1.9.5 Odorization facilities.
- 1.10 Gas Tech Services or Gas Storage Supervisor will determine what procedures should be taken for the protection of the above listed facilities.

Facilities can be isolated or temporarily disconnected by the use of valves, control fittings, or squeezing.

- 1.11 The Gas Supervisor shall assign additional gas field personnel to the site when the scope of the response has been determined.
- 1.11.1 The additional personnel shall report to AIC's first responder upon arrival.
 - 1.11.2 AIC's field gas personnel shall provide the Fire Department person in charge with an update of AIC's activities.
- 1.12 Depending on the extent of the situation:
- 1.12.1 If the Gas Supervisor/Gas Superintendent and/or Gas Tech Service Supervisor determines:
 1. There may be a potential for isolating or shutting down a section/segment of the system:
 - 1 a. Contact Gas Control to verify that the affected system is remotely monitored.
 - 1 b. If Gas Control verifies that the affected system is remotely monitored, see [EMER 2.4 Subsection 4.8](#).
- 1.13 Gas Supervisor shall:
- 1.13.1 In conjunction with the Gas Superintendent and Gas Control,
 1. Determine the consequences and necessity of an immediate shutdown.
 2. Consider whether to implement [EMER 2.4.11](#). Loss and Restoration of Services.
 3. Consider the temporary use of CNG Trailers. See [EMER 2.9](#).
- 1.14 Once the emergency situation has been eliminated, the integrity of any disconnected gas facilities shall be determined prior to reinstating the facilities into operations. See [PURG](#) and [RNST](#).

End of Instructions

EMER 2.4.8 Gas Field Personnel Train Derailment near Pipeline Facilities

1.0 Train Derailment near Pipeline Facilities (§192.615 (a)(5), (a)(6), (a)(7), (a)(8), (a)(9))

- 1.1 When notified of a train derailment, the Gas Supervisor shall:
 - 1.1.1 Verify if AIC pipeline facilities are located within the vicinity of the derailment.
 - 1.1.2 When AIC pipeline facilities are located within the vicinity of the derailment:
 - 1. Provide pertinent information to rail operators and emergency response officials:
 - 1 a. So that movement of heavy equipment and debris on the right-of-way does not:
 - (i.) Pose a hazard to the public, AIC's customers, and people working in and around the derailment.
 - (ii.) Damage or rupture the pipeline
 - 1 b. The information shall include verification of: Presence.
 - (i). Depth
 - (ii). Location
 - 1.1.3 Notify AIC's Gas Integrity Management group of the derailment.
 - 1.1.4 Once the emergency situation has been eliminated, the integrity of any gas facilities involved shall be determined prior to reinstating the facilities into operations. See [PURG](#) and [RNST](#).

EMERGENCY PLAN

April 1, 2021

EMER 2.4.9 Gas Field Personnel Low-Pressure Situation**1.0 Low-Pressure Situation (§192.615 (a)(5), (a)(6), (a)(7), (a)(8), (a)(9))**

- When responding to a low-pressure situation, a major concern is that pilot lights may go out resulting in gas leaking into the customers' structures.
- Pressures below 4" W.C. on low-pressure systems and 2 PSIG on distribution pressure systems may cause pilot outage.

Low pressure may result from any of the following:

- Line break.
- Line obstruction.
- Mechanical failure in a regulator station.
- Ice formation over vents of regulators.
- Increased load on the system.
- Unintentional shutting off or restricting gas supply to an area.

1.1 When a low-pressure situation is discovered, gas field personnel shall:

1.1.1 Immediately notify the Gas Supervisor of the low-pressure situation and:

1. Identify the extent and general geographical location of the low-pressure area.
2. Request additional assistance if necessary.

1.1.2 Check the pressures at the extremities of the system.

1.1.3 Determine if the low pressure will create a customer outage.

1.1.4 Check for pilot outages and close and lock the meter valve of those customers affected if the pressure drops below a safe level.

1. See [EMER 2.4 Paragraph 4.2](#) before touching the meter.

1.1.5 Isolate the affected area to conserve pressure in adjacent areas.

1. Use maps showing critical valves and pressure control stations.

1.1.6 In conjunction with the Gas Supervisor and Gas Superintendent,

1. Discuss the possibility of bypass operations to stabilize the distribution pressure.

UNCONTROLLED IF PRINTED

2. Identify critical customers such as hospitals, nursing homes, schools or other public facilities that may need additional support or temporary supply during an outage.
 3. Discuss possible curtailments of large use customers.
 4. Implement the results of these discussions.
- 1.2 Gas Supervisor shall notify Gas Control of the situation and advise them of any assistance that may be needed or could be provided with the affected system(s). If Gas Control verifies the affected system is remotely monitored, see [EMER 2.4 Subsection 4.8](#).
- 1.3 Gas Supervisor, in conjunction with Gas Superintendent and Gas Control, shall:
- 1.3.1 Determine the consequences and necessity of an immediate shutdown.
 - 1.3.2 Consider whether to implement [EMER 2.4.11](#), Loss and Restoration of Services.
 - 1.3.3 Consider the temporary use of CNG Trailers. See [EMER 2.9](#).
- 1.4 After the repairs are complete to correct the cause of the low pressure, purge the system of air and relight the affected customers. See [PURG](#) and [TURN](#).

End of Instructions

Document Rescission

EMER 2.04 Emergency Plan: Gas Field Personnel, April 1, 2020.

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

EMERGENCY PLAN

October 1, 2020

EMER 2.4.10 Emergency Plan: Gas Field Personnel Over-Pressure Situation

1.0 Over-Pressure Situation (§192.615 (a)(5), (a)(6), (a)(7), (a)(8), (a)(9))

- When responding to a high-pressure situation, a major concern is the effect of the pressure exceeding the Maximum Emergency Pressure (MEP) of the system. See [Table 1](#).
- This effect may result in serious leaks, fires, explosions, and the customers' appliances burning out of control.

- All systems have an allowable build up over the established Maximum Allowable Operating Pressure (MAOP).
- This allowable build up is the MEP. See [Table 1](#).
- A relief valve or over pressure protection device should be operating if the system pressure has exceeded the MAOP. Relief valves are designed to vent system gas to the atmosphere.
- The system pressure may exceed the Normal Operating Pressure up to the MAOP established for each system.

- Increasing system pressure may result from any of the following:
- Mechanical failure in a regulator station.
 - Decreased load on the system.
 - Unintentional gas supply entering the system.

Table 1: Normal Operating and Maximum Emergency Pressures for Pressure Classes

Pressure Class	Normal Operating Pressure	Maximum Emergency Pressure (MEP)
Low-Pressure	4" W.C. to 14" W.C.	27.6" W.C.
Distribution Pressure 1	1 PSIG < 12 PSIG	MAOP + 50%
Distribution Pressure 2	12 PSIG < 60 PSIG	MAOP + 6 PSIG
High-Pressure Distribution & Transmission	60 PSIG & Over	MAOP + 10% or 75% SMYS whichever is less

UNCONTROLLED IF PRINTED

- 1.1 If system pressure exceeds the MAOP of the system, gas field personnel shall:
 - 1.1.1 Immediately notify the Gas Supervisor who shall refer to Subsections [1.3](#), [1.4](#), and [1.5](#).
 - 1.1.2 Allow a relief valve to continue blowing. DO NOT valve off the relief valve.
 - 1.1.3 Continue troubleshooting the system for probable causes.
 - 1.1.4 When the operator qualified regulator personnel or technician arrives, see [Sub-section 1.6](#).
- 1.2 If the system pressure has exceeded the MEP, the gas field personnel shall immediately notify the Gas Supervisor.
 - 1.2.1 The Gas Supervisor shall:
 - 1. Immediately contact Gas Superintendent, Supervisor GTS and Director Pipeline Safety and Compliance. See [PRES 2.1](#) for additional information.
 - 2. Consider to at least communicate with the local fire department and/or police in case their assistance may be needed.
- 1.3 Gas Supervisor shall notify Gas Control of the situation and advise them on any assistance that may be needed or could be provided with the affected system. If Gas Control verifies that the affected system is remotely monitored, see [EMER 2.4 Subsection 4.8](#).
- 1.4 Gas Supervisor, in conjunction with Gas Superintendent and Gas Control, shall:
 - 1.4.1 Determine the consequences and necessity of an immediate shutdown.
 - 1.4.2 Consider whether to implement [EMER 2.4.11](#), Loss and Restoration of Services.
 - 1.4.3 Consider the temporary use of CNG Trailers. See [EMER 2.9](#).
- 1.5 Gas Supervisor or Gas Tech Services Supervisor shall ensure an operator qualified regulator personnel or technician has been notified and dispatched.
- 1.6 The operator qualified regulator personnel or technician shall work with the on-site gas field personnel as follows.
 - 1.6.1 Use valves to throttle or shut down the feed to the system until the pressure is within the normal operating range.
 - 1. Valves shall be continuously monitored until pressure is within the normal operating range.
 - 1.6.2 Troubleshoot to identify the reason for the high-pressure situation.
 - 1.6.3 Make repairs and reestablish normal operating pressure to the affected area.

EMER 2.4.11 Gas Field Personnel Loss and Restoration of Service

1.0 Loss and Restoration of Service (§192.615(a)(5), (a)(6), (a)(7), (a)(8), (a)(9))

When a general loss of system pressure is detected,

- Actions shall be directed toward protecting people first and then property.
- The cause and effect of the pressure loss shall be determined.
- A qualified work force shall be established to safely restore service to the affected area.

The following steps shall be taken whenever there is a major loss of service that is expected to take more than 8 hours to restore.

1.1 Gas Control, Dispatch and/or gas field personnel shall notify Gas Supervisor of the loss of system pressure.

1.2 Gas Supervisor/Gas Superintendent shall contact Gas Control to:

1.2.1 Determine or verify that the affected system or adjacent systems are remotely monitored.

1.2.2 Notify them of the situation and discuss assistance Gas Control may be able to provide with monitoring operating parameters of the affected and adjacent systems. See [EMER 2.4 Subsection 4.8](#) regarding communications.

1.2.3 Consider the temporary use of CNG Trailers. See [EMER 2.9](#).

1.3 Gas field personnel shall:

1.3.1 Determine the cause for the loss of service and isolate the affected area from the rest of the system.

1.3.2 Identify critical customers such as hospitals, nursing homes, schools or other public facilities that may need additional support or temporary supply during an outage.

1.3.3 Identify the extent of the loss of service and the number of customers affected.

1.3.4 Conduct pressure checks on the outer ends of the system.

1.3.5 Check for pilot light outage.

1.3.6 Plot the outage area on a system map.

1.3.7 Estimate the number of customers out of service.

1.4 Gas Supervisor may obtain a list of gas customers for the affected outage. The customer list is obtained by contacting Gas Engineering, DDC/PDC, or Gas Tech Engineering - Planning group who can assist in obtaining a list.

1.5 An AIC designated person shall notify other appropriate groups about of the loss of service.

1.5.1 Customer Care Center (Provide a general description of the loss of service area.)

UNCONTROLLED IF PRINTED

- 1.5.2 Dispatch.
- 1.5.3 Gas Tech Services Supervisor shall be contacted if transmission or high-pressure distribution facilities or regulator stations are involved.
- 1.5.4 Gas Compliance.
- 1.5.5 Affected large industrial and commercial customers and management of public housing units.
- 1.5.6 Fire and Police Departments.
- 1.5.7 Other Regions if assistance may be required.

If the Emergency Operations Center (EOC) is activated for a major outage, they shall assume control and coordinate obtaining the necessary resources from outside the affected Region.

- 1.6 AIC Communication shall notify local media.
 - 1.6.1 If the loss of service has affected a large area, the Region Director, in consultation with AIC Communication, may initiate a news release to local newspapers, radios, and TV stations.
 - 1.6.2 Inform the public of the area affected.
 - 1.6.3 Notify the public that gas field personnel will be assigned to turn-on their appliances. Suggest that the affected customers leave their porch light on if they wish to be turned-on during the evening hours.
 - 1.6.4 Customers should not attempt to turn-on their own appliances during the outage.
 - 1.6.5 Give a brief description of the cause for loss of service.
- 1.7 Gas Compliance shall notify Illinois Commerce Commission and Illinois Emergency Management Agency in the event that the loss of service affects a large area and it is apparent that more than 1000 people, approximately 400 meters, will be without gas for a period of 24 hours or more. See [INCD 1](#) for the protocol to report this event.
- 1.8 Gas Supervisor/Gas Superintendent shall consider the following when determining the appropriate staffing levels to respond to the emergency:
 - 1.8.1 Plan for a maximum time of 24 hours for complete restoration of service.
 - 1. Cold weather conditions may require restoration time frame to shorten.
 - 1.8.2 Each qualified gas field personnel should be able to turn-on 5 customers per hour.
 - 1.8.3 Assign one Gas Supervisor to supervise the work of approximately 10 gas field personnel.
 - 1.8.4 Plan for a two-person forcible entry crew for inaccessible meters.
 - 1.8.5 Request EOC assistance for additional contractors, and/or other resources from outside the Region.
- 1.9 Gas Supervisor/Gas Superintendent or designated person shall organize the OAS workflow.

- 1.9.1 Notify Dispatch that the Region will handle the OAS orders relating to the loss of service for the affected area. Dispatch shall continue to handle emergency leak calls.
- 1.9.2 Request assistance from local office personnel to process the OAS orders.
- 1.10 Gas Supervisor/Gas Superintendent shall organize the work force.
 - 1.10.1 One Gas Supervisor shall have the overall responsibility for coordinating the restoration of service.
 - 1.10.2 Gas Supervisor or designee will maintain the customer record at the assigned headquarters.
 - 1.10.3 Gas Supervisor or designee shall use the customer record to cross reference all customer turned off and turned on from the Emergency Gas Meter Status Record form. See [EMER 3](#) for copy of Emergency Gas Meter Status Record form.
 - 1.10.4 Divide the outage into manageable areas.
 - 1.10.5 Assign 5 to 10 gas field personnel and a Gas Supervisor to each area.
 1. Each supervisor will be given maps for the affected area.
 2. Gas field personnel shall be assigned designated streets/area to turn off, and
 3. Record the information on the Emergency Gas Meter Status Record form.
 - 1.10.6 If possible, the same gas field personnel should be assigned to turn-on the same area that they were assigned to turn-off.
 - 1.10.7 Review turn-off/turn-on requirements for an outage.
- 1.11 Gas field personnel Turn-off requirement for an outage:
 - 1.11.1 Turn-off the meter valve or curb valve for each affected customer: The meter valve shall be locked. See [EMER 2.4 Subsection 4.2](#) *before touching gas meter*.

Locking the meter valve ensures customer does not attempt to re-light during the outage.

 - 1.11.2 Record the address and meter number on the Emergency Gas Meter Status Record form.
 - 1.11.3 Place an outage door hanger on the customer's door to notify them of the loss of service and that a turn-on will occur after the gas has been restored.
 - 1.11.4 Consider painting a white dot or other indicating method on or at the curb in front of the premise to indicate that the meter valve is off.
 - 1.11.5 If the meter valve or curb valve is inaccessible, record the address and meter number. Turn this information over to the Gas Supervisor for the forcible entry crew.
 - 1.11.6 The recorded meter numbers and addresses shall be correlated with the meter list to ensure that all affected customers are turned off.
- 1.12 Gas Supervisor is responsible for verifying that all meters are turned-off in their assigned area.

UNCONTROLLED IF PRINTED

- 1.13 For cases where the turn-off cannot be made without forcible entry:
 - 1.13.1 A two-person forcible entry crew shall be assigned the work.
 - 1.13.2 A locksmith shall be utilized to access the premise.
 - 1.13.3 Ameren Security personnel, police officer, or neighbor shall witness a forced entry and asked to stand by while work is performed inside the premise.
 - 1.13.4 A cone shall be placed at each entrance to the premise if no one is available to stand by while work is performed.
 - 1.13.5 The premise must be secured following the forced entry.
 1. Leave a door hanger or notice notifying the customer that due to an emergency, AIC had to make a forcible entry.
 2. Door hanger or notice shall contain AIC's contact number 800-755-5000.
 - 1.13.6 Document damage to the premise from the forced entry along with the names of those present.

<p>If police officer witnessed the forced entry, record the officer's name and badge number.</p>
--

- 1.13.7 Notify Corporate Claims that damage has occurred. See [INCD 1 Appendix D](#).
- 1.14 During the meter turn-off phase, available supervisory personnel shall have a conference to formulate detailed plans for:
 - 1.14.1 Purging and the re-pressurization of the system. See [PURG 2](#).
 - 1.14.2 Customer turn-on process and a list of essential/priority customers.
 - 1.14.3 Ensuring an adequate supply of flashlights, batteries, wrenches, appliance lighters, matches, etc.
 - 1.14.4 Reviewing the instructions to be given to gas field personnel prior to beginning the turn-on process.
- 1.15 Before the reintroduction of gas in the system, Gas Supervisor shall complete a final verification that all affected customers have been shut off to prevent the escape of natural gas into the structures and/or an air/gas mixture in the piping systems.
- 1.16 The purge and re-pressurization **shall not** begin until all affected customer meter valves are turned off.
 - 1.16.1 If possible, sectionalize the area and purge each section at the extreme ends, reintroducing gas in a moderately rapid and continuous flow. Multiple feeds shall be turned on individually rather than collectively.
 - 1.16.2 Confirm that the purge is complete with a CGI reading.
 - 1.16.3 Re-pressurize the system to the normal operating pressure.
 - 1.16.4 Individual service lines will each need to be purged of air during the turn-on process.
- 1.17 Gas field personnel shall purge and re-pressurize the system. See [PURG 2](#).

UNCONTROLLED IF PRINTED

- 1.18 An AIC designated person or Gas Supervisor shall update the Customer Care Center and AIC Communications (see [INCD 1 Appendix D](#)).
 - 1.18.1 Notify the Customer Care Center and AIC Communications when the turn-on process will begin and that gas field personnel will be contacting customers to turn on their gas and light the appliances.
 - 1.18.2 Suggest that the affected customers leave their porch light on if they wish to be turned-on during the evening hours.
 - 1.18.3 Turn-ons will continue throughout the night when temperatures are below freezing.
 - 1.18.4 If the temperatures are mild, the turn-on process may be suspended between 10:00 PM and 6:00 AM unless a porch light is on.
- 1.19 Gas Supervisor shall implement the plan to restore service to individual customers.
 - 1.19.1 Equip gas field personnel with maps, "Warning" tags, door hanger and the tools and supplies required for the turn-on process.
 - 1.19.2 The same gas field personnel should be assigned to turn-on the same area that they were assigned to turn-off.
 - 1.19.3 Prioritize to work with essential/priority customers first.
 - 1.19.4 Use the turn-off records to record the time and date that gas was restored to the customer.
 - 1.19.5 As gas is restored, forward the paperwork to the Gas Supervisor to ensure that the OAS order is closed.
 - 1.19.6 Monitor OAS for customers that have been missed during the turn-on phase.
- 1.20 Gas field personnel Turn-on requirements for an outage:
 - 1.20.1 Air must be purged from the service with natural gas before lighting the appliances.
 - 1.20.2 A 30-second shut-in test shall be performed using normal delivery pressure to ensure that there are no open fuel lines or appliance safeties that have failed in the open position.
 - 1.20.3 Customer may choose to relight their own appliance unless the 30 second shut-in test fails.
 - 1.20.4 When a customer chooses to have AIC relight the appliances, enter the premise and purge the customer's piping of air.
 - 1.20.5 Light the pilots on the gas utilization equipment. Place the equipment into operation.

During the warmer times of the year, customers may not want their pilots lit on space heating equipment.

 - 1.20.6 If a hazardous condition is observed, it shall be isolated, and a "Warning" tag installed. Report these conditions to the Gas Supervisor for follow-up action. Refer to [TURN 2.7](#) Warning Tag.

- 1.20.7 Appliances where the pilots will not remain lit shall be isolated, a "Warning" tag installed and reported to the Gas Supervisor for follow-up action.
1. AIC personnel shall contact an HVAC contractor to correct this type of appliance problem at AIC's expense.
 2. Corporate Claims (see [INCD 1 Appendix D](#)) may be utilized to process HVAC invoices.
- 1.20.8 Gas field personnel should record, at a minimum, the customer address, meter number, times, and dates of service restoration.
1. This information shall be added to the Emergency Gas Meter Status Record form, and
 2. Given to the Gas Supervisor or designee for cross reference with the customer records to assure that all customers have been turned back on.
- 1.20.9 Gas field personnel should consider painting a second white dot or other indicating method on or at the curb in front of the premise to indicate that a turn-on has been performed and the customer's appliances have been lit.
1. Multiple meter sets should have the second dot painted after all meters are turned on.
- 1.21 An AIC designated person or Gas Supervisor shall update the Customer Care Center and AIC Communications. See [INCD 1 Appendix D](#).
- 1.21.1 Notify Dispatch, Customer Care Center, and AIC Communications when the restoration of service is complete.
- 1.21.2 Request that customers contact by calling the Customer Care Center at 1-800-755-5000 if they do not have their gas turned on.
- 1.21.3 Thank the customers.

End of Instructions

Document Rescission

EMER 2.04 Emergency Plan: Gas Field Personnel, April 1, 2020.

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

UNCONTROLLED IF PRINTED

EMERGENCY PLAN

October 1, 2022

EMER 2.5 Natural Disasters and Civil Disobedience**1.0 Purpose**

This document outlines procedures for Ameren Illinois's (AIC's) response to natural disasters in accordance with 49 CFR §192.615 and civil disobedience.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 Natural Disasters - Other Than Floods](#)****[5.0 Natural Disasters: Floods](#)****[6.0 Civil Disobedience](#)****3.0 Target Audience**

- Gas Control Personnel
- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Service (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Pipeline Integrity Management Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Control

4.0 Natural Disasters - Other Than Floods (§192.615(a)(3)(iv), (a)(5))

Natural disasters other than floods may include earthquakes, landslides, tornadoes, and wild-fires. In addition to directing actions toward protecting people first and then property, the Incident Command Structure (ICS) Supervisor, Gas Supervisor or designee shall:

- 4.1 Contact Gas Control to advise them of the situation and to determine if the affected gas systems are remotely monitored.
- 4.2 If Gas Control verifies that they remotely monitor the affected systems, establish a line of communications for the purpose of:
 - 4.2.1 Keeping them updated on the status of situation throughout the disaster.
 - 4.2.2 Requesting their assistance in monitoring.
 - 4.2.3 Determining at what point Gas Control should issue a warning of potential system problem.
 - 4.2.4 Keeping Gas Control updated on the status of restoration efforts and the condition of adjacent gas systems.
 - 4.2.5 Notifying Gas Control when the situation has been corrected and the system should be back to normal operation. Verifying that monitored operating parameters have been restored.
- 4.3 Contact Gas Tech Services (GTS) or Gas Storage Field personnel if any of their respective facilities could be potentially affected such as:

UNCONTROLLED IF PRINTED

- 4.3.1 Transmission lines.
- 4.3.2 High-pressure distribution mains.
- 4.3.3 Pressure control stations.
- 4.3.4 Odorization stations.
- 4.3.5 Gas storage field lines, wells, or compressors.
- 4.3.6 GTS or Gas Storage Field personnel shall assume responsibility for their respective facilities.
- 4.4 Dispatch gas field personnel to the area of the natural disaster to:
 - 4.4.1 Determine if AIC's facilities are damaged or in danger of failing.
 - 4.4.2 Communicate with the appropriate fire department about the potential impact on AIC's facilities.
 - 4.4.3 Determine where uncontrolled overpressure exists or large amounts of gas are being released and evaluate the hazards involved.
 - 4.4.4 Prepare to isolate affected areas.
 - 4.4.5 Check adjoining systems for damage or confirm they are operating normally after affected areas are isolated.
- 4.5 Consider shutting off the gas supply to the affected area if the safety of the public or conservation of pressure in the overall system is in jeopardy.
 - 4.5.1 Advise Gas Control of areas to be isolated to determine if they can be of assistance with isolating the areas.
- 4.6 Implement other appropriate sections of the Emergency Plan.
- 4.7 Notify Director, Pipeline Safety & Compliance about the situation and provide current status reports about the situation.
- 4.8 Contact Corporate Security to arrange for security guards to protect vulnerable portions of AIC's gas facilities from further damage.
- 4.9 Consider governmental reporting requirements. See [SAFT 1](#) and [INCD 1](#).
- 4.10 Contact Corporate Communications to issue a media release to the affected area. This media release should:
 - 4.10.1 Instruct occupants to call AIC if they smell gas.
 - 4.10.2 Inform the occupant of the activities AIC is performing to ensure the safe delivery of natural gas.
- 4.11 Make an evaluation of required repairs.
- 4.12 Following the natural disaster, ensure that facilities have not been damaged or that repairs are made before gas service is restored.

5.0 Natural Disasters: Floods (§192.615(a)(3)(iv), (a)(5))

In addition to directing actions toward protecting people first and then property, the Gas Supervisor or designee shall consider:

- 5.1 Prior to Flooding:
 - 5.1.1 Determining if Gas Control needs to be contacted in cases where the affected systems are remotely monitored.

UNCONTROLLED IF PRINTED

1. Discussing options available in the event flooding does occur and establish a line of communications. See [Subsection 4.2](#).
- 5.1.2 Contacting GTS personnel and requesting their assistance if flooding could potentially affect transmission or high-pressure distribution facilities.
- 5.1.3 Leaving the system pressurized to prevent water infiltration into the mains, if possible.
 1. Service can be left on as long as the regulator and relief vents are extended above the expected high water line.
 2. Gas meters will function when submerged, but the AMI device will require replacement following submergence.
- 5.1.4 Shutting off and locking individual services where regulator and relief vents could be submerged, with priority given to inside services.
- 5.1.5 Securing odorant bulk tanks.
- 5.1.6 Contacting Gas Control prior to disconnecting telemetering equipment.
- 5.1.7 Sandbagging and protecting facilities, if possible.
- 5.1.8 Raising pressure gauges and recording equipment above anticipated flood level, if possible.
- 5.1.9 Extending regulator vent lines and relief stacks at least above the level of anticipated flooding.
- 5.2 During the Flood
 - 5.2.1 Being alert to areas of flooding and having gas field personnel available for emergency response actions such as shutdown, isolation, and containment.
 - 5.2.2 If the affected systems are remotely monitored by Gas Control,
 1. Notifying them of the situation.
 2. Discussing plans for isolating or shutting down sections of the system.
 3. Developing a plan and line of communications for keeping all involved updated of the situation.
 - 5.2.3 Evaluating the accessibility of pipeline facilities, such as emergency valves, needed to isolate water crossings or other sections of pipelines that might be jeopardized.
 - 5.2.4 Performing frequent patrols to evaluate right-of-way conditions at water crossings during flooding and after waters subside.
 1. Determining if flooding has exposed and/or undermined pipelines.
 - 5.2.5 Coordinating with other pipeline companies and communicating with personnel at emergency response centers.
 1. Providing information on pipeline location and condition to emergency responders.
 - 5.2.6 Considering extending regulator vent lines and relief stacks.
 - 5.2.7 Determining whether facilities (such as meter sets, regulator stations, valve stations, farm taps, and regulator or relief valve vent lines) that have become submerged could be struck by watercraft or floating debris.

1. Marking submerged facilities with buoys.

5.2.8 Consider governmental reporting requirements. See [SAFT 1](#) and [INCD 1](#).

5.3 Following the flood, the Gas Supervisor or GTS Supervisor, where applicable, shall ensure the following actions are taken:

5.3.1 If Gas Control was involved in any of the operations taken to protect the gas systems or gas facilities from flooding, notifying them that:

1. Flooding has receded.
2. The gas system is being returned or is at normal operations.

5.3.2 Replace AMI device on all gas meters that were submerged during the flood.

1. AMI can be replaced on the existing meter, OR
2. Exchange the meter and ship to the Gas Meter Shop. The meter should be tagged "Submerged".

5.3.3 Inspect regulator stations for water damage.

1. If water has entered equipment through breather vents or relief outlets, replacing or rebuilding the equipment.
 - 1 a. Prior to beginning work on a regulator station that is remotely monitored, advising Gas Control of the situation.
 - 1 b. Replacing aluminum regulator parts subjected to water due to the potentially corrosive nature of the flood water.
 - 1 c. Cleaning cast iron or steel regulator parts.
2. Contact Gas Control once work has been completed and verifying operating parameters have been restored.

5.3.4 Issue a Warning Tag if:

1. Water had covered the control valves on interior appliances, OR
2. If service has to be shut off. Refer to [TURN 2.7](#) Warning Tag

5.3.5 Notify customers about:

1. The potential damage associated with appliances controls and pilots being submerged in water.
2. Having a qualified plumbing or heating contractor inspect their equipment prior placing it back in service.

5.3.6 Ensure that pipeline markers are still in place.

5.3.7 Remind contractors, highway departments, and others involved in excavation and clearing activities associated with cleanup about:

1. The presence of pipelines.
2. The operating hazards that could occur due to reduced pipeline cover.

5.3.8 Where there is significant land erosion, performing surveys to determine the depth of cover over pipelines.

1. Notify landowners of reduced cover.
2. Request agricultural agencies to assist in reminding farmers of the potential hazards caused by reduced cover over pipelines.

UNCONTROLLED IF PRINTED

- 5.3.9 Create critical area patrols in Maximo for any pipeline segments that become exposed, undermined, or at risk due to reduced cover. See [PTRL 2.2](#).
- 5.3.10 Inspect any exposed gas pipeline for damage that may affect the system integrity and take measures to repair the damage. See [REPR 1](#).
- 5.3.11 If appropriate, notify Gas Control of damage to pipeline in system that are remotely monitored that may need system pressure lowered in order to repair the damage.

6.0 Civil Disobedience

- 6.1 When an emergency results from sabotage, riot, or other forms of mob action, the Gas Supervisor shall:
 - 6.1.1 Protect the public and AIC's customers and personnel from injury due to possible damage to AIC's system.
 - 6.1.2 Protect AIC's system from possible damage.
- 6.2 At the first instance of civil disobedience, Gas Supervisor shall:
 - 6.2.1 Secure AIC's system in the area of the emergency by:
 - 1. Requesting police surveillance of critical gas facilities.
 - 2. Contacting Corporate Security to arrange for security guards.
 - 3. Assigning gas personnel to patrol the outskirts of the area including major regulator stations. Their function should only be for observing and reporting any developments in the area.
 - 6.2.2 If the potentially affected systems are remotely monitored, notify Gas Control of the situation.
 - 1. Discuss plans for isolating or shutting down sections of the system if the need arises.
 - 2. Develop a plan and line of communications for keeping all involved updated of the situation. See [Subsection 4.2](#).
 - 6.2.3 If violence or any threat to the safety of AIC's personnel persists:
 - 1. Withdraw AIC's personnel from the area.
 - 2. Notify law enforcement and Ameren Security.
 - 6.2.4 If the emergency remains unabated, take the necessary steps to sectionalize the area and shutdown that portion of the system.
 - 1. If Gas Control has verified they are remotely monitoring the systems, coordinate the isolation and/or shutdown process with them.
 - 6.2.5 Consider implementing other sections of the Emergency Plan as needed.
 - 6.2.6 Consider governmental reporting requirements. See [SAFT 1](#) and [INCD 1](#).

End of Instructions.

EMERGENCY PLAN

October 1, 2021

EMER 2.6 Emergency Personnel and Materials

1.0 Purpose

This document outlines procedures for Ameren Illinois's (AIC's) availability of personnel, equipment, tools, and materials as needed at the scene of an emergency in accordance with 49 CFR §192.615.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Personnel, Storeroom, Specialized Tools and Equipment](#)

[5.0 Emergency Gas Material](#)

[6.0 Centralized Emergency Gas Material](#)

[7.0 Non-Centralized Emergency Gas Material](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Supervisors
- Gas Tech Service (GTS) Personnel
- Storeroom Personnel
- Gas Engineering
- Gas Tech Engineering (GTE)

4.0 Personnel, Storeroom, Specialized Tools and Equipment (§192.615(a)(4))

4.1 The Gas Supervisor shall:

- 4.1.1 Maintain a list of available qualified personnel.
- 4.1.2 Ensure that the storeroom stocks an adequate quantity of emergency gas materials required for responding to and mitigating emergency situations.
- 4.1.3 Identify specialized tools and equipment needed for emergency situations.

5.0 Emergency Gas Material

5.1 The quantity and location of stocked emergency gas material is available through EM-PRV in the 607 storeroom.

6.0 Centralized Emergency Gas Material

6.1 The Gas Standards Engineer shall:

- 6.1.1 Determine what emergency gas material will be stored in each of the designated centralized storeroom locations.
- 6.1.2 Maintain a list of emergency gas material stored at centralized locations. The list is available on the Ameren Illinois Gas Operations SharePoint site, Standards & Materials.

UNCONTROLLED IF PRINTED

6.1.3 Inventory emergency gas material at centralized locations 1 time each calendar year.

6.2 Centralized emergency gas material shall include:

6.2.1 Steel pipe that is:

1. In sizes 2 through 30 inches.
2. Coated with fusion bond epoxy.
3. Pretested. See [PTST 1](#).
 - 3 a. Gas Tech Engineering (GTE) shall provide test pressures.
 - 3 b. Documentation of test pressure, date tested, medium used, duration of test, and witnesses shall be kept with each pipe joint.
4. In pipe joints of double random lengths.

6.2.2 Steel pipe fittings designated as emergency stock.

6.3 Storage requirements for centralized emergency gas material:

6.3.1 Stored at Decatur MDF:

1. In a separate location designated for emergency gas material.
2. Protected from ultraviolet light to prevent coating deterioration.

6.3.2 Steel pipe fittings designated as emergency stock shall be stored with their respective emergency gas material.

6.4 Regarding the use, replenishment, and verification of centralized emergency gas material, storeroom personnel shall:

- 6.4.1 After a request for emergency gas material is made, arrange for picking, loading, and shipping the required items.
- 6.4.2 Replace all material with like size and kind immediately after use through an automated process in EMPRV.
- 6.4.3 Verify that the minimum quantity of each item is on hand and properly stored.

7.0 Non-Centralized Emergency Gas Material

7.1 Non-centralized emergency gas material shall include:

7.1.1 PE pipe that:

1. Is pretested. See [PTST 1](#).
 - 1 a. Documentation of test pressure, date of test, medium used, duration of test and witness should be kept with each emergency plastic pipe segment.
2. Has the ends of the pipe covered, capped, or plugged to prevent debris from entering.
3. May have smaller diameter pipe stored inside larger diameter pipe to minimize storage.
4. Is stored for emergencies shall be inspected to ensure it does not exceed its shelf life.
 - 4 a. 3 years from the date of manufacture for PE 2708 (MDPE)

OR

4 b. 10 years from the date of manufacture for PE 4710 (HDPE).

7.1.2 Each operating area shall determine the minimum number and type of plastic and steel fittings to be kept in their local emergency inventory.

7.1.3 Steel pipe that is:

1. In sizes $\frac{3}{4}$ inch through 4 inches.
2. Up to 100 feet long for each size.
3. Coated with fusion bond epoxy.
4. Pretested. See [PTST 1](#).

4 a. Documentation of test pressure, date tested, medium used, duration of test, and witnesses shall be kept with each pipe joint.

5. Sealed at the ends of each pipe joint.
6. Stored in a location to prevent ultraviolet light from deteriorating the coating.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

EMERGENCY PLAN

October 1, 2020

EMER 2.7 Emergency Response Review

1.0 Purpose

This document outlines procedures for Ameren Illinois's (AIC's) review of employee response to an emergency in accordance with 49 CFR §192.615.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Written Report](#)

Appendices:

[Appendix A - Sample Emergency Response Review Form](#)

3.0 Target Audience

- Gas Compliance Personnel
- Gas Supervisors
- Gas Tech Service (GTS) Supervisors
- Incident Commander
- Gas Storage Field Supervisor

4.0 General (§192.615(b)(3))

- 4.1 Following a declared natural gas emergency, the Incident Commander, Gas Superintendent / Supervisor or Gas Storage Field Superintendent / Supervisor shall conduct a formal review of the response to the emergency.
- 4.2 The review shall evaluate if the response of the personnel followed O&M Emergency Plan procedures.
- 4.3 In situations where the response of the personnel did not follow the procedures in the Emergency Plan, the response should be analyzed to determine the following:
 - 4.3.1 If the response was appropriate for the emergency situation.
 - 4.3.2 If the Emergency Plan needs to be updated to reflect this type of an emergency.
 - 4.3.3 If additional training on the Emergency Plan is required.

5.0 Written Report

- 5.1 A written report of the Emergency Response Review (see [Appendix A](#)) shall be completed for the following types of gas emergencies.
 - 5.1.1 Inside leak response with a hazardous concentration of gas (10% LEL or 0.5% gas in air or greater) involving multiple structures requiring evacuation by gas field personnel and/or Emergency Responder.
 - 5.1.2 Major leak or line break on high pressure distribution/transmission in a Class 3 or 4 location.

UNCONTROLLED IF PRINTED

- 5.1.3 Gas in a sewer migrating into a structure, with a hazardous concentration of gas (30% LEL or 1.5% gas in air or greater), requiring evacuation by gas field personnel.
 - 5.1.4 Fire, ignition, or explosion caused by a release of gas from AIC's facilities.
 - 5.1.5 Low pressure situation where 1000 people are interrupted for more than 24 hours.
 - 5.1.6 High pressure situation that results in a serious leak, fire, or explosion.
 - 5.1.7 Natural disaster declared by state or federal authorities that requires an emergency response by gas field personnel.
- 5.2 Send the written report to:
- 5.2.1 Manager - Pipeline Safety Compliance, 2125 E. State Route 104, Pawnee, IL 62558

EMERGENCY PLAN

October 1, 2020

EMER 2.8 Training

1.0 Purpose

This document outlines procedures for the emergency response training of Ameren Illinois' (AIC's) operating personnel in accordance with 49 CFR §192.615.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Initial Training](#)

[6.0 Refresher Training](#)

[7.0 Verification of Training Effectiveness](#)

3.0 Target Audience

- Gas Compliance Personnel
- Gas Training Personnel
- Gas Operator Qualification (OQ) Personnel
- Emergency Response Personnel
- Gas Field Personnel
- Gas Supervisors
- Gas Engineering
- Gas Storage Engineering (GSE)
- Gas Tech Engineering (GTE)
- Gas Tech Services (GTS) Supervisors
- Gas Tech Service (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 General (§192.615(b)(2))

4.1 Personnel engaged in emergency response activities shall receive:

4.1.1 Initial training on the Emergency Plan.

4.1.2 Refresher training on the Emergency Plan.

4.2 AIC shall verify that the training is effective.

5.0 Initial Training

5.1 Initial Emergency Plan training is done during AIC's apprenticeship program. See [AP-PR](#).

6.0 Refresher Training

Refresher training ensures that personnel engaged in emergency response activities are knowledgeable about the current Emergency Plan.

6.1 Gas Supervisor shall ensure the refresher training is conducted during the first quarter of each year.

6.2 Gas Compliance Group shall send out an annual notification for the refresher training along with instructions and an Insight Roster.

UNCONTROLLED IF PRINTED

- 6.3 Each employee receiving the refresher training shall sign the Insight Roster.
- 6.4 Gas Supervisor or individual conducting the training shall sign and date the Insight Roster.
- 6.5 Gas Supervisor shall:
 - 6.5.1 Have the Insight Roster locally entered into Ameren's Insight program
OR
 - 6.5.2 Scan the Insight Roster and email it to the designated person at Pawnee Gas Training Center for entry into Ameren's Insight program.

7.0 Verification of Training Effectiveness

- 7.1 Training effectiveness is verified by:
 - 7.1.1 Examinations during AIC's apprentice and Operator Qualifications programs. See [APPR](#) and [OQAL](#).
 - 7.1.2 Post incident reviews. See [EMER 2.7](#).

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

1.0 Purpose

This procedure provides information about Ameren Illinois's (AIC's) portable Compressed Natural Gas (CNG) trailers in accordance with 49 CFR Part 172.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 CNG Trailers by Location and Capacity](#)

[6.0 Regulating and Relief Equipment](#)

[7.0 Other Equipment](#)

[8.0 CNG Filling Stations](#)

[9.0 CNG Cylinders](#)

[10.0 CNG Transportation Requirements](#)

[11.0 Using CNG Trailers](#)

[12.0 Instructions](#)

[13.0 Examples](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- HAZMAT Employees
- HAZMAT Drivers
- Gas Tech Engineering (GTE)

4.0 General

4.1 Use a CNG trailer to provide a temporary gas supply for:

4.1.1 One or more residential customers or a small commercial customer to prevent an outage and subsequent relights during:

1. An emergency affecting AIC facilities such as a meter, regulator station, farm tap, main, or service

OR

2. Scheduled work.

4.1.2 An uprate or a strength test in specific cases.

5.0 CNG Trailers by Location and Capacity

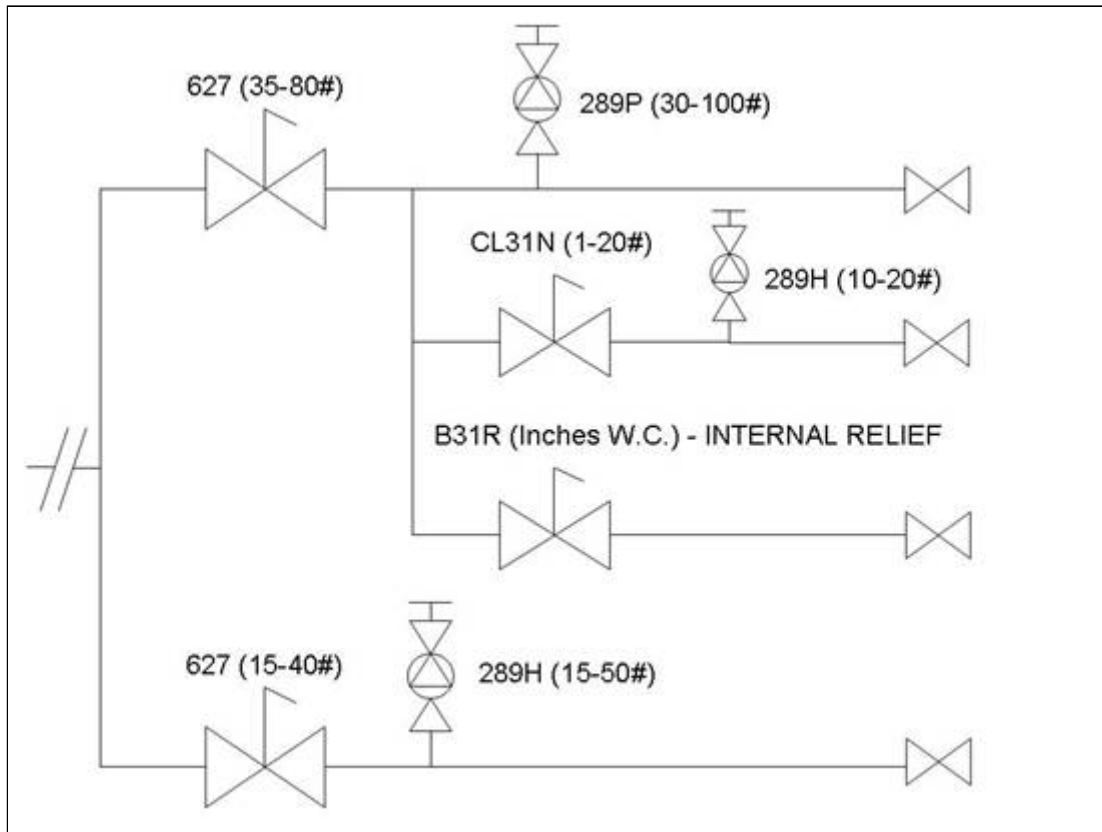

Figure 2: Typical Regulator Connections on CNG Trailers

1. Under special circumstances, full cylinder pressure can be made available from the filling tubing
2. Catalytic heaters provided on all trailers to prevent regulator freeze up.
3. Individual run configuration and physical appearance may vary from trailer to trailer.
4. GTE or GTS may approve the use of other pressure control equipment.

7.0 Other Equipment

7.1 Each trailer must also carry the following equipment:

7.1.1 A valved "Y" fitting to allow uninterrupted changing of trailers under load.

- 7.1.2 Minimum 50 feet of 1-inch rubber hose to tie into delivery location.
- 7.1.3 A static line to ground the trailer and prevent accidental ignition.
- 7.1.4 Fire Extinguisher, dry chemical (A. B. C.), 20 pound minimum.
- 7.1.5 Wheel chocks to be used when the trailer is in operation.
- 7.1.6 Miscellaneous fittings to connect to typical standards riser/meter set.
- 7.1.7 Minimum of 4 safety cones.

8.0 CNG Filling Stations

8.1 Refill CNG trailers in a timely fashion after use. See Table 3 for approved filling locations.

Table 3: Approved CNG Trailer Filling Locations

Company	Location	Address
Ameren Illinois	Edwards, IL	Peoria Gas OC, 7064 W Highway 150, Edwards, IL 61528
Ameren Illinois	Maryville, IL	2050 Vadalabene Drive Maryville, IL 62062
Springfield MTD	Springfield, IL	928 S. 9th St Springfield, IL 62703
Laclede Gas Company	Shrewsbury, MO	4118 Shrewsbury Ave Saint Louis, MO 63119
Peoria Disposal Company (PDC)	West Peoria, IL	1113 N. Swords Ave. West Peoria, IL 61604

9.0 CNG Cylinders

9.1 CNG cylinders shall be inspected and hydrostatically tested every 5 years by an approved testing facility.

10.0 CNG Transportation Requirements (49 CFR Part 172, Subpart C)

10.1 Properly fill out CNG Shipping Papers (see [EMER 3](#)) by entering:

- 10.1.1 The date, delivery address, and the route - if applicable.
- 10.1.2 The shipping name for CNG per 49 CFR §172.101 (see [EMER 3](#)):
 - 1. Methane, compressed
 - OR
 - 2. Natural gas, compressed (with high methane content).
- 10.1.3 The identification number of UN1971.
- 10.1.4 The hazard class of 2.1.
- 10.1.5 An "X" mark for Hazmat endorsement.
- 10.1.6 The signatures of the shipper and driver.

[EMER 3](#) (Shipping Paper for a CNG Trailer)

10.2 Additionally, shipping papers are required:

- 10.2.1 To remain within reach of the driver during transport.
- 10.2.2 Whether the tanks are full or empty.
- 10.2.3 To be retained for 2 years by GTS.

Contact GTS for more information about shipping papers.
Shipping papers are included in this manual; see [EMER 3](#).

10.3 HAZMAT Employees

10.3.1 HAZMAT employees shall be:

- 1. Trained and certified in accordance with §172.704 every 3 years.
- 2. Qualified in accordance with the Complex Pressure Control OQ to operate a CNG trailer.

10.3.2 HAZMAT drivers shall have a valid CDL with a HAZMAT endorsement to transport CNG trailers.

10.3.3 GTS shall keep a record of current training of each HAZMAT employee, inclusive of the preceding 3 years, for as long as that employee is an AIC HAZMAT employee and for 90 days thereafter.

10.4 Placarding CNG Trailers

10.4.1 Placards shall:

- 1. Have the identification number of 1971 and hazard class of 2.1.
- 2. Be displayed on all 4 sides of the trailer.
- 3. Be readily visible and not obscured.
- 4. Remain on the trailer even when the CNG cylinders are empty.

11.0 Using CNG Trailers

11.1 Determine the flow rate, pressure, and anticipated time of use requirements for the situation before using a CNG Trailer. Gas Engineering is available for assistance when using a CNG Trailer.

11.2 Rules of thumb for load/flow rate estimating:

11.2.1 The average residential customer has a maximum flow rate of 0.01 MCFH in summer.

11.2.2 Estimate a commercial or light industrial customer's flow rate using their connected equipment load or by contacting GTE or Gas Planning.

11.2.3 A CNG trailer has a maximum flow rate of 2.5 MCFH.

11.2.4 Use the integral catalytic heaters when:

- 1. The connected load exceeds 1,000 SCFH
- Or
- 2. Signs of freeze-up are observed.

UNCONTROLLED IF PRINTED

11.2.5 CNG trailers stationed at Belleville, Decatur, and Kewanee have 20 cylinders and hold about 8.1 MCF. CNG trailers stationed at Peoria and Springfield have 15 cylinders and hold about 6.1 MCF.

11.3 Use the Gas System Study books, prepared by Gas Planning, to estimate the load of an entire gas system. The books provide:

11.3.1 The maximum flow rate through a gas system's regulator station.

11.3.2 The number of customers assigned to a gas system.

11.4 Estimate a gas system's summer load (no space heating) equal to 10% of the gas system's flow rate shown in the Gas System Study books.

11.5 Use Table 4 or Table 5 below to estimate the volume of gas in a trailer by knowing the pressure on the cylinders and number of cylinders. The tables can be used to estimate the actual flow rate in the field.

Table 4: Trailer Volume vs Pressure: 20 Cylinders

Table 4: Trailer Volume vs Pressure: 20 Cylinders	
Trailer IDs: 80060, 80061, 80129, 80130	
Pressure (PSIG)	Volume (MCF)
3600	8.10
3500	7.88
3400	7.65
3300	7.43
3200	7.20
3100	6.98
3000	6.75
2900	6.53
2800	6.30
2700	6.08
2600	5.85
2500	5.63
2400	5.40
2300	5.18
2200	4.95
2100	4.73
2000	4.50
1900	4.28
1800	4.05
1700	3.83
1600	3.60
1500	3.38
1400	3.15
1300	2.93
1200	2.70
1100	2.48
1000	2.25
900	2.03
800	1.80
700	1.58
600	1.35
500	1.13
400	0.90
300	0.68
200	0.45
100	0.23
0	0.00

12.0 Instructions

- 12.1 Determine required flow rate, pressure set point, MAOP/MEP, and anticipated time of use requirements.
- 12.2 Determine which regulator/relief run is to be used (pressure required).
- 12.3 Determine where connection is to be made to system.
- 12.4 Ground trailer and attach static line to existing piping.
- 12.5 Connect trailer to system using the valved "Y" fitting provided. This allows trailers to be changed out without interruption if necessary. Leave valves at "Y" CLOSED.
- 12.6 OPEN all cylinder valves to supply gas (verify intended delivery pressure run is supplying gas).
- 12.7 Verify regulator and relief set points, adjust as necessary.
- 12.8 Transfer loads to CNG trailer by SLOWLY OPENING valve at "Y" fitting.
- 12.9 Secure and lock trailer to prevent unauthorized operation when left unattended.
- 12.10 Monitor trailer periodically for correct pressure and remaining capacity when utilized over long periods of time.
- 12.11 Pay close attention to regulator performance and watch for freeze-up. Light catalytic heaters if necessary.
- 12.12 If anticipated time of usage exceeds a single trailer's capacity, arrange for a 2nd trailer and complete [steps 4 through 9](#) to transfer load.

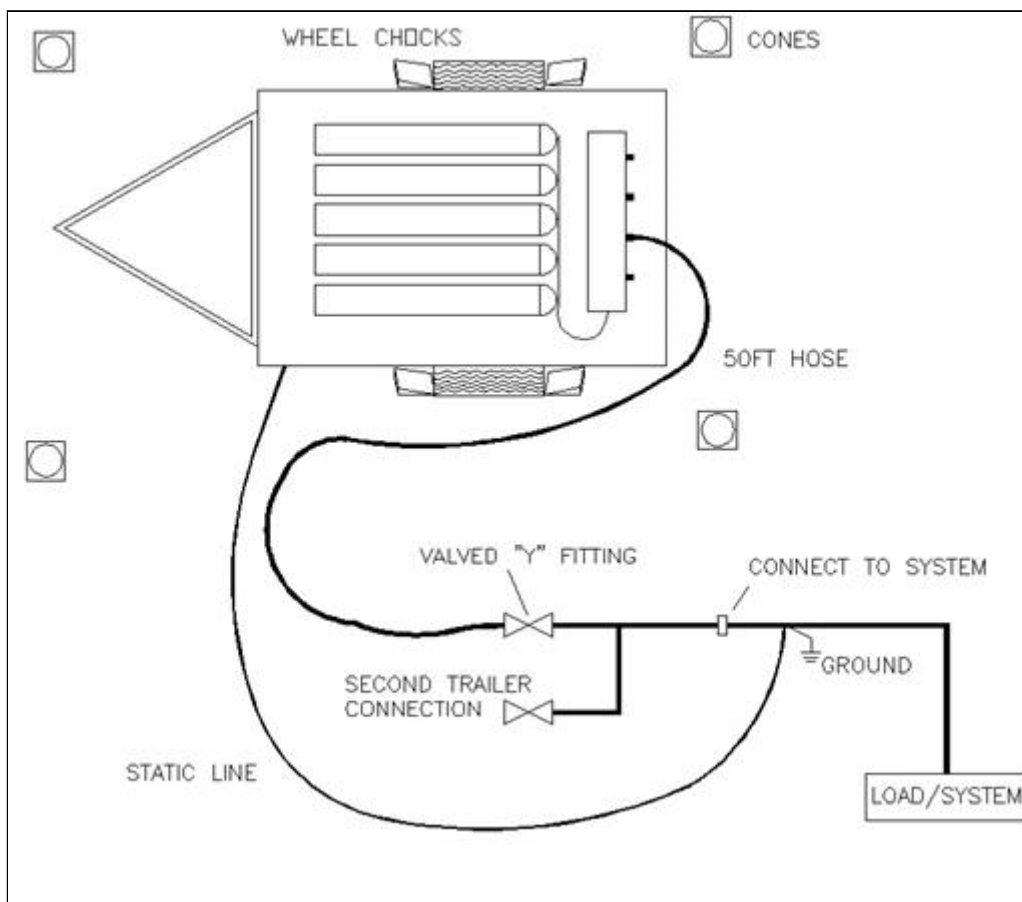

Figure 4: Typical CNG Trailer Application

13.0 Examples

UNCONTROLLED IF PRINTED

13.1 Can a CNG trailer be used to supply gas to a subdivision containing 65 homes during May when the temperature is about 70 °F? We want to maintain about 40 PSIG in the main feeding the subdivision.

$$(65 \text{ homes}) \times (0.01 \text{ MCF/home}) = 0.65 \text{ MCFH}$$

Yes: The 0.65 MCFH is less than the maximum flow rate of 2.5 MCFH of a CNG trailer.

13.2 Could a CNG trailer be used to supply the same 65 home subdivision on a winter "peak" day?

$$(65 \text{ homes}) \times (0.10 \text{ MCF/home}) = 6.50 \text{ MCFH}$$

No: The flow rate exceeds the maximum flow rate of a CNG trailer.

13.3 If a CNG trailer is brought out with 2800 PSIG in the cylinders, how long will it supply the load in Example 1?

From Table 4: trailer at 2800 PSIG has 6.3 MCF

$$(6.3 \text{ MCF}) \div (0.65 \text{ MCFH}) = \mathbf{9.69 \text{ Hours}}$$

From Table 5: trailer at 2800 PSIG has 4.7 MCF

$$(4.7 \text{ MCF}) \div (0.65 \text{ MCFH}) = \mathbf{7.23 \text{ Hours}}$$

13.4 If we would expect to replace the first CNG trailer with a second trailer when the pressure in the first trailer reaches 500 PSIG, how long would it take for the first CNG trailer to lower to 500 PSIG from 2800 PSIG?

From Table 4: trailer at 2800 PSIG has 6.3 MCF

trailer at 500 PSIG has 1.13 MCF

$$\text{Gas used} = 6.3 - 1.13 = 5.17 \text{ MCF}$$

$$(5.17 \text{ MCF}) \div (0.65 \text{ MCFH}) = \mathbf{7.95 \text{ Hours}}$$

From Table 5: trailer at 2800 PSIG has 4.7 MCF

trailer at 500 PSIG has 0.85 MCF

$$\text{Gas used} = 4.7 - 0.85 = 3.85 \text{ MCF}$$

$$(3.85 \text{ MCF}) \div (0.65 \text{ MCFH}) = \mathbf{5.92 \text{ Hours}}$$

13.5 If after 1 hour of use, a CNG trailer has dropped from 2800 to 2400 PSIG, what would the actual hourly rate of use be?

From Table 4: trailer at 2800 PSIG has 6.3 MCF (Starting Volume)

trailer at 2400 PSIG has 5.4 MCF (Ending Volume)

$$\text{Gas used} = 6.3 - 5.4 = \mathbf{0.9 \text{ MCFH}}$$

From Table 5: trailer at 2800 PSIG has 4.7 MCF (Starting Volume)

trailer at 2400 PSIG has 4.07 MCF (Ending Volume)

$$\text{Gas used} = 4.7 - 4.07 = \mathbf{0.63 \text{ MCFH}}$$

13.6 How many hours would be left in the trailer at the actual determined flow rate of 0.9 MCFH? Assume you can use the trailer down to 200 PSIG. The duration time should be adjusted for the actual usage flow rate.

From Table 4: trailer at 2400 PSIG has 5.4 MCF (Starting Volume)

trailer at 200 PSIG has 0.45 MCF (Ending Volume)

Gas available = 4.95 MCF

$(4.95 \text{ MCF}) \div (0.90 \text{ MCFH}) = \mathbf{5.5 \text{ Hours}}$

From Table 5: trailer at 2400 PSIG has 4.07 MCF (Starting Volume)

trailer at 200 PSIG has 0.34 MCF (Ending Volume)

Gas available = 3.73 MCF

$(3.73 \text{ MCF}) \div (0.90 \text{ MCFH}) = \mathbf{4.14 \text{ Hours}}$

13.7 Calculate the therms of gas it takes to fill a trailer if it has 700 PSIG in it before filling and it tops off at 3200 PSIG at a filling station. Reference (10 therms/MCF).

From Table 4: Volume @ 700 PSIG = 1.58 MCF

Volume @ 3200 PSIG = 7.20 MCF

Gas to fill = 7.20 - 1.58 = **5.62 MCF or 56.2 therms (added)**

From Table 5: Volume @ 700 PSIG = 1.19 MCF

Volume @ 3200 PSIG = 5.42 MCF

Gas to fill = 5.42 - 1.19 = **4.23 MCF or 42.3 therms (added)**

End of Instructions.

Section 8.0 – CNG Filling Stations	Added CNG filling station at the Peoria Gas Operating Center in Edwards, IL.

EMERGENCY PLAN

October 1, 2021

EMER 2.10 Gas Control

1.0 Purpose

This procedure provides information about Ameren Illinois's (AIC's) Gas Control's response when there has been a loss of communication with or an alarm from a remotely monitored or controlled device.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Loss of Communication](#)[6.0 Alarm Management](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Tech Services (GTS) Supervisors
- Gas Tech Service (GTS) Personnel
- Gas Control

4.0 General

- 4.1 AIC's Gas Control remotely monitors and controls specific gas facilities and pipeline interconnects to ensure that Ameren Illinois' gas system is operating safely and is providing an adequate and reliable supply of gas to Ameren Illinois customers.
- 4.2 Gas Control remotely monitors and controls such parameters as gas pressures, gas flow, odorization rates, and valve positioning within the Ameren Illinois gas transmission and distribution system along with gas being supplied by pipeline suppliers.
- 4.3 Monitored points have established alarm settings which provide an indication of an abnormal operation, potential problem or malfunction of equipment at that location or within the monitored system.
- 4.4 Gas Control provides further assistance to AIC's gas operations personnel in emergency situations, during major maintenance or construction activities, and inspection activities at the monitored gas facility that could affect the integrity or reliability of the gas system.
- 4.5 Since Gas Control remotely monitors and controls critical points of AIC's transmission and distribution gas systems. Required communications and coordination between operations personnel and Gas Control is included throughout the Ameren Illinois Gas O&M Plan.
- 4.6 Control Room Management Plan, a separate document, provides documentation and guidelines for the operations of Gas Control and Gas Control personnel. Once Gas Control personnel determine a situation requires operating personnel involvement, Gas O&M procedures will be followed.

5.0 Loss of Communications

UNCONTROLLED IF PRINTED

- 5.1 Remote monitoring and control of gas facilities is accomplished through SCADA equipment and the installation of electronic pressure recorders (ERXs)..
- 5.2 If communication is lost to these devices, Control Room personnel will determine the extent of the loss and the possible cause and duration of the loss.
 - 5.2.1 If the determination of the loss is isolated to a particular piece of equipment in the field, Control Room personnel will contact the appropriate GTS personnel or GTS Supervisor.
 - 5.2.2 GTS personnel may be dispatched to the site to determine the cause and, if possible, remedy the situation. Gas Control will be contacted to verify communications has been restored and normal operations has resumed.
 - 5.2.3 When immediate repairs cannot be made, GTS personnel will determine what is needed to correct the situation and schedule the repair. Gas Control will be notified of the findings and the plans for repair.
- 5.3 When SCADA indicates a monitoring, control or communications problem, GTS personnel may be dispatched to the site.
- 5.4 When the loss is determined to be wide spread or the conditions indicate a long duration,
 - 5.4.1 Gas Control may initiate Manual Operations per the CRM Plan, and/or initiate an EOC assessment call.
 - 5.4.2 During the EOC assessment call, a determination will be made for further actions, up to activation of the EOC, if necessary.

6.0 Alarm Management

- 6.1 Gas Control has alarm settings for devices they remotely monitor. The settings are established to provide safe and effective pipeline operations.
- 6.2 When Gas Control personnel have determined the alarm or indicated situation requires field investigation, the appropriate GTS personnel or GTS Supervisor are contacted.
 - 6.2.1 GTS personnel will go to the site to investigate the cause of the alarm and notify Gas Control upon their arrival at the site.
 - 6.2.2 Following the repair(s), Gas Tech Services personnel will notify Gas Control what repairs were made and that the alarm has been cleared.
 - 6.2.3 If the alarm(s) were due to a significant abnormal operation that could have had an impact on adjacent systems, Gas Control will monitor and review critical facilities in the adjacent systems to ensure the integrity of EACH associated gas system has not been compromised and their MEP has not been exceeded.
- 6.3 Alarms at an odorization station may indicate the odorizer is either injecting too much or too little odorant into the gas system or the odorizer has quit working.

End of Instructions.

Operator Qualification (OQ) Required?

YES

1371 Operate Gas Pipeline – System Control Center Operations

1381 Operate Gas Pipeline – Local Facility Remote Control Operation

EMER 2.10 Emergency Plan: Gas Control, October 1, 2020.

Revision Notes

Location of Changes	Summary of Changes
1.0 Purpose	Clarified EMER 2.10 addresses Gas Control's response when there has been a loss of communication with or an alarm from a remotely monitored device.
Throughout the document	Added "and controls" where there was a reference to Gas Control remotely monitors.
Subsection 4.5 - General	Revised – Gas Control remotely monitors and controls critical points of AIC's transmission and distribution gas systems. Required communications and coordination between operations personnel and Gas Control is included throughout the Ameren Illinois Gas O&M Plan.
Paragraph 5.2.2 – Loss of Communications	GTS personnel may be dispatched to the site to remedy the situation.
Paragraph 5.2.3	When immediate repairs cannot be made, GTS personnel will determine what is needed to correct the situation and schedule the repairs.
Subsection 5.3	When SCADA indicated a monitoring, control or communications problem, GTS personnel may be dispatched to the site.
Subsection 5.4 and Paragraph 5.4.1	Grammatical – added "When", "or, and "may"
Subsection 6.2 – Alarm Management	Grammatical – added "When"
Paragraph 6.2.1	GTS personnel will go to the site to investigate the cause if the alarm and notify Gas Control upon their arrival at the site.
Paragraph 6.2.3	Gas Control will monitor and review critical facilities in the adjacent systems to ensure the integrity of EACH associated gas system has not been compromised and their MEP had not been exceeded.
Operator Qualifications	Added: 1371 Operate Gas Pipeline – System Control Center Operations 1381 Operate Gas Pipeline – Local Facility Remote Control Operation

EMERGENCY PLAN

July 22, 2022

EMER 2.11 Gas Storage

1.0 Purpose

This procedure provides information about Ameren Illinois (AIC) Gas Storage's response to accidental releases, equipment failures, natural disasters, and third-party emergencies and is in accordance with 49 CFR § 192.12.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Accidental Releases from an Underground Natural Gas Storage Facility](#)[6.0 Equipment Failures at an Underground Natural Gas Storage Facility](#)[7.0 Natural Disasters](#)[8.0 Third Party Emergencies](#)**3.0 Target Audience**

- Gas Storage Engineering (GSE)
- Gas Storage Operations
- Gas Storage Supervisors
- Gas Tech Service (GTS)
- Gas Supply

4.0 General

- 4.1 AIC's Gas Storage monitors and operates 12 underground natural gas facilities to ensure that Ameren Illinois' gas system is operating safely and is providing an adequate and reliable supply of gas to Ameren Illinois customers.
- 4.2 This procedure outlines the requirements and corresponding steps to address emergency situations. This procedure identifies roles and responsibilities of individuals during an event.
- 4.3 Safety-related conditions shall be reported as defined in [SAFT 1 Section 4.3](#) Underground Storage Facilities and [SAFT 1 Appendix A](#).
- 4.4 Incident reporting shall be reported as defined in [INCD 1 Section 5](#) Natural Gas Incident.
- 4.5 Environmental considerations shall be made and addressed during an incident and documented.
 - 4.5.1 Refer to [Gas Storage Emergency Manual](#) for Emergency Spill Response actions and inventory of materials (Flammables) for each Storage facility.
 - 4.5.2 Refer to the [Blowout Contingency Plan \(WCERP\)](#) for accidental release response actions.

UNCONTROLLED IF PRINTED

- 4.6 Emergency responders and mutual assistance information for each underground natural gas storage facility is in the [Gas Storage Emergency Manual](#).
- 4.7 The Gas Storage Incident Management Team organizational chart identifies roles and responsibilities for emergency response. The Incident Management Team organizational chart is located on the Ameren Illinois Emergency Operations Center SharePoint site.
- 4.8 Employee training for the Gas Storage Emergency Response Plan is conducted annually not to exceed 15 months.

5.0 Accidental Release from an Underground Natural Gas Storage Facility

- 5.1 Accidental releases (gas escaping) are defined as controllable or uncontrollable incidents.
- 5.2 In the event of an accidental release (gas escaping) refer to the flow chart in the [Gas Storage Emergency Manual](#) to determine if the release is controllable or uncontrollable.
- 5.3 For a release determined to be a controllable incident, follow the steps for gas escaping in a controllable release.
- 5.4 For a release determined to be an uncontrollable incident, follow the steps for gas escaping in an uncontrollable release, which integrates the [Gas Storage Blowout Contingency Plan \(WCERP\)](#).
 - 5.4.1 Follow the steps in in the Initial Response Actions (Section 2) of the WCERP to determine the response level and actions.

6.0 Equipment Failures at an Underground Natural Gas Storage Facility

- 6.1 Equipment failure can occur on station equipment or well-related equipment.
- 6.2 In the event of station equipment failure refer to the flow chart in the [Gas Storage Emergency Manual](#) and follow the steps for Station/Plant Hazards.
- 6.3 In the event of well-related equipment failure, Gas Storage engineering will evaluate the incident and develop an action plan (procedure).

7.0 Natural Disasters

- 7.1 For natural disasters refer to [EMER 2.5](#) Natural Disasters and Civil Disobedience.

8.0 Third-Party Emergencies

- 8.1 In the event of a station emergency caused by a third party refer to the flow chart in the Gas Storage Emergency Manual and follow the steps for Station/Plant Hazards.
- 8.2 In the event of a well-related emergency caused by a third party, resulting in an uncontrollable incident, follow the steps in the Initial Response Actions (Section 2) of the WCERP to determine the response level and actions.

End of Instructions.

EXCAVATION SAFETY

October 1, 2022

EXCV 1 Requirements

1.0 Purpose

1. Procedures are required to provide for safety during maintenance and operations activities which includes taking adequate precautions in excavated trenches to protect personnel from the hazards of cave-ins, traffic and equipment, falling loads, or hazardous environment.
2. Excavation safety is regulated under the Occupational Safety and Health Administration (OSHA) Part 1926 Safety and Health Regulations for Construction. Ameren Illinois (AIC) Safety Department is responsible for administering OSHA regulations. AIC's Safety Supervisors should be contacted with questions or concerns with excavation safety.
3. The Pipeline Hazardous Materials Safety Administration (PHMSA) under §192.605 (b)(9) does require protection of personnel from hazards of unsafe accumulations of vapors or gas in an excavation.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Excavations](#)[5.0 Sloping an Benching Proctive System](#)[6.0 Shoring or Shields Protective Systems](#)[7.0 Soil Classification](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Personnel
- Gas Storage Field Supervisors
- Gas Construction Services personnel
- Gas Construction Services Supervisors

4.0 Excavations

- 4.1 Excavations 4 feet or more in depth shall have an adequate means for workers to safely enter and exit with no more than 25 feet of lateral travel from any location where people are working.
- 4.2 Excavations 5 feet or more in depth, or excavations of any depth where the Competent Person determines that a cave-in hazard to personnel exists, shall be protected from cave-ins by sloping, benching, and/or shoring/shielding, as appropriate for the soil type(s) before personnel are allowed to enter.

UNCONTROLLED IF PRINTED

- 4.3 Excavations 20 feet or more in depth require the excavation protection system be designed by a registered professional engineer.
- 4.4 Emergency rescue equipment such as breathing apparatus, a safety harness and lifeline or a basket stretcher, must be readily available where hazardous environment conditions exist or may reasonably be expected to develop during work in an excavation as required under §192.605 (b)(9).
- 4.5 Excavations in which personnel will enter shall be inspected daily by the Competent Person for evidence of a situation that could result in possible cave-in, indications of failure of protective systems, hazardous environment, or other hazardous conditions.
 - 4.5.1 If the Competent Person finds evidence of a situation that could pose a threat to the safety of the employees, exposed employees will be removed from the hazardous area until necessary precautions have been taken to ensure their safety.

5.0 Sloping and Benching Protective System

- 5.1 Each employee shall be protected from cave-ins by an adequate protective system except where:
 - 5.1.1 The excavation is in stable rock.
 - 5.1.2 The excavation is less than 5 feet in depth and based on Competent Person examination there is no indication of potential cave-in.
- 5.2 Sloping and benching system configurations shall be selected and constructed based on results of soil classification, a visual examination of the area, adjacent activities that may affect the stability of soil, or soil that is part of a layered system.
- 5.3 Excavations of less than 20 feet in depth shall be sloped at an angle not steeper than one and one-half horizontal to one vertical (1-1/2H : 1V) or 34 degrees measured from horizontal unless the soil has been classified as Type A or Type B.
- 5.4 Benching configuration is dependent on soil type, Type A or Type B and depth of excavation.
- 5.5 Benching is not an adequate protection system in Type C soils.
- 5.6 Sloping or benching for excavation greater than 20 feet in depth shall be designed by registered professional engineer.

6.0 Shoring or Shields Protective System

- 6.1 Design of support system or shields system that are drawn from manufacturer's tabulated data shall be in accordance with all the specifications, recommendations, and limitations issued or made by the manufacturer.
- 6.2 Deviations from the specifications, recommendations, and limitations issued or made by the manufacturer shall only be allowed after manufacturer issues specific written approval.
- 6.3 Support systems shall be installed and removed in a manner that protects employees from cave-ins, structural collapse, or from being struck by members of the support system.
- 6.4 Shields shall be installed in a manner to restrict lateral or other hazardous movement of the shield in the event of the application of sudden lateral forces.

7.0 Soil Classification

- 7.1 A qualified Competent Person shall inspect every excavation and protective system for evidence of potential cave-in or failure of protective system.
- 7.2 The Competent Person is required to perform a soil analysis and soil classification to determine the potential for cave-in of an excavation, and to determine the appropriate protective measures, such as sloping, benching, shoring or shielding (trench) box to be utilized.
- 7.3 The soil classification must include both visual and manual tests. Refer to AIC Field Safety Manual, Section 33.0 Excavations available on the AIC Safety SharePoint site.

End of Instructions

EXCAVATION SAFETY

October 1, 2022

EXCV 2.1 Prior to Excavation

1.0 Purpose

This document outlines the inspection and preparation to be taken before excavation begins.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Job Site Inspection](#)

[5.0 Job Preparation](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Personnel
- Gas Storage Field Supervisors
- Gas Construction Services personnel
- Gas Construction Services Supervisors

4.0 Job Site Inspection

4.1 A Competent Person should be designated for the project.

4.2 The Competent Person should inspect the area of proposed excavation for situations or conditions that may pose a potential hazard to the excavation such as traffic, surface water movement, underground and overhead utilities, surface structures or recent construction activity.

5.0 Job Preparation

5.1 A Job Site Briefing shall be completed prior to beginning work.

5.2 Underground utilities shall be located and exposed preferably by hand or vacuum excavation when crossing or working within the tolerance zone. Machine excavating may be utilized in accordance with AIC Field Safety Manual provisions in Section 33.4 Work Within the Tolerance Zone. Available on the AIC Safety SharePoint site.

5.3 Vehicles and equipment not involved in excavation should be parked away from the excavation site to minimize surcharge load on excavation walls.

5.4 When necessary, measures should be taken to prevent vehicles and equipment from inadvertent entry into excavation by the use of barricades, stop logs, or spotter.

UNCONTROLLED IF PRINTED

5.5 Engine exhausts should be kept away from the excavation opening.

5.6 A fire extinguisher shall be on the jobsite when excavating around a gas line.

5.7 When required, the proper traffic control shall be in place.

5.8 Gas field personnel shall be aware of potential ignition sources and keep the work site safe from an accidental ignition. Refer to [ACIG 2.1](#) Work Area Protection

EXCAVATION SAFETY

October 1, 2022

EXCV 2.3 Work in Excavation

1.0 Purpose

This section outlines procedures to follow to ensure the safety of the individual while working in an excavation.

Any excavation in which vapors or gases could accumulate shall be checked for combustible gas concentration before allowing anyone in the excavation in accordance with §192.605 (b) (9).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Beginning Excavation](#)

[5.0 Inspection of Excavation](#)

[6.0 Working in Excavation](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Personnel
- Gas Storage Field Supervisors
- Gas Construction Services personnel
- Gas Quality Assurance Consultants

4.0 Beginning Excavations

4.1 As excavation begins, the Competent Person should watch for the following:

4.1.1 Soil that remains as a clump as it is deposited indicates the soil is cohesive.

4.1.2 Soil that breaks up easily as it is deposited indicates a more granular soil.

4.1.3 Moisture content of the soil as the excavation gets deeper. Watch for water standing or running into the excavation.

4.1.4 Possibility the soil material has been previously disturbed which will affect the stability of the sides of the excavation.

4.1.5 Layers sloping into excavation.

4.2 Observing these items will aid in the classification of the soil type.

4.3 Gas field personnel shall not be allowed to stand under loads being lifted or deposited by excavating equipment

UNCONTROLLED IF PRINTED

- 4.3.1 Gas field personnel assigned to spot for the digging machine operator should exit the excavation while digging is in progress and remain outside the swing radius of the equipment.
- 4.3.2 Digging equipment operator should set their bucket on the ground when there are gas field personnel in the excavation.
- 4.4 Protect workers and public from falls into the excavation or contact with construction equipment and materials. General considerations would include:
 - 4.4.1 Depth of excavation.
 - 4.4.2 Proximity to roadways.
 - 4.4.3 Proximity to pedestrian routes.
 - 4.4.4 Length of time excavation will be left open
- 4.5 When working near roads or sidewalks, the following precautions should be followed:
 - 4.5.1 Pedestrians should not be led into direct conflicts with work site vehicles, equipment, or operations.
 - 4.5.2 Rope off all work areas with a barricade/caution tape or equivalent and place tape or equivalent to designate a safe pedestrian walkway around obstructions, such as ditches, holes, tool carts, trailers, or piles of dirt on sidewalks.
 - 4.5.3 Pedestrians should be provided with a safe, convenient travel path that replicates as nearly as possible the standard sidewalk or footpath.
 - 4.5.4 Consideration should be made to separate pedestrian movements from both worksite activity and motor vehicle traffic.
 - 4.5.5 Pedestrians should be appropriately directed with advance signing that encourages them to cross to the opposite side of the roadway.
 - 4.5.6 Whenever it is feasible, closing off the work site from pedestrian intrusion may be preferable to channelizing pedestrian traffic along the site with temporary traffic control devices.
- 4.6 Spoils are always required to be a minimum of 2 feet from the edge of excavation.
 - 4.6.1 This will protect personnel from loose soil material that could fall into the excavation.
 - 4.6.2 The excavating equipment operator should scale or sweep the excavation face to eliminate loose material that could fall into the excavation and injure a worker.
- 4.7 All foreign underground utilities within 18 inches of the proposed excavation shall be uncovered preferable by hand digging or vacuum excavation prior to beginning the excavation. Machine excavating may be utilized in accordance with AIC Field Safety Manual, Section 33.4 Subsurface Utility Protection, <https://ameren.sharepoint.com/sites/IL-Safety>.
- 4.8 Underground facilities that are within the excavation shall be protected by hand shoveling the material away from the facility so the digging equipment's bucket can remain away from the facility.
- 4.9 Pipes exposed in the excavation shall be supported to avoid excessive sagging.
 - 4.9.1 If a significant length of pipe(s) is exposed - notify the utility owner of the pipe.
 - 4.9.2 Water and Sewer line joints should be supported to prevent pull-out or blow-out.

4.9.3 Notify utility owner if there has been any damage done to their pipe, pipe coating, or tracer wire.

4.9.4 Gas lines should be supported and inspected to ensure:

1. No damage to the coating or the pipe.
2. Pipe is not in undue stress.
3. Refer to [MAIN 2.4](#) Temporary Pipeline Support.

4.9.5 Supports should be free from sharp edges.

4.9.6 Backfilling operations should be carefully done and the backfill material should be compacted under the pipes before any supports are removed.

4.10 Cables can be supported by means of ropes to avoid excessive sagging. Cable owners should be notified of any damage to their cable or cable coating.

4.11 Neither exposed pipe nor cable should be supported by, hung from, or over gas piping.

5.0 Inspection of Excavation

5.1 If there is a potential for gas accumulation, the excavation shall be checked with a gas detector for combustible gas concentration before allowing anyone in the excavation.

5.2 The Competent Person is required to inspect all excavations and complete an "Excavation / Soils Checklist" each day an excavation is left open and workers are entering the excavation.

5.3 Additions/changes to the "Excavation / Soils Checklist" are required whenever there is a change in the soil characteristic of an excavation that could affect the stability of the excavation.

5.4 The Competent Person will perform an initial soil classification of the excavation material by performing at least one visual and one manual analysis test.

6.0 Working in Excavation

6.1 Excavations deeper than 4 feet shall have a means for workers to enter and exit.

6.2 The means to enter or exit shall be located no more than 25 feet laterally from any worker.

6.3 Acceptable means for providing access to and from an excavation are:

6.3.1 Constructing ramps at either end of excavation or within 25 feet of any worker whichever is less.

1. Ramps must be flat enough so a worker can walk out of the excavation unassisted.
2. Workers should not have to climb out on their hands and knees or use knotted ropes.
3. Ramps must not have slip or trip hazards.

6.3.2 Providing a ladder that is labeled as meeting OSHA requirements.

1. Ladder must extend 3 feet beyond point of contact with side of excavation and be secured to prevent movement.

6.3.3 Steps cut into the side of the excavation.

1. Steps must not have slip or trip hazards.

UNCONTROLLED IF PRINTED

2. Steps must be cut into stable soil.
 3. Steps must be a minimum of 12 inches in depth or deep enough so that the employee's foot is completely supported by the step.
 4. Steps must be wide enough for both of the individual's feet to stand on the step.
 5. The rise of the steps must be wide enough for both of the individual's feet to stand on the step.
 6. Toe holes in the side of excavation are not acceptable steps.
- 6.4 Excavations 5 feet and deeper, or excavations of any depth where a cave-in hazard to personnel exists, shall have a properly designed protective system to protect workers from a cave-in.
- 6.4.1 The Competent Person will determine the appropriate protective system.
 - 6.4.2 The acceptable protective system is dependent on the soil type and size of excavation.
 - 6.4.3 Acceptable protective system are:
 1. Sloping.
 2. Sloping and Benching.
 3. Aluminum Hydraulic Shoring.
 4. Trench Box.
 - 6.4.4 Gas field personnel are not permitted to enter the excavation until the protective system is in place.
- 6.5 Excavations that are 20 feet or greater in depth require a protective system designed by a registered professional engineer.
- 6.6 When workers are present in excavations 5 feet and deeper, there should be at least one worker on the surface who, under ordinary circumstances, should not leave the work location.
- 6.7 Gas field personnel shall not work in excavations where there is accumulating or accumulated water unless:
- 6.7.1 The water is diverted around the excavation.
 - 6.7.2 The water is removed from the excavation. The water removal equipment should be monitored on a regular basis to ensure proper operation.
- 6.8 Gas field personnel should use hand or mechanical signals to prevent equipment from inadvertently entering the excavation.
- 6.9 If the situation warrants, a barrier should be installed along the edge of the excavation to prevent equipment or material from coming into the excavation.
- 6.10 Sidewalks, pavements, and other hard surfaces should not be undermined unless a support system or other method of protection is provided to protect the workers from possible collapse.
- 6.11 Prior to leaving the jobsite, any open excavation should be fenced or barricaded to prevent unauthorized access.

EXCV 2.03 Excavation Safety: Working in Excavation, December 1, 2020

Revision Notes Location	Summary of Changes
Varying locations throughout	Minor punctuation mistakes and spelling errors fixed. Reformatted to match the October 1, 2020 re-write format
1.0 Purpose	New - Any excavation in which vapors or gases could accumulate shall be checked for combustible gas concentration before allowing anyone in the excavation in accordance with §192.605 (b)(9).
Subsection 4.7	Revised reference link to IL Safety Manual
Paragraph 4.9.4 – Item 3	Added reference to MAIN 2.4 Temporary Pipeline Support
Subsection 6.11 – Excavation left open	Added open excavations should be fenced or barricaded

1.0 Purpose

A Competent Person must perform at least one visual and one manual analysis in order to classify the deposits from the excavation. This is done to determine the soil type(s) within the excavation.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Visual Analysis](#)

[5.0 Manual Analysis](#)

[6.0 Soil Classification](#)

[7.0 Destabilizing Factors](#)

[8.0 Excavation/Soils Checklist](#)

3.0 Target Audience

- Gas Engineering
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Personnel
- Gas Storage Field Supervisors
- Gas Construction Services personnel

4.0 Visual Analysis

4.1 A Visual analysis is conducted to determine the quality of the soil in and adjacent to the excavation.

4.2 The Competent Person should use all of the following Visual Analysis tests that apply:

4.2.1 Observe a sample of the soil as it is excavated.

1. Soil that remains in clumps is cohesive.
2. Soil that breaks apart is granular.

4.2.2 Observe the soil grain in a handful of the sample.

1. Fine grain soil is cohesive.
2. Coarse grain soil is granular.

- 4.2.3 Observe the sides of the excavation for fissures. Fissures are natural or man-made faults/cracks in the soil. Crack-like openings in the side walls or chunks of soil spalling or flaking off are an indication of fissured material.
- 4.2.4 Observe the excavation for signs of bulging, boiling, or sloughing.
- 4.2.5 Observe the side of the excavation to see if the soil is layered.
 - 1. Each layer will need to be classified in the excavation.
 - 2. Determine if layers slope toward the excavation.
- 4.2.6 Observe the area in and around the excavation for evidence of previously disturbed soil.
- 4.2.7 Observe the area in and around the excavation for signs of water accumulation or water seepage from the sides of the excavation.
- 4.2.8 Observe the area around the excavation for heavy traffic or other signs of vibration.

5.0 Manual Analysis

5.1 The Competent Person should use one of the following Manual Analysis tests:

5.1.1 Test for Plasticity:

- 1. Most soils are a mixture of cohesive and granular materials. The goal of plasticity testing should be to determine the sensitivity of the soil to water content change.
 - 1 a. Soils with high plasticity will remain cohesive and maintain their strength over a wider range of water content.
 - 1 b. Soils with low plasticity will be very sensitive to water content changes and will lose their strength quickly, such as during rainy conditions.
- 2. Mold a moist or wet soil sample, free of large granular material, into a ball and then roll it into a 2" long 1/8" diameter thread.
- 3. If the thread can be held on one end without breaking, the soil is cohesive and has high plasticity.
- 4. If the sample breaks or cannot be rolled into a thread, the soil has low plasticity.

5.1.2 Dry Strength Test:

- 1. Handle and observe a dry clump of the soil to see how it breaks apart.
- 2. If the clump crumbles on its own or with moderate pressure, the sample can be considered granular.
- 3. If it breaks into clumps, but is harder to break into small clumps, it may be clay in combination with a granular soil.
- 4. If the soil breaks into clumps but does not break into smaller clumps without difficulty and there are no signs of fissures, it can be considered cohesive.

5.1.3 Unconfined Compressive Strength Test:

1. Thumb Penetration Test:

- 1 a. Using a relatively large sample of moist soil, insert thumb in the soil and observe depth of penetration. Do not test near the edge of the sample.

UNCONTROLLED IF PRINTED

- 1 b. Full thumb penetration indicates a weak Type C soil.
- 1 c. A moderate thumb penetration of 1" indicates a slightly stronger soil, possibly Type B.
- 1 d. None to slight thumb penetration indicates a strong soil that has high resistance to shearing, Type A.
2. Pocket Penetrometer Test:
 - 2 a. A penetrometer is an instrument used to measure unconfined compressive strength in units of tons per square foot.
 - 2 b. Push the penetrometer ¼" deep into the sample and obtain a compressive strength reading.
 - 2 c. Several readings should be taken in different samples and all of the readings averaged.
 - (i) Type C soil will have an average reading of 0.5 tons per square foot or less.
 - (ii) Type B soil will have an average reading of greater than 0.5 but less than 1.5 tons per square foot.
 - (iii) Type A soil will have an average reading of 1.5 tons per square foot or greater.
3. Torvane® Shear Test:
 - 3 a. The Torvane is an instrument with blades on one end that are pushed into the soil sample. It is then twisted until the soil sample breaks loose at which point a reading is taken.
 - 3 b. As with the pocket penetrometer several readings should be taken.
 - 3 c. Throw out the high and low reading and average the rest.
 - 3 d. The readings are in tons per square foot.
 - 3 e. The tons per square foot by soil type is the same as those listed for the Pocket Penetrometer shown above.

6.0 Soil Classification

6.1 Type C Soil Classification:

- 6.1.1 Cohesive soils with an unconfined compressive strength of 0.5 tons per square foot or less.
- 6.1.2 Granular soils including gravel, sand, or loamy clay
- 6.1.3 Submerged soil, soil where water is freely seeping, or submerged rock that is not stable.
- 6.1.4 A sample thumb penetration test indicates that a thumb can easily penetrate the sample.
- 6.1.5 Some tabulated data sheets classify Type C soil as either C-60 or C-80.
- 6.1.6 C-60 soil is soft cohesive or moist granular soil that is not flowing or submerged.
- 6.1.7 C-60 soil can be cut with a near vertical sidewalls and will stand unsupported long enough to allow vertical shoring to be properly installed.

UNCONTROLLED IF PRINTED

6.1.8 Sample tests using a Pocket Penetrometer or Torvane indicating a compressive strength reading of 0.5 tons per square foot or less.

6.2 Type B Soil Classification:

6.2.1 Cohesive soils with an unconfined compressive strength greater than 0.5 but less than 1.5 tons per square foot.

6.2.2 Granular non-cohesive soils such as angular gravel (similar to crushed rock), silt, silt loam, sandy loam, and in some cases silty clay loam, sandy clay loam, or dry unstable rock.

6.2.3 Type A soil that is fissured or subject to vibration

6.2.4 A sample thumb penetration test indicates that a thumb can penetrate the sample with moderate effort, 1 inch indentation.

6.2.5 Sample tests using a Pocket Penetrometer or Torvane indicating a compressive strength greater than 0.5 but less than 1.5 tons per square foot.

6.3 Type A Soil Classification:

6.3.1 Cohesive soils with an unconfined compressive strength of 1.5 tons per square foot or greater.

6.3.2 Examples of Type A soil include soils with a high clay content such as:

1. Clay
2. Silty clay
3. Sandy clay
4. Clay loam,
5. In some cases silty clay loam and sandy clay loam.

6.3.3 A sample thumb penetration test indicates that a thumb will have only slight to no penetration.

6.3.4 Sample tests using a Pocket Penetrometer or Torvane Shearvane indicating a compressive strength of 1.5 tons per square foot or greater.

6.3.5 Soil cannot be classified as Type A if:

1. The soil is fissured, which means that it exhibits open cracks, such as tension cracks, in an exposed surface.
2. The soil is subject to vibration from heavy traffic, pile driving, or other effects.
3. The soil has been previously disturbed.
4. The soil has other factors, such as water saturation, that would require it to be classified as a less stable material.

7.0 Destabilizing Factors

7.1 The Competent Person must investigate the excavation and adjacent area for signs of destabilizing factors that will result in downgrading the initial soil classification.

7.2 Destabilizing factors include:

7.2.1 Vibrations from heavy traffic or from nearby construction activity

7.2.2 Fissures in the soil face

UNCONTROLLED IF PRINTED

7.2.3 Previously disturbed soil

7.2.4 Free-flowing water from surface or subsurface sources

7.2.5 Surcharge loading from equipment, material, or spoil material

7.2.6 Wind loading against telephone poles, trees, or structures.

8.0 Excavation / Soils Checklist

8.1 An Excavation / Soils Checklist is required for every excavation greater than 2 feet in depth if personnel will enter the excavation.

8.2 The Competent Person is required to evaluate and classify the soil prior to personnel entering the excavation.

8.3 For excavations where an Excavation / Soils Checklist is required, a separate Checklist must be completed for each day an excavation is left open and workers are entering the excavation.

8.4 The Ameren Illinois (AIC) Safety Department develops and maintains the Excavation/ Soils Checklist. Contact an AIC Safety Supervisor for access to the Checklist.

1.0 Purpose

The purpose of this section is to define when and how Sloping Protective Systems apply to excavation safety.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Sloping Protective System](#)

[6.0 Typical Sections for Different Soil Configurations](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Personnel
- Gas Storage Field Supervisors
- Gas Construction Services personnel
- Gas Construction Services Supervisors
- Gas Construction Inspectors
- Gas Quality Assurance Consultants

4.0 General

4.1 A protective system is required on all excavations 5 feet in depth or greater into which personnel will enter.

4.2 A protective system is also required for all excavations less than 5 feet in depth if the Competent Person determines there is an indication of potential cave-in risk to personnel entering the excavation.

4.3 The Competent Person shall select the appropriate configuration based on the results of soil classification and operating conditions in the area of the excavation.

4.4 The Competent Person shall inspect the excavation daily, prior to workers entering the excavation, for indications of distress that would adversely affect the stability of the excavation such as:

4.4.1 Cracks in vertical soil face

4.4.2 Surface cracks behind the excavation

4.4.3 Water seepage

4.4.4 An increase in highly saturated soil at lower level of excavation

4.4.5 Sloughing of soil from vertical faces.

5.0 Sloping Protective System

5.1 Sloping requires cutting the soil back on all sides of the excavation/trench to an angle at which the soil can stand without failure.

5.2 The angle at which the soil can stand can be affected by:

5.2.1 Surcharge loads such as spoil pile, equipment or material located adjacent to the excavation.

5.2.2 Weather conditions, especially rain.

5.2.3 The soil being previously disturbed, either by excavation or as fill material.

5.3 The maximum slope for each soil type is: (width horizontally to depth vertically)

Type C - least stable	1-1/2H:1V	(e.g. 9' horizontal to 6' vertical)
Type B - moderately stable	1H:1V	(e.g. 6' horizontal to 6' vertical)
Type A - stable	3/4H:1V	(e.g. 4' horizontal to 6' vertical)

5.4 The actual slope of the excavation sides shall be no steeper than the maximum allowable slope.

5.5 When there are signs of distress in the side wall, the actual slope shall be at least 1/2H:1V flatter than the maximum allowable slope.

5.6 In a layered soil situation where a more stable soil is beneath a less stable soil, the maximum slope for each soil type can be used for each layer of soil.

5.7 In a layered soil situation where a less stable soil is beneath a more stable soil, the maximum slope for less stable soil must be used for the entire depth of excavation.

6.0 Typical Sections for Different Soil Configurations

6.1 Typical Sections below are in accordance with OSHA 1926.652 Appendix B to Subpart P.

6.2 Simple Slope configurations for the Soil Types A, B, and C:

6.3 In Type A soil, if the excavation is 12 feet or less in depth and the excavation is open for 24 hours or less, the maximum slope can be 1/2H:1V.

6.4 Slope configurations for various layered soil configurations:

Revision Notes Location	Summary of Changes
Entire document	Grammatical corrections and rewording Reformatted to match the October 1, 2020 re-write format.
Subsection 4.4	Added – prior to workers enter the excavation

1.0 Purpose

This section outlines the procedures, requirements, and limitations by which sloping and benching systems can be utilized when excavating.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Sloping & Benching Protective System](#)

[6.0 Excavation in Type A Soil](#)

[7.0 Excavation in Type B Soil](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Personnel
- Gas Storage Field Supervisors
- Gas Construction Services Personnel
- Gas Construction Services Supervisors

4.0 General

- 4.1 A protective system is required on all excavations 5 feet in depth or greater into which personnel will enter.
- 4.2 A protective system is also required for excavations less than 5 feet in depth if the Competent Person determines there is an indication of potential cave-in risk to personnel entering the excavation.
- 4.3 The Competent Person shall select the appropriate configuration based on the results of soil classification and operating conditions in the area of the excavation.
- 4.4 The Competent Person shall inspect the excavation daily, prior to workers entering the excavation, for indications of distress that would adversely affect the stability of the excavation such as:

- 4.4.1 Cracks in vertical soil face
- 4.4.2 Surface cracks behind the excavation
- 4.4.3 Water seepage
- 4.4.4 An increase in highly saturated soil at lower level of excavation
- 4.4.5 Sloughing of soil from vertical faces

5.0 Sloping & Benching Protective System

- 5.1 Sloping and benching is a combination of vertical benches cut into the slope at lower levels in the excavation and the upper portion sloped at the appropriate maximum angle for the type of soil.
- 5.2 The maximum applicable excavation depth is 20 feet.
- 5.3 The maximum angle of slope for the various soil types is shown in the Sloping Protective System section.
- 5.4 Sloping & Benching is only allowed in Type A and Type B soils, not in Type C soils.
- 5.5 A single bench is allowed in these configurations for Type A and Type B soils:
 - 5.5.1 In Type A soil, a 4 feet vertical face at the bottom with a 3 feet wide bench is allowed
 - 5.5.2 In Type B soil, a 4 feet vertical face at the bottom with a 4 feet wide bench is allowed.
- 5.6 The vertical height at the bottom of the trench must not exceed 4 feet for the first bench.
- 5.7 In Type A soil, subsequent benches may be up to 5 feet vertically up to a total excavation depth of 20 feet.
- 5.8 In Type B soil, subsequent benches may be up to 4 feet vertically up to a total excavation depth of 20 feet.
- 5.9 In Multiple Benching configurations the width of the first bench should be calculated as follows:
 - 5.9.1 Type A soil:
 1. The maximum allowable slope is 3/4H:1V.
 2. The height of the lowest bench (H1) cannot exceed 4 feet. The height of the second bench (H2) cannot exceed 5 feet.
 3. The minimum bench width for Type A soil is calculated as $(H1+H2) \times 0.75$.
 4. For example, where $H1 = 4 \text{ FT}$ and $H2 = 5 \text{ FT}$, the minimum bench width is 6.75 FT.
 - 5.9.2 Type B soil:
 1. The maximum allowable slope is 1H:1V
 2. The height of the lowest bench (H1) cannot exceed 4 feet. The height of the second bench (H2) cannot exceed 4 feet.
 3. The minimum bench width for Type B soil is calculated as $(H1+H2) \times 1.0$.
 4. For example, where $H1 = 4 \text{ FT}$ and $H2 = 4 \text{ FT}$, the minimum bench width is 8 FT.

5.9.3 Additional benches widths should be calculated based on the height of the bench times the applicable slope for the soil type, not to exceed the maximum total excavation height shown in diagrams below.

6.0 Excavation in Type A Soil

6.1 Typical Sections are in accordance with OSHA 1926.652 Appendix B to Subpart P.

6.2 Excavations 8 feet or less may have a maximum 3-1/2 feet unsupported vertical lower portion with the remaining soil sloped at a maximum of 3/4 H:1V.

6.3 Excavations between 8 feet and 12 feet with 3-1/2 feet unsupported vertical lower portion must have the remaining soil sloped at a maximum of 1H:1V.

7.0 Excavation in Type B Soil

7.1 Typical Sections are in accordance with OSHA 1926.652 Appendix B to Subpart P.

Revision Notes Location	Summary of Changes
Whole document	Minor grammar and tense issues fixed. Reformatted to match the October 1, 2020 re-write format
Subsection 4.4	Added – prior to workers entering the excavation

1.0 Purpose

This section outlines the requirements for the installation of a Aluminum Hydraulic Shoring Protective System.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Hydraulic Shoring](#)

[6.0 Typical Sections for Hydraulic Shoring](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Personnel
- Gas Storage Field Supervisors
- Gas Construction Services Personnel
- Gas Construction Services Supervisors
- Gas Construction Inspectors
- Gas Quality Assurance Consultants

4.0 General

4.1 Aluminum hydraulic shoring can be used in excavations of 20 feet in depth or less to protect workers from a cave-in.

4.2 Aluminum hydraulic shoring manufacturer's tabulated data table must be kept at the job site during the work.

4.3 A Competent Person is required to perform soil analysis and soil classification prior to installation of an aluminum hydraulic shoring system.

5.0 Hydraulic Shoring

- 5.1 When planning to use aluminum hydraulic shoring, plan the digging so that sides of excavation will support the rails.
- 5.2 The Manufacturer's tabulated data table for Speed Shore with sizes and allowable depths has a Registered Professional Engineer's stamp but there are no specific serial numbers listed.
- 5.3 No variation from the manufacturer's tabulated data table is allowed without written approval from the manufacturer or a registered professional engineer.
- 5.4 Hydraulic shoring should be checked during each work period for leaking hoses and/or cylinders, broken connections, cracked nipples, bent bases, and any other damaged or defective parts.
- 5.5 Hydraulic shoring members must be released slowly to note any movement in the adjacent ground or for failure of adjacent members.
- 5.6 Hydraulic shoring shall be installed from top down and removed from bottom up. At no time may personnel enter the excavation to install the shoring components necessary to protect from cave-in.
- 5.7 The centerline of the top cylinder shall be between 12 inches and 24 inches below the top of the excavation.
- 5.8 Two feet of the trench wall may be exposed beneath the bottom of the plywood sheeting, if used.
- 5.9 In excavations 6 feet or less in depth, one hydraulic cylinder is required in each vertical plane. The cylinder must be no more than 4 feet from the bottom of the excavation and no more than 2 feet below the top.
- 5.10 In excavations 6 feet to 10 feet in depth, there shall be a minimum of two hydraulic cylinders in each vertical plane. The horizontal spacing shall be that shown on the Tabulated Data Sheet for the shoring system being used.
- 5.11 The maximum vertical distance between horizontal rows of cylinders is 4 feet.
- 5.12 For excavations less than or equal to 12 feet in depth, there shall be a minimum of 3 consecutive cylinders in a horizontal row, at the horizontal spacing shown on the tabulated data sheet.
- 5.13 For excavations over 10 feet in depth, a minimum of 4 consecutive cylinders in a horizontal row shall be placed at the horizontal spacing shown on the tabulated data sheet.
- 5.14 For excavations that are not long enough for 3 or 4 cylinders, the cylinders shall be placed at the required horizontal spacing with a minimum of 2 cylinders, with one cylinder within 2 feet of each end of the excavation.
- 5.15 The ends of trenches must be protected from cave-in by sloping, benching, or trench-end shielding.
- 5.16 No vertical or lateral loads shall be applied to the shoring cylinders.
- 5.17 Sheeting is only used to prevent local raveling or sloughing of the trench face between the vertical shores.
- 5.18 Sheeting shall be either 3/4 inch thick, 14-ply, arctic white birch (Finn Form) plywood or 1-1/8 inch thick CDX plywood or approved equal.
- 5.19 Sheeting must extend to the top of the excavation and to within 2 feet of the bottom. If shoring/sheeting is used on a lower vertical section of a slope, the sheeting must ex-

tend a minimum of 18 inches above the bottom of the slope, in order to protect personnel from material rolling into the trench.

5.20 Excavations deeper than 4 feet shall have a means for workers to enter and exit which meets the requirements of **EXCV 2.3**.

5.20.1 The means to enter or exit shall be located no more than 25 feet laterally from any worker.

5.20.2 A ladder must be provided in each location between shoring cylinders where personnel are working.

5.20.3 Ladder must extend 3 feet above the top of the landing and be secured to prevent movement.

5.21 Any walkways crossing the excavation must meet OSHA walkway standards. Personnel must be protected from falls into excavations that are 6 feet or deeper.

5.22 When it can be reasonably expected that a hazardous environment could exist, the environment must be monitored for oxygen content and combustible or toxic gases with a calibrated gas detector.

EXCV 2.07 Excavation Safety: Aluminum Hydraulic Shoring Protective System, October 1, 2021

Revision Notes Location	Summary of Changes
Entire document	Minor grammar corrections but content is the same. Reformatted to match the October 1, 2020 re-write format
Subsection 4.3	Added – prior to the installation of an aluminum hydraulic shoring system.

1.0 Purpose

This document provides the requirements for the installation of a Trench Box system.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Trench Box Protective System](#)

[6.0 Typical Trench Box](#)

[7.0 Typical Sections for Trench Box Installation](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Personnel
- Gas Storage Field Supervisors
- Gas Construction Services Personnel
- Gas Construction Services Supervisors
- Gas Construction Inspectors
- Gas Quality Assurance Consultants

4.0 General

4.1 While shoring is designed to shore up or otherwise support the trench face, Trench shields (boxes) are intended primarily to protect gas field personnel from cave-ins and similar incidents.

4.2 Trench boxes can be used in excavations 20 feet in depth or less.

4.3 If space between the trench boxes and the excavation sides is greater than 6 inches, backfilling to 1/3 the height of the box is required to prevent lateral movement of the box.

- 4.4 A Competent Person is required to perform soil analysis and soil classification prior to installation of the trench box.
- 4.5 The manufacturer's tabulated data for a trench box must be kept at the job site during the work.

5.0 Trench Box Protective System

- 5.1 Trench boxes are generally used in open areas, but they also may be used in combination with sloping and benching.
- 5.2 Trench box shall not be subject to loads exceeding those specified in the manufacturer's tabulated data sheets.
- 5.3 Sloping above the trench box must be no greater than the maximum allowable slope for the soil type of the excavation.
- 5.4 The box shall extend at least 18 inches above the surrounding area to protect personnel from falling material if there is sloping toward the excavation. This can be accomplished by providing a benched area next to the box.
- 5.5 The ends of the box must be either enclosed with aluminum slats, Finn Form plywood or must be sloped at the appropriate allowable slope.
- 5.6 Trenches 4 feet and deeper must have a means of exit and entry by either a ramp or ladder in the side of the trench.
- 5.7 Ladder should be placed inside the trench box and must extend 3 feet above the landing and must be secured to prevent movement.
- 5.8 In longer excavations, an exit is required within 25 feet of each worker.
- 5.9 The box may be set 2 feet above the bottom of the trench, but the box must be designed for the full depth of the trench and there is no raveling of the soil below the box.
- 5.10 No variation from the manufacturer's tabulated data sheet is allowed without the written approval of the manufacturer or a registered professional engineer.
- 5.11 Workers shall not be allowed to be inside the trench box while it is being moved.
- 5.12 Workers shall not be allowed to be outside of the protective area of the trench box when working in a trench box protected excavation.
- 5.13 All components and structural members of the trench box shall be inspected daily to ensure they are properly connected and have not sustained damage to their structural integrity is in question.
- 5.14 Any walkways crossing the excavation must meet OSHA walkway standards. Personnel must be protected from falls into excavation that are 6 feet or deeper.
- 5.15 When it can be reasonably expected that a hazardous environment could exist, the environment must be monitored for oxygen content and combustible or toxic gases with a calibrated gas detector.

EXCV 2.08 Excavation Safety: Trench Box Protective System, October 1, 2021

Revision Notes Location	Summary of Changes
Entire Document	Small grammar correction. No major changes to content. Reformatted to match the October 1, 2020 re-write format
Subsection 4.4	Added – prior to installation of the trench box.

1.0 Purpose

This document provides the procedures and requirements for safely working in an excavation that is or could be considered a hazardous environment.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Prior to Beginning Work](#)

[6.0 Entering Excavation](#)

[7.0 Hazardous Concentration of Natural Gas – Level 1 PPE Requirement](#)

[8.0 Hazardous Concentration of Natural Gas – Level 2 PPE Requirement](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Personnel
- Gas Storage Field Supervisors
- Gas Construction Services Personnel
- Gas Construction Services Supervisors
- Gas Construction Inspectors
- Gas Quality Assurance Consultants

4.0 General

4.1 Gas field personnel shall not enter excavations that contain a hazardous environment until appropriate alternative work options have been explored and then only while utilizing the appropriate personal protective equipment (PPE).

- 4.2 A hazardous environment is present when gas concentrations are measured with a gas detector at 30% LEL or greater, when the oxygen level is measured at 19.5% or less, or when toxic gases (carbon monoxide, hydrogen sulfide, etc.) are present.
- 4.3 Gas field personnel will follow the procedures specified in [WIGE 2.1](#) Hazardous Environment.

5.0 Prior to Beginning Work

- 5.1 Gas field personnel shall explore and utilize all available options to eliminate a hazardous concentration of natural gas in an excavation before entering the excavation. This would include:
- 5.1.1 Utilizing valves.
 - 5.1.2 Squeezing plastic pipe.
 - 5.1.3 Installing control fittings.
 - 5.1.4 Using ventilating equipment
- 5.2 If the oxygen level of an excavation is less than 19.5%, ventilating equipment should be used to provide additional oxygen to the excavation and reduce gas concentrations.
- 5.2.1 Gas field personnel working in oxygen deficient excavations shall be provided with breathing equipment and emergency rescue equipment (full-body harness, life-line, and means to positively extract a worker).
 - 5.2.2 If the oxygen level cannot be raised above 19.5%, additional standby personnel, outfitted with the same level of protective equipment, shall be present to provide emergency assistance as needed.

6.0 Entering Excavation

- 6.1 The environment of the excavation shall be tested with a gas detection instrument to determine the amount of combustible gas present and the oxygen level.
- 6.2 If there is a possible source or indication of toxic gasses such as carbon monoxide or hydrogen sulfide, the environment should be tested for the specific gas(s) prior to allowing anyone to enter.
- 6.3 The environment must be checked and monitored in the immediate area where the work is to be performed.
- 6.4 Gas field personnel shall continuously monitor the environment in the excavation as long as gas field personnel are working in the excavation.
- 6.5 Gas field personnel wearing their standard work clothing may work in an excavation that has a gas concentration less than 30% LEL and an oxygen level of at least 19.5%

Gas personnel shall immediately vacate the excavation and suit-up in the proper PPE if:

Gas concentration rises to 30% LEL or higher, OR

Oxygen level drops below 19.5%.

- 6.6 If gas field personnel enter an excavation with a hazardous concentration of natural gas, they shall be positioned in the excavation in such a manner that the flow of natural gas is not directed toward them.
- 6.7 A properly sized dry chemical fire extinguisher shall be dry chemical (A, B, C) fire extinguisher shall be at the location of the work. See [WIGE 2.1](#) Subsection 4.3.2.

7.0 Hazardous Concentration of Natural Gas – Level 1 PPE Requirement

- 7.1 The following identifies a hazardous concentration of natural gas in an excavation which requires gas field personnel to wear Level 1 PPE as specified in [WIGE 2.2](#) Personal Protective Equipment, (no supplied air breathing apparatus).
- 7.1.1 Combustible gas-in-air 30% and 60% of the Lower Explosive Limit (3% natural gas-in-air) and oxygen level remains above 19.5%.

8.0 Hazardous Concentration of Natural Gas – Level 2 PPE Requirement

- 8.1 Environment with gas-in-air concentration in excess of 60% of the LEL (3% natural gas-in-air) or more follow the requirements in [WIGE 2.2](#) Personal Protective Equipment.

EXCV 4 Excavation Safety: Forms and Reference Materials, January 1, 2018

Revision Notes

Location of Changes	Summary of Changes
Whole document	Reformatted to match the October 1, 2020 re-write format

Acronyms used in the Industry and O&M:

- AIC** - Ameren Illinois Company
- AISI** - American Iron & Steel Institute
- AMI** - Advanced Metering Infrastructure
- AMR** - Automatic Meter Reading
- ANSI** - American National Standards Institute.
- AOC** - Abnormal Operating Condition
- API** - American Petroleum Institute
- ARO** - Abrasive Resistant Overcoat
- ASME** - American Society of Mechanical Engineers
- ASTM** - American Society for Testing & Materials
- ASV** – Automatic Shut-off Valve
- AWS** - American Welding Society
- BTU** - British Thermal Unit
- CATV** - Cable television
- CF** - Cubic feet
- CFH** - Cubic feet per hour
- CGI** - Combustible Gas Indicator
- CI** - Cast Iron
- CO** - Carbon Monoxide
- CP** - Cathodic Protection
- CTS** - Copper tubing size
- ECA** - Engineering Critical Assessment
- EFV** - Excess Flow Valve
- FBE** - Fusion Bonded Epoxy
- FE** - Flanged end
- FF** - Flat faced flange
- FI** - Flame Ionization Unit
- FIP** - Female iron pipe
- FPS**- Feet per second
- FPT**- Female pipe thread
- GMAW** - Gas metal arc welding

GSE - Gas Storage Engineering

GTE - Gas Tech Engineering

GTS - Gas Tech Services

HCA - High Consequence Area

ICC - Illinois Commerce Commission

ID - Inside diameter

IDNR - Illinois Department of Natural Resources

IEMA - Illinois Emergency Management Agency

IM - Integrity Management

In. W.C. - Inches water column

IPS - Iron pipe size

J.U.L.I.E. - Joint Utility Locating Information for Excavators, also known as the Illinois One Call System.

LEL - Lower Explosive Limit

LOTO - Acronym for lock out/tag out

MAOP - Maximum Allowable Operating Pressure

MCA - Moderate Consequence Area

MCF - 1000 cubic feet.

MCFH - 1,000 cubic feet per hour

MEP - Maximum Emergency Pressure

MMBTU - Million BTUs or approximately 1 MCF.

MMCF - Million cubic feet

MPT - Male pipe thread

mA - Milliampere

MTR - Mill Test Report

mV - Millivolt

NACE - National Association of Corrosion Engineers

NDT - Nondestructive Testing

NFPA - National Fire Protection Association

NPMS - National Pipeline Mapping System

NPT - National pipe thread

NRC - National Response Center

NTSB - National Transportation Safety Board

O&M - Operating and Maintenance Plan

OAS - Outage Analysis System

OD - Outside diameter

UNCONTROLLED IF PRINTED

OPP - Over Pressure Protection

OSHA - Occupational Safety & Health Administration

PE - Polyethylene Pipe

PHMSA - Pipeline and Hazardous Materials Safety Administration

PIC - Potential Impact Circle

PIR - Potential Impact Radius

PPE - Personal Protective Equipment

PPI - Plastic Pipe Institute

PPM - Parts per million

PSI - Internal pressure measurement in pounds per square inch

PSIA - Pounds per Square Inch Absolute

PSID - Pounds per square inch differential

PSIG - Pounds per Square Inch Gauge

P/S - Pipe-to-Soil

RCV – Remote Controlled Valve

RF - Raised face flange

RMV – Rupture Mitigation Valve

ROW - Right-of-Way

SCADA - Supervisory Control and Data Acquisition system

SCFH - Standard cubic feet per hour

SDR - Standard dimension ratio (a measure of pipe diameter to wall thickness)

SFR - Single Family Residence

SMAW - Shielded Metal Arc Welding

SMYS - Specified Minimum Yield Strength

UEL - Upper Explosive Limit

UNC ## - Uniform National Coarse (# of threads per inch)

W.C. - Water column

WE - Weld end

WOG - Water-oil-gas (a term used in regard to pressure ratings).

WOP - Working operating pressure

WPQR - Welding Procedure Qualification Report

WPS - Welding Procedure Specification

Abandoned Facility - A pipeline facility that is physically separated from its source of gas and is no longer maintained.

Abnormal Operating Condition (AOC) - A condition identified by Ameren that may indicate a malfunction of a component or a deviation from normal operations that may indicate an operating condition that could exceed design limits or result in hazard(s) to persons, property, or to the environment.

Absolute Pressure (PSIA) - One of two often-used pressure measurements. Absolute pressure is obtained by adding the atmospheric pressure to the gauge pressure.

Active Corrosion - Continuing corrosion that unless controlled, could result in a condition that is detrimental to public safety.

Air Intake - An opening (duct, pipe, vent) through which air is mechanically drawn into a structure.

Ameren Critical Gas Facilities - The Company has identified the gas facilities that are considered critical utilizing the criteria listed in the Office of Pipeline Safety Security Guidance document issued on September 5, 2002. The list of Critical Gas Facilities is confidential and, therefore, is maintained separately from this document.

Anode - The corroding area of a corrosion cell, or a device used to generate cathodic protection current.

Appurtenance - Any equipment or instrument directly connected to a main or service line.

Atmospheric Corrosion - Steady and gradual deterioration (actual loss of metal that results in pitting or wall loss) of the exposed surface of a metal by oxidation or reaction with elements of the atmosphere.

Atmospheric Pressure - The pressure of the weight of air and water vapor on the surface of the earth. (Approximately 14.4 pounds per square inch in the Midwest.)

Automatic Shut-off Valve - ASV has an electric or gas powered actuators to close a designated valve automatically based on data piped or wired to the actuator from pipeline taps and sensors.

Auxiliary Equipment - Means an integral device attached directly or remotely to a gas meter. The function of auxiliary equipment is to adjust gas meter usage measurements to account for changes in gas temperature or pressure (for example, correctors).

Backfill - Earth, material or low strength flow-able material that has been replaced in an excavation or trench after pipe or other device has been installed.

Bar Hole Testing - A test where a probe bar is used to make a hole in the ground to test for the presence of gas.

Base Pressure - The pressure used to define a standard cubic foot of gas. Base pressure is normally 14.73 psia which is also 0.25 psig or 7 inches water column.

Base Temperature - The temperature used to define a standard cubic foot of gas. Base temperature is normally 520° R which is also 60°F.

Bedding - Soil free of rocks, soil clumps and debris that is spread in a trench before a pipe is installed.

Bell Hole - An excavation to allow adequate work room for workmen to conduct a required operation--i.e. install service tees, make a tie-in, etc.

Benching - A worker protection method that involves cutting the sides of an excavation to form a series of steps. This technique helps workers by spreading the downward pressure on the excavation over a wider area.

Boring - Installing pipe by drilling a route below grade under or over a buried obstacle.

Branched Service Line - A gas service line that begins at the existing service line or is installed concurrently with the primary service line but serves a separate residence.

- Adjoining or adjacent residential or small commercial customer. Or
- Multiple residential or small commercial customers served through a meter header or manifold.

Bridging - Providing extra support for pipe in areas of abnormal stress or loading.

British Thermal Unit (BTU) - Energy measurement. The amount of heat required to raise 1 pound of water 1 degree F at standard conditions. The average BTU content of natural gas is 1,000 BTUs per cubic foot.

Building - Any structure which is regularly or periodically occupied by people.

Butt Fusion - A method of joining pipe by fusing two pipe sections directly end-to-end. The pipe ends are melted together and held until cooled.

Butt Weld - The joining of 2 abutting parts lying in approximately the same plane. Generally, the completed circumferential weld joining 2 sections of pipe.

Cadweld - A trade-name for the process of thermite welding used to attach wires to steel pipe.

Calibrating Gauge - Instruments that utilities use in the field or the meter shop to test the accuracy of auxiliary and tertiary equipment, transmitters, and other equipment associated with correcting a meter's output. Synonymous with Portable Standard

Capable of Being Locked Out - An energy isolating device is capable of being locked out if it has a hasp or other means of attachment to which or through which a lock can be affixed or it has a built in locking device. Other energy isolating devices are capable of being locked out if lockout can be achieved without the need to be dismantled, rebuilt, replaced, or permanently altering its energy control capability.

Carbon Dioxide (CO₂) - An inert gas formed by the combustion of organic materials often used for purging.

Carbon Monoxide (CO) - A toxic gas formed when a fuel such as natural gas is burned incompletely.

Carrier Pipe - A pipe that carries natural gas which is inserted into a larger casing.

Casing - A length of pipe used for encasing a smaller diameter carrier pipe for installation in a well or under a road, etc.

Cast Iron (CI) - An iron alloy which contains a high carbon content that is cast in molds. It is more brittle than steel.

Cathode - The protected area of a corrosion cell.

Cathodic Protection (CP) - The prevention of corrosion by the use of sacrificial anodes or rectifiers which provide a small electrical charge to concentrate corrosion on a controlled anode.

Class Location - An area that extends 220 yards on either side of the centerline of any continuous 1 mile length of a pipeline. The Class location ends 220 yards from the last feature that defines the class location.

- Class 1 Location - any class location unit that has 10 or less buildings intended for human occupancy.
- Class 2 Location - any class location unit that has more than 10 but less than 46 buildings intended for human occupancy.

UNCONTROLLED IF PRINTED

- **Class 3 Location** - any class location unit that has 46 or more buildings intended for human occupancy, or an area where the pipeline lies within 100 yards of a building or a small well defined outside area that is occupied by 20 or more persons during normal use, such as a playground, recreation area, outdoor theater, or any other place of public assembly.
- **Class 4 Location** - any class location where buildings of four or more stories above ground are prevalent.

Clean Construction or Demolition Debris (CCDD) - Means uncontaminated broken concrete without protruding metal bars, bricks, rock, stone, reclaimed or other asphalt pavement, or soil generated from construction or demolition activities. Does not include uncontaminated soil generated during construction, remodeling, repair, and demolition of utilities, structures, and roads provided the uncontaminated soil is not commingled with any clean construction or demolition debris or other waste.

ClickMobile - Mobile Workforce Management system used to document Gas Compliance activities electronically.

ClickSchedule - Mobile Workforce Management system used to schedule and dispatch Gas Compliance activities to field technicians

Coating - A corrosion preventing material which breaks up the corrosion cell by preventing electrolyte from contacting the pipe. (i.e. FBE, Hot or Cold Applied Tapes, Moisture Cured Wraps)

CO Detector - An instrument used to detect the presence and level of carbon monoxide.

Cohesive soil - Soil with a high clay content, which does not crumble.

Combination Leak and Strength Test - A pressure test that verifies gas pipeline or gas facility has no hazardous leak and qualifies the pipeline/facility's maximum allowable operating pressure (MAOP).

Combustible Gas Indicator (CGI) - An instrument used to measure the percentage of gas-in-air.

Commercial Service - A single or branch service line serving a gas meter or gas meters that are qualified to be billed under Ameren Illinois' Non - Residential Gas Delivery Service GDS - 2 thru GDS - 7 rates as specified in the Ameren Illinois Gas Service Tariff- Schedule 2. A small commercial customer is one that uses less than 5,000 therms annually as defined in the Public Utilities Act 220 ILCS 5.

Compaction - Pressing the soil into place during back filling operations.

Company - Refers to Ameren Illinois Company (AIC) or its designated agent. The Company may act through an inspector or another authorized representative.

Competent Person - A person that through training and qualification has the knowledge, skills, and ability to analyze ground conditions and take adequate precautions to protect workers from the hazards of cave-ins.

Conduit - A pipe or tube through which electric wires, cables or smaller pipe pass.

Confirmed Discovery - means when it can be reasonably determined, based on information available to the operator at the time a reportable event has occurred, based on a preliminary on-scene evaluation.

Contractor - Individual(s) retained by Ameren, who, on behalf of Ameren, perform(s) one or more covered tasks on Ameren pipeline facilities.

Controller - A qualified individual who remotely monitors and controls the safety-related operations of a pipeline facility via a SCADA system from a control room, and who has operational authority and accountability for the remote operational functions of the pipeline facility.

Control Line - A pressure sensing line connecting a regulator, relief valve or valve actuator to the segment of line for which controlled pressure is desired.

Control Room - An operations center staffed by personnel charged with the responsibility for remotely monitoring and controlling a pipeline facility.

Control Valve - A remote-set or locally-set device that is typically bi-functional and used to govern gas flow while self-monitoring downstream gas pressure as an override precaution.

Corrosion - The tendency of metal to return to its natural state. Steel returns to iron ore in the form of rust.

Corrosion Records - Sources of corrosion or cathodic protection data, such as structure maps, test point reads, rectifier reads, bond reads, gas service orders, gas leak repair reports, pipeline examination sheets, and computer data bases.

Coupling - A pipe fitting that connects the ends of two pipes. Common coupling types include threaded, welding, heat fusion or mechanical.

- **Mechanical Bolted** - The gasket compression is obtained by tightening long bolts connecting the follower at one end of the coupling body or middle ring to the follower on the opposite end of the coupling.
- **Mechanical Nut** - The coupling body is threaded on both ends, usually a male thread. The follower or nut has a matching thread usually a female thread. The gasket compression is obtained by tightening the nut.
- **Mechanical Stab** - A one piece self contained coupling used only on polyethylene plastic pipe. The plastic pipe is stabbed into the coupling. "O" rings provide seals against the exterior pipe wall. "Grippers" grab and prevent the pipe from being pulled out.

Covered Task - Those task(s) which can affect the safety or integrity of the pipeline.

Critical Areas - Gas main locations such as exposed main, main attachment to bridges, and areas of external loading where abnormal conditions may require special surveys or patrols.

Critical Interference Bond - An interference bond whose failure would jeopardize protection of the connected structure.

Cubic Foot (CF) - A three-dimensional volume one foot wide by one foot long, by one foot high.

Cubic Feet per Hour (CFH) - The average corrected volume of gas measured in one hour.

Curb Valve (also called property line valve, curb cock, curb tee) - A type of shutoff valve that provides immediate access for controlling the flow of gas in the service line normally installed near the property line.

Customer Meter - The meter that measures the transfer of gas from an operator to a consumer.

Delivery Station - Custody transfer point where AIC takes receipt of interstate gas supply.

Dent - A local depression in the pipe surface caused by mechanical damage that produces a gross disturbance in the curvature of the pipe without reducing the pipe wall thickness.

Department of Transportation (DOT) - Federal regulatory agency that regulates pipeline safety.

Design MAOP - The highest pressure that a new or replaced pipeline segment could ever be expected to be operated. Design MAOP replaces the term NFDP, New Facilities Design Pressure that was used by one of the legacy companies.

Diaphragm - A flexible membrane separating two chambers. Typically used in regulators, relief valves and meters.

Differential Pressure - The difference in pressure between any two points in a continuous system. The differential pressure is also called pressure drop.

Distribution Center - The initial point where gas enters the piping used primarily to deliver gas to customers who purchase it for consumption as opposed to customers who purchase it for resale. Examples of a distribution center could be at: metering location, pressure reduction location or where there is a reduction in the volume of gas such as a lateral off a transmission line. Transmission pipelines that operate downstream of a Distribution Center are considered to be operated as part of a distribution system.

Distribution Main - A pipeline which is not classified as transmission or gathering line.

Distribution System - The network of pipelines, mains, pressure reduction stations, valve or metering stations, service piping and equipment which are involved with the delivery of gas to customers for their consumption downstream of a Distribution Center.

Director Region Electric - Management employee responsible for Region Electric Operations.

Director Region Gas - Management employee responsible for Region Gas Operations.

Documentation - Recorded or pictorial information which describes, defines, specifies, reports or certifies activities, requirements, procedures, or results.

Double Random Pipe - A term used to describe a joint of pipe approximating 42 feet in length.

Downhole - The portion of an underground natural gas storage facility from the first flange attaching the wellhead to the piping equipment and continuing down the well casing to and including the storage reservoir.

Ductile Iron - A cast ferrous alloy material in which the free graphite present is in a spherical form rather than a flake form. It is less brittle than cast iron.

Easement - A formal permission granted by landowners for installation and maintenance of facilities. Easements are commonly referred to as Right-Of-Way grants.

Electric Resistance Weld pipe (ERW) - Pipe that has a straight longitudinal seam produced without the addition of filler material by the application of pressure and heat obtained from electrical resistance.

Electrical Survey - A series of closely spaced pipe-to-soil readings over pipelines which are subsequently analyzed to identify locations where a corrosive current is leaving the pipeline.

Electrofusion - A process used to join a plastic fitting to plastic pipe by introducing a controlled electric current to embedded wires inside the fitting. The wires produce heat, melting the plastic inside the pipe and bonding them together. The plastic fitting has internal electric coils which are heated by an electronic processor.

Electrolysis - A foreign source of electrical current which causes corrosion.

Electrolyte - The electrically conductive environment containing the anode and cathode.

Emergency - A situation involving gas facilities that may endanger life, damage property, or disrupt normal service. AOC (abnormal operating condition) is precursor.

Emergency Valve (also called critical valve, fire valve or key valve) - A designated valve that provides for the rapid shutdown of a piping system or segment of a piping system, that provides optimum control of gas flow in emergency situations.

Energized - Connected to an energy source or containing residual or stored energy.

Engineering Critical Assessment (ECA) - Documented analytical procedure based on fracture mechanics principles, relevant material properties (mechanical and fracture resistance properties), operating history, operational environment, in-service degradation, possible failure mechanism, initial and final defect sizes, and usage of future operating and maintenance procedures to determine the maximum tolerable sizes for imperfections based upon the pipeline segment maximum allowable operating pressure.

Entirely Replaced Onshore Transmission Pipeline Segments – For the purpose of § Part 192.179 NS 192.634, where 2 or more miles, in the aggregate, of onshore transmission pipeline have been replaced within any 5 contiguous miles of pipeline within any 24-month period.

Environmental Protection Agency (EPA) - Federal agency which regulates environmental impacts to air, water and noise.

Ethane (C₂H₆) - A hydrocarbon component of natural gas which has two atoms of carbon and six atoms of hydrogen to each molecule. Ethane is commonly referred to as the "finger print" of natural gas.

Excavation - A cavity, trench, or depression in the earth's surface, formed by earth removal.

Excess Flow Valve (EFV) - A valve designed to shut off the flow of gas when the flow rate exceeds the designed rate.

Expansion Joint - A provision, usually in piping, that accommodates the mechanical movement set up by contraction and expansion due to temperature changes in the piping system.

Exposed Underwater Pipeline - An underwater pipeline where the top of the pipe protrudes above the underwater natural bottom (as determined by recognized and generally accepted practices) in water less than 15 feet deep, as measured from mean low water.

Farm Tap - Gas regulation and over pressure protection equipment installed within a service line that is branched from a transmission, high pressure distribution, or gathering line to deliver gas to a customer and serves no more than two (2) service risers.

Fillet Weld - A roughly triangular cross-section generally used in a socket joint or tee joint which frequently joins 2 surfaces at right angles to each other.

Fire Extinguisher Locations - There are 3 location categories:

1. On the jobsite – fire extinguisher is located on the truck in the general vicinity of the work being performed.
2. At location of the work – fire extinguisher is off the truck and located near where the work is being performed.
3. Manned – qualified individual is actively manning the fire extinguisher near where work is being performed.

Flame Ionization Unit (FI) - Portable device that burns a hydrogen/nitrogen gas mixture to continuously analyze an atmospheric sample for combustible gas.

Flange - A round metal plate that is bolted to a matching plate to accomplish a pipe connection. A gasket is placed between the two plates to seal the joint.

Flow Control Station - Facilities for measuring or directing the flow of gas.

Foreign Pipeline Crossing - An Ameren main crossing a foreign pipeline which is using an impressed current system for protection.

Foundation - The base which supports a structure in which a human can enter and gas could accumulate. This does not include a pad used to support such things as: sign, stand-by generator, antenna, tower, grain bin, or structure not meant for human entry.

Franchise - An agreement between a city and a public utility permitting use of streets, alleys and public ways and granting the right to install and maintain facilities.

Fuel Line - The customer-owned gas piping downstream from the outlet of the customer meter or Ameren-owned pipe, whichever is further downstream.

Gas - Natural gas, flammable gas, or gas which is toxic or corrosive.

Gas Compliance System (GCS) - Company system utilized to manage and document various gas operating and maintenance activities. Beginning December 1, 2014, GCS was replaced with a suite of compliance products; Maximo, ClickMobile, and ClickSchedule

Gas Detection Instrument - An electronic Combustible Gas Indicator equipped with a PPM sensor capable of detecting a 50 PPM gas-in-air concentration.

Gas Engineering - Region based Gas Engineer

Gas Field Personnel - Craft or contract worker responsible for performing the physical work.

Gas Operations and Services - Gas Transmission, Gas Tech Engineering, Corrosion Control, Pipeline Integrity, Gas Storage, Gas Tech Services, Training and Quality Assurance, Compliance and Standards and Procedures.

Gas Standard (GS) - A document that provides guidance for the design and construction of gas facilities.

Gas Storage Well - A well drilled for input and/or withdrawal of natural gas or manufactured gas in a gas storage field.

Gas Superintendent - Management employee responsible for Region Gas Operations.

Gas Supervisor - Management employee responsible for local Gas Operations.

Gathering Line - A pipeline that transport gas from a current production facility to a transmission line or main.

Gauge - A device which will measure gauge pressure.

Gauge Pressure (PSIG) - The pressure one would read on a typical spring gauge or recording chart. The pressure above atmospheric pressure.

Generalized Corrosion - Corrosion over a large area of a metal pipe surface, resulting in flaking of the pipe wall and/or corrosion pitting grouped closely enough to affect the overall strength of the pipe.

Note: A large area is an area that cannot be covered with a single repair fitting.

Gouge - Local damage caused by mechanical or forceful removal of metal from a local area on the surface of the pipe that may work harden the pipe and make it more susceptible to cracking.

Graphitization - A form of corrosion associated with cast iron pipe.

Half Cell - A standard reference cell, usually a copper rod in a copper sulfate solution, used for cathodic protection measurements.

Half Sole - A patch plate with rounded corners welded on a steel main or service as a repair or reinforcement. (Not approved for transmission mains)

High Consequence Area - A transmission line segment that Ameren has determined meets one of the following requirements:

- The potential impact circle touches or contains an Identified Site.
- Has twenty (20) or more buildings intended for human occupancy within the potential impact circle

High Pressure Distribution Main - Any main connecting a supply source of natural gas to a distribution system. High pressure distribution mains are not classified as transmission but have a MAOP over 60 psig.

Holiday - A pipeline coating defect, such as a break or hole in the protective coating on steel pipe. These defects can expose the pipe to corrosion at that point.

Holiday Detector - An electronic device, commonly referred to as a Jeep, used to detect holidays in pipeline coating.

Hoop Stress - Circumferential stress on the pipe wall produced by pressure in the pipe.

Hot Spot - An area in which active corrosion leaks are found.

Hot Tap - A connection made to a main while it is in operation. The connecting and tapping is done while the facility is under pressure.

Hot Work - Any process that can be a source of ignition when flammable material is present or can be a fire hazard regardless of the presence of flammable material in the workplace. Common hot work processes are: flame cutting, welding, riveting, brazing, soldering, grinding, thermite welding, cadwelding, applying torch flame to pipe, or other fire or spark-producing operations.

Inert Gas - A gas that will not react or combine with other elements. Inert gas will not burn.

In-Service Welding - Pipeline maintenance welding is welding on a pipeline or piping system that contains a gas or liquid such as natural gas or similar products.

Interference - An electrical disturbance on a metallic structure caused by stray current.

Interference Bond - Wire used to provide electrical current flow between two sections of pipe.

Isolated Services - A steel service line which is not welded or electrically bonded to a main.

J.U.L.I.E. (JULIE) - Joint Utility Locating Information for Excavators, also known as the Illinois One Call System.

Leak - Any unintended escape of natural gas.

Leak Re-Check - A surveillance performed after a leak repair has been made. Frequency is within 30 days of repair.

Leak Surveillance - An investigation to determine leak class based upon hazard potential and volume of natural gas found. Leak surveillances are performed on both new and existing leaks where no repairs are made. Frequency depends upon leak classification.

Leak Survey - A systematic inspection made of pipeline facilities for the purpose of finding leaks.

Leak Test - A test which subjects a natural gas pipeline or facility to a pressure which verifies there are no defects in the material, connections or joints which could result in a hazardous leak.

Line Section - A continuous run of transmission line between adjacent compressor stations, between a compressor station and storage facilities, between a compressor station and a block valve, or between block valves.

Load - A means of expressing the quantity of gas required over a period of time. (i.e., cfh, mcfh, mcf/d)

Localized Pitting Corrosion - Pitting concentrated over a small area.

Note: A small area is an area that can be covered with a single repair fitting.

Locating - The process of finding and marking the location of an underground facility.

Lock Out - The placement of a lock out device on an energy isolating device, i.e. valve, electrical breaker, in accordance with established procedures for ensuring that the energy isolating device and the equipment being controlled cannot be operated until the lock out device is removed.

Lock Out Device - A device that utilizes a positive means, such as a key or combination lock, blank flanges or bolted slip blinds, to hold an energy isolating device in a safe position and prevent the energizing of a machine or equipment.

Lock-up - The increase in pressure necessary to provide a bubble tight shut-off for a regulator.

Low Pressure Distribution System - A distribution system in which the gas pressure in the main is substantially the same as the pressure provided to the customer, 4 inch w.c to 14 inches w.c.

Low Pressure - A main, service, or gas system with a MAOP less than 2 psig.

Lower Explosive Limit (LEL) - Lowest concentration of gas-in-air that will support combustion. For natural gas, the LEL is 5.0% gas-in-air.

Main - A distribution line that serves as a common source of supply for one or more service lines.

Malleable Iron - A mixture of iron and carbon, including small amounts of silicon, manganese, phosphorous and sulfur which, after cast, is converted structurally by heat treatment into primarily a matrix of ferrite containing nodules of tempered carbon. (non-weldable)

Manual Service Line Shut-Off Valve - A curb valve or other manually operated valve located near the service line that is safely accessible to operator personnel or other personnel authorized by the operator to manually shut-off gas flow to the service line, if needed.

Manufactured Home - NFPA 54: Defines a manufactured home as a structure, transportable in one or more sections, which is built on a chassis and designed to be used as a dwelling, with or without a permanent foundation when connected to the required utilities. A mobile home, trailer, or manufactured home will be considered a manufactured home for this policy.

Masking Agent - An odor control product which covers up unpleasant odors.

Maximo - Asset Management System utilized for Gas Compliance activities.

Maximum Allowable Operating Pressure (MAOP) - The maximum pressure at which a pipeline facility or segment of a main or service may be operated during normal operations.

Maximum Emergency Pressure (MEP) - The maximum pressure at which a pipeline or segment of a pipeline may operate for a period of time during an emergency or equipment failure. Base on the pressure class, the MEP for a pressure system is defined as follows:

Pressure Class	System MAOP	Maximum Emergency Pressure
----------------	-------------	----------------------------

Low Pressure	4" W.C. to 14" W.C.	27.6 W.C.
Distribution Pressure 1	1 PSIG to 12 PSIG	MAOP + 50%
Distribution Pressure 2	12 PSIG to 60 PSIG	MAOP + 6 PSIG
High Pressure Distribution & Transmission	Over 60 PSIG	MAOP + 10% or 75% SMYS, whichever is less

Meter - A mechanical device which measures the volume of gas delivered from the operator to the customer. Common types of meters are:

- Diaphragm - A positive displacement meter in which gas passes through a series of chambers which records the volume of gas. Most domestic meters are diaphragm type meters.
- Orifice - A meter for measuring gas by measurement of the pressure differential across a plate having a precisely cut hole in the center. Orifice meters are commonly used for high volume non billing applications, such as a storage field.
- Rotary - A positive-displacement meter in which gas passes through a series of impellers which turns a rotor recording the volume of gas. Most rotary meters are commonly used for commercial or small industrial applications.
- Turbine - A meter that records the flow of gas based upon the velocity of gas flowing through the turbines. A turbine meter is commonly used in very high volume applications.
- Ultrasonic - A meter that records the flow of gas by the absolute digital time travel (ADTT) measurement method.

Meter Set Assembly (also called Meter Header or Meter Loop) - All components from the meter valve to the customers piping.

Meter Valve (also called Wedge-seal, meter stop or lock cock) - A valve connecting the inlet service piping to the meter set assembly which is used to turn gas flow on or off.

Methane (CH₄) - The lightest of the hydrocarbons and has one atom of carbon and four atoms of hydrogen for each molecule. Natural gas is normally 87% methane.

Moderate Consequence Area (MCA) - A transmission line segment that Ameren has determined meets one of the following requirements, and is not considered an HCA:

- Has five (5) or more buildings intended for human occupancy within the potential impact circle.
- The potential impact circle touches or contains any portion of paved surface, including shoulders, of a designated interstate, freeway, expressway, or other principle four or more lane arterial roadway as defined in the Federal Highway Administration's "Highway Functional Classification Concepts, Criteria, and Procedures."

Migration - Movement of gas, normally below ground from one place to another.

Multipliers (also called Pressure Factors or Billing Constants) - Correction factors used to calculate the volumes of gas when metering at approved elevated pressures where a correcting device is not installed.

Multi-Fed System - Systems with more than one source of gas supply.

Natural Gas Reading - A reading of 2.0% LEL or less is considered 0% gas for leak classification/documentation purposes and is not a reportable reading if the reading is greater than five (5) feet from a foundation wall.

Navigable Waterway - Navigable waters of the US as defined in 33 CFR Part 329 are those waters subject to ebb and flow of the tide and/or are presently used, or have been used in the past, or may be susceptible for use to transport interstate or foreign commerce. Naviga-

ble waterways in Ameren Illinois service territory include the Illinois River, Mississippi River, and lower portion of the Kaskaskia River.

NDT - Nondestructive Testing: A noninvasive examination of the integrity of a weld that does not impair its serviceability. At Ameren Illinois nondestructive tests include: radiographic testing, magnetic particle testing, and liquid penetration testing.

Nitrogen - A colorless, odorless, non-flammable gas often used for pressure testing and purging. Nitrogen forms 80% of the atmosphere.

Non-Essential Business Operations - Construction and maintenance activities that do not impact the movement of gas through the system, such as training, meetings, business travel, DOT compliance activities, etc.

Non-routine Visitors - Those visitors who are at a Critical Gas Facility at their own invitation including government inspectors and salespersons.

Notification of Potential Rupture – The notification to, or observation by, an operator of indicia identified in § 192.635 of a potential unintentional release of a large volume of gas from a pipeline.

Observation Well - A well drilled to monitor subsurface conditions in or around a gas storage field.

Odorant - A blend of 2 or more liquid ingredients used to give natural gas a distinctive, recognizable odor.

Odorant Intensity Test - A test routinely performed on each odorized system to measure the percentage of natural gas-in-air at which the odorant becomes readily detectable to a person with a normal sense of smell. The operator uses an Odorometer or Odorator to measure the natural gas-in-air concentration.

Odorization - The accurate addition of odorant to natural gas and propane.

Odorizer - A device which introduces odorant into natural gas.

- Bypass - Odorizers in which a very small portion of the total volume of natural gas to be odorized is bypassed through the odorizing unit where it becomes saturated with odorant vapor, then is mixed with the main line gas stream.
- Drip - Odorizers in which odorant is gravity-fed from a pressure equalized vessel. Liquid head in the odorant storage vessel forces odorant through the unit into the pipeline.
- Liquid Injector Pump - Odorizers in which odorant is injected into the pipeline by a pump, generally operated by an injection rate controller.
- Wick - Odorizers in which a wick extends from the odorant into the main line gas stream and the odorant vapors are absorbed by the gas.
- Vaporization - Odorizers in which a small portion of gas becomes saturated after coming in contact with odorant vapors. Saturated gas is then mixed with the main line gas stream.

Odorometer or Odorator - An instrument that mixes odorized natural gas with air and allows the operator to read the percent gas concentration at which gas odor is readily detectable.

Operational Inspection - An inspection performed at a regulator station to ensure that the equipment is operating properly and at the correct set pressures. An operational inspection does not require the disassembly of the equipment.

Operating and Maintenance (O&M) Plan - A document that identifies the required activities to ensure compliance with regulatory requirements.

Outage Analysis System (OAS) - Company system utilized to report, manage and document customer complaints and gas leak investigations.

Over Pressure Protection Station - A pressure relief valve installed in a separate location from the regulator station.

Over Pressure Protection (OPP) - The means of protecting a system from exceeding the Maximum Emergency Pressure (MEP).

Oxygen - A colorless and odorless gas that forms approximately 21% of the atmosphere by volume.

Patrol - Periodic visual inspection of pipeline facilities for signs of gas leakage or conditions that could be detrimental.

Perimeter Type Leak Survey - A survey conducted along the outside building wall where the fuel line enters the building and along the nearest adjacent wall to include checks around windows, crawl space vents and other openings.

Permanent Repairs - A repair which allows a facility to be operated at its design MAOP.

Personal Protective Equipment (PPE) - Equipment such as hard hats, safety glasses and respirators used to protect you from dangers on the job and required in certain work situations.

Pig - A device inserted into a pipeline, which travels throughout the length of the pipeline, and is driven by the product flow. Pigs typically fall into 2 categories:

- Conventional or Utility Pigs - Used for cleaning, separating, or dewatering.
- Intelligent Pigs or In-line Inspection Tools - Provide information on line condition, as well as extent and location of problems.

Pipe - Any pipe or tubing used in the transportation of gas, including pipe-type holders.

Pipeline Facility - Pipelines, right-of-way, and any equipment, facility or building owned by Ameren and directly connected to and used in the transportation of gas or in the treatment of gas during the course of transportation.

Pipe-to-Soil (P/S) - The voltage difference between a pipe's metallic surface and electrolytes measured with a reference to an electrode in contact with electrolytes (soil).

Pit - A subsurface structure housing piping and piping components that has a volumetric internal content of less than 200 cubic feet and constructed in a manner that would allow gas to accumulate.

Polyethylene Pipe (PE) - A pipe made of lightweight thermo-plastic that is resistant to chemicals and moisture. PE2406/2708 is a medium density yellow polyethylene pipe with an maximum MAOP of 60 psig. PE 3408/4710 is a high density black with yellow stripe polyethylene pipe with an maximum MAOP of 100 psig.

Poly Vinyl Chloride Pipe (PVC) - A pipe made of PVC resin which is semi-rigid and is joined by the use of a solvent.

Portable Standards - Instruments that utilities use in the field or the meter shop to test the accuracy of auxiliary and tertiary equipment, transmitters, and other equipment associated with correcting a meter's output.

Potential Impact Circle (PIC) - A circle centered on transmission main that has a radius equal to the potential impact radius (PIR). The PIC is used to determine the location and size of a High Consequence Area (HCA) and Moderate Consequence Area (MCA).

Potential Impact Radius (PIR) - The radius of a circle within which the potential failure of a pipeline could have significant impact on people or property. The PIR is determined by the formula, $PIR = 0.69\sqrt{(p \cdot d^2)}$ where PIR is the radius of a circular area in feet surrounding the point of failure, p is the Maximum Allowable Operation Pressure (MAOP) in the pipeline seg-

ment in pounds per square inch (psi) and d=outside nominal diameter of the pipeline in inches.

Primary Inspection - An inspection performed at a regulator station which includes the disassembly of equipment to inspect the internal parts and replace any parts that are worn or defective.

Production Fluid - Liquids, regardless of chloride and total dissolved solids content, that is produced in conjunction with oil or natural gas production or natural gas storage operations.

Promptly - To act immediately without undue delay.

Protective System - A method of protecting personnel from cave-ins or collapse of adjacent structures. Protective systems include trench box, shoring and sloping.

Public Place - A location that is not restricted to specific persons and is generally open to all persons in a community. A public place includes churches, schools, and commercial property, as well as any publicly owned right-of-way or property that is frequented by people.

Pull-out - A situation that occurs when internal or external forces that act upon the pipe's centerline pull apart pipe ends joined by couplings.

Purging - The process of removing gas from or putting gas into a main or service line.

Qualified Individual - An individual who has been evaluated and can perform assigned covered tasks and is able to recognize and react to abnormal operating conditions.

Qualified Welder - A person who has welded successfully to the code requirements set forth in the DOT CFR 192 and API 1104. Said welder shall demonstrated by knowledge and ability, both written and hands-on weld testing. The welder must produce an acceptable weld that, at a minimum, meet Code and are in accordance with Company's qualified welding procedures.

Qualified Welding Inspector - An individual who has demonstrated the skills, training, knowledge and experience required to ensure the appropriate qualified welding procedures are being followed and proper procedures are being utilized to determine the acceptability of the welds.

Rectifier - An electrical device that converts AC to DC power, to impress DC energy between the piping and the ground bed anode, for cathodic protection of the pipe.

Reference Standards - Instruments that utilities use only for verifying the accuracy of portable standards, and whose accuracy is traceable back to the national standard maintained by the National Institute of Standards and Technology (NIST) or its successor. **Reference Standards are for use in a shop environment only and never taken to the field.**

Regulator - A mechanical device that controls the flow of gas at a constant pressure to meet downstream demand. Common types of regulators are:

- Monitor - A pressure regulator set in series with another pressure regulator, for the purpose of providing automatic over pressure protection in the event of a malfunction of the primary regulator.
- Pilot Loaded - Type of regulator loading system where a small regulator is used as the control for the main regulator. The pilot amplifies the change in downstream pressure, reducing the variance from the main regulator set point.
- Spring Loaded - The mechanical method of loading a regulator with a counterbalance force on the diaphragm to establish the set point.

Regulator Set-point - The desired downstream pressure controlled by the regulator during gas system demand.

Regulator Station - (city gate, take point, pipeline station, town border station) - Pressure regulating station consisting of equipment installed for the purpose of automatically controlling the flow and regulating the pressure in the downstream main to which it is connected. Included are piping and auxiliary devices such as valves, control instruments, control lines, the enclosure, and ventilation equipment.

Relief Valve - A safety valve that opens automatically to prevent over-pressurization by venting excess gas to atmosphere. A relief valve is a type of over pressure protection.

- Pilot Loaded - Type of loading system where a small regulator is used as the control. The pilot amplifies the change in downstream pressure, reducing the variance from the main set point.
- Spring Loaded - The mechanical method of loading a relief valve with a counterbalance force on the diaphragm to establish the set point.

Remote Control Valve - Equipped with electric or gas powered actuators to open or close a designated valve based on a command signal from a remote locations.

Replaced Service Line - A gas service line where the fitting that connects the service line to the main is replaced or the piping connected to this fitting is replaced.

Residential Service - A single or branch service line serving a gas meter or gas meters that are qualified to be billed under Ameren Illinois' Residential Gas Delivery Service GDS-1 rate as specified in the Ameren Illinois Gas Service Tariff- Schedule 2.

Retirement - An abandoned facility removed from Ameren property accounting records.

Right-Of-Way (ROW) - A strip of land, granted by deed or easement, in which facilities are installed.

Routine Visitors - Those visitors who have a recurring need to be at a Critical Gas Facility and are familiar to employees such as refuse collectors, UPS or FedEx delivery persons, mail carriers, cleaning staff, etc.

Rupture Mitigation Valve (RMV) – An automatic shut-off valve (ASV) or a remote-control valve (RCV) that a pipeline operator uses to minimize the volume of gas release from a pipeline and to mitigate the consequence of a rupture.

Saddle - A fitted plate, held in place by clamps, straps or welding, over a hole in a gas main, and into which a branch line or customer-service connection is connected.

SCADA - Supervisory Control and Data Acquisition system: Computer based system or systems used by a controller in a control room that collects and displays information about a pipeline facility and may have the ability to send commands back to the pipeline facility.

Secondary Gas Facilities - Ameren maintains a secondary list of gas facilities the Company considers to be important for the purpose of maintaining the reliability and operability of the Ameren gas system. These facilities are not considered to be a viable terrorist target, important to the nation's energy infrastructure or national defense, or likely to be used as a weapon to harm people or cause mass casualties.

The list of secondary gas facilities will be provided to the applicable local supervision. The risk control measures, in part or in whole, identified in this document may be applied to these facilities based upon operating requirements and the national and Ameren threat level.

Security Threat Alarm Levels - the National Terrorism Advisory System (NTAS) will only issue security threat alarms when credible information is available.

- Elevated Threat Level - warning of a credible terrorist threat against the United States.

- **Imminent Threat Level** - warning of a credible, specific, and impending terrorist threat against the United States.
- **Sunset Provision** - individual threat alert is issued for a specific time period and then automatically expires.

Service Line - A pipe that transports gas from a common source of supply to: a) an individual customer, b) two adjacent or adjoining residential or small commercial customers, or c) multiple residential or small commercial customers served through a meter header or manifold. A service ends at the outlet of the customer meter or at the connection to the customer piping, whichever is further downstream, or at the connection to customer piping if there is no meter.

Service Line Serving a Single Family Residence (SFR) - A gas service line that begins at the fitting that connects the service line to the main and serves only one single family residence.

Service Regulator - A mechanical device that controls the flow of gas at a constant pressure to meet downstream customers demand. Standard delivery pressure is normally 7 inches of water column.

Shall - Mandatory; must do.

Shoring - A worker protection method that uses structural components to support the walls of an excavation.

Short - An unintended electrical contact between two metal structures.

Shorted Pipeline Casing - A casing in direct metallic contact with the carrier pipe.

Should - A management decision incorporated into an operating practice or policy that is to be followed if at all possible.

Slam Shut Valve - A device designed to protect piping and equipment from either under or over pressure conditions by automatically activating at a pre-set pressure. This device requires a manual reset. Slam shut valve is a type of over pressure protection.

Single Random Pipe - A term used to describe a joint of pipe. A length of pipe approximately 21 feet in length.

Sloping - A method of worker protection based on digging the walls at an angle, so the trench is wider at the top than at the bottom.

Sniff Test - Is a smelling assignment that relies on the human olfactory system to detect the presence of odor in natural gas. Each sniff test is accomplished by inhaling through the nose to substantiate the tester is alerted to the presence or absence of odor in natural gas.

Specific Gravity - The weight of a gas in relation to the weight of air. A gas with a specific gravity less than 1.00, like natural gas (which is typically about 0.60), is lighter than air and will rise. A gas with a specific gravity greater than 1.00, like propane (which is typically about 1.50), is heavier than air, and will settle near ground level.

Specified Minimum Yield Strength (SMYS) - The specified minimum yield strength of the steel pipe.

Split Sleeve - A sleeve for pipe that is cut in half longitudinally so it can be fitted to a pipe in service. Provisions are made for bolting, clamping or welding the sleeve in place.

Spoil - The material, dirt, rock, soil, etc., removed or excavated from a trench or excavation.

Steel - A conductive metal alloy, consisting of mostly iron and small amounts of carbon, manganese, and other metals. (weldable).

Stray Current - Current in paths other than the intended circuit which can affect cathodic protection on pipe.

Strength Test - A test that qualifies the maximum allowable operating pressure (MAOP) of a gas pipeline or gas facility, by applying a test pressure equal to or greater than 1.5 times the design MAOP.

Surveillance - A periodic visual inspection of pipeline facilities and the review / analysis of records.

System MAOP - The maximum allowable operating pressure designation for an existing operating gas system or facility.

Tag Out - The placement of a tag out device on an energy isolating device, in accordance with established procedures to indicate that the energy isolating device and the equipment being controlled cannot be operated until the tag out device is removed.

Tag Out Device - A prominent warning device, such as a tag, which can be securely fastened to an energy isolating device in accordance with established procedures to indicate the energy isolating device and the equipment being controlled may not be operated until the tag out device is removed

Temperature Compensation - Term used mainly in the gas metering of gas. The capability to adjust the gas volume measured for changes in the temperature of the gas.

Tertiary Equipment - means a device that electronically converts signals from a gas measurement system (meter or auxiliary equipment or both) to a useful form such as flow rate (for example, flow computers and remote monitoring devices (RMD)).

Test Duration - The amount of time (typically in minutes or hours) for which a pressure test should be held. Test duration begins only after the test pressure has stabilized.

Test Medium - Water, air, natural gas, or nitrogen.

Test Station (also called test lead) - A test box, wire or other point on underground piping where electrical contact can be made to monitor the cathodic protection level.

Therm - A quantity of heat equivalent to 100,000 British Thermal Units (B.T.U.). Approximately the same heat content as 100 cubic feet of natural gas.

Tie in - Connecting a new gas system to an existing gas system.

Tie-In Test - A leak test performed on the final tie-in connection(s) of a tested segment of pipeline. The tie-in connection will be checked with leak detection fluid or leak detection instrument with the pipeline at normal operating pressure.

Tolerance Zone - (for excavating and locating purposes)

Illinois Definition: The approximate location of underground utility facilities defined as a strip of land at least 3' wide, but not wider than the width of the underground facility plus 1 1/2' (18 inches) on either side of such facility based upon the markings made by the owner or operator of the facility.

Transmission Line - A pipeline, other than a gathering line, that meets any of the following requirements:

- Transports gas from a gathering line or storage facility to a distribution center, storage facility or large volume customer that is not down-stream of a distribution center,
- Operates at 20% or more of the Specified Minimum Yield Strength (SMYS) or

Note: AIC classifies pipelines with MAOP of 20% SMYS or greater as transmission.

- Transports gas within a storage field or

- Other main as designated Transmission by Ameren's Pipeline Integrity Group.

Note: Contact Pipeline Integrity with questions concerning identification of Transmission facilities.

Transportation of Gas - The gathering, transmission or distribution of gas by pipeline or the storage of gas, in or affecting interstate or foreign commerce.

Trench - A narrow excavation in relation to its length made below the surface of the ground.

Union - A pipe fitting which connects two sections of pipe by means of a threaded connecting collar.

Uncontaminated Soil - Means soil that does not contain contaminated in concentrations that pose a threat to human health and safety and the environment.

Underground Facility (or Facilities) - Means and includes wires, ducts, fiber optic cable, conduits, pipes, sewers and cables and their connected appurtenances installed beneath the surface of the ground by a public utility.

Underground Natural Gas Storage Facility (UNGSF) - A facility that stores natural gas in an underground facility incidental to the transportation of natural gas, including: (1) a depleted hydrocarbon reservoir, (2) an aquifer reservoir or (3) a solution-mined salt cavern. In addition to the reservoir or cavern, a UNGSF includes injection, withdrawal, monitoring and observation wells; wellbores and downhole components; wellheads and associated wellhead piping; wing-valve assemblies that isolate the wellhead from connected piping beyond the wing-valve assemblies; and any other equipment, facility, right-of-way, or building used in the underground storage of natural gas.

Upper Explosive Limit (UEL) - The highest concentration of gas-in-air that will support combustion. For natural gas the UEL is 15.0% gas-in-air.

Valve - A mechanical device for controlling the flow of gases. Common types are ball, gate, globe, needle, plug and diaphragm.

- Ball - A quarter-turn valve that uses a ball to control flow. The ball turns inside the valve to allow more or less flow through a hole called a port.
- Gate - A multi-turn valve that operates by placing a metal disc, called a gate, across the opening of the pipe.
- Globe - A multi-turn valve that operates by raising and lowering a disc off or on to the seat. The flow bends inside the valve and the disc is in a horizontal position with the seat below.
- Plug - A quarter-turn valve that uses a rectangular plug to control flow. The plug turns inside the valve to allow more or less flow through a hole, called a port.

Vault - A subsurface structure housing pipe and piping components that has volumetric internal content of 200 cubic feet or more and constructed in a manner that would allow gas to accumulate.

Vent Limiter - Vent limiters are designed for use indoors and in spaces where limiting the amount of gas escapement due to diaphragm failure is critical. Ball check permits free inhalation for fast regulator-diaphragm response on opening cycle, but limits gas escapement to within ANSI standards, should a diaphragm rupture. Vent limiters must be screwed directly into the regulator vent boss and no intervening piping is allowed. Vent limiters should not be used outdoors if they are exposed to the environment.

Weak Link - Device or method used when pulling polyethylene pipe, typically through methods such as horizontal directional drilling, to ensure that damage will not occur to the pipeline by exceeding the maximum tensile stresses allowed.

Weld - The joining of 2 sections of steel by heating the metal and allowing the metal to flow together with the application of a filler material.

Welder - A person who performs manual or semi-automatic welding.

Welding Operator - A person who operates machine or automatic welding equipment.

Welding Procedure Qualification Report (WPQR) - Documentation of all essential variables in the Company's Welding Procedure Specification (WPS) will produce a weld that meets Section 5 of API 1104 code requirements. Variables such as process, amperage, voltage, type/size of electrode, travel speeds, number of passes, direction of travel, pre-heat temperature, root opening, and cleaning method are documented for each WPS. WPQR contains results of the destructive testing that documents the weld passes API 1104 qualifying standards.

Welding Procedure Specification (WPS) - A document which describes how production and maintenance welding should be performed that will ensure sound welds and suitable mechanical properties. Document contains all of the essential variables required by Section 5 of API 1104 code that are to be followed by the welder.

Yardline - A residential customer's underground primary fuel line, where the gas meter set is more than three (3) feet from the outside wall of the residential premise being served by the gas meter.

INCIDENT REPORTING

April 1, 2023

INCD 1 Requirements**1.0 Purpose**

This document describes Ameren Illinois' (AIC's) requirements for

- Determining reportable incidents in accordance with 49 CFR Parts 191 and 192; Title 62 Ch 1 IDNR 240; and Title 83 Ch I ICC SubCh D 501, 590, 595
- Reporting incidents in accordance with 49 CFR Part 191; ICC 501, 590, 595; IDNR 240; and 20 ILCS 3305 (IMEA 3305).
- Post-incident alcohol and drug testing in accordance with 49 CFR Part 199.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 General](#)****[5.0 Natural Gas Incident](#)****[6.0 Significant Event](#)****[7.0 Courtesy Notification](#)****[8.0 Service Interruption / Curtailment Notification](#)****[9.0 Gas Supervisor and Supervisor Gas Storage Responsibilities](#)****[10.0 Gas Compliance Responsibilities](#)****[11.0 Post-Incident Alcohol and Drug Testing](#)**

Appendices:

[Appendix A - Gas Compliance Reporting Matrix](#)**[Appendix B - State and Federal Reporting Matrix](#)****[Appendix C - AIC, State and Federal Reporting Contacts](#)****[Appendix D - Ameren Corporate and AIC Internal Contacts](#)****[Appendix E - PHMSA Policy - Reporting Suspected Natural Gas Explosions](#)****3.0 Target Audience**

- | | |
|--|--------------------------------------|
| • Pipeline Safety Compliance Personnel | • Gas Storage Field Supervisor |
| • Gas Supervisors | • Gas Storage Field Personnel |
| • Gas Field Personnel | • Gas Control Personnel |
| • Gas Tech Services (GTS) Supervisor | • Gas Integrity Management Personnel |
| • Gas Tech Services (GTS) Personnel | • Public Awareness Group |

4.0 General (49 CFR §§ 191.3, 191.5, 191.9, 191.15; ICC 501.520, 590.10, 595.110, 595.120, 595.130; IDNR 240.1805)

UNCONTROLLED IF PRINTED

- 4.1 AIC shall inform state and federal agencies about certain events involving its pipeline systems and underground natural gas storage facilities (UNGSF). See [Appendix B](#).
 - 4.1.1 Additional AIC, state, and federal reporting may be required depending on the type of event and the course of its investigation.
- 4.2 AIC personnel shall strive to achieve AIC's several reporting time constraints.
 - 4.2.1 Potential natural gas incidents and other potential significant events require notification to Gas Compliance within 1 hour of confirmed discovery.

Confirmed discovery means when it can be reasonably determined, based on information available to the operator at the time a reportable event has occurred, based on a preliminary on-scene evaluation.

- 4.2.2 Gas field personnel or gas storage field personnel shall refer to the table in [Appendix A](#) - Gas Compliance Reporting Matrix for potential incidents requiring 1 hour notification to Gas Compliance.
- 4.2.3 If there is a potential reportable incident:
 - 1. Gas field personnel shall *promptly verbally* notify Gas Supervisor when there is a Potential Incident.
 - 2. Storage field personnel shall *promptly verbally* notify Supervisor Gas Storage when there is a Potential Incident.

Normally, Gas Supervisor or Supervisor Gas Storage receives initial notification about a Potential Incident through the Outage Analysis System (OAS). See [EMER 2.1](#) and [EMER 2.2](#). On-site information is provided by gas field personnel (see [EMER 2.4](#)) or storage field personnel responding to the OAS.

- 4.2.4 Following Supervisor notification, first priority is dealing with the situation to protect people first then property:
 - 1. Make the scene safe.
 - 2. Notify required emergency response agencies
 - 3. Attend to injuries
- 4.3 Gas Supervisor or Gas Storage Field Supervisor has the responsibility for identifying a potentially reportable natural gas incident and verbally notifying Gas Compliance immediately such that in Incident Report can be made within 1 hour of confirmed discovery.
 - 4.3.1 See [Appendix A](#) Gas Compliance Reporting Matrix
 - 4.3.2 See [Appendix C Table 1](#) Gas Compliance Contacts
 - 4.3.3 Gas Supervisor or Gas Storage Field Supervisor should refer to [Section 9.0](#) for additional responsibilities.

5.0 Natural Gas Incident (49 CFR §191.3, ICC 590.10, and IDNR 240.1805)

5.1 A natural gas incident is an event that involves the release of natural gas from an AIC pipeline system or UNGSF including downhole portion that results in one or more of the following:

5.1.1 A death.

5.1.2 Any personal injury requiring in-patient hospitalization.

- "Personal injury" includes injury to someone from the public, a customer, a contractor, an emergency responder, AIC personnel, etc.
- "In-patient hospitalization" means hospital admission and at least one overnight stay.

5.1.3 Estimated property damage including loss to AIC and/others, but excluding the cost of gas lost.

1. \$ 50,000 or more for reporting to ICC or IDNR
2. \$129,300 or more per §191.3 for reporting to PHMSA

The ICC falls under Section 595 of Illinois Title 83 Public Utilities, for reporting of Accidents or Incidents.

Under Section 595 the definition of an Incident is based on 49 CFR 191.3 as of January 1, 2011 which had the estimated property damage value at \$50,000.

IDNR 240.1805 - Estimate property damage is the result of a release of stored natural gas from the downhole portion of an underground natural gas storage facility.

5.1.4 Unintentional estimated gas loss of 3 million cubic feet or more.

5.1.5 An event that results in an emergency shutdown of an UNGSF.

Activation of an emergency shutdown system for other than an actual emergency does not constitute an incident.

5.1.6 Unintentional estimated gas loss from the downhole portion of an UNGSF of 500,000 cubic feet or more that occurs with 1/8 mile of a dwelling used as a residence, place of business or place of public assembly.

5.1.7 An event that is significant in the judgement of AIC, even though it did not meet the criteria above.

5.2 If the event meets the criteria of a Natural Gas Incident it is reportable to: See [Appendix B](#) State and Federal Reporting Matrix.

5.2.1 Pipeline and Hazardous Materials Safety Administration (PHMSA) via the National Response Center ([Appendix C Table 3](#)), and

5.2.2 Illinois Commerce Commission (ICC) ([Appendix C Table 2](#)), and

5.2.3 Illinois Department of Natural Resources (IDNR) ([Appendix C Table 2](#))

6.0 Significant Event (49 CFR §191.3(3), ICC 590.10)

6.1 A Potential Significant Event may involve one or more of the following.

6.1.1 Any personal injury requiring medical treatment.

6.1.2 An explosion.

PHMSA request any suspected natural gas explosion be reported even though AIC facilities were not involved.

6.1.3 A natural gas fueled fire with estimated property damage exceeding \$25,000.

6.1.4 Supply or pressure problems that cause curtailment of firm load to more than 50 customers.

6.1.5 Gas service interruption to 25 or more customers for durations of 8 hours or more.

6.1.6 Damage to any high-pressure distribution or transmission line.

6.1.7 Damage to any distribution main with an estimated repair time in excess of 8 hours excluding gas service interruption relight time.

6.2 Gas Compliance shall determine if a Significant Event is reportable as a Natural Gas Incident.

6.2.1 If the Significant Event is not reportable as an Incident, it may be reportable as a:

1. Courtesy Notification. Or
2. Service Interruption/Curtailment Notification.

7.0 Courtesy Notification

7.1 As soon as practicable, Gas Compliance may provide courtesy notification to ICC's Pipeline Safety Personnel about any of the following events.

7.1.1 Fire and/or Police Emergency Response to a release of natural gas from an AIC facility where gas migration requires any of the following:

1. Evacuation of *more than one* residential structure.
2. Evacuation of multiple occupancy buildings such as a restaurant, store, apartment, school, church, hospital, nursing home, factory, etc.
3. Closure of a major road, highway, railroad, etc.

7.1.2 News media response to a release of natural gas.

- 7.1.3 Odorant release resulting in an increase in odor/leak calls from the public.
- 7.1.4 Odorizer failure resulting in either over odorization or under odorization.
- 7.1.5 Potential significant events that are not deemed to be reportable as a Natural Gas Incident.

8.0 Service Interruption / Curtailment Notification

- 8.1 ICC and IEMA, [Appendix C Table 2](#), shall be notified when:
 - 8.1.1 Gas service is interrupted to more than 1,000 people (approximately 400 meters based upon 2.5 people per household).
 - 8.1.2 Supply or pressure problems cause AIC to curtail firm (contract) load to more than 50 customers.
- 8.2 As soon as practicable, notify ICC Consumer Services Division and Safety and Reliability Division personnel, [Appendix C Table 4](#), when:
 - 8.2.1 Gas service interruption to 50 or more customers for a period of 12 hours or more.

9.0 Gas Supervisor and Supervisor Gas Storage Responsibilities (49 CFR §192.605(b)(4))

- 9.1 Supervisor shall:
 - 9.1.1 Gather as much preliminary information about Potential Incident for the 1-Hour Report from contact with appropriate on-site field personnel and OAS messages.

Complete information is not necessary for the 1- hour report.
Rough estimates are expected and acceptable.

1. Brief description of Potential Incident
2. Summary of actions taken to date.
3. Preliminary information needed for the top portion of page 1, Potential Incident Report Form (see [INCD 2](#)). Include the following information:
 - 3 a. Location of event including address and county.
 - 3 b. Event date and time (include AM or PM).
 - 3 c. Pipe diameter, material, and pressure at time of event.
 - 3 d. Number of personal injuries requiring hospital admittance.
 - 3 e. Number of customers affected by gas service interruption. (Approximation only)
 - 3 f. Number of fatalities.
 - 3 g. Dollar value of property damage. (Indicate if it appears to be considerable)
 - 3 h. Indicate if gas released
 - 3 i. Cubic feet of gas released. (Give approximate length of time gas was blowing)

UNCONTROLLED IF PRINTED

3 j. Person providing information and time information provided (include AM or PM)

3 k. Weather conditions including wind strength and direction

9.1.2 Provide Gas Compliance with preliminary information for 1-Hour Report about Potential Incident.

9.2 If Gas Compliance personnel cannot be contacted, Supervisor shall notify appropriate Superintendent or Director.

9.3 Superintendent or Director will make the report to:

9.3.1 ICC. See [Appendix C Table 2](#)

And

9.3.2 PHMSA via NRC. [Appendix C Table 3](#) for NRC.

And

9.3.3 Notify Gas Compliance that the report has been submitted.

9.4 Coordinate with appropriate Superintendent concerning drug and alcohol testing if the Potential Incident results from tasks performed by AIC personnel. See [Section 11.0](#).

9.4.1 Review Ameren Supervisor Guidelines for Drug and Alcohol Testing. See [INCD 2](#).

10.0 Gas Compliance Responsibilities

10.1 Complete a Potential Incident Report Form (see [INCD 2](#)) based on information provided by Gas Supervisor or Supervisor Gas Storage (see [Subsection 9.1.1](#)) and any other sources.

10.2 Determine if the Potential Incident meets reporting criteria of:

10.2.1 [Section 5.0](#), Natural Gas Incidents.

10.2.2 [Section 6.0](#), Potential Significant Events.

10.2.3 [Section 7.0](#), Courtesy Notifications.

10.2.4 [Section 8.0](#), Service Interruption / Curtailment Notifications.

10.3 Report a Natural Gas Incident to PHMSA and ICC as follows.

10.3.1 The 1-Hour Report.

- The 1-Hour Report is based on the Potential Incident Report Form
- Complete information is not necessary for the 1-Hour Report.
- Provide a 24-hour telephone number for where more detailed information can be obtained.
- Record a report number if provided by recipient.
- Record recipient's name plus date and time of contact.

1. National Response Center (NRC). See [Appendix C Table 3](#).

UNCONTROLLED IF PRINTED

2. ICC. See [Appendix C Table 2](#).
3. Appropriate AIC internal notifications: See [Appendix D](#).

10.3.2 The 48-Hour Report.

1. Within 48 hours after the confirmed discovery of incident, to the extent practicable, revise or confirm 1-Hour Report filed with NRC and the ICC.
2. Revisions may include updated information about:
 - 2a. Amount of natural gas released.
 - 2b. Number of fatalities and injuries.
 - 2c. Significant facts relevant to the cause of the incident.
 - 2d. Extent of damages.

10.3.3 The 30-Day Report.

1. Within 30 days of confirmed discovery one of the following forms shall be filed with PHMSA : See [INCD 2](#) for forms and instructions
 - 1a. Form RSPA F 7100.1 Incident Report - Gas Distribution System,
or
 - 1b. Form RSPA F 7100.2 Incident Report - Gas Transmission and Gathering Systems
2. **If additional relevant information is obtained after submittal of the 30-day report, a supplemental report shall be submitted as deemed necessary. The supplemental report shall have a clear reference by date and subject to the original report.**

10.3.4 Retracting reports.

1. For 1-Hour Reports: PHMSA no longer requests operators to retract erroneously reported 1-Hour or 48 Hour NRC Notification Reports.
2. If the incident is subsequently determined to be caused by non-jurisdictional piping, an email should be sent to PHMSA Accident Investigation Division and ICC Pipeline Safety Office prior to the 30-day report requirement.
 - 2 a. The email should state that "AIC will not be submitting a 30-day report due to the event being determined to be caused by non- jurisdictional release of gas."
 - (i) The email should be sent to PHMSAAccidentInvestigationDivision@dot.gov, referencing the NRC notification number used for the initial report.
 - (ii) A copy of the email should be sent to the Assistant Director, Pipeline Safety, ICC and the Administrative Assistant, ICC Pipeline Safety.
3. For 30-Day Reports: If a report has been filed and further investigation reveals that the Natural Gas Incident was not an "incident" and therefore not reportable, Gas Compliance shall request that the report be retracted by contacting the PHMSA Informational Resources Manager by email at InformationResourcesManager@dot.gov. Requests are to include the following information:

- 3 a. The Report ID (the unique 8-digit identifier assigned by PHMSA).
- 3 b. Operator name.
- 3 c. PHMSA issued OPID number.
- 3 d. The number assigned by the National Response Center (NRC) when an immediate notice was made in accordance with §191.5. If Supplemental Reports were made to the NRC for the event, list all NRC Report numbers associated with the event.
- 3 e. Date of the event.
- 3 f. Location of the event.
- 3 g. A brief statement as to why the report should be retracted.
4. Also notify ICC and AIC's internal recipients, as appropriate, and include the brief statement about why the reports should be retracted.

10.4 Report a Natural Gas Incident to IDNR as follows:

10.4.1 The 24 Hour Report:

- The 24-Hour Report is based on the Potential Incident Report Form.
- Complete information is not necessary for the 24-Hour Report.
- Provide a 24-hour telephone number for where more detailed information can be obtained.
- Record a report number if provided by recipient.
- Record recipient's name plus date and time of contact.

1. The underground natural gas storage field where the release from the down-hole portion occurred.
2. The origin and extent of the release, including the name and location of the well.
3. The cause of the release.
4. Any corrective action taken by AIC to address the release or an explanation why corrective action was not taken.
5. Appropriate AIC internal notifications: See [Appendix D](#).

10.5 Annual Report on Service Interruptions:

10.5.1 A report of gas service interruptions that affect 25 or more customers for 8 hours or more shall be filed with the ICC Director of the Safety and Reliability Division and the Ameren Illinois Regulatory Affairs by April 1 with the following details for the previous year.

1. The number of service interruptions that:
 - 1 a. Lasted 8 hours or more but less than 12 hours.
 - 1 b. Lasted 12 hours or more.

UNCONTROLLED IF PRINTED

2. Dates of service interruptions that exceeded 8 hours in duration.
3. City and location of service interruptions that exceeded 8 hours in duration.
4. Reason for service interruptions that exceeded 8 hours in duration.

11.0 Post-Incident Alcohol and Drug Testing (49 CFR Part 199)

- 11.1 If the Potential Incident results from tasks performed by AIC personnel, drug and alcohol testing shall be administered within 2 hours for alcohol tests and 32 hours for drug tests.
- 11.2 Gas Superintendent / Gas Supervisor or Superintendent / Supervisor Gas Storage shall contact Supervisor Gas Control if Gas Control personnel could be subjected to alcohol or drug testing.
- 11.3 Appropriate Superintendent, Supervisor, and/or Supervisor Gas Control shall immediately contact Clinical Collection Management, Inc. (CCM) to arrange for alcohol and drug testing. See [Appendix D, Table 4](#) to arrange for testing.
- 11.4 An alcohol and drug test shall be administered at the earliest practical moment, but no later than 2 hours for the alcohol test and 32 hours for the drug test following an incident where:
- 11.4.1 Gas field personnel, storage field personnel, or Gas Control Specialist performance contributed to the incident or their performance cannot be completely discounted as a contributing factor to the incident.
 - 11.4.2 If the alcohol test is not administered within 2 hours following the incident, the appropriate Supervisor shall prepare and maintain a record stating the reasons the test was not promptly administered.
 - 11.4.3 If the alcohol test is not administered within 8 hours following the incident, the appropriate Supervisor shall cease attempts to administer an alcohol test and shall state in the record the reasons for not administering the test.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Revision Notes

Location of Changes	Summary of Changes
Subsection 10.2	Formatting Correction - "Determine if the Potential Incident meets reporting criteria of:" should have been Subsection 10.2 but was missed during the Re-write.
Paragraph 10.3.3, Item 2.	Added reference to a Supplemental Report to the 30-day report
Appendix D	Added Table 5 - Integrated Operation Center (IOC) – AMI Readings with contact information to request AMI readings

Appendix A - Gas Compliance Reporting Matrix

Gas Compliance shall be contacted within 1 hour of confirmed discovery	
1	Death.
2	Personal injury requiring medical treatment or in-patient hospitalization.
3	Estimated property damage excluding cost of gas lost:
	a. \$25,000 or more for potential reporting to ICC or PHMSA
	b. \$25,000 or more for UNGSF potential reporting to IDNR.
4	Unintentional estimated gas loss of 3 million cubic feet or more.
5	An event that results in an emergency shutdown of an UNGSF.
6	An explosion.
7	Natural gas fueled fire with estimated property damage:
	a. \$25,000 or more for potential reporting to ICC or PHMSA or
	b. \$25,000 or more for UNGSF potential reporting to IDNR.
8	Damage to any high-pressure distribution or transmission line.
9	Damage to any distribution main with an estimated repair time in excess of 8 hours excluding gas service interruption relight time.
10	Gas service interruption to more than 400 meters.
11	Gas service interruption to 25 or more customers for durations of 8 hours or more.
12	Supply or pressure problems cause the Company to curtail firm (contract) load to more than 50 customers.
13	Unintentional estimated gas loss from the downhole portion of an UNGSF of 500,000 cubic feet or more that occurs within 1/8 mile of a dwelling used as a residence, place of business, or place of public assembly.

Appendix B - State and Federal Reporting Matrix

Report within 1 hour of confirmed discovery Exception: Report to IDNR is within 24 hours		ICC	IDNR (1)	IEMA	PHMSA
1	Death.	X	X		X
2	Personal injury requiring in-patient hospitalization.	X	X		X
3	Estimated property damage, excluding the cost of gas lost: \$129,300 or more per §191.3				X (2)
	\$50,000 or more	X	X		
4	Unintentional estimated gas loss of 3 million cubic feet or more.	X	X		X
5	An event that results in an emergency shutdown of an UNGSF.	X	X		X
6	An event that is significant in AIC's judgment, even though it did not meet the criteria of items 1 - 5 above.	X			X

UNCONTROLLED IF PRINTED

7	Gas service interruption to 50 or more meters for 12 hours or more.	X			
8	Gas service interruption to more than 400 meters.	X		X	
9	Supply or pressure problems cause AIC to curtail firm (contract) load to more than 50 customers.	X		X	
10	Any suspected natural gas explosion where it is initially unclear if a leak from AIC's facilities contributed to the explosion.	X			X
11	Unintentional estimated gas loss from downhole portion of an UNGSF of 500,000 cubic feet or more that occurs within 1/8 mile of a dwelling used as a residence, place of business, or place of public assembly.		X		

- (1) IDNR is notified when Natural Gas Incident involves a release of stored natural gas from the downhole portion of an UNGSF. That notification is required within a minimum of 24 hours.
- (2) The estimated property damage value threshold for PHMSA reporting will be adjusted each July 1, beginning July, 2022, for inflation in accordance with Appendix A of Part 191. PHMSA's adjusted value will be reflected in the next scheduled O&M Update.

Appendix E - PHMSA Policy: Reporting Suspected Natural Gas Explosions

During the first few hours following a house explosion, the source of the leaking gas is often unknown. Operators should promptly report these events telephonically to the NRC and state that the role of gas in the event is being investigated. Although NRC reports cannot be rescinded, they also do not count against an operator. PHMSA would prefer that operators make NRC reports for events that later prove to be non-jurisdictional than to not make NRC reports for events that later are determined to be jurisdictional.

In the days following a house explosion, the source of leaking gas is typically determined. If a leak on jurisdictional piping is determined to be the source of gas and an incident criterion has been met, the operator must also submit a 30-Day Report to PHMSA. If a leak on non-jurisdictional piping is determined to be the source of gas, the operator should not submit a 30-Day Report to PHMSA, unless the damage to the operator's property exceeds \$50,000. If the source of gas is still undetermined 30 days after the event, submit a report to PHMSA - it can be retracted, if necessary, after the source of gas has been determined. In summary, always call the NRC, but only report to PHMSA jurisdictional releases meeting the reporting criteria.

INVESTIGATION OF INCIDENTS

October 1, 2020

INVE 1 Requirements

1.0 Purpose

This document outlines Ameren Illinois (AIC) requirements for investigation of incidents in accordance with 49 CFR §192.617.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 NTSB Investigation of Incident](#)**3.0 Target Audience**

- Gas Compliance Personnel
- Quality Assurance Personnel
- Gas Supervisors
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Tech Service (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 General (49 CFR §192.617, Part 199)

4.1 AIC shall investigate potential incidents and reportable incidents (see [INCD 1](#) for descriptions) to determine if:

4.1.1 There was a failure in the gas system which caused or contributed to the incident.

4.1.2 Actions by members of the general public, natural disaster (e.g. lightning, flooding, storms, ground movement) or by an accident (i.e. vehicular crash, derailment or structure collapse) caused or contributed to the incident.

4.2 The incident investigation shall be:

4.2.1 Thorough.

4.2.2 Accurately and properly documented.

4.2.3 Confidential.

4.2.4 Inclusive of:

1. Pre-incident events (activities that may have contributed to the incident).
2. Concurrent-incident events (activities while the incident was happening).
3. Post-incident events (activities after the incident).

4.2.5 Focused on minimizing the possibility of recurrence. See [CNTS 1](#) and [INVE 2.3](#).

As used in the subparagraphs of [4.2.4](#), "activities" include actions by members of the general public, AIC customers, AIC personnel, and facilities, natural disasters and accidents).

4.3 AIC personnel shall:

- 4.3.1 Communicate and cooperate with emergency agencies and authorities having jurisdiction over the investigation (Authorities).
- 4.3.2 Secure the incident site and affected gas facilities to prevent tampering with evidence and exposing personnel to additional hazards until after the investigation is complete.
 - 1. Exceptions include:
 - 1 a. Authorities determine:
 - i.) Natural gas was not a contributing factor to the incident.
 - Or
 - ii.) Preserving the site and facilities would create a safety hazard to the general public.
 - 1 b. If Authorities determine natural gas is not a contributing factor to the incident, Ameren Claims shall determine if any evidence needs to be retained in AIC custody.
- 4.3.3 Inspect gas facilities, mains, and services in the vicinity to ensure they are safe, reliable, and unaffected by the incident. See [INVE 2.1](#).
- 4.3.4 For gas facilities that may have failed or may have been impacted, preserve and keep them in a secured location until Ameren Claims specifies a location where facilities can be analyzed.

5.0 NTSB Investigation of Incident

- 5.1 In the event that the National Transportation Safety Board (NTSB) is going to launch an investigation of the incident refer to [INVE 2.1 Section 10](#) NTSB Investigation of Incidents.

End of Instructions.

INVESTIGATION OF INCIDENTS

October 1, 2022

INVE 2.1 Incident Investigation

1.0 Purpose

This document outlines Ameren Illinois (AIC) incident investigation procedures for determining the apparent cause of an incident and minimizing the possibility of a recurrence in accordance with 49 CFR §192.617.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 General](#)****[5.0 Incident Commander Responsibilities - Documentation](#)****[6.0 Incident Commander Responsibilities - Facility Investigation](#)****[7.0 Incident Commander Responsibilities - Chain of Custody](#)****[8.0 Analysis of the Incident](#)****[9.0 Preservation of Evidence](#)****[10.0 NTSB Investigation of Incidents](#)****3.0 Target Audience**

- Gas Compliance Personnel.
- Quality Assurance Personnel
- Gas Supervisors
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Control

4.0 General

4.1 The following actions should have been completed prior to beginning the investigation.

4.2.1 Emergency Plan (**[EMER 1](#)**) has been implemented and a hazardous condition no longer exists.

1. First responders (e.g., gas field personnel, gas supervisors) are on site and -
 - 1 a. Initially, giving the safety of the public and AIC customers and personnel top priority. Also coordinating with responding emergency agencies.
 - 1 b. Secondly, protecting property by dealing with affected facilities and making the area safe.

4.2.2 Incident Reporting (**[INCD 1](#)**) has been implemented.

4.2 An Incident Commander will be in control and coordinate the investigation. The Incident Commander should be an AIC management person and/or and Ameren Claims person.

4.3 AIC personnel shall cooperate with public officials, emergency response personnel, and regulatory authorities.

UNCONTROLLED IF PRINTED

- 4.4 AIC personnel shall courteously decline requests for information and investigation results by stating:
 - 4.4.1 *"The incident is under investigation, and official information will be provided through Ameren Illinois Communications when it becomes available"*.
 - 4.4.2 Requests for information shall be referred to Ameren Illinois Communications. See [INCD 1, Appendix D, Table 2](#).
 - 4.4.3 Requests for investigation results shall be referred to Ameren Legal & Claims. See [INCD 1, Appendix D, Table 1](#).
- 4.5 After the emergency has been resolved, AIC personnel -
 - 4.5.1 Shall notify Gas Standards & Procedures if a material failure or defect maybe involved in the incident. See [INVE 2.3](#).
 - 4.5.2 Shall implement:
 - 1. Sections [5.0](#) through 9.0.
UNLESS
 - 2. The National Transportation Safety Board (NTSB) notifies AIC that they will conduct the investigation. Then implement [Section 10.0](#).
- 4.6 Investigation of incidents related to fire or explosion is addressed in [INVE 2.2](#).

5.0 Incident Commander Responsibilities - Documentation

- 5.1 Limit the number of qualified gas field personnel and management required to perform the investigation.
 - 5.1.1 One person should be assigned to take photos and document the investigation. Warn all individuals not to record the scene by photograph and/or video.

Devices used to take photographs and/or videos, (i.e. cameras, cell phones, tablets) may be accessed as evidence.

- 5.1.2 Preserve the site.
 - 1. Do not disturb any materials or remove AIC facilities.
 - 2. Do not enter any structure associated with incident without permission or by request of public official having jurisdiction over scene.
- 5.1.3 If incident involves remotely monitored gas system or facility, contact Gas Control and request:
 - 1. A review of their data logs for any pertinent information.
 - 2. Flow and/or odorization information for the time of and around the incident.
- 5.1.4 Ensure that all information and evidence is accounted for in the Gas Incident Investigation Log. See [INVE 3](#).
- 5.1.5 Place high value on:
 - 1. Accurate and precise information.
 - 2. Report only facts not opinions.

3. Photographs of the investigation scene.
 4. Neat site drawings and sketches.
- 5.1.6 Record the sequence of events leading up to and throughout the incident.
1. Pre-incident events - activities that may have contributed to the incident
 2. Incident - activities while the incident was happening
 3. Post-incident events - activities following the incident
 4. Include information and data for Gas Control when applicable
- NOTE:** Activities are defined in [INVE 1 Subsection 4.2.4](#).
- 5.1.7 Create a photographic record of the investigation scene and note where photographs and/or videos were taken.
1. Pay special attention to areas which may include:
 - 1 a. Distribution of debris.
 - 1 b. Condition of exterior walls, roofs, and floors.
 - 1 c. Location of the explosion or fire.
 - 1 d. Condition of AIC equipment.
 - 1 e. Location of utilities and evidence of locates.
 - 1 f. Evidence of heat.
 - 1 g. Location of gas appliances and piping.
 - 1 h. Location of other combustibles.
 - 1 i. Consider any other areas of interest such as sewer traps, sewer clean-outs, etc.
- 5.1.8 Until Ameren Claims personnel arrive, process the witnesses.
1. Ensure that names, addresses, and phone numbers of all who witnessed the incident are recorded in the Gas Incident Investigation Log. Where applicable, include witness agency, title, and email address.
 2. Begin interviewing witnesses who may not be able to wait for the arrival of Ameren Claims personnel. Otherwise, consider having witnesses wait for Ameren Claims personnel.
- 5.1.9 Interview the witnesses by asking the questions below and recording their answers on "interview pages" in the Gas Incident Investigation Log.
1. Describe what happened including what was observed.
 2. Where were you when the incident took place?
 3. What time was it when the incident took place?
 4. What were you doing at the time of the incident?
- 5.1.10 Ensure that once on the scene, Ameren Claims personnel:
1. Are updated on status of the investigation.
 2. Reviews all of the documentation, photos and videos taken.

3. Takes custody of all photographs, videos, and documentation produced thus far.
 4. Finish processing witnesses.
 5. Coordinates the completion of the investigation.
- 5.1.11 Review the documents received and actions taken before continuing to Section 6.0.

6.0 Incident Commander Responsibilities - Facility Investigation

- 6.1 Ensure AIC facilities that may have been involved in the incident are investigated to verify proper operation.
- 6.2 Ensure a leak survey of the gas service and main is completed including sampling sewers, manholes and utility pedestals. See [LEAK 2.2](#).
- 6.3 Ensure AIC gas field personnel:
 - 6.3.1 Inspect gas meter sets to verify the meter sets -
 1. Have not been damaged by the incident,Or
 2. Are in danger of being damaged to the point of contributing fuel to the incident.
 - 6.3.2 *Before touching a gas meter set*, check the riser, meter and customer piping with a volt stick. See [METR 2.2 Section 7.0 paragraph 7.2.2](#).
 - 6.3.3 Write down the gas meter reading and meter number.
 - 6.3.4 Request remote automated meter readings, AMI, as soon as practical by contacting the Integrated Operation Center (IOC) Hotline at 835-904-2462, 24 hours per day / 7 days per week.
 - 6.3.5 Check condition of regulator for evidence of malfunctioning or tampering.
 - 6.3.6 Check condition of gas meter for damage or leakage.
 - 6.3.7 Check meter valve for possible heat damage that would allow gas to leak by the meter valve.
 - 6.3.8 Check riser for PE service that could be damaged by the heat.
- 6.4 Ensure odorant level of the gas is checked by qualified AIC gas field personnel using an approved odorator. See [ODOR 3](#) for manufacturer's instructions.
 - 6.4.1 In addition to the reading performed by AIC personnel, request that a public official, (i.e. police or fire department personnel), check the readily detectable odorant level.
 - 6.4.2 Perform a reading upstream and downstream of the incident and as close to the incident as possible.
- 6.5 Ensure multiple samples of natural gas, air, and materials are collected and marked for identification.
- 6.6 Ensure delivery pressure and lock up pressure of the service regulator are checked. See [TURN 2.1](#).
- 6.7 Test the gas service at operating pressure if required by the local agency, state, or federal authorities.

6.8 Ensure AIC facilities are:

6.8.1 Removed only after receiving approvals from the incident investigating team, including:

- AIC Gas Compliance
- State Fire Marshal
- Illinois Department of Natural Resources
- Illinois Commerce Commission
- Ameren Claims

6.8.2 Tagged and secured as evidence.

6.9 Ensure the transfer of custody of the evidence is documented on the Chain of Custody Log. See [INVE 3](#).

7.0 Incident Commander Responsibilities - Chain of Custody

7.1 The Incident Commander shall ensure the following:

7.1.1 AIC personnel document the chain of custody for all removed facilities that may have been involved in the incident.

7.1.2 If there is reason to believe that an individual's performance of a covered task contributed to the incident,

1. Any and all tools and equipment involved in the performance of the covered task shall be removed from service.
2. The transfer of custody shall be documented. See Paragraph 7.1.3.

7.1.3 Facilities, tools, and equipment removed from service shall be tagged using Chain of Custody Tag. See [INVE 3](#).

7.1.4 The transfer of custody shall be documented on the Chain of Custody Tag and on the Chain of Custody Log. See [INVE 3](#).

8.0 Analysis of the Incident

8.1 AIC Claims and AIC management personnel shall review the information collected during the initial investigation.

8.2 The Incident Commander shall:

8.2.1 Convene a meeting including:

1. AIC gas field personnel involved in the field investigation.
2. AIC Supervisors.
3. Ameren Risk Management.
4. Ameren Legal & Claims representatives.
5. Gas Standards & Procedures if a material failure or defect is involved.
6. Gas Control personnel if they provided any information.

8.2.2 Review all actions taken and documents collected.

8.2.3 Determine what additional information needs to be obtained.

8.2.4 Determine what additional interviews need to be completed.

8.2.5 Determine what additional AIC records may be needed.

UNCONTROLLED IF PRINTED

- 8.2.6 Review emergency response agency reports.
- 8.2.7 Determine if an outside specialist is needed to conduct further investigations.
- 8.2.8 Develop a summary of the events that led up to, through, and after the incident.

8.3 The final report shall:

- 8.3.1 Outline the facts that led up to, through, and after the incident.
- 8.3.2 Contain supporting documentation.
- 8.3.3 Establish the apparent cause of the incident.
- 8.3.4 Propose steps to minimize the possibility of recurrence.

9.0 Preservation of Evidence

- 9.1 AIC Gas Compliance and Ameren Legal & Claims shall prescribe preservation protocols for information collected through the investigation and analysis of the incident.
- 9.2 Documents shall be numbered and filed.
- 9.3 Facilities removed shall be tagged and stored in a secure location for a minimum of 5 years unless Ameren Legal provides written notification that the facilities may be disposed of or placed back into service.
- 9.4 Tools and equipment removed from service shall be tagged and stored in a secure location until the investigation is complete.
 - 9.4.1 Equipment such as a trencher, backhoe, or directional boring machine may be secured at the Operating Center (OC) by removing the ignition key and being tagged "Out of Service".
 - 9.4.2 Tools and equipment may be placed back in service once the investigation is complete and the Ameren Legal Department provides written notification that the tools or equipment may be placed back into service.
- 9.5 Once the facilities, tools, and equipment are disposed of or placed back into service, the chain of custody documentation shall be placed in the incident investigation file.

10.0 NTSB Investigation of Incidents

Section 10.0 provides an overview of instructions and guidance to AIC personnel if the National Transportation Safety Board (NTSB) launches an investigation of an incident. See [INVE 3](#) NTSB Pipeline Investigation Guide for specific details.

- 10.1 NTSB takes complete control of investigation.
- 10.2 Prior to the arrival of or communication with the NTSB Investigator-in-Charge, affirmative investigative activity shall be limited to excavation, testing, etc. that:
 - 10.2.1 Cannot wait.
 - 10.2.2 Is intended to mitigate the hazard.
 - 10.2.3 Preserves life and property.
- 10.3 NTSB Party Members include:

10.3.1 Ameren Party Coordinator (APC) and Alternate.

1. The APC shall:
 - 1 a. Manage the disclosure of information and documentation to NTSB.
 - 1 b. Serve as the face of AIC in all NTSB interactions.

All information shared with NTSB may become public information.

2. APC and Alternate shall be:
 - 2 a. AIC personnel who are not attorneys.
 - 2 b. Trained in the procedural and substantive aspects of NTSB investigations.

10.3.2 APC Assistant.

1. AIC personnel who assists APC in taking notes and collecting data requested by NTSB.

End of Instructions.

INVESTIGATION OF INCIDENTS

October 1, 2020

INVE 2.2 Investigation of Fires

1.0 Purpose

This document outlines Ameren Illinois (AIC) procedures for investigating the apparent cause of gas related fires, ignitions, and explosions in accordance with 49 CFR §192.617.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Management of Fire, Ignition, or Explosion Investigation](#)[6.0 Initial Assessment](#)**3.0 Target Audience**

- Gas Compliance Personnel.
- Quality Assurance Personnel
- Gas Supervisors.
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel.
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 General

4.1 The following actions should have been completed prior to beginning the investigation.

4.1.1 The appropriate Emergency Plan has been implemented and a hazardous condition no longer exists.

4.1.2 Incident Reporting ([INCD 1](#)) has been implemented.

4.2 An AIC management personnel will serve as AIC's Incident Commander to coordinate AIC's investigation and AIC's interaction with the scene's Unified Commander. See [Subsection 5.1](#).

4.3 The presence of the media, general public, and AIC customers at fires, ignitions, and explosion is common.

4.3.1 AIC personnel shall:

1. Courteously decline any requests for information by stating:

"The incident is under investigation, and official information will be provided through Ameren Illinois Communications when it becomes available".

2. Refer all requests for information to Ameren Illinois Communications. See [IN-CD 1, Appendix D, Table 2](#).

4.3.2 Press releases shall be coordinated with the Incident Command System protocol.

4.4 Once determined that natural gas is suspected or confirmed to have been involved in the incident, AIC's personnel shall limit discussions with the Incident Commander / fire

UNCONTROLLED IF PRINTED

department to a designated AIC individual while continuing to cooperate to make the scene safe for the fire department, general public, and AIC customers.

- 4.4.1 Any requests for investigation results should be directed to Ameren Legal & Claims.
- 4.4.2 AIC's Incident Commander will designate an individual to maintain a log of the investigation documenting the actions taken and evidence gathered. See [INVE 2.1](#).
- 4.4.3 The content of the investigation should remain confidential and should not be released to anyone external to AIC without approval from Ameren Legal & Claims.

5.0 Management of Fire, Ignition, or Explosion Investigation

- 5.1 The scene may be under the jurisdiction of an outside authority. AIC Incident Commander should communicate and cooperate with that authority.

6.0 Initial Assessment

- 6.1 AIC gas field personnel shall look for any indications that natural gas may have been involved including:
 - 6.1.1 Reports of an explosion or loud noise.
 - 6.1.2 Smell of gas before the fire.
 - 6.1.3 Windows that are blown out.
 - 6.1.4 Walls that have collapsed outward.
 - 6.1.5 Roof that has shifted.
 - 6.1.6 Burns or charring near gas appliances and piping.
- 6.2 The AIC gas field personnel shall attempt to talk with the Incident Commander, Fire Marshal, Fire Department, or other investigating authority at the scene to determine if they have identified the probable cause of the fire.
 - 6.2.1 If the information received indicates that *natural gas was not involved* in the cause of the fire, no further investigation is required. The AIC gas field personnel shall notify Gas Supervisor that they responded to a fire that did not involve natural gas.
 - 6.2.2 If the information received indicates that *natural gas could be or is involved*, the gas field personnel shall immediately contact Gas Supervisor.
- 6.3 Once the determination has been made that AIC gas facilities could be or are involved in a fire, the investigation activities shall be performed in accordance with [INVE 2.1](#).

End of Instructions.

INVESTIGATION OF INCIDENTS

October 1, 2022

INVE 2.3 Investigation of Failures

1.0 Purpose

This document outlines Ameren Illinois (AIC) procedures for investigating failed facilities or equipment that may have caused an emergency in accordance with 49 CFR §192.617.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 General](#)****[5.0 Analysis of Failed or Defective Materials](#)****3.0 Target Audience**

- Gas Compliance Personnel
- Quality Assurance Personnel
- Gas Supervisors
- Gas field personnel.
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 General**4.1 Gas Standards & Procedures shall -**

- 4.1.1 Ensure failed facilities and equipment are analyzed to determine the root cause of the failure.
- 4.1.2 Work with the Integrity Management personnel to determine what actions should be taken to minimize the possibility of a recurrence.

4.2 Guidelines for analysis of failed or defective materials.

- 4.2.1 All failed or defective materials found or reported in AIC gas transmission, distribution systems or gas storage field facilities shall be fully analyzed and documented.
- 4.2.2 Gas Standards & Procedures is to be notified of a material failure or defect. An analysis will be initiated to determine the cause of the problem and to develop preventive or corrective measures.
- 4.2.3 The failed or defective material is often sent to a third party testing facility or to the manufacturer for testing and analysis.

By collecting and inspecting failed materials at a central location, the potential impact of the failures can be assessed, interim information communicated to operations, and system-wide decisions can be made concerning need to take preventive measures.

- 4.2.4 Gas Standards & Procedures will coordinate the analysis for the following situations:
1. Failure due to defective materials or components.
 2. Failure due to incorrect use of a component.
 3. Failure occurring during installation of a component.
 4. Failure occurring while the component is in service.
 5. Components suspected of being defective before use.
 6. Incorrect part or material supplied by the manufacturer.
- 4.2.5 In the following situations, it will not be necessary to perform a failure analysis:
1. Pipe that was damaged by a third party.
 2. Corroded pipe.
 3. Leaks due to loosely threaded fittings.
 4. Known material/component with an established corrective policy, such as DuPont Aldyl-A- and Plexco tapping tee caps, compression couplings, tees, valves, or the Mueller inner-lock meter valves.

5.0 Analysis of Failed or Defective Materials

- 5.1 If the failure warrants an analysis according to the guidelines outlined above, an e-mail with an attached completed Failed Gas Material Form (see [INVE 3](#)) shall be sent to Gas Standards & Procedures, ILGasStandards@ameren.com, as soon as possible.
- 5.2 Include a detailed description of the circumstances surrounding the failure on the completed form.
- 5.3 A Failed Gas Material Tag (see [INVE 3](#)) should be affixed to the failed material item and the item should be sent to the Gas Standards & Procedures, 10 Executive Drive, Collinsville, IL 62234 for analysis, if practical.
- 5.3.1 Material items that cannot be shipped should be retained at the local office. Arrangement will be made to pick-up the material.
- 5.3.2 The unique tag number should be included in the e-mail notification for reference.
- 5.4 After being notified of a failed or defective material item, Gas Standards & Procedures will:
- 5.4.1 Promptly notify the Gas Standards Committee and other areas of AIC about failure to ensure all Operating Centers are alert to the possibility that similar failures may occur.
- 5.4.2 Conduct a thorough investigation to determine the root cause of the problem. The investigation may include lab analysis and research with vendors, other gas utilities, and/or industry associations.
- 5.4.3 Notify Integrity Management about the failure and the subsequent results of the analysis.
- 5.4.4 Notify the Gas Standards Committee and Gas Superintendents about the results of the analysis and provide recommendations for actions to alleviate the problem on a system-wide basis.

5.4.5 Determine whether the material will be removed from the Ameren material catalog in EMPRV.

1. If a stock item is to be removed from the material catalog, Gas Standards shall determine an alternative material to replace the material removed.
2. Changes to the material catalog shall be communicated to the Gas Superintendents and appropriate field operating personnel.

End of Instructions.

Operator Qualification (OQ) Required?

LEAK MANAGEMENT

April 1, 2023

LEAK 1 Requirements

1.0 Purpose

This document describes requirements for Ameren Illinois (AIC) to ensure that all natural-gas leakage is investigated, classified, monitored, repaired, and reported in accordance with applicable federal / state regulations.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Leak Investigations - General](#)[5.0 Leak Detection and Classification](#)[6.0 Transmission Leak Surveys](#)[7.0 Distribution Leak Surveys](#)[8.0 Upgrading a Leak](#)[9.0 Foreign Gas](#)[10.0 Leak Surveillance, Repair, and Reevaluation](#)[11.0 Multiple Public Leak Calls](#)[12.0 Recheck of Repaired Leak](#)[13.0 Leak Response Time](#)[14.0 Records](#)

Appendices:

[Appendix A - Conversion Chart - Natural Gas Readings](#)[Appendix B - Leak Process Flow Charts](#)**3.0 Target Audience**

- Gas Field Personnel.
- Gas Supervisors.
- Gas Tech Services Personnel.
- Gas Tech Services Supervisors.

4.0 Leak Investigations - General

- 4.1 Transmission lines, gas mains, and services must be maintained to operate in a safe and reliable manner. Any leak that impairs system serviceability and reliability must be investigated and repaired in accordance with applicable procedures and methods contained in the O&M Plan. See [REPR 1](#).
- 4.2 AIC will respond to all leak or odor complaints in a timely / priority manner and complete a thorough investigation to ensure public safety.
- 4.3 If the initial investigation determines AIC is not the licensed gas distribution company for the area and does not have gas facilities in the vicinity, the gas personnel shall:

UNCONTROLLED IF PRINTED

- 4.3.1 Check for hazardous condition.
- 4.3.2 If hazardous condition exists, take appropriate action to protect the public and property, such as:
 - 1. Shutting off gas meter valve.
 - 2. Evacuating the structure.
 - 3. Notifying Police or Fire Department.
- 4.3.3 Notify Gas Dispatch that the leak is from a non-AIC facility.
- 4.3.4 Notify and update the Company or organization that provides the gas service of the situation.
 - 1. Gas Dispatcher may have contact information, or
 - 2. Contact local emergency agencies.

Unless a hazardous condition exists, gas personnel do not need to wait for the appropriate Company or organization to arrive.

- 4.3.5 Enter actions taken on the OAS order.
- 4.4 Qualified personnel must follow detailed procedures for investigation of indoor and outdoor gas leak complaints.
- 4.5 While performing a gas leak investigation at the customer premise, gas field personnel should use their nose to sniff test the gas to ensure odorant is readily detectable and document it. See **LEAK 2.3, Paragraphs 5.6.1** and **6.4.1** for documenting a sniff test.
- 4.6 An identified hazardous condition may require implementation of the AIC Emergency Plan.
- 4.7 Leak investigations must be properly documented and reported.
- 4.8 AIC will investigate / report any gas odor call, received through the Customer Service Center, where response time exceeds 60 minutes.

5.0 Leak Detection and Classification

- 5.1 Identified gas leaks must be evaluated and classified based on:
 - 5.1.1 Location,
 - 5.1.2 Hazard potential, and
 - 5.1.3 Measured volume of gas-in-air (reference sustained reading with Combustible Gas Indicator (CGI)).
- 5.2 Leak measuring requirements are as follows:
 - 5.2.1 **Below grade:** Use CGI test instrument (designed to register % gas-in-air), calibrated according to manufacturer instructions.
 - 5.2.2 **Above grade:** See [Appendix B](#) for Leak Process Flow Chart.
 - 5.2.3 **Water area:** Area covered or saturated by water, where bubbles are an indicator of a leak, should use the following procedure:
 - 1. Determine if the leak is blowing or bubbling.

2. If gas is blowing, classify leak Class 1 and handle appropriately.
3. If gas is bubbling, assume entire area underwater has a reading of 100% gas since CGI cannot obtain a gas reading underwater.
 - 3 a. Zero out the gas leak in a minimum of four directions and classify accordingly.
 - Leak migration must be checked by doing a thorough leak investigation following the procedures outlined in [LEAK 2.2, Section 7.0](#), Below-Grade Gas Facilities.
 - 3 b. If leak cannot be zeroed out in a minimum of four directions, leak shall be classified as Class 1 and handled appropriately.
- 5.3 Leaks shall be evaluated based on natural gas being sampled under stabilized conditions.
- 5.4 Classification shall only be made by qualified gas field personnel and/or qualified Gas Supervisor.
- 5.5 Leak classes establish repair priority and action criteria:
 - 5.5.1 **Class 1 leak:** Existing or probable hazard to property and general public, which requires continuous monitoring and immediate repair or action to eliminate hazardous condition.
 - 5.5.2 **Class 2 leak:** Not immediate hazard to property or general public but has potential of becoming a hazard; must be resurveyed *every 6 months* and *repaired within 1 calendar year* (no later than 15 months from leak report date).
 - 5.5.3 **Class 3 leak:** Non-hazardous and expected to remain non-hazardous; requires *reevaluation at next survey* (no later than 15 months from leak report date) to ensure leak remains non-hazardous.
- 5.6 Leak class determination and the required surveillance must be properly documented.

1. Gas leaks on customer facilities are not to be classified.
2. Gas leaks (above or below grade) on AIC facilities shall be classified and documented in ClickMobile.

- 5.7 If gas concentration is detectible on a CGI, but sustained reading is 2% LEL or less, this is not a reportable reading and considered no leak. However, if the reading is within 5 feet of a foundation wall, additional investigation measures may include:

See [Appendix A](#) for natural gas conversion chart.

- 5.7.1 Recheck the reading with a different CGI to verify 0% LEL reading, or
- 5.7.2 Physically dig up the service at the foundation wall and visually inspect for possible leak.
- 5.8 Any leak indication on a regulator station relief valve should be reported to Gas Tech Services as soon as possible.

- 5.9 Leaks identified on AIC facilities during routine work activities shall follow the same classification procedures outlined in this procedure.

6.0 Transmission Leak Surveys (49 CFR §192.706)

- 6.1 Transmission lines are required to be surveyed annually (not to exceed 15 months) using leak detection equipment. If located in Class 3 or Class 4 location, the required interval is as follows:
- 6.1.1 **Class 3 location:** Survey 2 times each calendar year (not to exceed 7-1/2 months).
- 6.1.2 **Class 4 location:** Survey 4 times each calendar year (not to exceed 4-1/2 months).

AIC does not have any transmission lines in Class 4 locations.

7.0 Distribution Leak Surveys (49 CFR §192.723)

- 7.1 Leak surveys are required using appropriate leak detection equipment as follows:
- 7.1.1 Cathodically protected gas facilities located *outside of Business Districts*: every 4 years (not to exceed 51 months).
- 7.1.2 Distribution mains and services located *within Business Districts*: once each calendar year (not to exceed 15 months).
- 7.1.3 Inside gas meters located *outside Business Districts*: once every 4 years (not to exceed 51 months).
- 7.1.4 Cathodically unprotected distribution lines at least once every 3 calendar years not to exceed 39 months.
- 7.2 Residential "yardlines" are customer-owned, primary underground gas lines where meter is located more than 3 feet from the outside wall of the served structure. Yard lines to be leak surveyed every 3 calendar years (not to exceed 39 months).

8.0 Upgrading a Leak

- 8.1 At the discretion of the qualified gas field personnel at the scene, a leak may be upgraded to Class 1 or Class 2.
- 8.2 Some of the factors which should be considered when upgrading a leak are:
- 8.2.1 Frozen ground.
- 8.2.2 Concrete or asphalted surface.
- 8.2.3 Heavily traveled areas.
- 8.2.4 Public buildings.
- 8.2.5 Conditions which may affect the migration of gas.

9.0 Foreign Gas

- 9.1 Combustible gases, other than those from AIC facilities, are not required to be classified. These might include:
- 9.1.1 Gasoline.

- 9.1.2 Sewer gas.
- 9.1.3 Swamp gas.
- 9.1.4 Methane from other decomposing material.
- 9.1.5 Natural gas from another supplier or utility.

9.2 An ethane identifier should be used to verify that the foreign gas is not natural gas. See [LEAK 3](#) for the reference material on ethane identifier.

10.0 Leak Surveillance, Repair, and Reevaluation (49 CFR §192.613)

- 10.1 Surveillance must be performed by qualified gas field personnel.
- 10.2 Surveillance information, including sketches, should be compared to previously performed surveillance to determine if there has been any significant change.
- 10.3 *Class 1*: Requires immediate repair or continuous action until the hazardous condition no longer exists.
 - 10.3.1 Venting may be employed to protect the public and property; however, the leak remains Class 1 leak until approved repairs are completed.
 - 10.3.2 Leak repairs on compression fittings must follow [REPR 2.1 - Section 5.0](#).
 - 10.3.3 Additional actions may be employed to eliminate the hazardous condition, with Director approval. The leak remains a Class 1 leak.
 - 1. After additional actions are completed, verify the hazardous condition no longer exists.
 - 2. Monitor daily until permanent repairs are made.
 - 3. Document approval and actions taken and attach documentation to the leak in Maximo.
- 10.4 *Class 2*:
 - 10.4.1 Surveillance shall be performed once *every 6 months* using CGI.
 - 1. If surveillance indicates no leak, additional surveillance shall be performed *within 6 months* to verify leak no longer exists.
 - 10.4.2 Repair: Class 2 leak shall be repaired *within 1 year* (not to exceed 15 months).
- 10.5 *Class 3*:
 - 10.5.1 Reevaluate during *next scheduled survey*, but within 15 months.
 - 10.5.2 Surveillance of below-grade leaks must be performed using a CGI and bar holes.
 - 10.5.3 Surveillance of above-grade leaks can be performed using leak detection fluid or leak detection instrument.
 - 10.5.4 If leak surveillance indicates no leak, an additional surveillance shall be performed *within 6 months* to verify the leak no longer exists.
 - 10.5.5 Repair: Class 3 leak does not have a required repair schedule providing surveillance continues to classify the leak as Class 3.

11.0 Multiple Public Leak Calls

11.1 When multiple leak calls (3 or more) are received from the public, Gas Supervisor will determine the actions needed to expedite repair and ensure that planned repairs are communicated to:

- 11.1.1 Customer,
- 11.1.2 Adjacent property owners, or
- 11.1.3 Individuals who reported the leak.

11.2 Gas Compliance will run a monthly Outage Analysis System (OAS) report of Multiple Public Leak Calls by address and distribute to the Gas Supervisor to help identify where 3 or more leak calls have been reported within the year.

12.0 Recheck of Repaired Leak

12.1 Below Grade

12.1.1 At the time of leak repair, gas field personnel shall probe soil around excavation (in direction of gas facility) and obtain CGI readings to determine if there is additional leakage potential.

12.1.2 Following the repair, a recheck shall be performed by qualified personnel using CGI to verify leak was successfully repaired.

12.1.3 Where residual gas is detected in the soil,

1. The presence of residual gas shall be documented on the ClickMobile Leak Repair Form.
2. If residual gas readings are detected within 5 feet from the foundation wall:
 - Daily readings shall be performed until there is a 0% LEL gas reading.
 - If daily readings show increased levels of gas, a check shall be made for gas migration inside the structure.

12.1.4 Leak recheck must be performed within 30 days following repair. If natural gas readings are detected, the leak recheck should be completed noting the readings and classifying the leak accordingly.

12.2 Above Grade

12.2.1 Following the repair of an aboveground leak, a final check must be made with leak detection fluid or gas detection instrument to verify no further leak.

12.2.2 No recheck is required.

13.0 Leak Response Time

13.1 Delayed Response Time

13.1.1 Illinois Commerce Commission (ICC) has identified an expected response time for a gas leak or odor complaint.

13.1.2 A response time exceeding *60 minutes* from the time of receipt of call for an indoor or outdoor leak is considered delayed and requires explanation.

13.2 Monitoring, Investigating, and Reporting

13.2.1 Gas Compliance will monitor response times, through OAS system, to ensure compliance with regulatory requirements.

13.2.2 Gas Supervisor will be requested to investigate a delayed response time.

13.2.3 Gas Supervisor will provide Gas Compliance an explanation for delay.

13.2.4 The Dispatch Supervisor will be notified when dispatch time exceeds 15 minutes, contributing to a delayed response time, and asked to investigate.

13.2.5 Dispatch Supervisor will provide Gas Compliance an explanation for delay in assigning investigation order.

13.2.6 Gas Compliance will compile explanations in a monthly report (titled, "Delayed Gas Leak Response Times") for internal use.

14.0 Records (49 CFR §192.603, §192.605, §192.709)

14.1 The edges of the leak should be established and documented in ClickMobile, by probing bar holes in the ground and verifying a clear indication in at least four directions (e.g., N, S, E, & W) in order to determine the limits of the leak.

14.2 Leak investigation, repair, monitor, and recheck information shall be recorded in Click-Mobile.

14.3 The record detail and associated sketches shall be recorded in ClickMobile and retained in Maximo.

14.4 Record Retention:

14.4.1 Leak classification and surveillance records shall be maintained for 6 years.

14.4.2 Leak repair information shall be maintained for life of the facility.

14.4.3 Gas Compliance will maintain the monthly explanation reports titled "Delayed Gas Leak Response Times" (retaining only as long as warranted).

End of Instructions.

LEAK 2.1 Indoor Investigations

1.0 Purpose

This document describes procedures for Ameren Illinois (AIC) to responsibly address investigation of all indoor reported leaks, doing such in a manner to ensure public and employee safety. Further, this covers proper documentation of the response and investigation.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Upon Arrival](#)[6.0 Approaching Structure](#)[7.0 Customer Home](#)[8.0 Customer Not Home or Structure Inaccessible](#)[9.0 Leak on Customer Facility](#)[10.0 Records](#)

Appendices:

[Appendix A - Sample Views of OAS 62, 63, 65, 6F, and 6H](#)**3.0 Target Audience**

- Gas Field Personnel.
- Gas Supervisors.
- Gas Tech Services Personnel.
- Gas Tech Services Supervisors.

4.0 General

- 4.1 AIC shall respond to all leak or odor complaints in a priority manner.
- 4.2 These procedures are organized to address common considerations for investigating indoor complaints.
- 4.3 Where hazardous conditions of 10% LEL (0.5% Gas-In-Air) or greater are found, the Emergency Plan may need to be implemented.

Unless otherwise specified, gas detection is using a Combustible Gas Indicator (CGI) with bar holes or other approved gas detection instrument.

5.0 Upon Arrival

- 5.1 Minimum equipment is CGI, with % LEL and % GAS capability, checked for daily operation. For calibration, see [LEAK 2.5, Section 6.0](#), Combustible Gas Indicator (CGI).

UNCONTROLLED IF PRINTED

FI is not to be used for inside leak investigation.

5.2 Purge and zero the detection instrument in a gas-free environment. Ensure the instrument is on % LEL scale.

5.3 Confirm location of reported complaint. Verify meter number if applicable.

6.0 Approaching Structure

6.1 Observe for indications of gas leakage:

6.1.1 Listen for sound of escaping gas and smell of natural gas odor.

6.1.2 Check the area for dead or dying grass, shrubs, or trees.

6.1.3 Look for signs of recent construction activity that could have damaged gas facilities.

6.2 Before touching gas meter, check the riser, meter set, and customer piping with a volt stick. If voltage stick alarms, refer to [METR 2.2, Section 7.2](#), AC Voltage on Meter Set.

Image of Volt Stick

6.3 Observe test hand on gas meter for rapid movement. If open fuel line is suspected, shut off meter valve.

6.4 Before entering, ensure that all personnel electronic devices, such as cell phones, are powered off and all intrinsically safe equipment, such as CGI and flashlight, are powered on.

The flashlight on the volt stick is not intrinsically safe and should be left off while inside.

6.5 Knock on door -- **Do Not ring the doorbell.**

7.0 Customer Home

7.1 Upon entering the structure:

7.1.1 Sample atmosphere at entrance to determine if immediate hazard exists, holding the intake as high as possible, with CGI set on the LEL scale.

7.1.2. Ask customer where they smell gas odor.

7.1.3 Advise customer not to operate any switches or use any electronic devices, such as cell phone, while the investigations is being conducted.

7.1.4 Continue to monitor the atmosphere while moving to the area where the odor is suspected.

- 7.1.5 Sample atmosphere in areas where customer believes they detected odor.
- 7.2 Monitor the CGI readings for immediate hazardous concentration.
 - 7.2.1 Indoor concentration of gas-in-air at entrance or ambient atmosphere throughout the structure of 10% LEL (0.5% Gas-In-Air) or greater is an immediate hazard and the structure should be evacuated, and [EMER 2.4.1](#) implemented.
 - 7.2.2 If carbon monoxide is detected at a reading of 100 PPM or greater, it is considered hazardous. Gas field personnel should evacuate the structure and not enter until ventilated.
 - 7.2.3 Gas field personnel should:
 - 1. Shut off the gas meter or, if available, customer valve downstream of meter.
 - 2. Call 9-1-1; the fire department may assist with the evacuation and ventilation.
 - 7.2.4 Issue a Warning Tag and advise customer to contact a qualified plumbing or heating professional to have the system checked.
- 7.3 Investigate for the source of leak using CGI, gas detection instrument (except not FI for inside, per **Note** above [under 5.1](#)), and/or leak detection fluid. Check the following:
 - 7.3.1 Structure openings - Inspect the following for migration of gas from an outside source:
 - 1. Gas service entrance.
 - 2. Beam pocket along walls.
 - 3. Water service and utility entrances.
 - 4. Floor drain, sewer entry, and sump pumps.
 - 5. Basement floor along walls and cracks in foundation.
 - 6. Any other points of entry into the structure
 - 7.3.2 Appliances
 - 1. Inspect for leakage.
 - 2. Ensure standing pilots are lit.
 - 3. Check appliances and connectors.
 - 4. If appliance is moved during investigation, recheck connections after appliance is moved back in-place.
 - 7.3.3 Exposed piping - Inspect piping connections and inside meter sets.
- 7.4 If gas is detected migrating into the structure from outside, perform an outdoor leak investigation. See [LEAK 2.2](#).
- 7.5 A shut-in test may not be necessary on all leak investigations. However, when there is inaccessible piping and/or appliances that cannot be readily checked with leak detection instrument or leak detection fluid, a minimum 5-minute shut in test should be performed. See [TURN 2.1](#).
- 7.6 Once the inside leak investigation is complete, check all above grade piping and meter set for leakage to ensure there is no leakage on AIC's above grade facilities.

8.0 Customer Not Home or Structure Inaccessible

- 8.1 Before touching the gas meter, check the riser, meter set, and customer piping with volt stick. If voltage stick alarms, refer to [METR 2.2, Section 7.2](#), AC Voltage on Meter Set.
- 8.2 Investigate the outside perimeter, using CGI, to include checking around:
 - 8.2.1 Windows,
 - 8.2.2 Doors,
 - 8.2.3 Crawl space vents, and
 - 8.2.4 Other openings.
- 8.3 Conduct a perimeter check around foundation and gutter downspout outlets, if tiled away from the foundation. Use a CGI with bar holes, Fi unit or gas detection instrument with ppm sensor capable of detecting 50 ppm.
- 8.4 Check along the gas service line.
- 8.5 If no gas is detected:
 - 8.5.1 Shut-off and "Red Pin" the outside meter valve.
 - 8.5.2 Leave door hanger advising customer their gas service has been disconnected due to a possible gas leak.
 - 8.5.3. Complete Outage Analysis System (OAS) 6H screen, "Red Pin", so Call Taker will see "Hazard Condition" on the account when customer calls. See [Appendix A](#) for sample OAS 6H.

"Red Pin" is a term used when meter valve is locked in closed position due to hazard condition on the customer's facilities. A barrel lock is used to lock the meter, and, in several locations, those barrel locks are painted red.

- 8.6 If gas is detected inside the structure, take the following actions:
 - 8.6.1 Shut-off gas at meter valve and Red Pin or disconnect the service line.
 - 8.6.2 Contact AIC Dispatcher and/or Gas Supervisor - request additional assistance and request they contact proper authorities, such as Fire Department, Police Department, electric and other affected utilities, for possible disconnect.
 - 8.6.3. Check adjacent structures, using CGI.
 - 8.6.4 Check available underground openings (such as sewers and valve boxes) and areas of recent excavation.
 - 8.6.5 Attempt to vent manholes, valve boxes, etc. if any gas is detected.
- 8.7 If forcible entry is required to perform an inside leak investigation, contact the Gas Supervisor. See [EMER 2.4.11](#), Emergency Plan: Gas Field Personnel Loss and Restoration of Service.
- 8.8 Leave door hanger advising customer their gas service has been disconnected due to possible gas leak.

9.0 Leak on Customer Facility

- 9.1 Indoor gas leak on customer facility:

- 9.1.1 Make simple repairs where possible.
- 9.1.2 If simple repair cannot be made, notify customer of gas leak and advise customer that they should have a qualified professional make the repair.
 - 1. Isolate gas leak upstream of leak by shutting off:
 - 1 a. Appliance control valve, or
 - 1 b. Customer owned valve, or
 - 1 c. Locking the meter valve closed.
 - 2. Complete the OAS 6H screen and issue Warning Tag. See [Appendix A](#) and [TURN 2.7](#).
- 9.2 If gas leak is not immediate hazard (i.e., soap-bubble test holds), an exception may be made with Gas Supervisor approval due to:
 - 9.2.1 Cold weather conditions, or
 - 9.2.2 Commercial/industrial process.
- 9.3 Notify customer of the gas leak and advise that they are responsible for repair with following options:
 - 9.3.1 Immediately call a qualified plumbing or heating professional to do repair and AIC will turn leak and Warning Tag over to them upon arrival. Where a commercial/industrial process is involved that has their own in-house maintenance personnel, AIC will turn the leak over to them if maintenance personnel are immediately on-site. Document that leak is turned over to a qualified person on OAS 63 screen (see [Appendix A](#) for sample), or
 - 9.3.2 Isolate the appliance or piping, complete the OAS 6H screen, and issue a Warning Tag. See [TURN 2.7](#).

10.0 Records

- 10.1 If a leak is discovered on AIC facilities, leak investigation shall be initiated within Click-Mobile.
- 10.2 If a previous leak still exists at the address/location, a leak surveillance shall be performed and documented within ClickMobile.
- 10.3 Complete Leak Investigation Form (see [LEAK 2.3](#)), or
- 10.4 If using electronic device, complete appropriate entries on OAS screens 62, 63, 6F, and 6H. See [Appendix A](#) for sample images of OAS screens.

End of Instructions.

LEAK MANAGEMENT

April 1, 2023

LEAK 2.2 Outdoor Investigations

1.0 Purpose

This document describes procedures for Ameren Illinois (AIC) to responsibly address investigation of all outdoor reported leaks, doing such in a manner to ensure public and employee safety. Further, this covers proper documentation of the response and investigation.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Upon Arrival](#)[6.0 Below-Grade Gas Facilities](#)[7.0 Above-Grade Gas Facilities](#)[8.0 Classifying Outdoor Leaks](#)[9.0 Hazardous Conditions](#)[10.0 Leaks on Customer-Owned Facilities](#)[11.0 Records](#)**3.0 Target Audience**

- Gas Field Personnel.
- Gas Supervisors.
- Gas Tech Services Personnel.
- Gas Tech Services Supervisors.

4.0 General

- 4.1 AIC shall respond to all leak or odor complaints in a priority manner.
- 4.2 This procedure is organized to address common considerations for outdoor investigations followed by specifics for outdoor complaints.
- 4.3 Where hazardous conditions of 30% LEL (1.5% Gas-In-Air) or greater are found, the Emergency Plan may need to be implemented.

Unless otherwise specified, gas detection is using a Combustible Gas Indicator (CGI) with bar holes, Flame Ionization Detector (FI), or other approved gas detection instrument.

5.0 Upon Arrival

- 5.1 Minimum equipment for investigation is:
 - 5.1.1 CGI, or
 - 5.1.2 FI Device, or

UNCONTROLLED IF PRINTED

- 5.1.3 Other gas detection instrument capable of detecting gas concentration of 50 ppm gas in air.
- 5.1.4 Bar Hole Probe or drive rod.

Instruments shall be calibrated and checked for daily operation in accordance with manufacturers' instructions.

- 5.2 Purge and zero instrument in a gas-free environment. Where applicable, ensure instrument is on % LEL scale. See [LEAK 2.5](#).
- 5.3 Confirm location of reported complaint. Verify meter number if applicable.
- 5.4 Attempt to contact customer who made report of odor for all available information.
- 5.5 Based on information received from customer or caller, assess area for immediate hazards and migration. Take necessary action to protect life and property.
- 5.6 Thoroughly inspect area for any of the following items, using sense of sight, smell, and hearing:
 - 5.6.1 Outdoor odors.
 - 5.6.2 Dead or dying vegetation.
 - 5.6.3 Unusual changes to the soil.
 - 5.6.4 Dry blowing dirt.
 - 5.6.5 Bubbling water.
 - 5.6.6 Sounds of escaping gas.
 - 5.6.7 Unusual swarm of insects.
 - 5.6.8 Recent construction activities.
 - 5.6.9 Extensive corrosion or physical damage of facilities.

6.0 Below-Grade Gas Facilities

- 6.1 Gas detection instrument or FI unit can be used to check for migration near a foundation and for initial identification of general location of possible leak. If ground is frozen, bar holes may be required. Investigation should include the following locations:
 - 6.1.1 Along the main.
 - 6.1.2 At service tee.
 - 6.1.3 Along service line.
 - 6.1.4 At meter set.
 - 6.1.5 Along building foundation.
 - 6.1.6 Along customer yard lines and fuel lines.
 - 6.1.7 Along foundations of adjacent buildings.
 - 6.1.8 Adjacent meter sets.
 - 6.1.9 Adjacent service lines.
 - 6.1.10 Along sewer lines.

UNCONTROLLED IF PRINTED

6.1.11 Around vaults and underground conduits.

6.2 If gas leak is detected, sampling of subsurface environment is required.

6.2.1 Sampling of subsurface environment must be done at sufficient intervals and locations to ensure safety of persons and property in surrounding area. It is critically important to confirm that gas has not migrated to a structure.

If gas is detected at the foundation of a structure, the structure shall be immediately checked for possible presence of gas.

6.2.2 Sampling requires checking bar holes with CGI having a bar hole probe.

6.2.3 If necessary, locate gas lines in vicinity of leak investigation.

6.2.4 Give specific attention to gas lines located in areas of recent construction activity or crossing buried foreign facilities.

6.2.5 Bar holes should be approximate equal depth.

6.2.6 Start bar hole spacing at 6 to 10 feet apart until the approximate limit of gas migration is defined. Then, reduce spacing to about 2 feet until highest concentration of gas is found. To pinpoint leak, reduce interval to approximately 1 foot.

6.3 Once leak location is determined, additional samples should be taken to determine perimeter of leak migration.

6.3.1 Adjust bar/test hole spacing to identify extent of migration in a minimum of 4 directions.

6.3.2 Record bar hole locations and % gas readings as used to determine leak classification on the leak sketch within ClickMobile. Use comments section to provide added particulars that support sketch.

6.4 If you suspect migration to a structure, obtain additional samples inside. For possible hazardous condition, see [Section 9.0](#).

6.5 Ground/surface conditions that do not allow for accurate pinpointing of gas leak may require:

6.5.1 Drilling of purge hole.

6.5.2 Utilizing air mover to ventilate purge holes, thus, to void holes of natural gas. See [PURG 3](#) for Vapor Extraction Unit (VEU) manufacturer's instructions.

6.5.3 Allowing sufficient time for gas vapors to build-up.

6.5.4 Checking gas concentration in purge holes with CGI to determine which have higher concentration.

6.6 If gas concentration is detected in a sewer line, the following steps should be taken:

6.6.1 Consider possible migration into premises. Check along sewer laterals, including available outside sewer clean-outs. If necessary, attempt access to customer premise to verify whether or not gas has migrated into premise.

6.6.2 Until an ethane identifier has been used to verify source as either foreign gas or natural gas, investigation shall assume source to be natural gas.

- 6.6.3 If reading is 30% LEL or greater, *initiate Emergency Plan* as described in [EMER 2.4.4](#), Emergency Plan: Gas Field Personnel Dispatched to Gas in a Sewer Hazardous Condition.
- 6.6.4 If reading less than 30% LEL, expand investigation by checking nearest sewer manhole and/or points of entry:
 - 1. Request additional assistance if needed.
 - 2. Consider contacting municipal sewer department for sewer layout and access location.
- 6.6.5 If there is a detectable reading greater than 2% LEL in manhole and/or point of entry, classify the leak appropriately.

7.0 Above-Grade Gas Facilities

- 7.1 All above-grade facilities should be checked for leaks, such as:
 - 7.1.1 Before touching gas meter, check the riser, meter set, and customer piping with volt stick. If voltage is present, contact Gas Supervisor to initiate investigation for source prior to any work. See [METR 2.2, Section 7.2](#), AC Voltage on Meter Set.
 - 7.1.2 Regulator station.
 - 7.1.3 Above-grade valve station.
 - 7.1.4 Odorizer.
 - 7.1.5 Any other above-grade AIC facilities.
 - 7.1.6 Customer owned natural gas facilities such as; standby generators, pool heaters, barbecue, etc.

8.0 Classifying Outdoor Leaks

- 8.1 Can only be classified once extent of leak is known.
- 8.2 All below-grade leaks are to be classified in accordance with [LEAK 1, Section 5.0](#), Leak Detection and Classification.

9.0 Hazardous Conditions

- 9.1 First priority is to determine whether there is a hazardous condition. The following would be considered hazardous and may require implementation of [EMER 2.4.2](#), Emergency Plan: Gas Field Personnel Dispatched to Outdoor Odor or Leak.
 - 9.1.1 A reading in air at 30% LEL (1.5% gas-in-air) or greater in:
 - 1. Open environment where gas could enter a structure or ignition source located in close proximity.
 - 2. A sanitary sewer.
 - 9.1.2 Blowing gas.
 - 9.1.3 Suspected damaged gas facility.
 - 9.1.4 Gas along a foundation or gas migrating into a structure.

A pad constructed with concrete or other structural material used to support such things as: sign, stand-by generator, antenna, tower, grain bin, or any structure not meant for a person to enter

UNCONTROLLED IF PRINTED

should not be considered a foundation when classifying a gas leak.

Exception: Pad located adjacent to foundation of a structure where a person can enter, and underground sampling cannot be performed between pad and foundation to verify gas is not migrating under or into the structure.

9.1.5 Gas along a foundation where there is no access to the structure.

9.1.6 Any leak, which in the judgement of qualified personnel at scene, is regarded as potentially hazardous.

9.2 Gas field personnel shall remain at site of hazardous leak until leak is repaired.

9.3 If necessary, request additional resources to establish and maintain a safety zone to prevent unauthorized personnel from entering until repairs are made or the situation made safe.

9.4 If there is indication of gas migrating into a structure where gas field personnel cannot gain access, see [LEAK 2.1, Section 8.0](#), Customer Not Home or Structure Inaccessible.

10.0 Leaks on Customer-Owned Facilities

10.1 If a gas leak is discovered on a customer-owned, buried fuel line or an aboveground, outdoor fuel line that is a potential hazard:

10.1.1 Make simple repairs where possible.

10.1.2 If simple repairs cannot be made, notify customer of gas leak and advise customer that they should have a qualified professional make the repair (see [10.2 below](#)).

1. If leak is on customer fuel line that extends into the structure:

I. Shutting off customer owned valve, or

II. Isolate the gas leak at meter valve and "Red Pin" the meter valve closed.

"Red Pin" is a term used when meter valve is locked in closed position due to hazard condition on the customer's facilities. A barrel lock is used to lock the meter and, in several locations, those barrel locks are painted red.

1 b. Complete the OAS 6H screen and issue a Warning Tag, See [TURN 2.7](#).

2. If leak is on customer fuel line or facility that is separate from structure:

2 a. Isolate gas leak at one of the following:

- Customer valve.
- Meter valve.

2 b. If isolated at the meter valve, lock/"Red Pin" the meter valve closed.

- 2 c. Complete the OAS 6H screen and issue Warning Tag, See [TURN 2.7](#).
3. If gas leak is not immediate hazard, an exception may be made with Gas Supervisor approval due to:
 - 3 a Cold weather conditions, or
 - 3 b. Commercial/industrial process.

10.2 Notify customer of the gas leak and advise that they are responsible for repair with following options:

10.2.1 Immediately call a qualified plumbing or heating professional to do repair and AIC will turn leak and Warning Tag over to them upon arrival. Where a commercial / industrial process is involved that has their own in-house maintenance personnel, AIC will turn the leak over to them if maintenance personnel are immediately on-site. Document turning over the leak to a qualified person on OAS 63 screen (see LEAK 2 for image), or

10.2.2 Isolate customer piping, complete the OAS 6H screen (see [LEAK 2.1](#) for image), and issue a Warning Tag. See [TURN 2.7](#).

11.0 Records

- 11.1 If a leak is discovered on AIC facilities, leak investigation shall be initiated within Click-Mobile.
- 11.2 If a previous leak still exists at the address / location, a leak surveillance shall be performed and documented within ClickMobile.
- 11.3 Complete Leak Investigation Form (see [LEAK 2.3](#)) for all leaks on AIC facilities, or
- 11.4 If using MDT, make appropriate entries on OAS Screens 62, 63, 65, 6F, and 6H. See [LEAK 2.1 Appendix A](#) for sample OAS Screens.

October 1, 2022

LEAK 2.3 Leak Investigation Form

1.0 Purpose

This describes the documentation for Ameren Illinois (AIC) addressing the response and investigation of all odor complaints and leaks in accordance with applicable federal / state requirements. It is typically documented in the OAS system or on the ClickMobile Leak Investigation Form or paper Gas Leak Investigation Form.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General Information \(Top Block of Form\)](#)[5.0 Indoor Leak Investigation Record](#)[6.0 Outdoor Leak Investigation Record](#)[7.0 Back-Page Information](#)[8.0 Records Retention](#)[9.0 Gas Leak Investigation Form](#)

Appendices:

[Appendix A - Gas Leak Investigation Form](#)[Appendix B: ClickMobile Leak Investigation Form](#)**3.0 Target Audience**

- Gas Field Personnel.
- Gas Tech Services Personnel.
- Gas Supervisors.
- Gas Tech Services Supervisors.

4.0 General Information (Top Block of Form)**4.1 Gas Leak Investigation Form: Form A-2551, Stock Code 37-21-992**

For field personnel without access to electronic device, this general information on leak call is recorded on the top portion of form (see [Appendix A](#)). Guidance for entering items is as follows:

- 4.1.1 OAS No. - Obtain from Dispatcher.
- 4.1.2 Date - Record actual date of leak complaint.
- 4.1.3 Call Receive Time - Obtain from Dispatcher.
- 4.1.4 Dispatch Time - Reference assignment by Dispatcher.
- 4.1.5 Arrive Time - Enter arrival time at reported leak location.
- 4.1.6 Complete Time - Enter time of completing investigation.
- 4.1.7 Reason for Call - Obtain from Dispatcher.

UNCONTROLLED IF PRINTED

- 4.1.8 Customer Name - Obtain from Dispatcher.
- 4.1.9 Customer Address - Obtain from Dispatcher.
- 4.1.10 Meter Number - Obtain from Dispatcher and confirm at premise.
- 4.1.11 Account Number - Obtain customer number from Dispatcher.

4.2 Electronic Device User: OAS 62 and 06F Screen

For field personnel who utilize electronic device, the "Top Block General Information" on the 62 and 06F screens (see [LEAK 2.1, Appendix A](#) for images) is automatically populated from AIC Customer Service System (CSS), with exception of the following:

- 4.2.1 Dispatch Time - Dispatcher enters when qualified person accepts order.
- 4.2.2 Arrival Time - Enter arrival time at reported leak location.
- 4.2.3 Complete Time - Enter time of completing investigation.

5.0 Indoor Leak Investigation Record

If any of the following tasks are not applicable, place "N/A" on appropriate line of Gas Leak Investigation Form (see [Appendix A](#)) or type "N/A" on the OAS 06F screen. Indicate completed tasks by entering (√) on appropriate Form line or "C" on OAS 06F screen.

5.1 Initial CGI Reading at Entrance of Building

- 5.1.1 Upon entering building, take initial CGI reading just inside entrance.
- 5.1.2 Record initial reading from LEL scale.

5.2 Check All Appliances

- 5.2.1 Ensure pilots are lit.
- 5.2.2 Check for leakage, including all connectors.
- 5.2.3 If a leak is found, record findings:
 - 1. On back of form under "Leaks Found and Action Taken," or
 - 2. On OAS 63 screen

5.3 Check Exposed Piping

- 5.3.1 Check all exposed piping connections with soap solution or electronic gas detection instrument.
- 5.3.2 If a leak is found, record findings:
 - 1. On back of form under "Leaks Found and Action Taken," or
 - 2. On OAS 63 screen.

5.4 Check Building Openings - Using an CGI and/or electronic gas detection instrument

- 5.4.1 Check for gas concentration at gas service entrance.
- 5.4.2 Check box sill along foundation wall.

UNCONTROLLED IF PRINTED

- 5.4.3 Check water service and other utility entrances.
- 5.4.4 Check floor drain and sewer entry or sump pump.
- 5.4.5 Check basement floor along walls and any cracks in foundation.
- 5.4.6 If a leak is found, record findings:
 - 1. On back of form under "Leaks Found and Action Taken," or
 - 2. On OAS 63 screen.

5.5 Check Meter Set - Indoor or outside

- 5.5.1 Turn off all appliance valves.
- 5.5.2 Conduct low flow meter test to ensure low flow rate registers. See [TURN 2.1](#).
- 5.5.3 Conduct 5-minute shut-in test.
- 5.5.4 Soap all pipe connections on meter set.
- 5.5.5 If a leak is found, record findings:
 - 1. On back of form under "Leaks Found and Action Taken," or
 - 2. On OAS 63 screen.

5.6 Odorant Readily Detected

- 5.6.1 Conduct sniff test at convenient location to determine if odorant is readily detected. Mark N/A if unable to perform a sniff test.
- 5.6.2 Record "Y" (Yes) or "N" (No) after completing task.
- 5.6.3 If "N" is recorded:
 - 1. Report situation to Gas Supervisor immediately.
 - 2. Record findings on back of form under "Leaks Found and Action Taken," or
 - 3. Enter on OAS 63 screen.

6.0 Outdoor Leak Investigation Record

If any of the following tasks are not applicable, place "N/A" on appropriate line of Gas Leak Investigation Form (see [Appendix A](#)) or type "N/A" on the OAS 06F screen. Indicate completed tasks by entering (√) on appropriate Form line or "C" on OAS 06F screen.

6.1 Check Outside Area

- 6.1.1 Check area for natural gas or like odors.
- 6.1.2 Leaks above ground facilities.
- 6.1.3 Dead or dying vegetation.
- 6.1.4 Unusual soil changes.
- 6.1.5 Dry blowing dirt.

UNCONTROLLED IF PRINTED

6.1.6 Bubbling water.

6.1.7 Unusual swarm of insects.

6.1.8 Extensive corrosion, or damage to facilities.

6.1.9 Recent construction or excavation activity, fence installation, settling or subsidence.

6.1.10 If indication of gas is detected from any of above observations:

1. Soap the above ground facilities.
2. Sample subsurface environment with CGI to verify presence of gas.

6.1.11 If a leak is found, record findings:

1. On back of form under "Leaks Found and Action Taken," or
2. On OAS 63 screen.
3. If leak is on AIC facility, document leak and surveillance information in Click-Mobile.

6.2 Perform Sampling (with approved leak detection instrument)

6.2.1 Perform gas sampling.

1. Along the main.
2. At service tee.
3. Along service line.
4. At meter set.
5. Along building foundation.
6. Along customer yard lines and fuel lines.
7. Along foundations of adjacent buildings.
8. Adjacent meter sets.
9. Adjacent service lines.
10. Along sewer lines.
11. Around vaults and underground conduits.

6.2.2 If a leak is detected:

1. Quantify the concentrations using CGI and bar holes.
2. Record findings on back of form under "Leaks Found and Action Taken," or
3. Enter findings on OAS 63 screen.
4. If leak is on AIC facility, document leak and surveillance information in Click-Mobile.

6.3 Bar Test Meter Riser

6.3.1 Bar test riser using probe rod and CGI, or

6.3.2 Leak survey service with FI or gas detection instrument.

6.3.3 If a leak is found, record findings:

UNCONTROLLED IF PRINTED

1. On back of form under "Leaks Found and Action Taken," or
2. On OAS 63 screen.
3. If leak is on AIC facility, document leak and surveillance information in Click-Mobile.

6.4 Odorant Readily Detected - At a convenient location

- 6.4.1 Conduct sniff test to determine if odorant is readily detected.
- 6.4.2 Record "Y" for Yes or "N" for No after completing task.
- 6.4.3 If "N" is recorded:
 1. Report situation to Gas Supervisor immediately.
 2. Record findings on back of form under "Leaks Found and Action Taken," or
 3. On OAS 63 screen.

7.0 Back-Page Information

7.1 Leaks Found and Action Taken

- 7.1.1 Detail the leak(s) that was discovered.
- 7.1.2 Describe action taken.
- 7.1.3 When using OAS, record leaks found and actions taken on OAS 63 screen.

7.2 Carbon Monoxide (CO) Found and Action Taken

- 7.2.1 Detail the readings, symptoms, or signs that indicated the presence of CO.
- 7.2.2 Describe action taken.
- 7.2.3 When using OAS, record carbon monoxide found and action taken on OAS 63 screen.

7.3 Follow-up Action

- 7.3.1 List any needed actions to complete the investigation, repairs, or restoration.
- 7.3.2 When using OAS, record follow-up actions on OAS 63 screen and immediately report to Gas Supervisor.
- 7.3.3 When using OAS, show follow-up action that requires gas construction crew:
 1. AP the OAS order that automatically creates DOJM Work Request.
 2. Notify Gas Supervisor.
 3. Leak repair order will be available for completion by crew in ClickMobile.

7.4 Investigation Completed By:

- 7.4.1 Gas field personnel completing investigation shall sign form.
- 7.4.2 When using OAS, gas field personnel completing investigation to be identified on OAS 62 screen.

7.5 CGI/FI Serial Number

- 7.5.1 Record serial number of CGI/gas detection instrument/FI unit used during investigation.
- 7.5.2 When using OAS, document information on OAS 06F screen.

UNCONTROLLED IF PRINTED

7.6 Approval

7.6.1 Gas Supervisor shall review/approve (sign and date) investigation.

7.6.2 When using OAS, Gas Supervisor approves by entering initials on OAS 63 screen and AIC employee number on OAS 06F screen.

8.0 Records Retention

8.1 Records pertaining to leak investigations, classification, and surveillance shall be maintained for 6 years. That includes:

8.1.1 Gas Leak Investigation Form.

8.1.2 OAS documentation.

8.1.3 ClickMobile/Maximo leak investigation/surveillance work orders.

9.0 Gas Leak Investigation Form

9.1 See [Appendix A](#).

End of Instructions.

Operator Qualification (OQ) Required?

LEAK 2.3 Leak Management – Leak Investigation Form, October 1, 2021

Revision Notes

Location of Changes	Summary of Changes
1.0 Purpose	Added; ClickMobile Leak Investigation Form
2.0 Scope – Appendices	Added: Appendix B: ClickMobile Leak Investigation Form
Appendix B:	ClickMobile Leak Investigation Form

Appendix A: Gas Leak Investigation Form

[\(View/download PDF version.\)](#)

GAS LEAK INVESTIGATION FORM

OAS No. _____ Date: _____ Call Receive Time: _____ Arrive Time: _____
 GCS No. _____ Dispatch Time: _____ Complete Time: _____
 Reason For Call: _____

Customer Name: _____
Customer Address: _____
Meter No. _____ **Account No.** _____

Indoor Investigation

An indoor leak investigation shall be performed using the LEL scale of a CGI. Once it is determined that there is not an immediate hazard, electronic leak detection instruments can be used to pinpoint a leak.

If the initial CGI reading at the entrance to the building or throughout the building is equal to or greater than 10% LEL, there is an immediate hazard. The building should be evacuated and the Emergency Plan implemented.

If Building is not Accessible:

- Shut off and lock the meter valve _____
- Report no access to the Dispatcher or Gas Supervisor _____

(Items 2-6: Check (√) when completed or write N/A if not applicable to the investigation)

1. **Initial CGI Reading at Entrance of Building**
 - Record initial reading from LEL scale _____ %
2. **Check All Appliances (√)**
 - Inspect for leakage _____
 - Make sure pilots are lit _____
 - Appliance connectors _____
3. **Check Exposed Piping (√)**
 - Piping connections with soap or leak detection instrument _____
4. **Check Building Openings (√)**
(Use leak detection instruments or CGI)
 - Gas service entrance _____
 - Box sill along foundation wall _____
 - Water service and utility entrance _____
 - Floor drain, sewer entry, sump pumps _____
 - Basement floor along walls _____
 - Cracks in foundation _____
5. **Check Meter Set (√)**
 - Turn off all appliance valves _____
 - Conduct low flow meter test _____
 - Soap test all meter connections _____
 - Conduct a five minute, shut-in test _____
6. **Odorant Readily Detected**
 - Record Yes (Y) or No (N) _____

Outdoor Investigation

An outdoor leak investigation shall be performed using a CGI or FI unit. If an initial CGI reading in a sanitary sewer is greater than 30% LEL (1.5% Gas-In-Air) or a reading in the air of 30% LEL (1.5% Gas-In-Air) or greater, there is an immediate hazard and the Emergency Plan should be implemented. If gas is discovered along a foundation, an indoor leak investigation shall be performed to determine if gas is migrating into the building.

*All leaks on Company facilities must be classified according to the **Leak Classification and Surveillance** section of the O&M Plan. If a leak is discovered underground on Company facilities, a GCS Leak Case Field Report shall be completed and recorded in the system. If a leak is discovered above ground on Company facilities and **not** immediately repaired, a GCS Leak Case Field Report shall be completed and recorded in the system. Any above ground leaks on Company facilities that are immediately repaired are only required to be documented on the Gas Leak Investigation Form.*

(Items 1-3: Check (√) when complete or write N/A if not applicable to the investigation)

1. **Check Outside Area (√)**
 - Natural gas or like odors; Leaks on above ground facilities; Dead or dying vegetation; Unusual soil changes; Dry blowing dirt; Bubbling water; Unusual swarm of insects; Extensive corrosion of facilities; Damage to facilities _____
2. **Perform Subsurface Sampling (√)**
 - Along the main _____
 - At the service tee _____
 - Along the service line _____
 - At the meter set _____
 - Along the building foundation _____
 - Customer yard lines and fuel lines _____
 - Adjacent building foundations _____
 - Adjacent meter sets _____
 - Adjacent service lines _____
 - Sewers _____
 - Vaults and underground conduits _____
3. **Odorant Readily Detected**
 - Record Yes (Y) or No (N) _____

Carbon Monoxide Found and Action Taken:

Follow-up Action:

Investigation Completed By: _____ CGI/FI Serial Number: _____

Approved By: _____ Date: _____

This completed form shall be kept on file for six (6) years.

Appendix B: ClickMobile Leak Investigation Form

Leak Investigation ClickMobile Form – Effective October 2020

Leak Location:

Blowing Gas?

Any indication of natural gas entering structure?

Any natural gas reading within 5' of foundation wall?

Natural gas reading 30% LEL (1.5% gas in air) or greater in a sanitary sewer or tunnel?

Natural gas reading less than 30% LEL (1.5% gas in air) in a sanitary sewer or tunnel?

Any natural gas reading within 15' of foundation wall?

Any natural gas reading under pavement extending to foundation wall?

Any natural gas reading in a storm sewer, water meter box, utility pedestal, pit/vault or vent pipe?

Natural gas reading 80% LEL (4% gas in air) or greater in a valve box?

Natural gas reading of less than 80% LEL (4% gas in air) in a valve box?

Leak is Class 3?

Upgrade leak due to frozen ground, concrete or asphalted Surface, heavily traveled area, public building, or condition which may affect the migration of gas?

LEAK MANAGEMENT

October 1, 2022

LEAK 2.4 Leak Surveys

1.0 Purpose

This describes procedure to be used by Ameren Illinois (AIC) gas field personnel and contracted companies to obtain consistent and quality leak surveys on all AIC facilities. It details the equipment, techniques, documentation requirements, weather considerations, and added survey checks for conducting leak surveys on transmission lines, mains, service lines, meter sets, and in business districts. All gas facilities are classified as either "Transmission" or "Distribution" and shall be leak surveyed using the type of surveys addressed.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Transmission Lines](#)[5.0 High-Pressure Distribution Mains and Services](#)[6.0 Business Districts](#)[7.0 Yardlines](#)[8.0 Inside Meter Set](#)[9.0 Uprotected Steel Lines](#)[10.0 Common Survey Actions and Considerations](#)[11.0 Inaccessible Gas Facilities](#)

3.0 Target Audience

- Gas Field Personnel.
- Gas Supervisors.
- Leak Surveyor
- Gas Tech Services Personnel.
- Gas Tech Services Supervisors.

4.0 Transmission Lines (49 CFR §192.706)

4.1 Definition of *Transmission Line*:

- 4.1.1 Transports gas from gathering lines or storage facility to a gas distribution center, storage facility, or large volume customer that is not downstream from a gas distribution center.
- 4.1.2 Gas pipeline operating at or above 20% SMYS.
- 4.1.3 Transports gas within a storage field.
- 4.1.4 Other pipelines as may be designated as transmission by AIC-Pipeline Integrity Group.

4.2 Frequency of leak surveys is based on Class Location; applies to both odorized and non-odorized lines.

- 4.2.1 Class 1 and 2 -- survey *once each calendar year* (not to exceed 15 months).

UNCONTROLLED IF PRINTED

4.2.2 Class 3 -- survey *2 times each calendar year* (not to exceed 7-1/2 months).

4.2.3 Class 4 -- survey *4 times each calendar year* (not to exceed 4-1/2 months).

1. AIC-Pipeline Integrity Group determines / designates Class locations.
2. AIC does not have facilities in Class 4 locations.

4.3 Farm taps and service lines extending off transmission lines *are not classified Transmission* but should be leak surveyed once annually along with associated transmission pipeline surveys.

4.4 See [Section 10.0](#) for Common Survey Actions and Considerations.

5.0 High-Pressure Distribution Mains and Services (49 CFR §192.723)

5.1 Definition of *Distribution Line*:

5.1.1 Pipeline other than gathering or transmission line.

5.1.2 Gas pipeline/main that operates at less than 20% SMYS.

High-pressure distribution main and services, MAOP greater than 60 psig but less than 20% SMYS, are covered under Distribution Leak Surveys.

5.2 Frequency and extent of leak surveys are:

5.2.1 Steel lines are categorized as being under cathodic protection or no protection.

1. Survey cathodically protected steel mains and services *once every 4 calendar years* (not to exceed 51 months).

Atmospheric corrosion monitoring survey, as required under §192.481 and [CORR 1 Paragraph 15.3.2](#), is included in the distribution mains and services leak surveys.

2. Survey unprotected steel mains and services *once every 3 calendar years* (not to exceed 39 months).

5.2.2 Survey plastic mains and services *once every 4 calendar years* (not to exceed 51 months).

5.3 See [Section 10.0](#) for Common Survey Actions and Considerations.

6.0 Business Districts (49 CFR §192.723)

6.1 Definition of *Business District*:

6.1.1 Represents the primary business area in a community.

- 6.1.2 Area where majority of buildings on either side of street are utilized for commercial, industrial, financial, religious, educational, health, or recreational purposes.
- 6.1.3 Area where gas mains and services are under continuous pavement extending either from the road centerline to building walls or from main to building wall.

These areas have potential for any leaking gas to migrate under pavement to the building wall - creating a hazardous condition.

6.2 Other areas for consideration by the Gas Supervisor:

6.2.1 Examples:

- 1. Schools.
- 2. Churches.
- 3. Areas of commercial development, such as strip malls and shopping centers.
- 4. Nursing homes and healthcare facilities.
- 5. Civic Centers or community buildings.

6.2.2 These areas should be included in a Business District Survey if there is continuous pavement over AIC gas facilities from main to the building wall.

6.2.3 Region Engineering and gas supervision should review Business District areas *periodically, not to exceed 5 years* (commenced in 2015).

6.3 Frequency of leak surveys: *once each calendar year* (not to exceed 15 months).

6.4 Meter and related piping:

6.4.1 Inside meters are to be included in survey.

FI unit is not to be used for surveying inside meter sets.

6.4.2. Inside meter surveys shall include a leak survey of outside service line and inside gas facilities.

6.4.3 A visual inspection should be performed of meter set and piping condition (to the building wall).

6.4.4 Gas detection equipment and/or leak detection fluid shall be used to check meter set and primary fuel line piping from building wall to gas meter for leakage.

6.5 Inside service regulators shall have their regulator vent and relief vent piped and terminated outdoors. The relief vent shall terminate such that gas can escape freely to the atmosphere and away from ignition sources or openings into the structure.

6.6 See [Section 10.0](#) for common survey actions and considerations.

7.0 Yardlines

7.1 Definition of *Yardline* and related leak survey:

- 7.1.1 A yardline is a residential customer's underground primary fuel line where the gas meter is more than 3 feet from the outside wall of the residential structure being served.
- 7.1.2 If multiple structures are served from 1 gas meter, structure means the first building nearest to service line connection.
- 7.1.3 If gas meter is more than 3 feet from mobile home or trailer, customer's buried fuel line is from meter outlet to trailer skirting (or perimeter of trailer if no skirting).
- 7.1.4 Yardline leak survey begins at outlet of meter and ends at outside wall of structure being served.
- 7.2 Gas Supervisor will maintain lists of all residential yardlines in Maximo.
- 7.3 Should the customer's yardline location be unknown, the FI survey must be performed along entire side of premise/trailer where the yardline is likely located.
- 7.4 AIC is responsible for primary yardline. Secondary lines, such as gas line to gas grill, gas yard lights, or additional structures, are customer's responsibility.
- 7.5 Conduct yardline surveys *once every 3 calendar years* (not to exceed 39 months).
- 7.6 Leaks found on yardlines must be made safe.
 - 7.6.1 A contract surveyor will call the AIC emergency phone number (1.800.755.5000) to report leak. AIC gas field personnel will contact the Gas Supervisor or AIC designee.
 - 7.6.2 An OAS EMGL will be created, and a qualified gas field person dispatched to respond to the leak.
 - 7.6.3 Leak surveyor will remain at site until first responder arrives.
- 7.7 Repair of gas leak found on yardline:
 - 7.7.1 Consider replacing existing yardline/service line and/or relocate gas meter to within 3 feet of structure, thereby eliminating yardline.
 - 7.7.2 If service line is not replaced and/or relocated, follow the same procedures as stipulated in [LEAK 2.2, Section 10](#), Leaks on Customer-Owned Facilities.
- 7.8 If unqualified piping is found on a yardline, meter valve shall be closed and locked. A Hazardous Warning Tag shall be issued to the customer indicating that an immediate hazard exists and notified that:
 - 7.8.1 They are responsible for making repairs.
 - 7.8.2 Service will not be restored until unqualified pipe is replaced with qualified piping for natural gas service.
 - 7.8.3 Consideration should be given to replacing existing service line and/or relocating gas meter to within 3 feet of the structure, thereby eliminating yardline.

Unqualified pipe is pipe that is not approved or classified for underground natural gas use, i.e. PVC water/sewer pipe, rubber hoses.

8.0 Inside Meter Sets

8.1 Definition of *Inside meter sets*:

8.1.1 Those meters located outside of Business Districts that are installed inside buildings, structures, or dwellings.

8.2 Effort should be made to schedule moving these meters outside.

8.3 Inside meter surveys are either maintained and surveyed under a separate Leak Survey ID or included in leak surveys for respective Distribution and High-Pressure Distribution Mains and Services.

8.4 Inside meter surveys shall include a leak survey of outside service line and inside gas facilities.

FI unit is not to be used for surveying inside meter sets.

8.5 In addition to performing leak survey on inside meters, a visual inspection should be performed of meter set and piping condition (to the building wall).

8.6 Frequency of inside meter leak surveys is:

8.6.1 Survey cathodically protected steel systems or plastic piping *once every 4 calendar years* (not to exceed 51 months).

8.6.2 Survey unprotected steel systems *once every 3 calendar years* (not to exceed 39 months).

9.0 Unprotected Steel Lines

9.1 Perform survey in same manner as Distribution Mains and Services Survey in [Section 5.0](#) with exception of frequency.

9.2 Frequency of surveying unprotected steel pipelines and services is once every 3 calendar years (not to exceed 39 months).

10.0 Common Survey Actions and Considerations (where applicable)

10.1 Include leak survey of service line to outlet of gas meter.

10.2 If gas meter has underground fuel line more than 3 feet from the residential structure, record the location for Gas Supervisor to check appropriate yardline survey listing.

10.2.1 If needed, Gas Supervisor will add the location to appropriate yardline survey.

10.3 Gas detection equipment and/or leak detection fluid shall be used to check meter set from building wall to meter.

10.4 Meter, regulator, and piping must be inspected for evidence of tampering, vandalism, or damage.

10.5 Meter set and piping should also be inspected for:

10.5.1 Possibility of AC voltage by checking with "volt stick" prior to physically touching meter set. See [METR 2.2 Section 7.0](#) Meter Header Inspection

10.5.2 Undue piping strain.

10.5.3 Atmospheric corrosion.

- 10.5.4 Foreign grounding from telephone or cable TV.
- 10.5.5 Relief valve vented to the outside atmosphere away from openings into structure and where vented gas will not accumulate.
- 10.5.6 Bug screen present in vents for relief valve, farm tap regulator, and service regulator.
- 10.5.7 Corroded bolts on banded regulators (Rockwell 8012, Lancaster Model 61, Universal Model 61). See [METR 2.2, Appendix B](#) for pictures.
- 10.5.8 Check for substandard regulators and regulators containing mercury. Notify Gas Supervisor if any are encountered. See [METR 2.2, Appendix B](#) for pictures.
 - 1. Substandard Regulators: Fisher 733-C2, Fisher 738.
 - 2. Mercury Regulators: Fisher 102-4, Reynolds Model 20.
- 10.5.9 Any regulator or relief valve found inside a building or garage that is not vented to outside shall be reported to Gas Supervisor for follow-up investigation and action.
- 10.6 If any above deficiencies are noted, repair immediately or report within ClickMobile for follow-up action.

11.0 Inaccessible Gas Facilities

- 11.1 During any leak survey, there may be facilities identified as inaccessible:
 - 11.1.1 Because of restricted access due to locked fence.
 - 11.1.2 Hazards due to aggressive dogs.
 - 11.1.3 Where customer has not been responsive to multiple contacts by AIC to survey the facilities.
- 11.2 These inaccessible facilities must be surveyed, isolated, or physically disconnected from gas supply by the required survey compliance date.

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0301: Manually Opening and Closing Valves

LEAK 2.4 Leak Management – Leak Surveys, December 15, 2021

Revision Notes

Location of Changes	Summary of Changes
Subsection 6.5 – Inside regulators	Revised to comply with the Code 192.355; Inside service regulators shall have their regulator vent and relief vent piped and terminated outdoors. The relief vent shall terminate such that gas can escape freely to the atmosphere and away from ignition sources or openings into the structure.

LEAK MANAGEMENT

April 1, 2023

LEAK 2.5 Leak Detection Equipment

1.0 Purpose

This document describes equipment / instruments that can be used by Ameren Illinois (AIC) personnel (and contracted companies) in performing **leak investigations and** leak surveys. Gas detection instruments are key requirement for safe and accurate investigation of gas leak calls and for required leak surveys.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 General](#)****[5.0 Portable Flame Ionization Instrument](#)****[6.0 Combustible Gas Indicator \(CGI\)](#)****[7.0 Gas Detection Instrument](#)****[8.0 Mobile Flame Ionization Unit \(FI\)](#)****[9.0 Remote Methane Detector \(RMD\)](#)****[10.0 Laser Spectroscopy - Advance Mobile Leak Detection \(AMLD\)](#)****[11.0 Records](#)****3.0 Target Audience**

- Gas Field Personnel.
- Gas Supervisors.
- Leak Surveyor
- Gas Tech Services Personnel.
- Gas Tech Services Supervisors.

4.0 General

- 4.1 All gas detection instruments must be checked and calibrated in accordance with procedures in the instrument operating manual to ensure dependable and accurate operation.
- 4.2 This procedure typically addresses requirement for monthly calibration of gas detection instruments plus daily operational checks.
- 4.3 Manufacturers' manuals for instruments being used at AIC are in **[LEAK 3](#)**.
- 4.4 As new leak equipment is evaluated / approved by Gas Standards group, applicable manuals will be added at appropriate O&M update.

5.0 Portable Flame Ionization Instrument (FI)

- 5.1 Used only for outside leak surveys.
- 5.2 Must take continuous samples capable of detecting 50 ppm gas-in-air concentration.
- 5.3 Samples must be taken at or near ground level when surveying buried facilities.

UNCONTROLLED IF PRINTED

- 5.4 Instrument shall be inspected / calibrated monthly in accordance with the manufacturer's operating manual (see [LEAK 3.](#)) and action recorded in Maximo. See [Section 11.0.](#)
- 5.5 Follow manufacturer's operating instructions on unit being used for start-up procedures, required maintenance (e.g., filter changes), daily operational check, and operating instructions.
- 5.6 A daily operational check should be performed prior to beginning survey in accordance with manufacturer's instructions / recommendations. If unit is used on daily basis for leak survey activity, it should be checked with the 50-ppm test/bump gas at end of day's activity to verify unit's sensor is responsive.
- 5.7 The bottle of hydrogen/nitrogen gas mixture that has sat in storage and not used for a long period (e.g., month or longer) should be rolled prior to filling the FI unit's cylinder, thus, to eliminate any separation that may have occurred. Bottles/cylinders that are being transported in vehicles will not have a mixture separation issue and do not need to be rolled prior to filling the FI unit's cylinder.

6.0 Combustible Gas Indicator (CGI)

- 6.1 Must be capable of detecting and measuring gas concentration in air as %LEL and/or %Methane.
- 6.2 Required for pinpointing and classifying underground leaks.
- 6.3 Requires use of probe rod for subsurface sampling.
- 6.4 Follow manufacturer's instruction manual for calibration procedure, daily operational check, unit inspection and maintenance, and operating instructions. See [LEAK 3.](#)
- 6.5 CGI calibration:
 - 6.5.1 Calibrate monthly and record in Maximo.
 - 6.5.2 Calibration is dependent on sensors installed in unit.
 - 6.5.3 Use a combination of test gas and line (system) gas.
 - 6.5.4 All CGI instruments are equipped with LEL and methane sensors. Calibrate as follows:
 1. Zero the %LEL and %gas sensors.
 2. Connect unit to a calibration test gas of 2.5% methane.
 3. Auto-calibrate or adjust the LEL sensor to read 50% LEL.
 4. Connect unit to test gas or line (system) gas.
 5. The %gas sensor should auto-calibrate or be adjusted to read 100% gas.
 - 6.5.5 Majority of CGIs are equipped with additional sensors that monitor carbon monoxide and oxygen level.
 - 6.5.6 Carbon monoxide test gas is 100 ppm carbon monoxide and normally comes as combination gas with 2-½% methane.
 - 6.5.7 Zero the CO sensor:
 1. Connect instrument to calibration source of 100 ppm CO test gas.
 2. CO sensor should auto-calibrate or be adjusted to read 100 ppm.

6.5.8 A sensor that cannot be accurately auto calibrated or adjusted should be replaced and unit recalibrated.

6.6 CGI operational checks:

6.6.1 *Daily or prior-to-use* following manufacturer's operating procedures for inspection:

1. Visually inspect the instrument for dirty filters, damaged components, or missing parts.
2. Check the sampling system for leaks.
3. Check for low-battery display or indication.
4. Zero the sensors.

6.6.2 *Weekly* verify sensors are functioning by:

1. Exposing instrument to a source of natural gas or bump gas; or
2. Registering a gas concentration during leak investigation.

7.0 Gas Detection Instrument

7.1 Gas detection instrument (GDI) can be used in place of FI unit when equipped with a ppm sensor when equipped with a ppm sensor capable of detecting 50 ppm.

7.2 Instrument can be used for short duration or intermittent leak surveys where use of FI unit is impractical.

7.3 Instrument can be used for leak surveying providing the manufacturer has specifically designed and specified it for such. Operator to then follow the manufacturer's operating instructions.

7.4 An electronic CGI equipped with PPM sensor capable of detecting 50 ppm gas-in-air is considered a GDI.

7.5 Manufacturer's specifications list instruments ppm sensitivity and resolution.

7.6 Samples must be taken at or near ground level when surveying buried facilities.

7.7 In "tick" mode, this instrument can be used for pinpointing an aboveground leak or providing indication that a combustible gas may be present.

7.8 Instrument's CGI sensors, such as LEL, Gas, and CO, shall be inspected and calibrated on a *monthly basis* (see [Section 6.0](#)) and recorded in Maximo (see [Section 11.0](#)).

7.9 A daily operational check with the 50-ppm ($\pm 10\%$) test/bump gas should be performed prior to beginning survey in accordance with manufacturer's instructions / recommendations. See [LEAK 3](#). If used daily for leak survey activity, unit should be checked with the 50-ppm test/bump gas at end of day's activity to verify unit's sensor is responsive.

7.10 Follow the instrument's operating/instruction manual for calibration procedure, daily operational check, instrument inspection and maintenance, and operating instructions.

8.0 Mobile Flame Ionization Unit (FI)

8.1 A standard FI unit is mounted on a motorized vehicle such as truck, car, or ATV. See [Section 5.0](#).

8.2 Sampling system is mounted on the outside and normally on front of vehicle.

8.3 Ensure FI unit is connected to sampling system in accordance with manufacturer's operating instructions.

UNCONTROLLED IF PRINTED

- 8.4 Follow the manufacturer's operating instructions on FI unit for start-up procedures, required maintenance (e.g., filter changes), daily operational check, and operating instructions. See [LEAK 3](#).
- 8.5 If FI unit is being utilized on daily basis for leak survey activity, the unit should be checked at end of day's activity to verify it is still operating properly.

9.0 Remote Methane Detector (RMD)

- 9.1 **RMD instruments** utilizes laser technology, Tunable Diode Laser Absorption Spectroscopy, to detect methane. **RMD instruments read and display in PPM*M (parts per million meter).**
- 9.2 **RMD instruments** can:
- 9.1.1 Detect methane gas up to 100 feet away.
 - 9.1.2 Be used in conjunction with Walking Leak Survey.
 - 9.1.3 Enable leak surveying of facilities that are difficult to access:
 - 1. Exposed facilities crossing creek or deep ravine.
 - 2. Facilities located in difficult terrain.
 - 3. Gas lines suspended under or along bridges.
 - 4. Under heavily traveled roadways.
 - 5. Aboveground facilities that are behind locked fences.
 - 6. Indoor commercial piping.
 - 7. Service lines.
 - 8. Inside meter sets if visible through a window.
 - 9. Can scan the area if exact location cannot be determined.
- 9.3 See manufacturer's operating manual for operating instructions, calibration, daily check, and required maintenance. See [LEAK 3](#).
- 9.4 Instrument must be calibrated in accordance with manufacturer's operating instructions and recorded in Maximo.

10.0 Laser Spectroscopy - Advanced Mobile Leak Detection (AML D)

- 10.1 AMLD uses a laser in a closed optical cavity that consists of two highly reflective mirrors. The laser reflects within the mirrors thousands of times giving an effective path length of several kilometers.
- 10.2 AMLD technology can detect methane at 1 ppb. It can also detect the presence of ethane down to 5 ppb.
- 10.3 The presence of methane could cause a signal (audio and visual), which is transmitted to the display in vehicle. Any other indications of methane that is not alerted to the display will be identified in reporting files.
- 10.4 The cavity of the analyzer is mounted on the inside of the vehicle and relies on a sample of the atmosphere from outside the vehicle.
- 10.5 The sampling system is mounted on the outside of the vehicle, normally on the front bumper.

- 10.6 AMLD units will operate in conjunction with a sonic anemometer mounted on the vehicle.
- 10.7 AMLD is not required to straddle the buried gas facility being surveyed. It can detect potential leaks up to hundreds of feet away.
- 10.8 The AMLD unit is self-calibrating during each start-up sequence.
- 10.9 Follow the manufacturer's operating instructions on AMLD unit for start-up procedures, required maintenance (e.g., filter changes), daily operational check, and operating instructions. See [LEAK 3 - ABB Ability Mobile Gas Leak Detection System \(Mobile-Guard\)](#) for manufacturer's instructions.

11.0 Records (49 CFR §192.709)

- 11.1 Calibration records for CGI and FI units are required *monthly*.
- 11.2 *Maintain calibration records* in Maximo for 6 years.
- 11.3 No record of CGI and FI daily operational checks is required.

End of Instructions.

LEAK 2.5 Leak Management – Leak Surveys -- Equipment, October 1, 2022

Revision Notes

Location of Changes	Summary of Changes
Header	Title Change – Leak Detection Equipment
1.0 Purpose	Revised to indicate equipment is used in performing leak investigations and leak surveys. Removed the reference to LEAK 2.4 Leak Surveys.
2.0 Scope	Removed the following sections: Gas-Trac Optical Methane Detector Corrected section name – Laser Spectroscopy – Advance Mobile Leak Detection (AMLD)
Subsection 5.4 – Portable FI	Updated reference link – Section 11.0 Records
Subsection 7.8 - Gas Detection Instrument	Updated reference link – Section 11.0 Records
Former Section 8.0 - Gas-Trac	Removed – Instrument no longer being used.
Section 8.0 – Mobile Flame Ionization Unit	Replaced Gas-Trac section
Section 9.0 – Remote Methane Detector (RMD)	Updated Section name to Remote Methane Detector (RMD)
Subsection 9.1	Revised – RMD instruments utilize laser technology
Subsection 9.2	New – RMD instruments can: 9.2.1 - Detect methane gas up to 100 feet away. 9.2.2 - Be used in conjunction with Walking Leak Survey. 9.2.3 - Enable leak surveying of facilities that are difficult to access.
Section 10.0	Is now Laser Spectroscopy – Advanced Mobile Leak Detection (AMLD)
Subsection 10.9 – AMLD	Update reference link description: ABB- Ability Mobile Gas Leak Detection System (MobileGuard)

UNCONTROLLED IF PRINTED

Section 11.0 = Optical Methane Detector (OMD)	Removed – AIC does not use an OMD.
Section 11.0	Is now Records
Operator Qualifications (OQ) Required	Removed – 1281 – Mobile Gas Leakage Survey – Optical Methane

LEAK MANAGEMENT

October 1, 2020

LEAK 2.6 Walking Leak Surveys

1.0 Purpose

The walking leak survey shall be performed with an industry recognized leak survey instrument that has been approved by the Ameren Illinois (AIC) Gas Standards and Procedures work group and performed in a manner to ensure public and employee safety.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Instrument Use](#)[6.0 Survey Routing](#)[7.0 Surveying Service Lines](#)[8.0 Outside Meter Set, Farm Tap, Regulator Station](#)[9.0 Fenced Facilities](#)[10.0 Inaccessible Facilities](#)[11.0 Weather Limitations](#)[12.0 Leak Detection - Using Gas Detection or FI Unit](#)[13.0 Remote Methane Leak Detector \(RMLD\) Survey](#)**3.0 Target Audience**

- Gas Field Personnel.
- Gas Supervisors.
- Gas Tech Services Personnel.
- Gas Tech Services Supervisors.
- Leak Surveyors.

4.0 General

- 4.1 Individuals performing leak survey should familiarize themselves with the gas system to be surveyed. This can be accomplished by reviewing gas system maps with local Gas Supervisor and/or gas field personnel prior to beginning survey.
- 4.2 Surveyors should be observant for gas locate marks, pipeline markers, street patches, gas valve boxes, or other aboveground facilities that indicate presence of buried gas line.
- 4.3 Arrangements should be made between surveyors, Gas Supervisor, and local gas personnel on accessing or obtaining information from service record cards, as-built construction plans, or any other available records.
- 4.4 Operation of gas leak detectors may be based on Flame Ionization, laser diode, infrared, hyperspectral imaging technology, optical methane detection, or catalytic combustion. See [LEAK 3](#) for manufactures' operating instructions.

UNCONTROLLED IF PRINTED

5.0 Instrument Use

- 5.1 Flame Ionization (FI) instrument, laser diode-based gas detection instrument, or Gas Detection Instrument intake should be as close to ground surface as practical.
- 5.2 In dry conditions, the intake cone should be dragged or placed along/or on the ground depending on design of detection unit being used.
- 5.3 Probe stiffener, if equipped, should be fully retracted when dragging intake cone.
- 5.4 Instrument intake probe should be moved slowly from side to side as surveyor walks along general location of gas line.
- 5.5 In areas with decaying vegetation, enough hydrocarbons are present to key the alarm. This can be significantly reduced by lifting instrument intake up 1 to 2 inches.
- 5.6 Instrument intake should not be dragged through wet grass, water, mud, or any other wet condition.
- 5.7 Walk at speeds slow enough to allow adequate sample to be continuously obtained by positioning intake cone over the most logical venting locations.

6.0 Survey Routing

- 6.1 *Areas with vegetative cover:* Leak survey should follow, as close as possible, the route of gas main and/or service. At minimum, the following items should be sampled when readily observed and are within 1 to 2 steps either side of the route:
 - 6.1.1 Manholes.
 - 6.1.2 Catch basins.
 - 6.1.3 Electrical and telephone duct openings.
 - 6.1.4 Water meter boxes.
 - 6.1.5 Regulator pits.
- 6.2 Vegetation survey can be used in conjunction with walking survey by providing an indication of possible gas leak:
 - 6.2.1 Unusual changes to soil.
 - 6.2.2 Dead or dying vegetation, shrubs, or trees.
 - 6.2.3 Dry blowing dirt.
 - 6.2.4 Bubbling water.
 - 6.2.5 Unusual swarm of insects.
- 6.3 *Mains and services:* Piping under concrete or other hard surface will be surveyed by sampling along the route of main and/or service lines at the following:
 - 6.3.1 Along curb lines.
 - 6.3.2 Along cracks or expansion joints in the immediate area.
 - 6.3.3 Manholes.
 - 6.3.4 Catch basins.
 - 6.3.5 Electrical and telephone duct openings.
 - 6.3.6 Water meter boxes.
 - 6.3.7 Along foundation walls.

6.3.8 Any point where gas could vent.

6.4 *Agricultural areas*: Leak survey should be performed when crop height or density will not hinder the surveyor in walking the approximate location of gas line or ability to detect leakage.

7.0 Surveying Service Lines

7.1 Service lines will be surveyed by sampling over most likely route and over areas where vegetation survey indicated possibility of gas leak. The instrument intake probe should be moved slowly from side to side as the surveyor walks along the general gas line location.

7.2 Different paths will be walked going from main to gas meter and back to main to increase probability of surveying over service line.

7.3 When surveyor is unable to determine the location of service line/meter, the surveyor should walk an "H" pattern at the structure.

7.4 Service lines with outside meter sets will be surveyed to outlet of meter.

8.0 Outside Meter Set, Farm Tap, Regulator Station

8.1 Below-grade leak survey should continue up to point where riser breaks through surface.

8.2 Use sweeping motion over aboveground piping and facilities. If instrument is equipped with probe stiffener, the stiffener can be used to extend probe, if necessary, to sweep over aboveground piping.

8.3 Sweeping motion over farm tap and outside meter set is an approximate 2- second sweep with approximate 6-inch separation between intake cone and piping.

8.4 Sweeping motion on meter set begins at riser and ends at outlet of meter.

8.5 Sweeping motion over regulator station, large commercial / industrial meter set, or extensive aboveground piping facility needs intake cone approximately 6 inches above piping and may take longer than 2 seconds.

8.6 All leak indications on exposed piping will be checked and verified with leak detection fluid.

8.7 If leak detection instrument indicates a leak, but no leak is detectable on AIC- owned facilities, surveyor will continue investigation on customer-owned facilities.

8.8 Surveyor shall follow the procedures contained in [LEAK 1, Section 5.0](#), Leak Detection and Classification.

8.9 Surveyor will initiate Leak Investigation Form in ClickMobile.

9.0 Fenced Facilities

9.1 Fenced gas facilities that are inspected annually may include:

9.1.1 Regulator station.

9.1.2 Valve station.

9.1.3 Pipeline delivery point.

9.1.4 Odorizer.

9.2 These leak surveys will be performed by Gas Tech Service personnel and documented on designated form in ClickMobile. Survey will be inside the fenced area.

UNCONTROLLED IF PRINTED

- 9.3 All fenced gas facilities (including below-grade and above-grade piping) to be leak surveyed and documented on Leak Survey task.
 - 9.3.1 Survey can be performed during annual inspection.
 - 9.3.2 If an odorizer is located within same fenced area, odorizer piping to be included in Leak Survey ID and documented on Leak Survey task.
- 9.4 Facilities associated with transmission surveys in Class 3 location to be surveyed *2 times each calendar year* (not to exceed 7-1/2 months).
 - 9.4.1 First survey will be performed during annual inspection and documented on appropriate inspection task.
 - 9.4.2 Second survey will be documented under its own designated Leak Survey task.
- 9.5 Stand-alone odorizers that are fenced will have their own designated Leak Survey task with a designated due and compliance date.
 - 9.5.1 Those odorizers classified as transmission facility will be surveyed *annually*; however,
 - 9.5.2. Those transmission odorizers in a Class 3 location will be surveyed *2 times each year* (not to exceed 7-1/2 months).
- 9.6 Fenced gas facilities that are not inspected annually may include:
 - 9.6.1 Valve stations.
 - 9.6.2 Large meter sets.
 - 9.6.3 If the leak surveyor cannot gain access inside the fenced area, it will be reported as an "Inaccessible Facility" within ClickMobile.

10.0 Inaccessible Facilities

- 10.1 Facilities that cannot be accessed during leak survey shall be reported by surveyor as Inaccessible Facility in ClickMobile.
- 10.2 Gas Supervisor will arrange to have buried and aboveground facilities inside fenced area leak surveyed within compliance date of the associated leak survey.
- 10.3 Associated leak survey cannot be closed until all inaccessible facilities have either been leak surveyed or disconnected from service.

11.0 Weather Limitations

- 11.1 Gas detector design or adverse conditions may limit the use of Walking Leak Survey.
 - 11.1.1 Adverse conditions that should be taken into considerations in determining if weather or conditions are unsuitable for a walking leak survey.
 1. Steady rain.
 2. Standing water.
 3. Heavy frost layer.
 4. Ice covering the ground surface.
 5. High or gusting winds.
- 11.2 If surface areas to be leak surveyed is predominately covered by one or any combination of first four conditions above, a walking survey should not be performed in that

area. Survey can be moved to areas not experiencing these conditions, such as areas where facilities are located under concrete or other solid surfaces.

- 11.3 Steady wind speeds approximating 25 mph or greater will quickly dissipate gas venting from the ground surface, which may result in an inaccurate leak survey. When continuous high wind exists, surveyor should move to areas that are shielded from high steady winds by buildings or geographic features.
- 11.4 If necessary to leak survey when ground is frozen, surveyor should perform survey in same manner as if gas line is under concrete or another hard surface.
- 11.5 Snow cover has little effect on gas migration, unless there is either a frost cap or heavy frost under snow cover.
- 11.6 Walking speed should be adjusted to compensate for adverse weather conditions, thereby ensuring continuous and accurate sampling is being achieved.
- 11.7 Gas Supervisor and Leak Technician are responsible for determining if weather is unacceptable for surveying.

12.0 Leak Detection - Using Gas Detection or FI Unit

- 12.1 If leak surveyor detects possible Class 1 leak, the surveyor will take immediate action to investigate and classify leak with CGI:
 - 12.1.1 Immediate action means surveyor will halt survey and quickly retrieve CGI and probe rod. If surveyor is using an instrument such as the Southern Cross 46 Hawk or Bascom Turner Gas Rover, a CGI is not necessary. The 46 Hawk or Gas Rover can be used to classify leak since they quantify and pinpoint below-ground leaks.
 - 12.1.2 Surveyor shall follow the leak classification procedures contained in [LEAK 1, Section 5.0](#), Leak Detection and Classification.
 - 12.1.3 If leak is classified as Class 1, a contract surveyor will immediately call AIC emergency phone number (1.800.755.5000) to report leak. AIC gas field personnel will contact the Gas Supervisor or AIC designee.
 - 12.1.4 Surveyor will remain at leak location until a qualified employee arrives to take control and make area safe.
 - 12.1.5 Surveyor will initiate and complete Leak Investigation task in ClickMobile.
 - 12.1.6 Surveyor will guard leak location to keep area safe.
- 12.2 If leak surveyor detects gas entering a building, thus, Class 1 leak:
 - 12.2.1 Contract surveyor will immediately call AIC emergency phone number (1.800.755.5000) to report leak. AIC gas field personnel will contact Gas Supervisor or an AIC designee. Surveyor will check for presence of gas at entrance to structure with CGI.
 - 12.2.2 If CGI registers 10% LEL or greater at entrance, the surveyor will immediately notify Gas Supervisor who may initiate [EMER 2.1](#) General and [EMER 2.4.1](#) Dispatched to Indoor Odor or Leak.
 - 12.2.3 Surveyor will notify customer and, if situation is considered hazardous, will evacuate the structure.
 - 12.2.4 Unless surveyor is OQ qualified for inside leak investigation, surveyor will not enter structure.
 - 12.2.5 The surveyor will remain at site until the AIC first responder arrives.

- 12.2.6 Surveyor will initiate and complete Leak Investigation task in ClickMobile.
- 12.2.7 The surveyor will guard structure to keep it safe and not allow anyone to enter.
- 12.2.8 If leak surveyor is OQ qualified for inside and outside leak investigation, procedures in [LEAK 2.1](#) and [LEAK 2.2](#) may be initiated.
- 12.3 If leak surveyor detects gas leak that appears to be non-hazardous, thus, Class 2 or Class 3:
 - 12.3.1 Surveyor may continue with survey until convenient to access vehicle for CGI and probe rod to do full investigation and classification.
 - 12.3.2 Surveyor shall follow the procedures contained in LEAK 1, Section 5.0, Leak Detection and Classification.
 - 12.3.3 Surveyor will initiate and complete Leak Investigation task in ClickMobile, or Leak Surveillance task in ClickMobile if leak is already known.
- 12.4 If leak surveyor detects gas leak on customer owned piping:
 - 12.4.1 Surveyor will immediately call the AIC emergency phone number (1.800.755.5000) to report leak.
 - 12.4.2 An OAS EMGL order will be created, and qualified gas field personnel will be dispatched to leak site.
 - 12.4.3 Surveyor will remain at site until first responder arrives.
 - 12.4.4 Leaks on customer facilities shall be documented in ClickMobile by selecting the Additional Work - Leak on Customer Facilities task.
- 12.5 If leak surveyor detects a gas leak from a valve box or pit that contains a gas facility:
 - 12.5.1 Surveyor will crack the lid slightly, insert CGI probe, and obtain a sustained gas-in-air reading. If surveyor cannot open valve box lid to complete a leak investigation, surveyor will contact local operations Supervisor or his designee for assistance.
 - 12.5.2 Surveyor will check around perimeter of box or pit for gas migration.
 - 12.5.3 Leak will be classified and documented within ClickMobile.

13.0 Remote Methane Leak Detector (RMLD) Survey

- 13.1 RMLD can be utilized in conjunction with Walking Leak Survey and Mobile Leak Survey.
- 13.2 RMLD can detect gas leaks up to 100 feet away.
- 13.3 If walking survey or mobile survey cannot access gas facilities, RMLD may be used to detect possible gas leaks.
- 13.4 Surveyor could use RMLD for above ground piping and facilities.
- 13.5 If there is an indication of possible gas leak, surveyor is required to investigate and classify leak.
- 13.6 Surveyor must be trained and qualified in use of RMLD instrument.

End of Instructions.

LEAK 2.7 Mobile Leak Surveys

1.0 Purpose

The mobile leak survey shall be performed with an industry recognized leak survey instrument that has been approved by the Ameren Illinois (AIC) Gas Standards and Procedures work group and performed in a manner to ensure public and employee safety.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Mobile Flame Ionization \(FI\) Leak Survey](#)[6.0 Weather Limitations](#)[7.0 Leak Detection](#)[8.0 Remote Methane Leak Detector \(RMLD\) Survey](#)[9.0 Optical Methane Detector \(OMD\) Survey](#)**3.0 Target Audience**

- Gas Field Personnel.
- Gas Supervisors.
- Gas Tech Services Personnel.
- Gas Tech Services Supervisors.
- Leak Surveyors.

4.0 General

- 4.1 A mobile survey can be performed in areas where a mobile unit is able to travel over transmission pipeline, high pressure distribution, distribution main, or possibly distribution service lines.
- 4.2 In areas with vegetative cover, the mobile unit should straddle pipeline.
- 4.3 In area where gas mains are located under concrete surface, mobile unit's sampling and sensing devices must be situated so they pass over the seam between pavement and curb plus back of curb.
- 4.4 A walking leak survey is to be used in conjunction with mobile leak survey where concrete or hard surface exists from road to the structures.
- 4.5 Walking leak survey is required for sampling along edges of buildings and other areas where gas could be venting.
- 4.6 The mobile leak survey method has limited application due to accessibility with a mobile unit. Surveyor will be required to walk portions with Gas Detection Instrument or FI Unit to complete the survey.

5.0 Mobile Flame Ionization (FI) Leak Survey

- 5.1 A standard FI unit is mounted on a motorized vehicle such as truck, car, or ATV. See [LEAK 2.5](#) for equipment particulars.

UNCONTROLLED IF PRINTED

- 5.2 Follow manufacturer's operating instructions on FI unit for start-up procedures, required maintenance (e.g., filter changes), daily operational check, and operating instructions. See [LEAK 3](#).
- 5.3 If FI unit is being utilized on daily basis for leak survey activity, the unit should be checked at end of day's activity to verify it is still operating properly.

6.0 Weather Limitations

- 6.1 Gas detector design or adverse conditions may limit the use of Mobile FI Leak Survey.
- 6.2 Adverse conditions that may affect venting of subsurface gas leaks include:
 - 6.2.1 Moisture, rain, or wet vegetation.
 - 6.2.2 Heavy frost layer.
 - 6.2.3 Ice and snow cover.
 - 6.2.4 High or gusting winds.
- 6.3 Gas Supervisor or Contract Leak Technician is responsible to determine if weather is acceptable for mobile leak surveying.
- 6.4 Driving speed should be adjusted to compensate for adverse weather conditions, thereby ensuring that continuous / accurate sampling is achieved.

7.0 Leak Detection

- 7.1 If mobile unit detects a possible gas leak, surveyor will quickly park the mobile unit.
- 7.2 Surveyor will take immediate action to investigate and classify leak with CGI in accordance with [LEAK 1](#).
- 7.3 If leak is classified Class 1, surveyor will follow procedures listed under Walking Leak Survey, [LEAK 2.6, Section 12.0](#), Leak Detection.
 - 7.3.1 Contract surveyor will call the AIC emergency phone number (1.800.755.5000) to report leak. AIC gas field personnel will contact Gas Supervisor or AIC designee.
 - 7.3.2 Surveyor will remain at leak location until a qualified employee arrives to take control and make area safe.
 - 7.3.3 Surveyor will complete Leak Investigation task in ClickMobile.
- 7.4 If leak surveyor detects gas leak that appears to be non-hazardous, thus, Class 2 or Class 3:
 - 7.4.1 Surveyor may continue with survey until convenient to access vehicle for probe rod and CGI to do full investigation and classification.
 - 7.4.2 Surveyor shall follow the procedures contained in [LEAK 1, Section 5.0](#), Leak Detection and Classification.
 - 7.4.3 Surveyor will initiate Leak Investigation task in ClickMobile, or Leak Surveillance task in ClickMobile if leak is already known.

8.0 Remote Methane Leak Detector (RMLD) Survey

- 8.1 RMLD can be used in conjunction with walking leak survey and mobile leak survey.
- 8.2 RMLD can detect gas leaks up to 100 feet away.

- 8.3 If walking survey or mobile survey cannot access gas facilities, RMLD may be used to detect possible gas leaks.
- 8.4 Surveyor could use RMLD for aboveground piping and facilities.
- 8.5 If there is an indication of possible gas leak, surveyor is required to investigate and classify leak.
- 8.6 Surveyor must be trained and qualified in use of RMLD instrument.

9.0 Optical Methane Detector (OMD) Survey

- 9.1 OMD can be used in conjunction with Walking Leak Survey.
- 9.2 OMD can only be used where the OMD can straddle the buried gas facility being surveyed.
- 9.3 Ground conditions over buried gas facility must allow natural gas to vent.
- 9.4 Where gas mains are located under concrete surface, see [Section 4.0](#).
- 9.5 If mobile unit detects a possible gas leak, surveyor will quickly park mobile unit.
- 9.6 The surveyor will take immediate action to investigate and classify leak with CGI in accordance with [LEAK 1](#).
- 9.7 If leak is classified Class 1, surveyor will follow procedures listed under Walking Leak Survey, [LEAK 2.6, Section 12.0](#), Leak Detection.
 - 9.7.1 Contract surveyor will immediately call AIC emergency phone number (1.800.755.5000) to report leak. AIC gas field personnel will contact Gas Supervisor or AIC designee.
 - 9.7.2 Surveyor will remain at leak location until a qualified employee arrives to take control and make area safe.
 - 9.7.3 Surveyor will initiate Leak Investigation task in ClickMobile.
- 9.8 If leak appears to be non-hazardous, thus, Class 2 or Class 3:
 - 9.8.1 Surveyor may continue with survey until convenient to access vehicle for probe rod and CGI to do full investigation and classification.
 - 9.8.2 Surveyor shall follow procedures contained in [LEAK 1, Section 5.0](#), Leak Detection and Classification.
 - 9.8.3 Surveyor will initiate Leak Investigation task in ClickMobile, or a Leak Surveillance task if leak is already known.
- 9.9 Mobile leak survey method has a limited application due to accessibility with a mobile unit. Surveyor will be required to walk portions with Gas Detection Instrument or FI Unit to complete survey.

End of Instructions.

LEAK 2.8 Advanced Mobile Leak Survey

1.0 Purpose

Advanced Mobile Leak Survey (AMLS) shall be performed with an industry recognized instrument utilizing Laser Spectroscopy. AMLS shall be performed with an instrument approved by the Ameren Illinois (AIC) Gas Standards and Procedures work group in a manner to ensure public and employee safety.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Data Collection Driving Protocol](#)[6.0 Indication Investigation](#)[7.0 Survey Gaps](#)**3.0 Target Audience**

- Gas Field Personnel.
- Gas Supervisors.
- Leak Surveyors

4.0 General

4.1 An AMLS consists of three separate activities. All three activities listed below shall be completed prior to the completion of the leak survey for any given survey route.

4.1.1 Data Collection Drive

4.1.1.1 The Advanced Mobile Leak Detection (AMLD) unit is driven along survey routes to collect atmospheric conditions such as: methane concentration, wind speed and direction, and GPS data.

4.1.1.2 After completion of data collection, the unit provides a report with potential leak indication areas.

4.1.2 Indication Investigation

4.1.2.1 Qualified field personnel shall conduct leak investigations within the search area defined by the AMLD unit reports.

4.1.2.2 Field personnel shall follow procedures defined in [LEAK 2.2 Outdoor Investigation](#).

4.1.3 Survey Gaps

4.1.3.1 If the AMLD unit does not cover the entire survey area during the data collection activity, then a walking survey shall be completed on the assets that have not been surveyed. See [LEAK 2.6 Walking Leak Surveys](#)

UNCONTROLLED IF PRINTED

5.0 Data Collection Driving Protocol

- 5.1 Follow the manufacturer's user manual for start-up and operating guidelines. User manuals can be found in [LEAK 3](#).
- 5.2 Weather, traffic, and vehicle speed may affect analyzer performance, follow manufacturer's recommendations when operating.
- 5.3 All accessible roads within the survey area should be driven on each side (unless single lane, one way) on two separate nights for a minimum of 4 passes.
 - 5.3.1 If possible, drive accessible areas where commercial offices, business centers, industrial parks, alleys, etc. are located. Try to maximize coverage area.
- 5.4 Driving operations should occur between sunset and sunrise unless otherwise approved by engineering or supervision.
- 5.5 If the instrument alarm indicates an error, survey data collection should stop until error is resolved.
 - 5.5.1 If the analyzer alarms due to a large presence of methane, the driver may stop the vehicle and stop or pause the analyzer.
 - 5.5.1.1 If the driver is qualified for Outside Gas Leak Investigation, then they may conduct an immediate leak investigation.
 - 5.5.1.2 If the driver is not qualified for Outside Gas Leak Investigation, then they may call in the potential leak and wait for gas field personnel to arrive.
- 5.6 Following the data collection, the AMLD unit will generate reports that detail indications of possible methane emissions. The report will require a review to determine the integrity of the data, if additional drives are required, or if the survey must be completed by another approved leak survey method.

6.0 Indication Investigation

- 6.1 The indications identified on an approved AMLD unit report shall be investigated to determine if there is a natural gas leak. Reference [LEAK 2.2 Outdoor Investigation](#).
- 6.2 All indications identified by the AMLD unit shall be investigated, including "indeterminate" and "biogas" emission indications.
- 6.3 Indications should be investigated during daytime hours following the completion of the final data collection drive. All indications shall be investigated prior to leak survey compliance date.
- 6.4 The radius of the investigation area should extend approximately 50' beyond the indication area. The investigation area may need to extend beyond the 50' radius if further investigation is needed.

7.0 Survey Gaps

- 7.1 Because the AMLS relies on wind speed and direction, the data collection phase might not cover/capture all of the assets within the survey route.
- 7.2 Any assets within the leak survey route that have not been covered will need to have additional drive passes or will need to be surveyed by other approved methods prior to the completion of the survey.

LEAK 2.9 Survey Maps and Records

1.0 Purpose

This document describes map and record requirements accompanying leak management by Ameren Illinois (AIC), all to ensure proper and timely documentation for any natural-gas leakage as surveyed, investigated, classified, monitored, repaired, and reported in accordance with applicable federal / state regulations.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Maps and Records](#)**3.0 Target Audience**

- Gas Field Personnel.
- Gas Supervisors.
- Gas Engineers.
- Gas Tech Services Personnel.
- Gas Tech Services Supervisors.
- Leak Surveyors.

4.0 General

- 4.1 In addition to performing a leak survey, the gas field personnel or contract leak technicians are required to report any deficiencies observed while conducting any leak survey within the AIC system. Deficiencies are documented in ClickMobile and are tracked in Maximo.
- 4.2 Leak survey deficiencies include:
 - 4.2.1 Atmospheric corrosion on aboveground facilities.
 - 4.2.2 Disbonded coating on risers at regulator stations, valving stations, meter sets.
 - 4.2.3 Inaccessible facilities.
 - 4.2.4 Facilities that need painting.
 - 4.2.5 Leak on customer facilities.
 - 4.2.6 Vent screen missing or missing spring cap.
 - 4.2.7 Electric ground wires attached to gas facilities.
 - 4.2.8 Items or material inappropriately attached to meter set.
 - 4.2.9 Inaccessible meter valves.
 - 4.2.10 Aboveground plastic pipe.
 - 4.2.11 Exposed mains or service lines.
- 4.3 Deficiencies and leaks found on AIC facilities are to be reported each day in ClickMobile.
- 4.4 Reported deficiencies are tracked in Maximo.

UNCONTROLLED IF PRINTED

5.0 Maps and Records (49 CFR §192.709, §192.481)

- 5.1 Electronic maps in ClickMobile will be used for all transmission, high pressure distribution, and distribution leak surveys.
- 5.2 Annual leak surveys performed by Gas Technical Services personnel inside fenced areas are documented in ClickMobile.
- 5.3 Leak surveyors will record each day's survey by "lassoing" completed sections of pipeline and facilities that were leak surveyed in ClickMobile.
- 5.4 Survey will be reviewed for completeness by appropriate Gas Engineer or Gas Supervisor. Corrections, revisions, or updates to maps will be submitted to personnel responsible for maintaining and updating system maps.
- 5.5 *Transmission* leak survey maps and records will be *maintained* in Maximo for *minimum of 5 years*.
- 5.6 *All distribution* leak survey maps and records will be *maintained* in Maximo for a *minimum of 6 years*.
 - 5.6.1 If atmospheric corrosion monitoring is performed in conjunction with the distribution leak surveys, records shall be maintained in Maximo of at least the two most recent atmospheric corrosion inspections.
- 5.7 Residential Yardline and Inside Meter Leak Survey Records:
 - 5.7.1 Gas Engineer or Gas Supervisor maintains location of each yardline to be surveyed in Maximo (or may keep such on spreadsheets).
 1. Surveyor signs (or initials) and dates when each location is surveyed.
 2. Surveyor will note if yardline has been eliminated so the spreadsheet can be updated before next survey.
 3. If during survey, surveyor finds a yardline that is not on spreadsheet, it will be added for spreadsheet update.
 4. When entire survey is completed, surveyor will complete Yardline Survey task in ClickMobile.
 - 5.7.2 Gas Engineer or Gas Supervisor maintains location of each inside gas meter outside the Business District in Maximo (or may keep on spreadsheet).
 1. Surveyor signs (or initials) and dates when each location is surveyed.
 2. Surveyor will note if inside meter has been eliminated so spreadsheet can be updated before next survey.
 3. When entire survey is completed, surveyor will complete Inside Meter Survey task in ClickMobile.
 - 5.7.3 Completed surveys and associated records will be maintained in Maximo.
 - 5.7.4 Leak records for both Residential Yardline and Inside Meter Leak Surveys will be *maintained for a minimum of 6 years*.

End of Instructions.

LOCATING

December 1, 2020

LOCT 1 Methods

1.0 Purpose

This section provides an overview of the different methods used by Ameren Illinois (AIC), or its contractor, for locating underground natural-gas facilities. This is to ensure that such pipeline facilities are properly located and identified to allow safe excavation activity and thus maintain safety for all parties and the public.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Locating Methods](#)[6.0 Instrument Setup Procedure](#)[7.0 Electronic Locating](#)

Appendices

[Appendix A - Locating Equipment](#)[Appendix B - Locate Markings](#)**3.0 Target Audience**

- Gas Field Personnel
- Gas Supervisors
- Damage Prevention Personnel

4.0 General

- 4.1 Locating is the process of finding and marking the location of underground facilities based on identifying any buried conductive metal, such as pipeline or tracer wire. These underground facilities are located prior to excavation activities and in response to requests received through the JULIE system.
- 4.2 Each JULIE member is responsible for having their own underground facilities marked with paint or flags.
- 4.3 AIC has adopted a modified version of the *Illinois Statewide Marking Guidelines for Underground Line Owners* as published by the JULIE One-Call System. See Appendix B for marking paint colors and flags.
- 4.4 AIC contracts with a third party to have AIC's buried facilities marked in response to JULIE requests. The AIC Damage Prevention group is responsible for monitoring the performance of contracted party.

5.0 Locating Methods

- 5.1 Visual

5.1.1 Search for pedestals or risers which might indicate an underground cable or pipe nearby.

5.1.2 Report evidence of underground utilities to JULIE if no markings exist.

5.2 Probe

5.2.1 A probe is inserted in ground to locate a line by feel.

5.2.2 Probing is time consuming, impractical for deep facilities, and may damage a facility's coating.

5.3 Electronic

5.3.1 An electronic device is used to detect underground facilities by utilizing either Radio Frequency (RF) or Audio Frequency (AF).

5.4 Measurement

5.4.1 Location is marked by using dimensions indicated on existing AIC records.

5.4.2 Use this method only when facilities cannot be located electronically.

5.5 Excavate

5.5.1 Excavating is done to expose the underground facility.

5.5.2 Excavation within the tolerance zone requires extra care and precaution. Refer to AIC Field Safety Manual, Section 33.4 Work within the Tolerance Zone.

5.5.3 Methods include hand excavation, vacuum excavation, and visually inspecting the excavation while in progress until clear of existing facility.

5.5.4 Excavating is most accurate method but requires extreme caution.

6.0 Instrument Setup Procedure

6.1 Test transmitter battery.

6.2 Turn transmitter "On."

6.3 Test receiver battery.

6.4 Turn receiver "On."

6.5 Select locating method (i.e., inductive, conductive).

For the rest of the tuning procedure, hold the instrument above the ground at an even height.

6.6 Select transmitter location.

6.7 Adjust receiver for tone.

6.8 Do not "swing" the receiver. Keep it low to the ground and hold it either vertically (peak) or horizontally (null).

Maximum signals are obtained when the pipe is crossed at right angles. When locating service lines, walk parallel to the curb. When locating a main, walk perpendicular to the curb.

7.0 Electronic Locating

7.1 General

- 7.1.1 Preferred method of electronic locating is to actively apply signal onto pipeline facility using a direct connection.
- 7.1.2 If direct connection is not possible, use of induction clamp (coupler) is next most effective method of applying locate signal onto target conductor. Using an induction clamp is not as effective at transmitting a signal as direct connection. It can only be used within certain frequency ranges and must use a higher power output.
- 7.1.3 Least preferred method is induction or broadcast mode on a transmitter. This usually results in a weak signal that can "bleed over" to any conductor in the area.
- 7.1.4 Both peak and null methods can be used in conductive and inductive locating.

7.2 Conductive Method

Signal is produced on underground facility through a wire lead attached to facility and to locator transmitter.

- 7.2.1 Plug direct-connect transmitter cable into transmitter output jack.
- 7.2.2 Connect red clip to conductor (pipe, valve, etc.).
- 7.2.3 Connect black clip to ground rod. Set the ground rod in good soil several feet away and perpendicular to facility path.

Never ground to water pipe or other services in the area as returning signal may create an out-of-phase condition which will mislead the locate.

- 7.2.4 Locate and mark the facility.

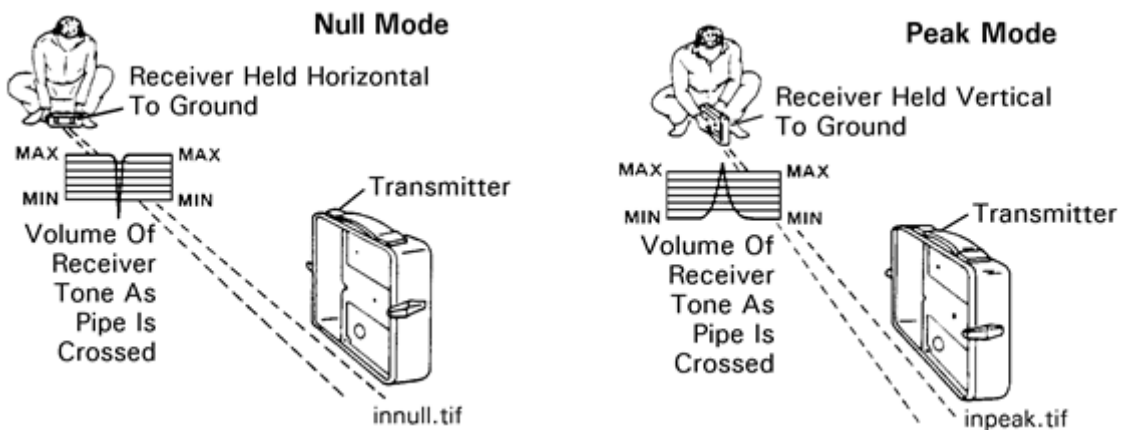

Do not connect the two clips to one another with the switch on. This will "short-circuit" transmitter's output circuit.

7.3 Inductive Method

7.3.1 General: Signal is produced on underground facility through the ground from transmitter to receiver. Locating equipment is not attached to either the underground facility or locator transmitter.

Exercise care when utilizing inductive methods that only the target facility is marked.

If other underground or overhead utilities (such as telephone, CATV, and water pipes) are in the same area, use conductive method or inductive coupling.

1. Set transmitter on ground near the facility.
2. Locate and mark facility. Maintain appropriate distance (usually 50 - 75 feet) between receiver and transmitter to avoid air-to-air signal.

7.3.2 Inductive Coupling (Units with Capability)

1. The inductive method can only be performed when transmitter is in RF mode.
2. The coupler puts tone selectively on facility by clamping around it. While this eliminates need to disconnect bonds or make direct connection to a conductor, it requires direct access to the underground facility.

7.3.3 Inductive, Off-Handle without Partner

1. Place transmitter on ground over and parallel to pipe to be traced. A radio frequency should be detected as receiver is swung across the pipe path.
2. Operating Suggestions
 - 2 a. If pipe is exposed, do not set transmitter directly on pipe, or within 1 foot of any mass of metal. This will overload transmitter and cause a frequency shift or stop transmitter's oscillation.
 - 2 b. For long tracing runs, the transmitter can be moved up (or forward) to reenergize the pipe when the signal becomes weak.
 - 2 c. Be alert to air-to-air signals when working close to the transmitter. Either offset transmitter 10 feet or carry it to another point to energize pipe.
 - 2 d. Signals impressed on a pipe at one point can be transferred to another pipe through a common point and cause erroneous readings. *Examples:* It is possible signal may carry through the gas piping back to gas-fired water heater where it is mechanically (and electrically) common with the water pipe. Also, it is possible signal can be carried on the water service or water main. Be aware of these possibilities for false signals.

7.3.4 Inductive, Off-Handle with Partner

1. One person carries transmitter and another the receiver. Keep boxes in line with each other and a constant distance between the equipment. This method is extremely useful when the approximate location of main is unknown. When both operators are directly above the pipe, signal will be at its maximum.

7.4 Depth Estimation by Triangulation Method

7.4.1 Mark the location of the facility.

7.4.2 Place receiver at a location parallel to main and tilt the bottom at 45° angle relative to ground. Maintaining the 45° angle, move to side of and perpendicular to pipe path until receiver again indicates a null. Mark ground at point directly below center of the receiver. The distance between first mark and second mark *minus* the height of receiver above ground equals pipeline depth below first mark. See diagram below. Again, subtract the height above ground from the horizontal distance to calculate pipe depth.

$$B = A - C$$

Where:

- A = Horizontal distance from 1st mark
- B = Pipe depth
- C = Distance from ground to center of receiver

1. AIC does not provide outside parties with depth measurements. Various locators can provide depth estimation by other methods. For AIC use, see operator's manual for specific make and model of locator used to estimate facility depth.
2. Depth measurements with current technology and locating tools are not exact and are frequently inaccurate in areas with multiple underground facilities or even nearby conductive objects, such as a metal shed, due to the inability of equipment to distinguish multiple objects.

7.5 Locating a Lateral or Branch

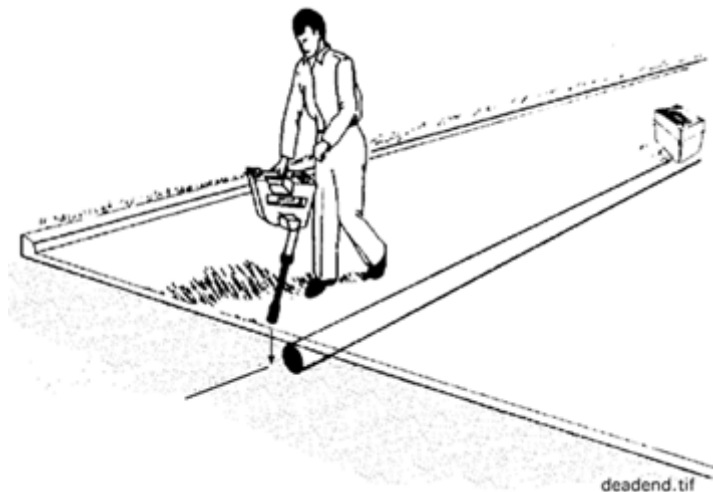

To locate a service or branch lateral off the main line:

- 7.5.1 Energize, locate, and mark the main line using a suitable transmitter application.
- 7.5.2 With receiver in operating mode, move approximately 5' away from the main. Slowly sweep parallel to main line with receiver positioned perpendicular to main line as shown below.
- 7.5.3 Follow visual and audio indications. Use null method to pinpoint the lateral.

7.6 Locating a Dead End

- 7.6.1 Trace along the line. When receiver crosses over a dead end, audio signal should drop. Stop and slowly move receiver in a 180° sweep to verify signal loss was the end, not a bend. If no other signal is detected, retrace initial steps. A distinct tone change indicates end of the conductor. Perform this operation slowly and carefully.

7.7 Locating a Bend

- 7.7.1 As operator approaches the bend area, tone should change. Stop and sweep receiver 180° along ground to determine direction of the bend. Locate pipe in both directions toward bend and mark bend where lines intersect. There may be a confused signal area at the exact bend point.

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0301 Manually Opening and Closing Valves
- 1201 Temporary Isolation of Service Lines and Service Discontinuance
- 1291 Locate Underground Pipelines
- 1301 Install and Maintain Pipeline Markers
- 1311 Inspect Pipeline Surface Conditions - Patrol Right of Way or Easement
- 1321 Damage Prevention During Excavation Activities by or on Behalf of The Operator
- 1331 Damage Prevention During Third Party Excavation or Encroachment Activities as Determined Necessary by Operator

Appendix B - Locate Markings

B-1. Utility Marking Colors

B-1.1 The following APWA Uniform Color Code shows the colors each utility will use when staking, painting, and/or flagging the location of a buried utility facility:

Identification Color	Utility/Type of Product
Yellow	Gas, Oil, Steam, Petroleum

Red	Electric
Blue	Potable Water
Orange	Communication, Telephone, TV
Green	Sewer and Drain Lines
Purple	Reclaimed Water, Irrigation, Slurry Lines
Pink	Temporary Survey
White (Black on snow)	Proposed Area of Excavation

B-2. Marking Paint

B-2.1 Marking paint should be biodegradable.

B-2.2 Only marking paints designed to spray from the inverted position should be used.

B-2.3 A line should be sprayed on the surface above the underground gas line as follows:

B-2.3.1 Approximately 12 inches long and 2 inches wide.

B-2.3.2 Length of each mark should be approximately 12 - 18 inches.

B-2.3.3 Distance between marks depends on site conditions but should be no greater than 20 feet.

B-2.3.4 End marks should contain arrows if line continues.

B-2.3.5 Company identification should be painted at reasonable intervals to allow quick identification.

B-2.4 The following paints are stocked for use by AIC gas field personnel:

Color	Utility	Stock No.
Yellow	Gas Facilities	30 60 044
White	Proposed Excavation	30 51 384
		30 60 246

B-2.5 Contract locators supply their own marking paint which has been approved (or subject to approval) by Damage Prevention.

B-3. Marking Flags

The following marking flags are stocked for use by AIC gas field personnel:

Color	Utility	Stock No.
Yellow/Gas	Gas Facilities	16 02 183
Yellow/No Gas		16 02 348
White	Proposed Excavation	16 02 568

MAIN INSTALLATION

April 1, 2023

MAIN 1 Requirements

1.0 Purpose

The purpose of this procedure is to prescribe the requirements for installing gas mains. The design, construction and testing of mains shall comply with all applicable local and state regulations. The procedure also meets minimum requirements of 49 CFR §§ 192.319, 192.325, and 192.327.

The term “main” in this document refers to distribution and high pressure distribution mains or transmission lines and pipelines.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Location](#)[5.0 Cover](#)[6.0 Pipe Handling](#)[7.0 Trench Requirements](#)[8.0 Excavation and Work Area Protection](#)[9.0 Laying and Lowering](#)[10.0 Underground Clearances](#)[11.0 Joining](#)[12.0 Offset Bends](#)[13.0 Protection and Backfill](#)[14.0 Trenchless Excavation Installations](#)[15.0 Pigging](#)[16.0 Clean Up](#)[17.0 Back-Flagging](#)[18.0 Design Considerations](#)[19.0 Records](#)

Appendices:

[Appendix A - Tuff-N-Nuff Rock Shield](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services personnel

UNCONTROLLED IF PRINTED

4.0 Location

- 4.1 Mains shall be installed in streets, alleys, utility easements, or within granted private easements.
- 4.2 Permits and easements requirements shall be determined and the necessary easements be obtained before starting construction.

Permits are generally required for crossing or parallel encroachments on railroads and state, county, city and township roads.

- 4.3 Main installations shall comply with the provisions of franchises, permits, and easements.
- 4.4 New, relocated, or replaced mains shall not be installed under buildings.

5.0 Cover (49 CFR §192.327 Cover)

- 5.1 Each main must be installed with a minimum cover, measured from the top of the pipe, as listed in Table 1.

Table 1 Minimum Cover Requirements

Minimum Cover Requirements		
Main Type or Location	Normal Soil inches	Consolidated Rock inches
Distribution Mains and High Pressure Distribution Mains	30	24
Transmission Lines	36	24
Crossings of Navigable Rivers or Streams	48	24
Permitted Highway and Railroad Crossings	As specified on permit	As specified on permit

- 5.2 Where an existing underground structure prevents the installation with minimum cover, the main may be installed provided that additional protection against anticipated external loads such as loaded truck traffic, material storage, or farming operations.
 - 5.2.1 If such conditions are encountered, the Gas Supervisor or Contractor Services Supervisor shall contact either area Gas Engineering for distribution main installations or Gas Tech Engineering (GTE) for transmission for high pressure distribution installations or Gas Storage Engineer (GSE) for gas storage field installations.
 - 5.2.2 Engineering personnel will review to determine if additional protection is required and specify appropriate protection method to protect the main from anticipated external loads.
 - 5.2.3 Location of shallow main should be recorded on the As-Built plans and indicated on Ameren Illinois (AIC) gas electronic mapping system.
- 5.3 Where gas carrying fittings are attached to mains, fittings **should** have a minimum cover of **24 inches**.

- 5.4 If the minimum cover cannot be maintained, then install Safety Barrier Tape (Stock Code 16 06 958) approximately 12 inches below the surface to provide advance warning to excavators. **For additional protection Tuff-N-Nuff (49 22 241) may be used. See [Appendix A](#).**
- 5.5 In cultivated areas, areas where future grading is required, or in areas subject to erosion, additional cover must be provided to compensate for these conditions.
 - 5.5.1 Gas Engineering shall specify additional depth requirements.
- 5.6 Gas mains shall not be installed more than 48 inches deep to prevent the need for shoring or other protective systems during installation or in future excavations unless required for:
 - 5.6.1 Road crossings,
 - 5.6.2 Railroad crossings,
 - 5.6.3 Stream crossings,
 - 5.6.4 Avoid conflict with another buried facilities,
or
 - 5.6.5 Specified by Gas Engineering.

6.0 Pipe Handling

- 6.1 Handle pipe in a manner that will prevent damage to the pipe or coating.
- 6.2 Load and unload pipe with non-abrasive canvas slings, padded calipers, or by hand.
- 6.3 **Do not** roll or drop pipe from trailers.
- 6.4 When unloading pipe at the job site carry it. **Do not** drag it into position.

7.0 Trench Requirements (49 CFR §192.319)

- 7.1 Trenches shall be a minimum of 2 inches wider than the main being installed.
- 7.2 The trench bottom should provide a firm bearing for the pipe to minimize stresses.
- 7.3 Keep trench clean of rocks and other debris that might damage the pipe or coating.

8.0 Excavation and Work Area Protection

- 8.1 Shoring, sloping, and benching of excavations shall be in accordance with [EXCV 1](#).
- 8.2 Always maintain safe public access around and through the construction zone.
- 8.3 Barricades, signs, warning lights, flagmen and other safety devices shall be used to protect the construction area.

9.0 Laying and Lowering

- 9.1 Place the main in the trench without damaging the pipe or coating.
- 9.2 Lower the main into the ditch with sufficient slack to allow for expansion and contraction.
- 9.3 Ensure that the main fits the ditch without the use of external force to hold it in place.
- 9.4 Seal pipe ends at the end of each day to prevent the following from entering the pipe:
 - 9.4.1 Debris
 - 9.4.2 Water

9.4.3 Animals

9.5 Visually inspect the pipe and pipe coating as it is laid in the ditch looking for the following that could affect serviceability of the pipe:

9.5.1 Gouges

9.5.2 Small dents

9.5.3 Scraps

9.5.4 Other damages or imperfections.

9.6 Consider use of pipe rollers when pulling coated steel pipe to protect the pipe and coating from damage.

10.0 Underground Clearances (49 CFR §192.325)

10.1 Underground clearances apply to plastic and steel pipe that is installed either by direct bury excavation, boring or other trenchless methods.

10.2 At the time of installation, there shall be sufficient clearance to allow for installation and maintenance activities:

10.2.1 A minimum of 12 inches vertically and horizontally, between transmission lines, high pressure distribution mains or distribution mains and existing buried:

1. Utility lines (electric, telephone, cable, etc.)
2. Structures (drainage, storm sewers, etc.)
3. Pipes (gas, water, sewer, drain, etc.)
4. Abandoned facilities since they have the potential to provide a path for migration of leaking gas

10.2.2 If the minimum clearance is not possible, then adequate measures shall be taken to protect the pipe from damage by installing means such as,

1. A sleeve shield
2. Tuff-N-Nuff (Refer to [Appendix A](#))
3. Rubber matting
4. Fiberglass or PVC shield
5. Sand-cement bags
6. Concrete pads
7. A casing pipe shall be installed around or along the main
8. Gas Engineering, GTE, or GSE may specify an alternative protection method.

Electric lines can produce heat.

10.2.3 Refer to [POLY 2.3, Section 7.0](#), Clearance from Thermal Sources, if PE pipe is being installed near a steam pipe.

10.3 Clearance should be adequate to install a pressure control fitting or leak repair clamps on steel mains, squeeze off PE mains or install lateral main connections or services.

UNCONTROLLED IF PRINTED

10.4 See MAIN 2.1 for additional clearances associated with joint trench installations.

11.0 Joining

11.1 Welding is the principal method for joining steel pipe. See [WELD 2.3](#) and [WELD 4](#) for acceptable welding procedures.

11.2 Butt fusion and electrofusion shall be used to join PE mains. See [POLY 2.4](#) and [POLY 2.5](#).

11.3 Mechanical fittings shall not be used to permanently join gas main.

12.0 Offset Bends

12.1 See [STLP 1](#) for offset bends in steel pipe and [POLY 2.3, Section 9.0](#) for the minimum bending radius for PE pipe.

12.2 Fittings shall be used when bending the pipe is not feasible.

13.0 Protection and Backfill

13.1 All debris shall be removed from trenches before backfilling.

13.2 Each gas main shall be protected from washouts, floods, unstable soil, landslides or other hazards that may cause the main to move and/or to sustain abnormal loads.

Excavated material used for backfill must be free of rock (larger than 2 inches), construction debris, concrete or asphalt chunks, brush, skids, or other debris materials that could damage the pipe or its coating.

13.2.1 The main shall be protected from rock or other abrasive material that could damage the pipe or its coating. Use one of the following over the pipe before backfilling with spoils containing rock, gravel or cinders is placed in the excavation.

1. A minimum layer, approximately twelve (12) inches thick, of clean construction material,

2. Granular material equal to or less than 1/4",

OR

3. Sand.

13.3 If suitable material is not available to initially cover the pipe, then install a rock shield such as Tuff-N-Nuff (see [Appendix A](#)) or a rigid sleeve.

13.4 Backfill the main in a manner that provides firm support under the pipe and prevents damage to the pipe and coating from equipment or from backfill material.

13.5 Install wash-out breakers, made from sacks filled with earth or sand and placed in the ditch over the pipe, where necessary to prevent the fresh backfill from being washed out of the ditch.

13.6 Use sufficient backfill so that depressions do not occur after settlement.

13.7 Avoid excessive mounds.

13.8 Compact backfill by hand tamping, mechanical tamping, rolling, or wetting down.

- 13.9 Repair and resurface openings in streets, alleys and sidewalks in accordance with the permit or the municipality's regulations.

14.0 Trenchless Excavation Installations

- 14.1 [BORE 2.1 Section 5.0](#) addresses the general requirements for pipe being installed by boring methods.
- 14.2 [BORE 2.1 Subsection 5.2](#) addresses the installation of PE pipe.
- 14.3 [BORE 2.1 Subsection 5.3](#) addresses the installation of steel pipe.

15.0 Pigging

- 15.1 If the internal condition of new or replacement pipe cannot be visually inspected for debris or cleanliness, then consider pigging the pipe segment(s) before tying into existing mains.

Coiled plastic pipe that has been capped or plugged prior to installation does not need to be pigged unless a condition during installation resulted in contaminants entering the pipe.

16.0 Clean Up

- 16.1 Keep the right-of-way clear of construction debris during and after construction.

17.0 Back-Flagging

- 17.1 Newly installed AIC gas facilities shall be "back-flagged" as stated in [DAMG 1 Section 11.0](#).

18.0 Design Considerations

- 18.1 When designing a new pipeline or replacement project, care should be taken to consider safety of the public and co-workers as a top priority. Considerations include:
- 18.1.1 Work area protection.
 - 18.1.2 Traffic conditions.
 - 18.1.3 Depth at tie-in locations.
 - 18.1.4 Other utility locations
 - 18.1.5 Required PPE.
 - 18.1.6 Customer threats.
- 18.2 Additional considerations should be taken for the protection of the environment. Considerations include:
- 18.2.1 Location of valves, stoppers, and squeeze off locations are optimized to limit release of gas to the atmosphere.
 - 18.2.2 Existing system leaks are considered for repair opportunistically.
 - 18.2.3 Flaring on high pressure applications.
 - 18.2.4 Lowering of system pressure prior to purging.
 - 18.2.5 Ensuring the ability to locate the main in the future.

18.3 Prone-to-leak facilities should be considered for replacement opportunistically and on a program level based on risk results. These include:

18.3.1 Mechanically coupled steel.

18.3.2 Adyl-A.

18.3.3 Difficult to locate facilities.

19.0 Records

19.1 New, relocated or replaced gas mains shall be recorded on AIC's electronic mapping system within 90 days from the time the job has been completed and/or placed in Status 70 (Construction Completed) in DOJM.

19.1.1 Region operations or Gas Tech Engineering should review and approve the completed job packet within 30 days from the time the job is complete and/or move to Status 70 in DOJM.

19.1.2 The electronic mapping should be updated within forty-five (45) days of receipt of completed job packet and/or moved to Status 80 (Ready for Closing) in DOJM.

19.2 Required geospatial data for AIC's transmission pipelines will be submitted by Transmission Integrity Management (TIMP) personnel to the National Pipeline Mapping System (NPMS) on or before March 15th each year. The submitted data should reflect conditions in the field as of December 31st of the previous year.

End of Instructions.

Document Rescission

MAIN 1 Main Installation: Requirements, May 15, 2022

Revision Notes

Location of Changes	Summary of Changes
Subsection 5.3	Revised – Where gas carrying fittings are attached to mains, fittings should have a required minimum cover of 24 inches.
Subsection 5.4	Added : For additional protection Tuff-N-Nuff (49 22 241) may be used/ See Appendix A Removed 5.4.1 since Safety Wrap is no longer manufactured.
Subsection 19.2	Required geospatial data for AIC's transmission pipelines will be submitted by Transmission Integrity Management (TIMP) personnel to the National Pipeline Mapping System (NPMS) on or before March 15th each year. The submitted data should reflect conditions in the field as of December 31 of the previous year.

Appendix A - Tuff-N-Nuff Rock Shield

A-1. General

- A-1.1 Tuff-N-Nuff rock shield is to be used when placing rip-rap or other rock over pipes to prevent future erosion.

Tuff-N-Nuff Rock Shield (49 22 241)

3/8" thick x 36" wide x 30' long

- A-1.2 The porosity of Tuff-N-Nuff allows cathodic protection to reach the pipe without shielding.

A-2. Installation

- A-2.1 Always check and repair pipe coating before installing Tuff-N-Nuff.
- A-2.2 Cigarette wrap around the pipe cutting to the desired length.
- A-2.3 Rock shield should be positioned flat side out, rough side to the pipe.
- A-2.4 It is recommended to overlap the sides at the 6 o'clock position of the pipe to insure "double layer" protection at the critical weight bearing point.
- A-2.5 If side overlap is used, (3 or 9 o'clock positions) shiplap the sides over the top to avoid "cupping" that could divert backfill under the rockshield.
- A-2.6 Use tape to hold the wrap in place.

Tuff-N-Nuff can be ordered for specific pipe diameters to minimize waste on large projects.

MAIN INSTALLATION

October 1, 2021

MAIN 2.1 Joint Trench Installation

1.0 Purpose

The purpose of this standard is to prescribe the requirements for installing gas mains and service lines in a joint trench. The procedures in this document meet the minimum requirements of 49 CFR §§ 192.325 and 192.327.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Gas/Electric Joint Trench Installation](#)

[6.0 Multiple Utility Joint Trench Installation](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 General

4.1 When conditions warrant joint trench installation, the specifications of this standard shall be followed.

5.0 Gas/Electric Joint Trench Installation (49 CFR §§ 192.325, 192.327)

5.1 Installation Requirements

5.1.1 Bottom of trench should be free from:

1. Rocks
2. Debris
3. Abrupt changes in elevation

5.1.2 Mechanical tamping of the trench bottom should be done in fill areas and where excessive settling might occur.

5.1.3 Use clean backfill that is free from debris that may damage the gas line or electric cable.

1. Place 12 inches of backfill over the electric and gas line.
2. Maintain a minimum of 12 inches of clearance between facilities. See [Figures 1 and 2](#).

5.1.4 The top 24 inches of the trench shall require mechanical tamping if under a surface traversed by vehicle traffic.

UNCONTROLLED IF PRINTED

- 5.1.5 Place gas main above electric line for main/primary installations due to tapping required for gas service lines. See Figure 1.
- 5.1.6 Joint trench for service lines may be installed with the gas service line on top and the electric service on the bottom. See Figure 2.
- 5.1.7 If required minimum cover cannot be maintained, then install Safety Barrier Tape (Stock Code 16 06 958) approximately 12 inches below the surface to provide advance warning to excavators. See [MAIN 1](#).

Figure 1

Joint Primary/Secondary and Gas Main Trench Detail

Figure 2

Typical Joint Service Trench Detail

- 5.1.8 For lateral crossings of other facilities, it is recommended to maintain a minimum clearance of 12 inches.
- 5.1.9 "Joint Trench" shall be noted on the appropriate as-built construction plans or service record.

5.2 Typical Joint Service Trench Route

5.2.1 The typical layout for a gas and electric service line joint trench installation is shown in Figure 3.

Figure 3 Trench Route

6.0 Multiple Utility Joint Trench Installation

6.1 In multiple utility joint trench installations, all natural gas facilities should be installed above all other utilities at minimum depth requirements and with 12 inches of separation.

End of Instructions.

Operator Qualification (OQ) Required?

YES

0151: Visual Inspection of Buried Pipe and Components when Exposed

0201: Visual Inspection of Buried Pipe and Components for Mechanical Damage

0641: Visually Inspect Pipe and Components Prior to Installation

0901: Installation of Plastic Pipe in a Ditch

Revision Notes

Location of Changes	Summary of Changes
Paragraph 5.1.8	Maintain a minimum of 12 inch clearance for lateral crossing of other facilities.

MAIN 2.2 Lowering or Realignment of Pipe

1.0 Purpose

This procedure is a guide in determining the feasibility of safely lowering or realigning in-service pipe and performing such work.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Engineering Review](#)

[6.0 Steel Pipe Maximum Potential Realignment Distance \(Strip Back\)](#)

[7.0 PE Pipe Maximum Potential Realignment Span](#)

[8.0 Realignment Concerns](#)

[9.0 Inspections Required Prior to Movement](#)

[10.0 Performing the Work](#)

[11.0 Inspections Required After Movement](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Engineer (GSE)
- Gas Storage Field Personnel
- Gas Storage Field Supervisor
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 General

4.1 The realignment of in-service pipe (movement in any direction) is done to clear shorts and realign pipe in conflict with other utilities or planned excavation activities.

4.2 The following groups shall be responsible for determining the feasibility of safely lowering or realigning in-service pipe:

4.2.1 Gas Region Engineering

1. Steel pipe with a Design MAOP of 60 PSIG or less

OR

2. PE pipe having Design MAOP of 125 PSIG or less.

4.2.2 Gas Tech Engineering (GTE):

1. Steel pipe with Design MAOP greater than 60 PSIG.

4.2.3 Gas Storage Engineer (GTE):

UNCONTROLLED IF PRINTED

1. Piping within the storage field.

5.0 Engineering Review

- 5.1 If an application for lowering an in-service pipe appears feasible, an analysis should be completed by Region Gas Engineering, GTE, or GSE depending on the Design MAOP and pipe material. The analysis shall include,
 - 5.1.1 Review of pipe records
 - 5.1.2 Joint type
 - 5.1.3 Leak history
 - 5.1.4 Attached appurtenances
 - 5.1.5 Terrain
 - 5.1.6 Excavation safety
 - 5.1.7 Other underground facility conflicts.
- 5.2 A field procedure for lowering in-service pipe should be completed, and may include:
 - 5.2.1 A general procedure. (see [Section 10](#))
 - 5.2.2 The minimum strip-back length.
 - 5.2.3 A depth profile.
 - 5.2.4 Emergency shutdown procedures.
 - 5.2.5 Pipeline support method.
 - 5.2.6 Pipeline movement method.

6.0 Steel Pipe Maximum Potential Realignment Distance (Strip Back)

- 6.1 The strip back distances shown in the following table represent "L" as shown in [Figure 1](#), not the total ditch length.
 - 6.1.1 Total ditch length = (Minimum of two times the strip back distance) + (Length of the pipe to be lowered).

These are minimum distances from the location where change in elevation starts at the original elevation to where change in elevation ends at the new elevation.

- 6.2 For pipe sizes, wall thickness, pipe grade and depth of lower **NOT SHOWN** in Table 1, consult with Gas Tech Engineering or Gas Region Engineer for strip back distances per API RP 1117, Movement of In-Service Pipelines.

Table 1: Minimum Strip Back Distances

MAOP (psi)	Nominal Pipe Size (inches)	OD (inches)	Wall Thickness (inches)	Pipe Grade	Yield Strength (psi)	Depth of Lower (h)		
						1 ft.	3 ft.	5 ft.
						Strip Back Length (L) in Feet		

60 or less	2	2.375	0.154	B	35,000	89	214	335
				A25	25,000	110	263	412
	4	4.500	0.188	B	35,000	109	240	364
				A25	25,000	134	295	447
	6	6.625	0.219	B	35,000	126	263	390
	8	8.625	0.250	B	35,000	140	284	413
	10	10.750	0.250	B	35,000	153	233	437
12	12.750	0.250	B	35,000	165	322	458	

Notes

1. Calculation Criteria: Pipe Design Factor = 0.72, Installation Temperature = 60° F, Operating Temperature 40° F.
2. Calculations used Pipeline Tool Box App. Ref: API RP 1117 Manual Movement of In-Service Pipelines.
3. Footage represents the total minimum trench length (L) to realign pipeline.
4. Legacy companies only purchased Grade A25 pipe 4 inch or less diameter.

Figure 1 Steel Pipe Lowering Schematic

7.0 PE Pipe Maximum Potential Realignment Span

7.1 The distances shown in Table 2 represent the total ditch length (L) that allows for an approximate 6-inch drop (D). For ditch lengths that allow for drops other than 6 inches contact engineering. See [Figure 2](#) for PE pipe lowering schematic.

Table 2: Ditch Length vs PE pipe drop

Size (inches)	Ditch Length "L" (feet)	Approximate Drop "D" (inches)
2	11.5	6
3	14.0	6
4	16.0	6
6	19.0	6
8	21.5	6

Figure 2 PE Pipe Lowering Schematic

UNCONTROLLED IF PRINTED

8.0 Realignment Concerns

8.1 Items to consider when moving, realigning, or lowering pipe:

8.1.1 Maintain Pipe Integrity

1. The primary concern when realigning a pipe in service, besides attaining the required depth, is preserving its integrity.
2. Pipeline integrity is threatened by construction equipment or failure of the pipe from being overstressed through improper lowering practices.

Hazards caused by a puncture or rupture, during realigning, can be reduced by minimizing the operating pressure. Buckling and tensile failure can be avoided by limiting the stress level and deformation of the pipe during realigning.

8.1.2 Recognize Terrain Limitations

1. Pipes in relatively level terrain generally have lower values of internal stress. Pipes installed on steep hillsides could be under additional stress due to potentially unstable slope.

Avoid realigning pipes in unstable soils or soil which is subjected to frost heave.

8.1.3 Consider Soil Types

1. The soil type will dictate whether the pipe is realigning in a vertical plane or offset to the side.
2. Rock or cohesive soils may allow an offset trench for realigning the pipe to the side.
3. Realigning the pipe into an offset trench is not as easy as a vertical drop, and involves increased stresses.

8.1.4 Examine Types of Welds

Avoid realigning pipes larger than 1 1/4" that contain acetylene welds.

1. Prior to realigning the in-service pipe, consider performing visual and nondestructive inspection of girth welds.
2. Prior to movement, repair welds of questionable or unknown quality as identified by the inspection. See [REPR 1, Section 7.0](#) for transmission or HP distribution or [REPR 1, Section 8.0](#) for distribution pipe.

8.1.5 Know the Pipe Being Moved

1. Review available records for features such as the following, all of which can affect realignment:
 - 1 a. Pipe material properties (i.e., grade, wall thickness and seam)
 - 1 b. Age
 - 1 c. Leak repair history
 - 1 d. Location of fittings and field bends
- 8.1.6 Lowering Induced Stresses
1. There are temporary and permanent stresses induced on a pipe by realigning.
 2. The curvature change and elongation required for the pipe to fit the new trench profile can cause permanent stresses.
 3. Lifting the pipe during the realigning process and temperature changes experienced by the freshly exposed pipe can cause temporary stresses.

Temperature induced stresses can be reduced by realigning the pipe during warm weather.

9.0 Inspections Required Prior to Movement

- 9.1 External corrosion. See [CORR 1 Section 9](#) "External Corrosion Visual Inspection and Repair" for requirements.
- 9.2 Mechanical damage. See [REPR 1](#) if defects are found.
- 9.3 Pipe coating. See [CORR 2.3 Section 11.0](#) Coating Inspection if defects are found.

10.0 Performing the Work

- 10.1 Use the following procedure when performing the work.
 - 10.1.1 Monitor the operating pressure during realignment to ensure that the maximum operating pressure (MOP) is not exceeded.
 - 10.1.2 Plan for fast shutdown and isolation of the pipeline being worked on if the MOP is exceeded.
 - 10.1.3 Minimize personnel and public exposure at the work site.
 - 10.1.4 Anticipate potential adverse effects of:
 1. Weather conditions
 2. Ground and surface water
 3. Bank stability
 - 10.1.5 Check the adequacy of pipe supports to prevent unintended movement.
 - 10.1.6 Ensure backfill and compaction is performed to prevent additional movement due to settlement after realignment.

11.0 Inspections Required After Movement

- 11.1 Pipe coating. See [CORR 2.3 Section 11.0](#) Coating Inspection if defects are found.

MAIN 2.2 Main Installation: Lowering or Realignment of Pipe, October 1, 2021

Revision Notes

Location of Changes	Summary of Changes
Paragraph 4.2.1 Item 2. – Gas Re- gion Engineering	Updated – Responsible for PE pipe having Design MAOP of 125 psig.

1.0 Purpose

The purpose of this document is to define unconstrained, partially constrained, and unconstrained piping configurations. This document also provides instruction on the protection for coupling and compression fittings from pull out.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Constraint](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GS) Supervisors
- Gas Storage Engineers (GSE)
- Gas Storage Field Operators
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 General

4.1 All pipe joints, including temporary exposure, shall be protected from forces caused by:

- 4.1.1 Thrust
- 4.1.2 Thermal expansion
- 4.1.3 Contraction
- 4.1.4 Vibration
- 4.1.5 Weight of pipe and its contents.

Although movements seldom occur in buried piping systems due to restraint by the surrounding soil, there are forces that act on pressurized piping systems that tend to pull joints.

4.2 All piping joints shall have enough support or anchors to resist the thrust forces caused by restrictions, offsets, or bends in the pipe.

5.0 Constraint

5.1 The following illustrations explain the concept of unconstrained, constrained, and partially constrained piping configurations.

- 5.1.1 Unconstrained

1. When a piping system is unconstrained, the thrust forces are primarily supported by the clamping force the mechanical coupling has on the pipe. The coupling acts as both a pressure seal and a clamp. See Figure 1.

Figure 1 Unconstrained Piping System

5.1.2 Partially Constrained

1. When a piping system is partially constrained, the thrust forces are supported collectively by the clamping force of the mechanical coupling and the structural resistance of the piping assembly. See Figure 2.

Figure 2 Partially Constrained Piping System

5.1.3 Fully Constrained

1. When a piping system is fully constrained, the thrust forces are contained by the friction between the piping and the soil. The mechanical coupling is only subject to the outward force of the gas pressure and acts only as a seal. See Figure 3.

Figure 3 Fully Constrained Piping System

5.2 Couplings

- 5.2.1 Provisions shall be made to offset external forces if compression or sleeve couplings are used in a piping system.
 1. If such provisions are not inherent to the couplings design, then provide suitable anchoring or strapping.

Ameren Illinois (AIC) does not install compression fitting on new steel pipe installations. Compression fittings are not approved for use.

- 5.2.2 Ensure that design of bracing or strapping does not interfere with the normal performance of the coupling or with maintenance.
- 5.2.3 For above ground applications, joint harnesses are the recommended restraint.
- 5.2.4 For below ground applications, see welded strap requirements in [Figure 4](#).

5.3 Welded Strapping for Compression or Sleeve Couplings

- 5.3.1 Space the straps evenly around the pipe.
- 5.3.2 Contact Gas Engineering, GTS, or GSE for pipe sizes and pressures not shown in [Table 1](#).

Figure 4 Welded Strapping for Compression or Sleeve Couplings

Strapping does not apply to PE systems.

Table 1: Strap and Weld Specifications

Pipe Size	Up To 100 psig Maximum			Up To 500 psig Maximum		
	Strap		Weld	Strap		Weld
	No.	t x w	S x L	No.	t x w	S x L
1 ¼"	2	1/8" x 1"	1/8" x 1"	2	1/8" x 1"	1/8" x 1"
2"	2	1/8" x 1"	1/8" x 1"	2	1/8" x 1"	1/8" x 1"
3"	2	1/8" x 1"	1/8" x 1"	2	1/4" x 1"	3/16" x 1"
4"	2	1/8" x 1"	1/8" x 1"	2	3/8" x 1"	5/16" x 1"
6"	2	1/4" x 1"	3/16" x 1"	2	3/8" x 1 3/4"	5/16" x 2 1/4"
8"	2	1/4" x 1"	3/16" x 1 1/4"	4	3/8" x 1"	5/16" x 1 3/4"
10"	2	1/4" x 1"	3/16" x 2"	4	3/8" x 1"	5/16" x 2 3/4"
12"	2	3/8" x 1"	5/16" x 1 3/4"	4	3/8" x 1"	5/16" x 4"

No. = number of A36 bar stock straps to be used.
 T = thickness of A36 bar stock strap
 W = width of A36 bar stock strap
 s = size of fillet weld (height)
 L = length of fillet weld on each side of strap at each end

MAIN 2.03 Main Installation: Pull Out Prevention, January 1, 2011.

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

MAIN INSTALLATION

May 15, 2022

MAIN 2.4 Temporary Pipeline Support

1.0 Purpose

This document provides various methods to temporarily support pipelines during construction in compliance with 49 CFR §192.161.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Support Method Table](#)

[6.0 Temporary Support Methods](#)

3.0 Target Audience

- Gas Technical Engineering (GTE)
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Engineer (GSE)
- Gas Storage Field Supervisor
- Gas Storage Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 General

4.1 This procedure provides guidelines to determine the temporary support methods of an in-service pipeline spanning a trench excavation.

4.2 The following groups are responsible for determining the temporary support of in-service piping:

4.2.1 Gas Region Engineering

1. Steel pipe with MAOP of 60 PSIG or less
2. PE pipe with MAOP of 125 PSIG or less.

4.2.2 Gas Tech Engineering

1. In-service steel pipeline with MAOP greater than 60 PSIG.

4.2.3 Gas Storage Engineering

1. In-service pipeline located within gas storage field or compressor station.

5.0 Support Method Table

5.1 Use Table 1 to determine the type of support method for a given span.

Table 1: Pipe Support Types vs Span

Pipe	Nominal Pipe Size	Span/Support Type
------	-------------------	-------------------

UNCONTROLLED IF PRINTED

		Under 5'	5'-10'	Over 10'
Welded Steel	Up to ¾"	--	A , E , F	B , C , E , F
	1 ¼" - 4"	--	A , E , F	C , D , E , F
	6" - 12"	--	--	C , D , E , F
	Over 12"	--	--	D , E
Coupled Steel (Threaded or Mechanical)	Up to ¾"	A , E , F	A , E , F	B , C , E , F
	1 ¼" - 4"	A , E , F	A , E , F	B , C , E , F
	6" - 12"	--	B , C , D	D
	Over 12"	--	C , D	D
Plastic	Up to 1 ⅛"	A , E , F	B , E , F	B , E , F
	1 ¼" - 4"	--	B , E , F	B , C , E , F
	6" - 8"	--	--	B , D , E , F

Notes:

- For A, B, C, D, E, F see [Section 6.0](#).
- "--" Not required

- 5.1.1 Reinforce exposed couplings in coupled steel lines or replace section with welded steel pipe.
- 5.1.2 If inserted cast iron or PVC pipe is involved, then contact GTE for further details.
- 5.1.3 Temporary support should remain in place until backfilled.
- 5.1.4 In backfilling, consider the use of rock shield to protect the pipe.
 1. Ensure the pipe is flat on compacted backfilled material and padded well with clean sand or fill dirt.
 2. Consider mechanical compaction to provide a firm support.
- 5.1.5 Keep weight of equipment off pipe until backfill is firmly installed beneath it.
- 5.1.6 The maximum span for steel pipe between supports is shown in Table 2.

Table 2: Maximum Span between Supports

Nominal Pipe Size	2"	3"	4"	6"	8"	10"	12"
Maximum Span	9'	11'	13'	16'	18'	20'	22'

Note: For steel pipe diameters not shown consult Gas Tech Engineering or Pipeline Toolbox Software Application, if available.

6.0 Temporary Support Methods

- 6.1 Type "A" Support (Figure 1)
 - 6.1.1 2" x 6" Timber
 - 6.1.2 Timber laid on edge beneath pipe
 - 6.1.3 Pipe Strapped

Figure 1: Type "A" Support

6.2 Type "B" Support (Figure 2)

6.2.1 "Vee" Trough Beneath Pipe

6.2.2 Pipe Strapped

6.2.3 Nail Trough Timbers Together

Figure 2: Type "B" Support

6.3 Type "C" Support (Figure 3)

6.3.1 Double Timbers (or Pole) Above Pipe

6.3.2 Cable Support

Figure 3: Type "C" Support

6.4 Type "D" Support (Figure 4)

6.4.1 Cribbing Beneath Pipe

6.4.2 4" x 4" x 3' Timbers

Figure 4: Type "D" Support

6.5 Type "E" Support

6.5.1 Sling Method of Pipe Support: Placement of slings should comply with the span lengths shown in [Table 2](#). Also see Figure 5.

Figure 5: Sling Method of Pipe Support

6.6 Type "F" Support

6.6.1 Side boom/Backhoe Method of Pipe Support: Span lengths should comply with the span lengths shown in [Table 2](#). Also see Figure 6.

Figure 6: Side Boom/Backhoe Pipe Support

Due to the possibility of equipment hydraulic pressure bleed off, the rigging should be checked constantly.

6.7 Other

- 6.7.1 The use of other support methods are acceptable as long as the methods comply with the span lengths shown in [Table 2](#) and provide adequate support to eliminate undue stress on the pipe.
- 6.7.2 Other methods of temporary support shall be submitted to the appropriate engineering group, Region Engineer, GTE, or GSE for acceptance and approval.

End of Instructions.

MAIN 2.4 MAIN Installation: Temporary Pipeline Support, October 1, 2020

Revision Notes

Location of Changes	Summary of Changes
Paragraph 4.2.1	Updated – Gas Region Engineering replaces Gas Division Engineering.
Paragraph 4.2.1 – Item 2	Updated – Responsible for PE pipe having Design MAOP of 125 psig.

MAIN INSTALLATION

May 15, 2022

MAIN 2.5 Pipe Coating and Gasket Removal

1.0 Purpose

This document describes the procedures to be used when removing and disposing of:

- Coal tar pipe coating that contains or potentially contains asbestos or low concentration of PCBs
- Flange gaskets suspected of containing asbestos.

These procedures meet the requirements of 49 CFR §§ 192.911, 173.6, 173.216, and 29 CFR §1926.110.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Sample Testing](#)

[6.0 Notifications](#)

[7.0 Inspections](#)

[8.0 Personal Protective Equipment, Other Equipment, Materials, Tools](#)

[9.0 Pipe Wrap and Gasket Removal Procedures](#)

[10.0 Waste Transportation](#)

[11.0 Collection and Storage for Disposal](#)

Appendices

[Appendix A - PPE, Material, and Equipment](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 General

4.1 The pipe wrap removal procedures listed only apply if the material is able to be removed intact.

4.1.1 "*Intact*" is defined by OSHA as Asbestos Containing Material (ACM) that "*has not crumbled, been pulverized, or otherwise deteriorated so that the asbestos is no longer likely to be bound within its matrix.*"

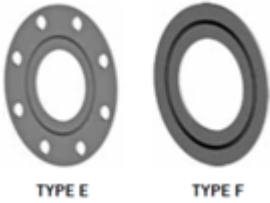

The work practices specified in this procedure normally will keep the materials intact.

- 4.1.2 ACM not able to be removed intact must be performed by a licensed asbestos abatement contractor.
- 4.1.3 Contact an Ameren Illinois Safety Supervisor to arrange for a contractor, if required.
- 4.2 All workers involved in the removal or handling of asbestos-containing coal tar pipe wrap and/or asbestos-containing gaskets shall receive the appropriate training prior to performing any such work.
 - 4.2.1 This training consists of Asbestos Pipe Wrap Worker and Class III Operations & Maintenance training for gasket removal.
 - 4.2.2 Refresher training shall be provided annually.

5.0 Sample Testing

- 5.1 When encountering coal tar coated pipe, assume the material contains asbestos and Polychlorinated biphenyls (PCB).
 - 5.1.1 The work shall be performed in accordance with this procedure.
 - 5.1.2 If the material is sampled and found to be negative for asbestos the work can be performed without asbestos-related precautions in handling of the coating material.
- 5.2 The gaskets in Table 1 do not contain asbestos. They do not require asbestos-related precautions when handling or removing.

Table 1: Asbestos-Free Gaskets

G.F. Central Plastic Jock O-Ring	 <p>TYPE E TYPE F</p>
Garlock Style 5500 Inorganic Fiber Gasket	
Garlock Blue-Gard	
TherMOSeal (Flexitallic Gaskets)	"Klinger SIL " gaskets do not contain asbestos.

UNCONTROLLED IF PRINTED

Thermoseal (Flexitallic) gaskets labeled "Klinge**RIT**" contain asbestos.

- 5.3 Assume that all other gaskets contain asbestos and shall be handled in accordance with this procedure, unless the gasket is sampled and found to be negative for asbestos.
- 5.4 If Ameren Illinois (AIC) requests a sample to be analyzed for asbestos, it shall be collected by an Inspector who is licensed by the Illinois Department of Public Health.
 - 5.4.1 Contact an AIC Safety Supervisor to arrange for an inspection.
- 5.5 Assume coal tar pipe coatings contains PCB's for disposal unless the material is sampled and analyzed for PCBs.
 - 5.5.1 Contact Corporate Environmental if necessary, to arrange for testing.

6.0 Notifications

- 6.1 For projects where the threshold quantity of 260 linear feet, 260 square feet, or 1 cubic meter of friable ACM may be exceeded, written notification to Illinois EPA shall be made at least 10 working days prior to start of the project.

When calculating the threshold quantity, include only pipe wrap that has been removed to facilitate removal of the pipe (i.e., to cut the pipe in sections) OR has been damaged during the removal process.

- 6.2 If field personnel anticipate the job will impact significantly more materials than previously estimated and possibly exceed the threshold amount, then contact the AIC Safety Supervisor so that any required regulatory notifications can be made.

7.0 Inspections

- 7.1 A designated Pipe Wrap Competent Person must examine the materials to be removed, and determine whether it is "intact", as defined in [Section 4.1.1](#).
 - 7.1.1 If the material is not intact, (or anytime during the work the material is identified as non-intact) then removal will be performed by a licensed asbestos abatement contractor.
 1. Cover the non-intact pipe wrap with plastic sheeting, mark-off the impacted area, and instruct personnel to stay out of that area.
 2. Contact AIC Safety Supervisor to have arrangements made for a licensed asbestos abatement contractor.
- 7.2 If a pipeline operating over 100 psig is exposed and its coating has become disbonded, bubbled, distorted, or is in very poor condition, then notify Pipeline Integrity personnel for instructions prior to removal. See Figures 1 and 2.

Figure 1: Bubbled or Blistered coating

Figure 2: Disbonded Coating

7.2.1 See [FORW Section 5.0](#) for contact information.

7.2.2 The Pipeline Integrity personnel may need to conduct an integrity examination for moisture, pH, and pipe condition before work continues.

7.3 The Pipe Wrap Competent Person shall also perform periodic inspections (at least daily) to ensure that the appropriate work practices are being followed.

8.0 Personal Protective Equipment, Other Equipment, Materials, Tools

8.1 The table in [Appendix A](#) provides the stock numbers and descriptions for the PPE, materials, and equipment that may be required for the removal and disposal asbestos containing coal tar/gaskets.

8.2 PPE for asbestos-containing pipe wrap or gaskets removal:

8.2.1 Standard work PPE:

1. Hardhat
2. Safety glasses
3. Safety-toed boots
4. Work gloves, etc.

8.2.2 Disposable flame resistant/retardant (FR) coveralls are available and may be worn to keep the pipe coating or gasket material off of clothes.

8.2.3 Respiratory protection is not required during removal of intact pipe wrap, provided the required work practices are followed.

UNCONTROLLED IF PRINTED

1. Employees may choose to wear a half-face, tight-fitting respirator equipped with P100 filters, provided they are medically qualified and have the appropriate respirator fit test.
2. Employees may also choose to wear a dust mask for comfort from general airborne dust.
3. If there is any doubt about an operation or exposures, contact AIC Safety Supervisor.

8.2.4 If the work to be performed requires Level I or Level II PPE per [WIGE 2.2](#), no additional PPE is required.

8.3 The following equipment, materials, and tools are required for asbestos-containing pipe wrap or gaskets removal:

8.3.1 A water solution to which surfactant (wetting agent) has been added to increase the ability of the liquid to penetrate ACM, such as:

1. Leak detection fluid
2. Soap and water solution

8.3.2 Pump spray bottle for amended water solution

8.3.3 Plastic bags, 6 mil minimum thickness.

8.3.4 Plastic sheeting, 6 mil minimum thickness.

8.3.5 Thin-film plastic wrap (i.e., "saran" wrap or shrink wrap, for pipe wrap removal)

8.3.6 Duct tape

8.3.7 Hammer/mallet, scraper, chisel, putty knife, sharp knife or machete

8.3.8 Solvent

8.3.9 Abrasive pads or metal file

8.3.10 Rags

8.3.11 Asbestos waste labels,

8.3.12 For gasket removal:

1. Caution tape
2. Asbestos warning signs

9.0 Pipe Wrap and Gasket Removal Procedures

9.1 All asbestos-containing gasket removal must be performed within a "Regulated Area" that is designated using asbestos warning sign and, if necessary, caution tape.

The use of power tools, grinders, and sanders, or other mechanical equipment or burning is strictly prohibited on asbestos-containing coating or gaskets.

9.2 When exposing or removing the pipe or other buried facility containing pipe wrap, take care to minimize damage to the pipe wrap.

9.3 Put on personal protective equipment.

- 9.4 Place plastic sheeting under the portion of the pipe where coal tar wrap or gasket is to be removed.
- 9.5 Wet the coal tar coating with an amended water solution. Leak detection fluid may be used.
 - 9.5.1 Keep the coating wet during removal.
 - 9.5.2 If necessary, use a sharp knife or other cutting tool to score the coating, to aid in the removal.
 - 9.5.3 To assist in containing the coal tar pipe coating to be removed, it is recommended to wrap with a thin film plastic wrap if feasible.
 - 9.5.4 Remove the coal tar coating with hammer to break the coating into large pieces.
 - 9.5.5 Once the majority of the coating is broken away from the pipe, cut the thin film plastic wrap along the top, allowing the material to drop onto the plastic sheeting on the ground.
 - 9.5.6 Use a scraper, putty knife or similar tool to complete removal.
 - 9.5.7 Use a solvent or amended water solution and abrasive pad/file to manually remove remaining residual coating material as needed.
- 9.6 Wet the gasket with an amended water solution. Leak detection fluid may be used.
 - 9.6.1 The gasket shall be kept wet during removal.
 - 9.6.2 Remove gaskets with scraper or other tool.
 - 9.6.3 Use a solvent or amended water solution and abrasive pad/file to manually remove remaining residual gasket material.
- 9.7 After coating or gasket has been removed, wipe pipe or flange surface down with wet rags/towels.
- 9.8 Once removal of the coal tar coating, or gasket is completed, ensure all pieces and any rags/towels used are on the plastic sheeting or in a plastic bag.
 - 9.8.1 Roll up the plastic sheeting.
 - 9.8.2 Secure with duct tape.
 - 9.8.3 Place the plastic into an asbestos labeled 6 mil (minimum) plastic bag.
- 9.9 Where sections of pipe are being removed, the pipe wrap on the remaining pipe should be cleared of all loose pieces prior to moving the pipe.
- 9.10 Removed section of pipe should be:
 - 9.10.1 Wrapped with a minimum 6 mil plastic sheeting, sealed with tape and labeled with the asbestos waste label (See [Figure 3](#)).
 - or
 - 9.10.2 Placed directly into a 6 mil plastic lined bin. The plastic must be sealed with tape at the end of the day and labeled with the asbestos waste label.

Figure 3 Asbestos Waste Labels

9.11 Perform clean-up according to the following:

- 9.11.1 Disposable wet wipes or wet rags should be used for wiping off tools and equipment, including Level I or Level II PPE, used during the removal.
- 9.11.2 Place all disposable items into the asbestos labeled plastic bag.
- 9.11.3 Remove disposable PPE, place in the asbestos labeled plastic bag and seal with duct tape
- 9.11.4 Wash hands, and face and arms as necessary.

10.0 Waste Transportation

10.1 All asbestos waste materials must be transported in accordance with DOT regulations.

10.2 Transportation of small quantities, less than 440 pounds, of asbestos waste may be transported in a sealed container/bag to the designated "Asbestos Storage for Disposal" (ASD) location without DOT placards or shipping manifests. See Figure 4. Refer to 49 CFR §173.6 (d).

Figure 4 Asbestos Waste Bag

11.0 Collection and Storage for Disposal

- 11.1 Removed asbestos waste will be stored at a designated ASD location or stored temporarily on site in an approved disposal container pending laboratory analysis, and then transported to an approved disposal site.
- 11.2 Bags of asbestos waste shall be placed in open-top 55-gallon drums.

UNCONTROLLED IF PRINTED

11.2.1 Each drum shall be appropriately labeled.

11.2.2 The lids for all drums containing asbestos wastes shall be kept closed except when in the process of adding more waste.

11.3 Large items of asbestos waste, appropriately wrapped in plastic and labeled, that cannot be placed in drums shall be placed on the ground within the ASD location.

11.4 Stores personnel shall be notified when drums are full or large items are ready for pick-up. Stores will then contact Ameren Corporate Environmental Services to make arrangements for pick-up.

End of Instructions.

1.0 Purpose

This procedure provides information on the insertion of PE main through abandoned gas mains or previously installed conduits. This procedure meets the requirements on 49 CFR §192.321.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Considerations](#)

[6.0 Planning](#)

[7.0 Tracer Wire Installation](#)

[8.0 Insertion Procedures](#)

[9.0 Conduit or Sleeve Insertion Procedures](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 General

4.1 There are two insertion scenario presented in this section:

4.1.1. Insertion of PE main through an abandoned gas main, and

4.1.2. Insertion of PE main through a previously installed non-metallic conduit.

4.2 Main insertion through abandoned gas main should only be performed with Supervising Engineer approval.

4.2.1. In these procedures the existing main to be abandoned will be referred to as conduit.

4.2.2. Replacement projects involving PE pipe main insertion through multiple segments of abandoned gas main require an Engineering review.

4.3 PE main can be inserted through a previously installed non-metallic conduit:

4.3.1. Under such hard surfaces; as roadways, driveways or parking lots.

4.3.2. In excavations to protect PE pipe from rock impingement.

4.4 New main shall not be inserted through any abandoned main or non-metallic conduit that does not meet the depth requirements as outlined in [MAIN 1](#).

4.5 PE mains inserted under highways, railroads or rivers shall be in accordance with permit requirements. Refer to [STLP 2.1](#) Casing Pipe Installation

5.0 Considerations

- 5.1 PE main insertion should be limited due to the difficulty of leak detection and installation of new service tee.
- 5.2 Inserting more than one block at a time should be avoid, if possible.
- 5.3 Existing line valve within the abandoned pipe segment should be removed or made inoperable by removing the operator prior to insertion.

6.0 Planning

- 6.1 Insertion of main may involve service disruption for multiple customers at one time.
 - 6.1.1. Plan each segment of insertion to minimize customer outages.
 - 6.1.2. Coordination between Ameren Illinois (AIC) crews and customers is essential as well as coordination among multiple crews working the same job.
 - 6.1.3. Notify customers well in advance of project date, so that any special needs by an individual customer can be addressed.
- 6.2 When engineering the project, ensure that guidance is provided as to which facilities will be inserted and which customers will be impacted.
- 6.3 An engineering insertion plan with written project specific procedures are need when inserting through multiply sections of abandoned gas main to be developed for each segment of insertion. The plan should indicate such items as:
 - 6.3.1. One-way feeds
 - 6.3.2. *Two-way feeds*
 - 6.3.3. *Different pressure systems*
 - 6.3.4. *Detail for each tie in*
 - 6.3.5. *Service lines to replace or tie-over*
- 6.4 Prior to beginning the project, the Gas Supervisor or Engineer shall review the plan for each segment in detail with crews.

7.0 Tracer Wire Installation

- 7.1 An approved tracer wire listed in Table 1 shall be pulled through the abandoned pipe with the new inserted pipe.

#14 solid soft drawn copper tracer wire, 18 66 677, is not approved for main insertion.

- 7.2 The tracer wire from inserted PE main shall be connected to the tracer wire of the existing PE main as required in [CORR 2.1 Section 7.0](#).
- 7.3 See [CORR 2.1 Section 7.0](#) for bonding recommendations at tie-in points to active steel mains.

Table 1 Approved Tracer Wire

Stock Code	Description	Spool Length	Tensile Strength
18 66 208	#12 Solid Soft Drawn Copper	500 ft.	198 lbs.

18 66 369	#12 Solid Soft Drawn Copper	1,500 ft.	198 lbs.
18 52 049	#10 Stainless Steel Stranded	530 ft.	1,260 lbs.
18 52 050	#10 Stainless Steel Stranded	1,000 ft.	1,260 lbs.

8.0 Insertion Procedures

- 8.1 Customers should be given prior notification that there will be service interruption.
- 8.2 To reduce customer down time, fuse together as much of the inserted PE pipe as possible before disconnecting any customers.
- 8.3 Following the insertion plan ([Section 6.3](#)), excavate at each end of the main to be inserted and at all proposed service tee locations.
- 8.4 Locate all valves necessary to isolate the section to be abandoned. If valves are not available, then identify location for line stopper fittings or squeeze offs, as necessary.
- 8.5 Turn off and lock the gas meter valve at each affected customer.
- 8.6 Isolate the main to be abandoned with the designated valves, line stopper fittings or squeeze offs.
- 8.7 Purge the segment to be abandoned according to [PURG 2](#) Purging: Methods.
- 8.8 Remove abandoned pipe sections at the tie-in locations leaving sufficient space for inserting the new main and making tie-ins.
- 8.9 Remove a segment of the abandoned pipe at the location of each proposed service tap.
- 8.10 Inspect all openings and remove burrs or sharp edges, which could damage the main as it is being inserted. Tools such as a pipe reamer, power grinder or file can be used to smooth the edges of the abandoned pipe.
- 8.11 Pull additional length of PE pipe through the abandoned pipe to inspect for damage. If the pipe is damaged then:
 - 8.11.1 Remove the inserted main.
 - 8.11.2 Inspect for cause of damage and make necessary corrections.
 - 8.11.3 Do not reuse the damaged pipe from the previous insertion.
 - 8.11.4 If multiple attempts at insertion have resulted in damage to the main, do not use the abandoned pipe as a casing.
- 8.12 When inserting coiled pipe, a section of straight pipe should be fused on to the leading end. An approved weak link shall be used if the main is to be pulled during the insertion. See [POLY 2.3](#) Polyethylene Pipe: Installation Requirements.
- 8.13 Plug the leading end of the main to prevent debris from entering the pipe.
- 8.14 Pad all locations where the main is entering and exiting the abandoned pipe to provide protection of the main during insertion.
 - 8.14.1 Protection methods may include:
 1. PE protector inserts
 2. Split pieces of PE pipe
 3. Tuff-N-Nuff rock shield. See [MAIN 1 Appendix A](#).
 4. Safety Wrap See [DAMG 1 Section 8.0](#).
 5. Link seals - See [STLP 2.1 Section 6.0](#).

UNCONTROLLED IF PRINTED

6. Preformed FRP Spacer - See [CORR 2.7 Subsection 12.3](#).

- 8.15 Insert main into the abandoned pipe and inspect the main and tracer wire for damage as it passes through cut out openings.
- 8.16 Make a final inspection of the inserted main, the leading edge and at all cutout openings in the conduit.
- 8.17 Fabricate any necessary piping for tie-ins on each end of the main.
- 8.18 Secure the protection methods in place by such means as tape, glue, adhesive or sealant.
- 8.19 Pressure test the inserted main as required in [PTST 1](#).
- 8.20 Tie-in the inserted main to the existing mains on either end of the job.
- 8.21 Introduce gas into the main and purge in accordance with [PURG 2](#) Purging: Methods.
- 8.22 Connect tested services to the inserted main.
 - 8.22.1. Purge service line.
 - 8.22.2. Reinstate service to customer.
- 8.23 Backfill as required in [MAIN 1](#). Compacted backfill under the exposed sections of the inserted main providing support to prevent possible shear points.
- 8.24 The inserted main shall be identified with sufficient information on the job As-Built construction plans that the location can designated in the AIC electronic mapping system.

9.0 Conduit or Sleeve Insertion Procedures (49 CFR §192.321)

- 9.1 Expose each end of the non- metallic conduit.
- 9.2 Ensure conduit is free of debris and the openings' edges are smooth.
- 9.3 Seal the leading end of PE pipe.
- 9.4 Insert the PE pipe and tracer wire through the conduit.
- 9.5 Pull additional length of PE pipe through and inspect the pipe for damage.
 - 9.5.1 If the pipe is damaged, remove the inserted pipe.
 - 9.5.2 Investigate the cause for the damage and correct if possible.

Do not reuse any damaged pipe from a previous insertion attempt.

- 9.5.3 Insert the main again and check for damage.
- 9.5.4 If the cause of the damage cannot be corrected, do not use the conduit
- 9.6 Seal both ends of the main until it is permanently tied-in using approved connections and fittings. See [POLY 2.5](#) Electrofusion or [POLY 2.4](#) Butt Fusion.
- 9.7 Compact the backfill material at the ends of the conduit to provide support for the main and to prevent the creation of a shear point.
- 9.8 Following table shows the minimum inside diameter (ID) of the conduit in which the PE main should be inserted.

Recommended Conduit Size

UNCONTROLLED IF PRINTED

Inserted Main Size	Minimum Conduit Size
2" IPS	4" ID
4" IPS	6" ID
6" IPS	8" ID
8" IPS	10" ID

9.9 The inserted section of main shall be identified on the job As-Built construction plans with sufficient information that the location can be designated in the AIC electronic mapping system.

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0041: Installation and Maintenance of Mechanical Electrical Connections
- 0051: Installation of Exothermic Electrical Connections
- 0061: Inspect or Test Cathodic Protection Bonds
- 0201: Visual Inspection of Installed Pipe and Components for Mechanical Damage
- 0301: Manually Opening and Closing Valves
- 0561: Pressure Test - Nonliquid Medium- MAOP Less than 100 Psi
- 0571: Pressure Test - Nonliquid Medium- MAOP Greater than or Equal to 100 PSI
- 0591: Leak Test at Operating Pressure

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

1.0 Purpose

This procedure provides installation and material requirements for lateral taps.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 PE Tees to PE Pipe](#)

[5.0 Steel Tees to PE Pipe](#)

[6.0 Steel Tees to Steel Pipe](#)

Appendices

[Appendix A - PE Tees to PE Pipe](#)

[Appendix B - Steel Tees to PE Pipe](#)

[Appendix C - Steel Tees to Steel Pipe](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 PE Tees to PE Pipe

- 4.1 High Volume Tee (See [Appendix A-1](#))
- 4.2 Inline Tee (See [Appendix A-2](#))
- 4.3 TDW Sidetap (See [Appendix A-3](#))

5.0 Steel Tees to PE Pipe

- 5.1 Mueller Tee: Steel to PE Pipe (See [Appendix B-1](#))
- 5.2 Mueller Curb Valve Tee: Steel to PE Pipe (See [Appendix B-2](#))
- 5.3 Mueller Bottom Out Tee: Steel to PE Pipe (See [Appendix B-3](#))
- 5.4 TDW Tee: Steel to PE Pipe (See [Appendix B-4](#))

6.0 Steel Tees to Steel Pipe

- 6.1 Mueller Tee (See [Appendix C-1](#))
- 6.2 Mueller Curb Valve Tee (See [Appendix C-2](#))
- 6.3 Mueller Bottom Out (See [Appendix C-3](#))
- 6.4 TDW Tee (See [Appendix C-4](#))

End of Instructions.

MAIN 3.1 Main Installation: Lateral Tap, April 1, 2021.

Revision Notes

Location of Changes	Summary of Changes
Subsection 5.2	Added "Curb" – Mueller Curb Valve Tee to PE Pipe
Subsection 6.2	Added "Curb" – Mueller Curb Valve Tee
Appendix B – B.2.1.1	Mueller Valve Tee, 19 33 562, may be substituted for the curb valve tee.
Appendix B – B-2 Mueller Valve Tee – Table 9 & 10	Updated stock code for Box, Curb, For 2" Valve Tee. Updated description for Tee, Steel, Curb Valve, 2", 1440 psig, with 2" x 2" Square Head
Appendix B – B-3 Mueller Bottom-Out Tees – Table 11 12	Change pressure rating form 2" Line Stopper to 250 psig Updated Stock Code for 6" Weld Inline Tee.

Appendix C – C-2 Mueller Curb Valve Tee – C-2.1.3	Mueller Valve Tee may be substituted for curb valve tee
Appendix C – C-2 Mueller Curb Valve Tee – Table 16	Updated stock code for Box, Curb, For 2" Valve Tee. Updated description for Tee, Steel, Curb Valve, 2", 1440 psig, with 2" x 2" Square Head
Appendix C – C-3 Mueller Bottom-Out Tee – Table 17	Change pressure rating form 2" Line Stopper to 250 psig Updated Stock Code for 4' and 6" Weld Inline Tee.

Appendix A, PE Tees to PE Pipe

A-1. High Volume Tee (See [Figure 1](#))

A-1.1 Installation

A-1.1.1 Connect new tracer wire to existing tracer wire.

A-1.1.2 Lateral connection shall be electrofusion or butt fusion.

A-1.2 Approved materials are listed in [Table 1](#) and [Table 2](#).

A-3. TDW Sidetap (See [Figure 4](#))

A-3.1 Installation

A-3.1.1 Connect new tracer wire to existing tracer wire.

A-3.1.2 Lateral connection shall be electrofusion or butt fusion.

A-3.1.3 Contact the Gas Training Center for proper training and use of the T.D. Williamson side tapping equipment.

A-3.1.4 The Shortstop and Valve combo are available through the MDF.

A-3.1.5 Refer to [TAPS 2.7](#) for installation and tapping procedures.

A-3.2 Approved materials are listed in [Table 5](#) and [Table 6](#).

Appendix B - Steel Tees to PE Pipe

Protective sleeve is required on fittings smaller than 2 inch and is optional on fittings 2 inch and larger.

Protective sleeve shall be installed as one piece and not split in half.

B-1. Mueller Tee: Steel Pipe to PE Pipe (See [Figure 5](#))

B-1.1 Installation

B-1.1.1 Contact the local operating center and verify compatibility of tapping and stopping equipment before calling for the installation of this procedure.

B-1.1.2 Ensure that all fittings have an adequate pressure rating for the pipeline on which they are being used.

B-1.1.3 If protective sleeve is installed, it shall be placed over the transition fitting. See Figure 5

B-1.2 Approved materials are listed in [Table 7](#) and [Table 8](#).

B-2. Mueller Curb Valve Tee: Steel Pipe to PE Pipe (See [Figure 6](#))

B-2.1 Installation

B-2.1.1 The Mueller Valve Tee, 19 33 562, may be substituted for the curb valve tee.

B-2.1.2 Contact the local operating center and verify compatibility of tapping and stopping equipment before calling for the installation of this standard.

B-2.1.3 In steel applications, ensure that all fittings have an adequate pressure rating for the pipeline on which it is being used.

B-2.1.4 If protective sleeve is installed it shall be placed over the transition fitting. See Figure 6.

B-2.2 Approved materials are listed in [Table 9](#) and [Table 10](#).

Appendix C - Steel to Steel Tees

C-1. Mueller Tee (See [Figure 9](#))

C-1.1 Installation

C-1.1.1 Contact the local operating center and verify compatibility of tapping and stopping equipment before calling for the installation of this standard.

C-1.1.2 Ensure that all fittings have an adequate pressure rating for the pipeline on which they are being used.

C-1.2 Approved materials are listed in [Table 15](#).

MAIN INSTALLATION

October 1, 2021

MAIN 3.2 End of Main Extension

1.0 Purpose

This procedure provides installation and material requirements for end of main extensions.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Main Extension - PE Pipe](#)[5.0 Main Extension - Steel to PE Pipe](#)[6.0 Main Extension - Steel to Steel Pipe](#)

Appendices

[Appendix A - Main Extension - PE Pipe](#)[Appendix B - Main Extension - Steel to PE Pipe](#)[Appendix C - Main Extension - Steel to Steel Pipe](#)**3.0 Target Audience**

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 Main Extension - PE Pipe

- 4.1 PE Pipe (See [Appendix A-1](#))
- 4.2 PE Pipe, Increasing Size (See [Appendix A-2](#))
- 4.3 PE Pipe, Decreasing Size (See [Appendix A-3](#))

5.0 Main Extension - Steel to PE Pipe

- 5.1 Mueller Stopper - Steel to PE Pipe (See [Appendix B-1](#))
- 5.2 Mueller Stopper - Steel to PE Pipe Increasing Size (See [Appendix B-2](#))
- 5.3 Mueller Stopper - Steel to PE Pipe Decreasing Size (See [Appendix B-3](#))
- 5.4 TDW Stopper - Steel to PE Pipe (See [Appendix B-4](#))
- 5.5 TDW Stopper - Steel to PE Pipe Increasing Size (See [Appendix B-5](#))
- 5.6 TDW Stopper - Steel to PE Pipe Decreasing Size (See [Appendix B-6](#))

6.0 Main Extension - Steel to Steel Pipe

- 6.1 Mueller Stopper (See [Appendix C-1](#))
- 6.2 Mueller Stopper - Steel to Steel Pipe Increasing Size (See [Appendix C-2](#))
- 6.3 Mueller Stopper - Steel to Steel Pipe Decreasing Size (See [Appendix C-3](#))

UNCONTROLLED IF PRINTED

- 6.4 TDW Stopper (See [Appendix C-4](#))
- 6.5 TDW Stopper - Steel to Steel Pipe Increasing Size (See [Appendix C-5](#))
- 6.6 TDW Stopper - Steel to Steel Pipe Decreasing Size (See [Appendix C-6](#))

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0641: Visually Inspect Pipe and Components Prior to Installation
- 0681: Joining of Plastic Pipe - Stab Fittings
- 0751: Joining of Plastic Pipe - Butt Heat Fusion: Manual
- 0761: Joining of Plastic Pipe - Butt Heat Fusion: Hydraulic Machine
- 0781: Joining of Plastic Pipe - Electrofusion
- 0801: Welding

Appendices

- [Appendix A - Main Extension - PE Pipe](#)
- [Appendix B - Main Extension - Steel to PE Pipe](#)
- [Appendix C - Main Extension - Steel to Steel Pipe](#)

Attachments

NONE.

Compliance Requirements

NONE.

A-3. PE Pipe, Decreasing Size (See [Figure 3](#))

A-3.1 Installation

A-3.1.1 Connect new tracer wire to existing tracer wire.

A-3.1.2 End of main connection shall be electrofusion or butt fusion.

A-3.2 Approved materials are listed in [Table 5](#) and [Table 6](#).

Appendix B - Main Extension - Steel to PE Pipe

NOTES

Protective sleeve is required on fittings smaller than 2 inch and is optional on fittings 2 inch and larger.

Protective sleeve shall be installed as one piece and not split in half.

B-1. Mueller Stopper: Steel to PE Pipe (See [Figure 4](#))

B-1.1 Installation

B-1.1.1 Contact the local operating center and verify compatibility of tapping and stopping equipment before calling for the installation of this standard.

B-1.1.2 The final tie-in weld shall be butt or socket weld. Socket weld is approved for 2 inch and smaller pipe.

B-1.1.3 If protective sleeve is installed, it shall be placed over the transition fitting. See Figure 4.

B-1.1.4 See [TAPS 2.4](#) for minimum cutting/welding distances to prevent damage to stopper.

B-1.2 Approved materials are listed in [Table 7](#) and [Table 8](#).

Appendix C - Main Extension - Steel to Steel Pipe

C-1. Mueller Stopper (See [Figure 10](#))

C-1.1 Installation

C-1.1.1 Contact the local operating center and verify compatibility of tapping and stopping equipment before calling for the installation of this standard.

C-1.1.2 The final tie-in weld shall be butt or socket weld. Socket weld is approved for 2 inch and smaller pipe. If necessary, use a transition weld fitting.

C-1.1.3 Ensure that the stopper fitting has an adequate pressure rating for the pipeline to which it is being used.

C-1.1.4 See [TAPS 2.4](#) for minimum cutting/welding distances to prevent damage to stopper.

C-1.2 Approved materials are listed in [Table 19](#).

METERING

April 1, 2023

METR 1 Requirements

1.0 Purpose

This document prescribes proper handling and installation of gas meters, auxiliary equipment, tertiary equipment, and regulators for Ameren Illinois (AIC) to ensure safe and accurate measurement of natural gas.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Care and Handling](#)

[6.0 Gas Meter Location](#)

[7.0 Installation](#)

[8.0 Regulator Vent Lines](#)

[9.0 Painting Meter Sets](#)

[10.0 Scheduled Removal of Inactive Meters](#)

[11.0 Removed Meters](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor

4.0 General

4.1 Definitions

4.1.1 *Auxiliary Equipment* means an integral device attached directly or remotely to a gas meter. The function of auxiliary equipment is to adjust gas meter usage measurements for changes in gas temperature or pressure (e.g., correctors).

4.1.2 *Tertiary Equipment* means a device that electronically converts signals from a gas measurement system (meter or auxiliary equipment or both) to a useful form, such as flow rate (e.g., flow computers, remote monitoring devices (RMD)).

4.2 Sizing Tables

4.2.1 See Table 1 for sizing meters and regulators as approved for new installations.

Table 1: Sizing Table for Meters and Regulators, New Installations

Application	Section
Meter Sizing:	

New	METR 3.1
Existing	METR 3.1
Regulator Sizing: 7" w.c. Delivery Pressure	METR 3.2, Appendix A
2 psig Delivery Pressure	METR 3.2, Appendix B
5 psig Delivery Pressure	METR 3.2, Appendix C
10 psig Delivery Pressure	METR 3.2, Appendix D
Alternate Approved Regulators	METR 3.2, Appendix E

4.3 Where practical, no building should have more than one-meter location.

4.4 For installation requirements on the related service lines, see [SERV 1](#).

5.0 Care and Handling

5.1 The following equipment, as used to measure and report customer gas usage, shall be transported and handled in a manner that ensures the safe, proper, reliable, and accurate operation:

5.1.1 Gas Meters

5.1.2 Auxiliary Equipment (e.g., correctors)

5.1.3 Tertiary Equipment (e.g., remote meter display (RMD))

The care is to ensure that equipment is installed at a customer site in a manner to measure gas reliably and accurately.

5.2 Handling and Transporting Considerations

5.2.1 General

1. **Connections:** The inlet and outlet connections of gas meter shall always be capped or plugged when not in service.

Meters do not have to be capped when located in the meter proofing room, soaking room, or after they have been tested and waiting for repairs.

2. **Meters, auxiliary equipment, and tertiary equipment:** Items that have been dropped or excessively jarred should not be placed in service, but do the following:
 - 2 a. Identify this equipment as "dropped."
 - 2 b. Return equipment to the meter shop for testing and adjustment to verify it will operate correctly and record accurately.

5.2.2 **Transporting meters:** Haul meters in an upright position and secured in place.

UNCONTROLLED IF PRINTED

1. If possible, transport small diaphragm meters in the meter compartments of utility trucks.
 2. Make every effort to minimize the time meters are carried on trucks.
- 5.2.3 *Rotary and turbine meters*: Drain oil before transporting unit. Securely fasten in the transport vehicle.
- 5.2.4 *Correcting devices and other remote monitoring devices (RMDs)*: Carefully transport and handle prior to installation and after removal from service to prevent damage.
- 5.2.5 *Regulators*: Transport in utility truck compartments or secure in the transport vehicle.

Proper handling is critical when meters and auxiliary/tertiary equipment are removed from service so that subsequent accuracy test at the meter shop is representative of the unit accuracy when they were in service.

- 5.3 Gas meters removed as part of a "Sample Lot" shall be handled with extra care. The handling is especially critical as such meters are accuracy tested and the results used to statistically evaluate meter accuracy of an entire group of meters, which are commonly referred to as a "Sample Lot."

If sample meters are jarred, dropped, or improperly handled or transported, their accuracy can be affected - possibly resulting in inaccurate test results and failure of the gas meter Sample Lot. Such failure would then cause the entire Lot to be removed from service.

- 5.4 Meters that are not in service shall be stored in a secure, weather protected environment and stacked in an upright position in a manner recommended by the manufacturer.

The weather protected environment does not apply to utility vehicles used to transport meters.

6.0 Gas Meter Location

6.1 Residential Meters

- 6.1.1 New or relocated meter sets shall be located:
1. Immediately adjacent to and should be within 3 feet of an outside wall.
 2. In a location where venting gas will not accumulate.
 3. At a location readily accessible to AIC personnel during normal working hours and during an emergency.

- 6.1.2 New or relocated meters shall not be installed indoors unless an outdoor installation is not possible or would make meter installation financially impracticable.
- 6.1.3 If a new or relocated meter must be installed inside, it shall be as follows:
 - 1. As close to service line entrance as possible.
 - 2. Installed in a ventilated location.
 - 3. Installed not less than 3 feet from any ignition source, or any heat source which might damage the meter.
 - 4. Regulator must be located outside the building or in a separate meter or regulator building.

6.2 Commercial or Industrial Meters

- 6.2.1 Meter sets shall be installed in a location acceptable to the local Gas Supervisor or Gas Engineering.
- 6.2.2 Meters may be installed inside a designated meter building that is not used for human occupancy.

6.3 Unacceptable Meter Locations

- 6.3.1 In front of a building unless the property owner gives consent and there is no other suitable location.
- 6.3.2 In locations where the installation, reading, inspection, repairing, testing, changing, and removal of the meter could be difficult or hazardous.
- 6.3.3 In an unvented or inaccessible location.
- 6.3.4 In a bedroom, closet, bathroom, or small unventilated rooms.
- 6.3.5 Under stairways or fire escapes.
- 6.3.6 Within 3 feet of a heat source which could damage the meter or exposed the meter to temperatures that are outside those recommended by the manufacturer, typically higher than 140 °F or below -40 °F.
- 6.3.7 In direct contact with the soil, concrete, or other surfaces that will cause corrosion (unless the gas meter is designed for those conditions). This also applies to any auxiliary and tertiary equipment/instruments connected to the meter.
- 6.3.8 Directly under downspouts or other facilities that may cause icing conditions.
- 6.3.9 Under cooking equipment exhaust where cooking grease residue could coat the meter.
- 6.3.10 Where the service regulator vent is:
 - 1. Within 3 feet of any ignition source, such as:
 - 1 a. Electric meter base.
 - 1 b. Meter sockets.
 - 1 c. Electrical disconnect switches.
 - 1 d. Light switches and electrical receptacles.
 - 1 e. AC condensing unit.
 - 1 f. Heat pump.
 - 1 g. Stand-by generator.

UNCONTROLLED IF PRINTED

2. Above, below, or within 12 inches horizontally:
 - 2 a. To the side of a basement window that can be opened.
 - 2 b. First floor window that can be opened.
 - 2 c. Door.
 - 2 d. Stairs.
 - 2 e. Dryer vent.
 - 2 f. Gas appliance exhaust.
 - 2 g. Air intake/high efficiency gas appliance intake.
3. Where the service regulator cannot vent freely to the atmosphere.
4. If the requirements above cannot be reasonably met, consult with Supervising Engineer for approval to install an approved slam-shut regulator.

Approved Slam-Shut Regulators				
Model	Body Size	Delivery Pressure	Max Inlet Pressure	Stock Code
BelGas P100SX	1" x 1"	7" w.c	125 psig	62 06 495
PF – 25	1" x 1"	7" w.c	125 psig	62 06 496

- 4 a. Regulator capacity information is in [METR 3.2 Appendix A](#)
- 4 b. Manufacturer's Operating Manuals are in [METR 4](#)

6.4 Damage Protection

- 6.4.1 When practical, locate a newly installed or relocated gas meter in an area free of vehicular traffic.
- 6.4.2 Where meter is exposed to vehicular traffic or other outside forces, it shall be protected using guard posts or railings. See Table 2 for meter guards (prefab steel post) available through the AIC storeroom.

Table 2: Available Meter Guards - AIC Stock

Stock Code	Description
62 05 159	2-inch IPS legs and cross members
62 05 160	4-inch IPS legs and 2-inch IPS cross members
<i>Note:</i> See METR 4 for drawings of these prefab meter guards.	

- 6.4.3 To extent doable, provide protection from extreme weather elements, especially to regulators and related vents where there is potential for severe water or freezing conditions to interfere with regulator operation.
Example: Provide protection where ice or snow could come off roof and damage equipment.

6.5 AIC may relocate unacceptable meter sets (created by others) to an acceptable location at customer expense. An unacceptable location is one that violates the provisions of this standard or governing authority.

6.6 Refusal of Service

- 6.6.1 A meter or service may be refused to a customer if, in AIC judgement:

1. The metering installation is hazardous,
 2. Customer's installation piping or gas utilization equipment is hazardous, OR
 3. Conditions are such that gas service cannot be safely provided.
- 6.6.2 In refusing, AIC shall inform the customer in writing within 5 business days of the reason for refusal to provide gas service.

7.0 Installation

7.1 General

- 7.1.1 The *gas meter set* is defined as all pipe, regulator(s), fittings, and equipment from the outlet of meter valve to outlet connection of the meter or furthest downstream connection to an AIC installed fitting or equipment.
- 7.1.2 Gas meter sets and all associated equipment are the property of AIC. Only qualified AIC employees, contractors approved by AIC, or agents of AIC are authorized to install, relocate, modify, or maintain a meter set owned by AIC.

7.2 Installation Considerations

- 7.2.1 Meter sets shall be secure, upright, plumb and level in all directions to ensure meter accuracy and to prevent undue stress on the connecting piping and meter.
- 7.2.2 Where possible, effort should be made to install one of the following, downstream of the meter bar outlet, on new, replaced, relocated, or rebuilt gas meter sets:
1. A system bypass valve:
 - 1a. Angle Bypass Valve, 1" x1", (Stock Code 39 22 632), OR
 - 1b. Mueller Brisco Bypass Valve, 1" x 1", (Stock Code 39 01 140),
- or
2. A lock wing ball valve.
- 7.2.3 For new installation, the residential customer's fuel line should be:
1. Minimum of a 1-inch black-iron pipe passing through the structure wall or foundation (with appropriate sealed sleeve), or through the mobile home skirting; or
 2. CSST terminal bracket mounted to the outside wall.
- 7.2.4 The black-iron pipe should be connected to outlet of the meter bar or header. This provides additional support which reduces the stress on the meter set.

An exception to this would be in areas where installation of flex braided connectors is required or recommended to protect against subsurface subsidence or earthquakes.

- 7.2.5 The meter set should present a good appearance.
- 7.2.6 All gas meters shall be temperature compensated or have auxiliary and/or tertiary equipment that compensates for temperature.

- 7.3 All meters (diaphragm, rotary, and turbine) shall have a register or display on the meter or correcting device that displays the gas consumption in a definite and known proportion to the actual gas delivered to the customer. The register or display should be plainly visible for the customer to read. If requested, the Company will explain how to read the display and how the reading is used for billing.
- 7.4 Security
 - 7.4.1 All meters, auxiliary and tertiary equipment must have security seals installed or measures taken to secure the AIC equipment to deter unauthorized personnel from tampering with the equipment.
 - 7.4.2 All meter by-pass valves located upstream of the meter outlet shall be locked closed, when not in use, to deter unauthorized personnel from tampering with the valve.
 - 7.4.3 Regulators installed on fixed factor meter installations shall be security sealed in accordance with [METR 2.8, Subsection 6.4](#), under Pressure Factor Metering.
- 7.5 The meter connections and service piping should be inspected and cleaned before making any connections. Damaged threads, dirt, or other debris could damage the meter or cause a leak. Use AIC approved NO-OX-ID grease as shown in Table 3 on all threaded meter swivel connections.

Table 3: NO-OX-ID (No Oxide) Grease for Lubricating Gas Meter Swivels

Stock Code	Description
31 53 099	Grease - No Oxide: NO-OX-ID A-Special, 1# can
31 55 246	Grease - No Oxide: NO-OX-ID A-Special, 8 oz tube
31 59 733	Grease - No Oxide: NO-OX-ID Homac TL 101, 8 oz squeeze bottle

- 7.6 If a gas meter or regulator is located inside a building, then install a readily accessible shut-off valve outside the building.
- 7.7 Regulators located inside a building shall be vented to the outside with metallic pipe/tubing. See [Section 8.0](#)
- 7.8 Gas meter sets susceptible to flooding shall be addressed as follows:
 - 7.8.1 Regulator vent lines extended above expected high-water line, OR
 - 7.8.2 Regulator and meter installed above the expected high-water line, OR
 - 7.8.3 Designated as; need to be removed during flood conditions.

Gas meters will function when submerged but will need the AMI devices replaced following submergence.

- 7.9 All new residential meter sets shall have an insulating fitting installed upstream of meter at the time of construction.
- 7.10 Review all large-meter installations with Corrosion Control personnel (for that operating area) to determine proper insulation measures. See [CORR 2.1, Section 7.0](#), Insulating Points.

8.0 Regulator Vent Lines

- 8.1 Relief vent lines or relief stacks are to be made from metallic pipe/tubing.
- 8.2 All relief lines shall be the same diameter, or larger, than the regulator vent opening.
 - 8.2.1 Increase the vent diameter one pipe size every 10 feet to minimize flow restriction.
 - 1. The 10 feet may include up to 4 threaded fittings, (elbows, tees, etc.)
 - 2. If more than 4 threaded fittings are needed in the vent line, contact engineering for support.
 - 8.2.2 **Do Not** use street elbows.
 - 8.2.3 Keep the length of relief vent line as short as possible to minimize restriction and prevent adverse regulator operations.
 - 8.2.4 Contact Gas Engineering for relief vent lines greater than 45 feet in length.
- 8.3 Provide adequate support for vent line to prevent strain on the regulator case.
- 8.4 Locate the relief vent opening at least 12 inches above grade and ensure sufficient distance from sources of ignition and building openings.
- 8.5 The vent line shall be gas-tight, and termination shall be located such that:
 - 8.5.1 Gas can escape freely into the atmosphere,
 - 8.5.2 Water, ice, or snow cannot block the opening, and
 - 8.5.3 To weatherproof, provide a bug screen facing downward or a hinged rain cap.
 - 8.5.4 Vent lines connected to a regulator spring case or to the outlet side of a relief valve do **NOT** require pressure testing.

If a hinged rain cap is used, care should be taken when painting to not paint the cap shut or affect its operation.

- 8.6 Where relief venting may produce a large flow of gas in a public area, the vent termination should be installed above the pedestrian traffic.
- 8.7 Install a separate vent line for each regulator.

Multiple vent lines may be manifolded (using larger pipe) in accordance with accepted engineering practices to minimize backpressure in event of diaphragm failure.

- 8.8 Consult with Gas Engineering for any variance from the above, or questions concerning sizing.

9.0 Painting Meter Sets

- 9.1 All **uncoated** piping, fittings, and valves **should** be cleaned and coated with AIC approved paint at the time of installation **in accordance with CORR 1 Subsection 16.1 Painting Pipeline Facilities**.
- 9.2 Touch-up pre-painted meters and regulators with approved paint if needed.

9.3 Do not paint:

9.3.1 Regulator and relief valve vent openings.

9.3.2 Meter and regulator name plate badges.

9.3.3 Meter indexes.

9.3.4 Electronic Corrector or any other auxiliary equipment.

9.3.5 Remote Meter Reading Device or other tertiary equipment.

9.4 When completing routine work at the customer's premise, inspect the meter set condition, and complete any necessary re-painting or note it for scheduling future maintenance.

10.0 Scheduled Removal of Inactive Meters

10.1 Meters that have been inactive for 18 months or longer are identified each day by CSS and an OAS order with an MJ-87 (inactive Meter Removal) trouble code will be issued.

10.2 The Gas Supervisor should periodically review these orders and take action to ensure that the inactive meters are removed from service within 6 months.

10.3 When performing meter removals, gas field personnel should be alert to any indications that the structure is being demolished and report these structures to the Gas Supervisor for follow up action.

11.0 Removed Meters

11.1 Removed meters shall be returned to the shop in their removal condition.

11.2 Treat removed meters with the same care as a new meter since they must be tested for accuracy when returned to the meter shop. The follow-up test results can impact the customer's bill and any reports to the state commission. For handling and transporting meters, see [Subsection 5.2](#).

11.3 If a meter is removed from service and removed from the premise for any reason, it must be read and returned to the Gas Meter Shop for testing before the meter and/or any associated devices are adjusted, repaired, or replaced.

End of Instructions.

Operator Qualification (OQ) Required?

YES

0201: Visual Inspection of Installed Pipe and Components for Mechanical Damage

0301: Manually Opening and Closing Valves

0381: Spring Loaded Pressure Regulating Device-Inspection and Testing, Preventive and Corrective Maintenance

0591: Leak Test at Operating Pressure

0641: Visually Inspect Pipe and Components Prior to Installation

0711: Joining of Pipe - Compression Couplings

0721: Joining of Pipe - Threaded Joints

UNCONTROLLED IF PRINTED

0731: Joining of Pipe - Flange Assembly

0951: Installation of Pipe Above Ground

0961: Above Ground Supports and Anchors - Inspection, Preventive and Corrective Maintenance

METERING

April 1, 2023

METR 2.1 Replacement and Retirement

1.0 Purpose

This document prescribes the considerations for proper replacement and retirement of Ameren Illinois (AIC) gas meters to ensure safe and accurate measurement of natural gas under varying pressure conditions. This includes timely upgrading of equipment consistent with industry practice and gas measuring technology. Further, it addresses various replacement of meters and provides the available avenues for retiring gas meters in MMS.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Obsolete Meters](#)[5.0 Meter Retirements](#)[6.0 Meter Exchanges](#)[7.0 Large-Volume Diaphragm Meter Replacement](#)[8.0 Meters Removed from Field](#)[9.0 Obstructions at Worksite](#)[10.0 Painting Meter Set](#)[11.0 Reporting](#)

Appendices

[Appendix A - Postcard Contact](#)[Appendix B - Letter Contact](#)**3.0 Target Audience**

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor

4.0 Obsolete Meters**4.1 General**

4.1.1 AIC has a wide variety of gas meters by various manufacturers, with different designs and case material, in service across the various operating territory. While most meters are mechanically reliable and accurate, some have been identified by current standards as obsolete.

4.1.2 This section identifies the obsolete meters that should be considered for replacement.

4.2 Replacing Obsolete Meters

UNCONTROLLED IF PRINTED

- 4.2.1 Residential gas meters that are considered obsolete should be exchanged, when possible, in conjunction with routine service work.
- 4.2.2 Exchanging these meters during routine service work will proactively reduce the number of problematic and/or obsolete meters while distributing the replacement cost over time.
- 4.2.3 This practice should reduce repeat visits, customer outages, and improve customer satisfaction.
- 4.2.4 Large diaphragm gas meters (EMCO, Sprague, and "B" Series) that are considered obsolete should be identified and replaced when resources are available based upon Region workload.
- 4.2.5 Gas meters shall not be replaced during routine service work solely based on age.
- 4.2.6 Table 1 identifies all those gas meters that are considered obsolete:

Table 1: Meters Considered Obsolete

METER TYPE	METER CODE
Diaphragm Meters	
Cast iron meters	Not Applicable
Meter/regulator combination units	02200 - 02240
American/Metric "B" series meters	Not Applicable
American 5B225 meters	01820, 01821, 01828, 01829, 91820 & 91821
Emco meters	01300 - 01370
Lancaster meters	01750, 01760
Rockwell 150 & RX meters	01500; RX per badge ID
Rockwell R175, R200 & R250 meters	01510, 01520, 01521, & 01530
Rockwell 310, 315 & 415 meters	01540; 01640, 01641, 01648, 01649 91640 & 91641; 01550, 01551, 01558, 01559, 91550 & 91551
Sprague 1A meters	01280
Sprague 175 & 240 meters with square index box	Not Applicable
Sprague Metris 250 meters	01270
Sprague 305 meters	01220
Sprague 400 large body meters (MCO1231)	(See above std. body)
Sprague 675 & 1000 meters	01240, 01241, 01248, 01249, 91240 & 91241; 01250, 01251, 01258, 01259, 91250 & 91251
Superior meters	01700 - 01720
Any meters that have appearance of being physically damaged by corrosive gases, abusive handling, fire, explosion, or over-pressurized	Not Applicable

Rotary Meters	
Roots/Connersville meters (old-style), sizes 2.5 x 7 through 28 x 42	Not Applicable
Roots meters, sizes 3M, 5M, 7M, 11M, and 16M with cast iron impellers	Not Applicable
American CVM meters	Not Applicable

5.0 Meter Retirements

5.1 Criteria for Retiring

5.1.1 Any gas meter that meets one or more of the following criteria should be retired once the meter has been "in-tested" and test results are recorded in MMS.

1. Small diaphragm meter (425 cfh or less) that:
 - 1 a. Is 30 years or older.
 - 1 b. Will require more than a "Class B" repair.
2. Damaged by exposure to corrosive gases, abusive handling, over-pressurization, fire, explosion, or is physically damaged.
3. Found with an internal leak.
4. Estimated repair cost exceeds 80% of a new meter (at similar capacity).

5.1.2 Turbine meters, orifice meters, and all other meters not covered above, may be retired at discretion of the Gas Meter Supervisor.

5.2 Procedure for Retiring Meters

5.2.1 All meters shall be retired in MMS.

5.2.2 A meter can be retired in the system by using **any one** of the following methods:

1. A report listing the gas meter retirements is passed to the Asset Management System (AMS) so that the meters can be removed from gas plant records.
2. A retirement exception (error) report is processed through Customer Service System (CSS) and forwarded to IL Metering and Projects for review and corrections when required.
 - 2 a. Under the system tab "Meter Data" - "Meter Information Update," click on the "Retire" button listed across the top.
 - 2 b. At the MMS "Receive Station."
 - 2 c. At the PC Prover test stand.
 - 2 d. At the MMS "Repair Station."

6.0 Meter Exchanges

6.1 General

6.1.1 Gas meters must be tested in accordance with Illinois Commerce Commission (ICC) regulations.

6.1.2 IL Metering and Projects is responsible for administering the various meter testing programs and will provide lists of meters to be tested to the various operating groups.

6.1.3 This procedure explains the testing programs and provides guidance to operating groups for scheduling and removing gas meters from service when they are due for test.

6.2 Meter Management System (MMS)

6.2.1 MMS is the computer system that provides overall support for AIC gas (and electric) meter testing activities.

6.2.2 MMS contains functionality to select meters for the sample, periodic, and mileage testing programs and produces the various lists, change orders, and other documents required to administer these programs.

6.2.3 MMS collects test information directly from various gas meter testing sites and transfers data to CSS.

6.3 Periodic Testing Program

6.3.1 *Periodic Testing* is a term applied to ICC's original rules for testing diaphragm gas meters on a fixed 10-year interval; thus, may not remain in service more than 120 months since the last test date (unless included in an approved sample testing program). This means that size 675 gas meters and larger shall be tested for accuracy at intervals not exceeding 120 months. And, this applies to any small meters that are not included in the sample testing program.

6.3.2 Periodic testing also includes a 60-month test requirement for all rotary and turbine meters. See [Paragraph 6.3.5](#).

6.3.3 Lists and Outage Analysis System (OAS) meter exchange and field test orders for meters due for periodic test may be distributed, typically in December. The list will contain the last test date for each meter listed.

6.3.4 The Gas Supervisor is responsible to ensure that all diaphragm meters are removed prior to their test due date.

6.3.5 The Gas Technical Services (GTS) Supervisor is responsible for ensuring rotary meter and turbine meter tests are performed prior to the due date from their last test date as follows:

1. Rotary meter differential tests performed at least *every 60 months*.
2. Turbine meter spin tests performed at least *every 12 months*.
3. Turbine accuracy tests performed at least *every 60 months*.

6.4 Mileage Testing Program

6.4.1 This testing program operates on the premise that measurement accuracy is a function of diaphragm cycles rather than years of service. However, it cannot extend the time limits. When considered, it is typically applied to larger size diaphragm meters.

The mileage testing program is not currently used at AIC. Therefore, details are not presented.

6.5 Sample Testing Program

6.5.1 AIC will provide notification to the ICC Staff of the intention to use "Sample testing." Since most gas meters maintain their accuracy for periods of 30 years or

longer, sample testing programs result in significant cost savings through reductions in the number of meters exchanged for test.

- 6.5.2 Meters subject to sample testing are assigned to meter lots as determined by manufacturer, size, and year installed. AIC meters are combined for sample testing purposes. The lots become eligible for sampling in their 9th year of service and are sampled each year thereafter until the lot fails, or in the alternative, all meters in the lot have been removed through normal attrition and sampling.
- 6.5.3 The sample test plan applicable to AIC is known as "Double Sampling" plan. Under such plan, an initial sample is selected and tested. Based upon the results of the first sample, the lot is either accepted, rejected, or identified as inconclusive. If the first results fall into the inconclusive category, a second sample is taken. Upon analysis of the second sample test results, the lot is either accepted or rejected.
- 6.5.4 Lists and OAS exchange orders for meters due for test under the first sample will typically be distributed in December. IL Metering and Projects will establish a due date for completion, typically by end of May. The advantages of this schedule are:
1. Allows work to be completed prior to construction season.
 2. Cooler temperatures facilitate operational checks of heating equipment upon completion of meter exchange.
 3. Early completion of the first sample allows time for second samples that might be required, or for completing any rejected lots.

6.6 Scheduling Meter Exchanges

- 6.6.1 All residential "sample meter" exchanges will be done by appointment unless otherwise approved by Gas Supervisor. Make initial contact with customers by phone, postcard, or letter at discretion of the Gas Supervisor. See [Appendix A](#) for a sample message. Avoid "Cold Calls" that result in wasted time and adverse customer reaction. To extent possible, schedule all meter exchanges during normal working hours to minimize costs and avoid overtime.

If meter set is equipped with a bypass valve for the use of a portable CNG tank, customer notification and/or presence is not necessary for the meter change.

- 6.6.2 Customers who fail to respond to an appointment request will receive a follow-up letter, which progressively stresses the urgency of the required work. Allow a minimum of one week for customer to respond before sending a third (final) letter. In event that the third letter is required, it will be sent via certified mail or CSS generated so that the final contact attempt is documented. See [Appendix B](#) for sample letter (also available in CSS).

6.7 Requesting Substitute Samples

- 6.7.1 From time to time, situations exist that make it extremely difficult to exchange a meter that is due for sample testing. In these circumstances, the Gas Supervisor may request that a test meter requirement be waived and that a substitute meter be selected. When a substitute meter is requested, it will be selected at random

from entire lot. This may result in work being shifted from one location to another. The Gas Supervisor should use such requests as a last resort.

6.7.2 No substitutes are allowed for meters identified for periodic testing.

6.8 Customer Satisfaction

6.8.1 Gas meter exchanges may require significant interaction with customers. As such, meter exchanges provide an opportunity to influence customer satisfaction, either positively or negatively, depending upon AIC performance.

6.8.2 To avoid dissatisfied customers, follow these practices:

1. Give customers advance notice by telephone, postcard, or letter that a meter test is due. An appointment will be made to do the meter exchange.
2. Make every effort to keep scheduled appointments. If an emergency arises that prevents honoring an appointment, then contact the customer and provide an explanation and apology.
3. Exercise care when entering a customer's home to avoid tracking in outside elements.
4. Never smoke in a customer's home.
5. Wipe off soap solution from exposed piping and floors.
6. Remove pilot lighting aids and related items from the home.
7. Always treat customers with courtesy and respect.

6.9 Malfunctioning Thermocouples and Control Valves

6.9.1 Occasionally, the pilot light on a gas appliance that has been shut off for meter exchange cannot be re-lit due to a defective thermocouple and/or control valve. In such instances, customers often claim that the equipment was damaged by gas field personnel since the appliance was working before the meter exchange. Rather than dispute such claims, the Gas Supervisor may authorize replacement of thermocouples and/or control valves at company expense when failure is identified at the time meter is exchanged.

6.9.2 This policy does not apply to:

1. Equipment that was not in service immediately prior to meter exchange, or
2. Any major repairs such as cracked heat exchangers, rusted or improper venting, defective piping, or similar items.

7.0 Large-Volume Diaphragm Meter Replacement

7.1 General

7.1.1 Large diaphragm gas meters are typically considered to be 800 cfh and larger.

7.1.2 The meter replacement could be for a like-size "Periodic" exchange or to rebuild/resize the meter set.

7.1.3 These procedures are established to perform safe and efficient meter replacement with minimal interruption to the customer's gas service.

7.1.4 Replacing this class of meter might require assistance of a vehicle equipped with crane.

7.1.5 The job assignment and meters/materials needed should be obtained from the OAS order on the assigned electronic device.

UNCONTROLLED IF PRINTED

7.2 Inspecting Customer Piping and Appliances

7.2.1 Gas field personnel shall look for code violations and/or hazardous conditions in accordance with the following:

1. NFPA 54, National Fuel Gas Code,
2. HUD Title 24 Building Code for manufactured housing, or
3. Applicable local codes.

7.2.2 If hazardous conditions exist and remediation work exceeds the normal scope of repair work performed by gas field personnel, then complete a Notice of Code Violation or a Hazardous Condition Warning tag and document on the OAS 6H screen.

7.3 Meter and Regulator Inspection

7.3.1 Before touching the meter set, check riser, meter, and customer piping for possibility of AC voltage with a "volt stick". If voltage is detected (i.e., volt-stick alarms), contact the Gas Supervisor to initiate an investigation of the voltage source prior to performing any additional work on energized section. See [METR 2.2, Subsection 7.2](#), AC Voltage on Meter Set.

Figure 1: Image of Volt Stick

7.3.2 Verify meter number.

7.3.3 Record the removed meter reading.

7.3.4 Check condition of the meter set.

7.3.5 Check regulator outlet pressure and lockup pressure:

1. On all "New-Service Connects."
2. Whenever a meter is exchanged or installed.
3. Whenever a meter valve or service regulator is changed.

7.4 Meter Header Inspection

7.4.1 Perform a "Meter Header Inspection" in accordance with [METR 2.2](#).

7.4.2 When weather conditions or other factors prevent any of the above inspections and maintenance work from being completed, gas field personnel shall document the condition and report to the Gas Supervisor for follow-up.

7.5 Meters Being Transported or Moved

7.5.1 Anytime a meter is moved, exercise care to prevent possible damage to meter or its ability to accurately measure gas consumption. Always handle meters carefully to avoid hitting, dropping, bumping, or any other disturbance that may negatively impact the meter operation. See [METR 1, Section 5.0](#), Care and Handling.

7.6 Exchanging the Meter

- 7.6.1 When exchanging the meter, use a backup wrench to prevent altering other piping or devices connected to meter.
- 7.6.2 Ensure that the bypass, where applicable, has been properly operated and that the load has been transferred to the bypass run.
- 7.6.3 For bypass operation, turn off the meter outlet valve first while monitoring an appropriate pressure gauge to ensure that gas supply to customer is not interrupted.
- 7.6.4 When a bypass operation is not used, closing the outlet valve will also eliminate any release of gas contained in the customer fuel line. The inlet valve to the meter can then be shut off to isolate meter.
- 7.6.5 If necessary, tap the meter nuts/unions with a hammer after applying penetrating oil to loosen rusted connections. Once the meter nuts/unions have been loosened, then remove the existing meter and set aside, taking care not to damage meter.
- 7.6.6 If the meter has inlet/outlet nipples, remove them and install them on the new meter. Clean and grease/dope old fittings to establish a gas tight seal to meter and connecting union.
- 7.6.7 Securely connect the replacement meter to inlet piping. Hand tighten the outlet meter nut/union, or flange, in order to purge air through meter to the outlet side once meter inlet valve is turned on. Once a slight natural gas odor is recognized, securely tighten the outlet connection. The meter, header, riser, and any other attachments that might have been altered shall be fully checked for leaks.
- 7.6.8 When transferring the load from, or to the meter, it is necessary to follow established bypass procedures. See [METR 2.5](#).
- 7.6.9 Perform an inspection of the customer's fuel line and appliances *only* if there is an interruption of gas service or customer complaint during the meter replacement.

7.7 Changing Correcting Devices

- 7.7.1 When doing a meter replacement, a correcting device exchange may be required.
 - 1. If the new meter does not have a correcting device, existing correcting device may be transferred to the new meter. Inspect the transferred correcting device to verify proper operations within 60 days following the meter exchange.
 - 2. If new meter has a correcting device on it, then input the required data to the OAS order and include on Gas Meter Data Sheet, [METR 2.10](#).
 - 3. Where the correcting device on existing meter is different than index on new meter (lbs. to in. or in. to lbs.), then the proper correcting device shall be provided for the new meter.
- 7.7.2 Meters with automated reading devices installed must be exchanged as a combined single unit. The AMI device must stay with the meter it was assigned to and is identified by that meter number.

8.0 Meters Removed from Field

- 8.1 Keep new or replacement meters separate from removed meters being returned from the field.

- 8.2 Ensure that removed meters have dirt or debris brushed off and that inlet and outlet ports have proper caps or plugs installed to keep out water, dirt, or debris. If no caps/plugs available, then use other protection (e.g., duct tape over the inlet/outlet connections) to prevent foreign material from entering meter.
- 8.3 Once meters are returned to the Service Center, handle them with care and place in appropriate location at the Service Center pending transfer to the gas meter shop.

9.0 Obstructions at Worksite

- 9.1 Obstructions at the worksite that interfere with performing meter replacement should be handled by the employee if they are minor and can be resolved reasonably.
- 9.2 Any significant obstructions (e.g., landscaping, large branches, material, drainage issues, vehicles, equipment) that may complicate the routine meter replacement shall be brought to the customer's attention for resolution; supervision is to be notified concerning the job. The Gas Supervisor or GTS Supervisor shall follow-up with the customer concerning removal of obstruction.
- 9.3 Evaluate the situation and advise the supervisor of observed alternatives to the obstruction issue impacting meter replacement. Enter information electronically for future reference.

10.0 Painting Meter Set

- 10.1 If above ground piping needs painted, it shall be done in accordance with [METR 1 Section 9.0 Painting Meter Set](#).

11.0 Reporting

- 11.1 Complete appropriate OAS orders.
- 11.2 Complete Gas Meter Data Sheet, as applicable, and distribute. See [METR 2.10](#).

End of Instructions.

Contact Effort 2: Use postcard if no response to initial contact.

CUSTOMER ACTION REQUIRED

[Or]

2nd NOTICE - CUSTOMER ACTION REQUIRED

Dear Valued Customer,

Your gas meter has been identified as due for test to comply with the Illinois Commerce Commission regulations. The meter must be replaced to be tested. For gas service to resume after replacing the meter, Ameren Illinois Utilities offer you a choice of two options:

1. Schedule an appointment to meet a representative at your residence to change the gas meter, inspect your appliances, and relight the pilot lights on your gas appliances. *(No charge for this service.)*
2. Identify a day to have the meter changed and your continuity of pilot service **left off**. This option allows you to relight your appliances at your convenience and you do not have to be present when a representative changes the meter. For appliances with electronic ignition, service would resume.

We ask that you call our office at xxx-xxx-xxxx during the hours of x:xx a.m. and x:xx p.m. to select the option you prefer for replacing your gas meter.

Appendix B - Final Letter Contact

Step 3: Letter used if previous contacts are ignored; send certified mail or use CSS generated letter so that third effort is documented.

CUSTOMER NAME

ADDRESS

CITY ST 99999

FINAL REQUEST:

METER APPOINTMENT REQUIRED

Service Address:	ADDRESS	Account Number	99999-99999
	CITY ST 99999	Meter Number	99999999

Dear Customer,

UNCONTROLLED IF PRINTED

This is our third attempt to contact you regarding need to test your natural gas meter. As explained in previous notices, your gas meter is due for testing, as required by the Illinois Commerce Commission.

Since the gas meter must be removed from service for testing, a short interruption of your gas service will be required while we install a replacement meter. Following the meter change, we will need access to your gas appliances to relight your appliances and restore gas service.

We had hoped to perform the meter change at a time convenient to you, so we could minimize the impact on your gas service. Unfortunately, we have not received a response to our previous requests for you to contact us regarding appointment.

As a result, our only remaining option is to change the meter and leave the gas supply off following the work. This work is currently scheduled to be performed on or after 9/9/99, unless you request a different appointment before that date. Please note that if we are called back to your home to relight appliances later, service charges may apply.

We once again urge you to call us to set up an appointment convenient to you so you can avoid an extended interruption of your gas service and possible service charges.

Thank you for your prompt attention to this matter.

Sincerely,

Customer Service: 1.800.755.5000

METERING

May 15, 2022

METR 2.2 Meter Inspection and Testing - Field

1.0 Purpose

This procedure identifies requirements for various testing of Ameren Illinois (AIC) gas meters and testing equipment to meet or exceed accuracy limits and schedules established by the Illinois Commerce Commission (ICC). It includes the various criteria and guidelines governing the inspection and testing programs applicable to field activities.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Sample Testing](#)

[5.0 Periodic Testing](#)

[6.0 Customer Requested Test](#)

[7.0 Meter Header Inspection](#)

[8.0 Records and Retention](#)

Appendices

[Appendix A - AC Voltage Potential at Meter Set](#)

[Appendix B - Regulator Related Pictures](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor
- Gas Meter Shop Foreman
- IL Metering and Projects Supervisor

4.0 Sample Testing

4.1 Regulatory Requirements

- 4.1.1 Illinois Administrative Code Part 501 allows for sample testing of all new and in-service diaphragm gas meters.
- 4.1.2 AIC must notify the ICC of intention to use "sample" testing.
- 4.1.3 The sample testing plan results shall be filed as part of the annual Form 21 report. IL Metering and Projects will provide the Form 21 data to Plant Account for formal filing of report.

4.2 Sampling Criteria

- 4.2.1 AIC practices the Double Sampling Plan for normal inspection as based on ANSI/ASQ Z1.4 2008, with General Inspection Level II at AQL of 6.5 using "Sampling Procedures and Tables for Inspection by Attributes." Sample lots are evalu-

UNCONTROLLED IF PRINTED

ated using the Kolmogorov-Smirnov (K-S) Test method with a (K-S) value of 95%.

1. Initial sample of meters is selected, removed from service, and tested. Based upon the results of the first sample, the lot is accepted, rejected, or identified as requiring re-sampling.
2. When re-sampling is required, a second sample lot (equal in size to the initial sample) is randomly selected. Those meters are removed from service and tested. The re-sampled lot is accepted or rejected based upon cumulative results of the first and second samples.
3. For sample testing, a meter is defined as out of tolerance when the average accuracy of the check rate and capacity rate tests is less than 97.0% OR greater than 103.0%.

4.3 Sample Lots

4.3.1 In the Meter Management System (MMS), assign gas meters (for sample testing) to meter lots as determined by:

1. Manufacturer,
2. Meter size, AND
3. Installation year.

4.3.2 Combine meters for sample testing purpose.

4.3.3 Sample the meter lots in their 9th year of service, and each year thereafter until:

1. The lot fails, OR
2. All meters in the lot have been removed through normal attrition and sampling.

4.3.4 IL Metering and Projects will evaluate small lots to determine if they should be scheduled for 100% change out.

4.3.5 There is no maximum in-service life for a gas meter in Illinois subject to Sample testing.

4.4 Annual Scheduling

4.4.1 Prior to scheduling, exclude any rejected lots from the current and previous years.

4.4.2 Following completion of the current year's Sample testing program, IL Metering and Projects will initiate the annual random sample selection process in MMS for the sample testing program that will be completed in the following year.

4.4.3 Customer lists and OAS exchange orders for meters due for test under 1st-round sampling will typically be distributed in *December*. Normal deadline for 1st-round exchanges will be *May 31*.

4.4.4 Following evaluation of 1st-round samples, if required, IL Metering and Projects, will initiate:

1. The MMS process for random selection of the 2nd sample gas meters, and
2. Customer lists and OAS exchange orders for 2nd sample meters will be generated and distributed.

3. Deadline for 2nd round meter exchanges will be determined by:

3 a. 1st-round completion of sample evaluations, and

3 b. Volume of the required 2nd-sample meter exchanges.

4.4.5 All required sample tests must be completed by end of the calendar year in which the tests are due for completion.

4.5 Requesting Substitute Sample Meters

4.5.1 It may be necessary to randomly select substitute samples to replace sample meters that were difficult to exchange or unable to be tested (e.g., lost, stolen, damaged).

4.5.2 Substitute samples will be chosen only when missing sample meter test results prevent the accept/resample/reject decision from being made.

4.5.3 When necessary, IL Metering and Projects will randomly select substitute samples from the lots that have missing sample meter test results.

4.6 Rejected Sample Lots

4.6.1 ICC Part 501 requires 100% removal of any remaining meters from a failed lot within 24 months after the current year's sampling. This is requirement for the sample testing process.

4.6.2 IL Metering and Projects will initiate the generation of customer lists and OAS exchange orders for all failed/rejected meters.

4.7 Sample Meter Test Results

4.7.1 Post the sample meter test results to MMS through the following methods:

1. *Sonic-Nozzle Provers*: Upload through the electronic interface to MMS.

2. *Manual Entry*: IL Metering and Projects may manually enter results into MMS for individual sample meters.

3. *Contractor Files*: IL Metering and Projects may receive results from contractor and upload to MMS by the batch upload process.

5.0 Periodic Testing

5.1 General

5.1.1 The term periodic testing applies to the original Illinois Commerce Commission rules for testing diaphragm gas meters on a 10-year interval.

5.1.2 This procedure identifies the requirements for periodic testing of gas meters not included in the AIC sample testing program.

5.1.3 Retain all required documentation such that it is readily available upon ICC request.

5.1.4 For testing of rotary and ultrasonic meters:

1. Rotary meters, see [METR 2.4, Section 5.0](#).

2. Ultrasonic meters, see [METR 2.4, Section 7.0](#).

5.2 Periodic Testing of Diaphragm Meters

5.2.1 Test all diaphragm gas meters that are not included in an approved sample testing program every *120 months* based upon the date of the last test.

UNCONTROLLED IF PRINTED

5.2.2 Typically, 800 scfh diaphragm meters and larger are to be tested according to the 10-year periodic schedule since they are not currently included in AIC's sample testing program.

5.3 Periodic Test Schedule

5.3.1 IL Metering and Projects will initiate the Periodic Meter Selection process each year - identifying meters in MMS as due for testing during the following year. Customer lists, OAS exchange, and field test orders will be processed and distributed. The list will contain the last test date for each meter listed.

5.3.2 Gas Supervisor is responsible to ensure that each diaphragm meter listed is removed from service prior to the test due date.

5.3.3 GTS Supervisor is responsible to ensure that the following actions are completed by the due date:

1. All listed rotary meters are tested.
2. All listed turbine meters are spin tested and/or accuracy tested.

5.4 Periodic Meter Test Results

5.4.1 Document all periodic meter test results in MMS (or as a paper record) through the following methods:

1. *OAS Entry*: Upload through the electronic interface to MMS.
2. *Manual Entry*: IL Metering and Projects may manually enter results into MMS for individual periodic meters.
3. *Contractor Files*: IL Metering and Projects may receive results from contractor and upload to MMS by the batch upload process.

6.0 Customer Requested Test

6.1 General

6.1.1 This procedure outlines the process to ensure proper notification of gas meter accuracy test results to all parties or their stated representatives.

6.1.2 *Customer Requested Test* is defined as any gas meter removed from service due to a customer complaint and request for an accuracy test.

6.1.3 The same requirements within this procedure apply to accuracy tests requested by an alternative gas supplier (AGS) or those requests received to have a Commission Staff member referee an accuracy test.

6.1.4 For a Commission Referee Test, the customer shall pay for the accuracy test based upon Schedule of Fees in ICC Code Part 501. Fee shall be refunded to the customer if gas meter is found to over-register gas by more than 2%.

6.2 AIC Requirements/Practices

6.2.1 Complete the accuracy test for a Customer Requested Test within *45 days* after receiving request, unless the customer agrees to a later time.

AIC has set a KPI goal to complete the test within *30 days*.

6.2.2 Perform accuracy test of the meter at no cost to the customer providing:

1. Meter has not been accuracy tested within *12 months* prior to the request. Otherwise, see [Paragraph 6.3.5](#).
2. Meter is rated below 16,000 cfh and does not require physical removal to complete test. Otherwise, see [Paragraph 6.3.6](#).
3. The requested test is not a Commission Referee Test.

6.2.3 All gas meters will be handled in accordance with the procedures contained in [METR 1, Section 5.0](#), Care and Handling.

6.3 Requested Meter Test

6.3.1 When receiving a request for a Customer Requested Test, the CSR (Customer Service Representative) initiates a Change Meter Order (CMO) with a "Reason for Order" of "Customer Request" to the local office. A WFM (Workflow Manager) shall be generated to the O.C. to notify the Gas Supervisor that a Customer Requested Test meter exchange is required.

1. Initiating the "Customer Requested Test" order will also generate a "Hold" for the gas meter in MMS. The "Hold" has comments in MMS to notify the meter shop co-worker "Receiving" the gas meter that special handling is required to complete the customer requested test.

6.3.2 The local Gas Supervisor will have the gas meter exchanged and tagged as "Customer Requested Test" with the actual reason for change, (Customer complaint) marked on the order. Arrange to transport the meter(s) to the gas meter shop.

6.3.3 Deliver the meter tagged "Customer Requested Test" to the gas meter shop within 5 business days following its removal from service.

6.3.4 Upon receiving meter, the gas meter shop foreman notifies the meter shop administrative clerk who will do the following:

1. Verify the request date to determine a valid test date.
2. Call the customer to schedule the test and see if the customer wants to witness the test. If the customer cannot be reached, the administrative clerk determines a valid date.
3. Notifies the foreman of the test date.

6.3.5 If the meter has been accuracy tested within the previous 12 months, advise the customer that charges may be pending for the additional accuracy testing per Section 501.260, 501.270, and 501.280 of the Illinois Administrative Code.

6.3.6 For meters rated at or above 16,000 cfh that require physical removal to perform test, the customer shall pay the costs associated with a Customer Requested Test.

1. The test charge shall not exceed \$10,000 for tests completed at AIC facility or \$25,000 for tests that require the meter to be sent to a non-affiliated third-party.
2. An itemized written cost statement for the requested test, the customer's agreement to pay the stated cost, and payment shall be received before any action is taken to remove the meter.
3. If meter is found to over-register by more than 2%, customer will be fully reimbursed those fees charged for the test.

UNCONTROLLED IF PRINTED

- 6.3.7 Schedule meter accuracy test within 15 days of receiving the Customer Requested Test gas meter in MMS at the gas meter shop. This time is required to schedule the test for a date, time and location for customer to witness the accuracy test, if desired.
1. Schedule test in the gas meter shop, unless the meter must be shipped to a third-party facility (for testing capacity reasons).
 2. Complete test as soon as possible if customer does not desire to witness test.
- 6.3.8 The gas meter shop foreman is responsible to complete the meter accuracy test at the scheduled date, time, and location with or without the customer presence. Should customer (or their designated representative) choose to witness the accuracy test, a gas meter supervisor or gas engineer should attend.
- 6.3.9 Record the accuracy test results as a "Customer Complaint" in MMS.
- 6.3.10 Provide a written summary of the accuracy test results to customer within *5 business days* of completing test.
- 6.3.11 Store meter temporarily to ensure that all parties have been notified of the accuracy test results.
1. Store for 90 days if there is no follow-up legal action pending.
 2. Store in excess of 90 days if there are ongoing or anticipated legal actions pending due to dispute with meter accuracy.
- 6.3.12 Gas meter subject to a Commission Referee Test for accuracy:
1. Meter shall not be disturbed upon receipt of notice unless in the presents of ICC Staff member or with authorization by Staff/customer. Document the authorization, including the name of person giving the authorization and date/time of the authorization.
 2. AIC co-worker or ICC Staff member shall transport a gas meter subject to Commission Referee Test to the testing facility and secure the meter to prevent potential tampering or disturbance from its in-service condition until the test begins.

7.0 Meter Header Inspection

7.1 General

- 7.1.1 This procedure describes inspections and maintenance that should be done at the meter set when performing any work on it.
- 7.1.2 This also addresses the potential hazards and precautions associated with the possibility of induced AC voltage on the meter set. See [Appendix A](#) for expanded discussion on AC voltage potential, especially with many older homes.

7.2 AC Voltage on Meter Set

- 7.2.1 An AC voltage risk occurs at the connection with customer piping due to improper grounding.
- 7.2.2 Before performing any work on a gas meter set, use a voltage stick to check for AC voltage on the listed locations. The AIC stock coded voltage tester (volt stick), 60 05 635, is a non-contact voltage tester, with an infrared thermometer, that will detect voltages from 12 VAC to 1000 VAC.
1. Service riser.

UNCONTROLLED IF PRINTED

2. Meter.
3. Customer fuel line.

Figure 1: Image of Volt Stick Klein Model NCVT-4IR

If voltage is detected, contact the Dispatcher to request an Electric person to measure voltage.

Volt stick models NCVT-3 or NCVT-3P can continue to be used, but take care to select the lower voltage when using a volt stick with voltage ranges.

7.3 AC Voltage Action Table

- 7.3.1 Do not work on the meter set if the measured voltage is 15 volts or higher until the voltage source has been eliminated. See [Table 1](#).

National Society of Corrosion Engineers (NACE) has a Recommended Practice RP 0177-2000 that defines a shock hazard as 15 volts AC.

Table 1: Voltage Action

	Voltage on Riser	Voltage on Customer Piping	Voltage on Both, Riser and Customer Piping
Volt Stick "Alarms"	Contact Dispatcher, Request Electric Service person to measure voltage. (See Paragraph 7.2.2.)	Contact Dispatcher, Request Electric Service person to measure voltage.	Contact Dispatcher, Request Electric Service person to measure voltage.
Measured Voltage at Less than 15 volts	<ul style="list-style-type: none"> • Not a Hazardous Condition. • No Corrective Action Required. 	<ul style="list-style-type: none"> • Not a Hazardous Condition. • No Corrective Action Required. 	<ul style="list-style-type: none"> • Not a Hazardous Condition. • No Corrective Action Required.

UNCONTROLLED IF PRINTED

<p>Measured Voltage at 15 Volts or Greater</p>	<p>Electric Department / Corrosion Tech to Investigate Source and Determine Corrective Action.</p>	<p>Electric Service person to notify Customer they have excessive voltage on their piping. Advise Customer to contact an electrician or HVAC contractor.</p>	<p>Electric Department / Corrosion Tech to Investigate Source and Determine Corrective Action.</p>
--	--	--	--

7.3.2 In non-Ameren electric service areas, Dispatcher should contact the appropriate electric service provider to request assistance.

7.3.3 The best remedial action for AIC facilities is to control the AC voltage at the source.

7.4 Inspections/Maintenance on Meter Sets

7.4.1 Perform the following checks when installing/changing gas meter or doing any work on the meter set:

1. Before touching meter set, check for possibility of AC voltage with a "volt stick". If voltage is detected, see [Subsection 7.2](#).
2. Check riser at the soil-to-air interface for disbonded coating and corrosion and address corrective action in accordance with [CORR 1, Subsection 15.5](#).
3. Check aboveground piping for atmospheric corrosion in accordance with [CORR 1, Section 15.0](#), Atmospheric Corrosion. Repair coating and paint meter set where needed. See [CORR 1, Section 16.0](#), Painting Pipeline Facilities.
4. Check the 10LT meter spud for corroded welds and replace when corrosion is encountered. See Figure 2.

Figure 2: RW Lyall 10LT Corroded Meter Spud Welds

5. Check meter header for strain on piping; ensure that it is essentially level.
6. Check that the riser meter valve is accessible.
7. Check or ensure meter is not partially buried or setting on ground.
8. Check for old abandoned risers that were not cut off below ground level when service was replaced. If encountered, cut off 6" below grade.
9. Check regulator for proper installation, to include bug screen being clear, relief properly/freely vented to atmosphere, and spring cap.
10. Check the meter set for foreign grounding from telephone or cable TV; report to Gas Supervisor for follow up action when encountered.
11. Check banded regulators for corroded band bolts and replace regulator when encountered. See [Appendix B, Figure B-1](#) for images of banded regulators.

UNCONTROLLED IF PRINTED

12. Check for substandard regulators and report to Gas Supervisor when encountered. See [Appendix B, Figure B-2](#) for images of substandard regulators.

Whenever a substandard regulator is identified that may contain mercury, notify the Gas Supervisor. Do not replace, remove, or disturb the regulator without specific handling instructions from AIC Environmental & Safety.

13. Check for Fisher 254 or American 1213B meter bar regulator assembly and install a vent/splash guard where encountered.
 14. Whenever any above deficiencies are noted, correct immediately or document in ClickMobile and report to Gas Supervisor for follow-up action.
- 7.4.2 If disassembling the meter set, perform the added corrective action or maintenance as follows:
1. Replace Mueller interlock meter valves or other obsolete or defective meter valves.
 2. Grease meter hubs with "NO-OX-IDE" grease.

7.5 Regulator Vent/Splash Guard

- 7.5.1 Gas field personnel to install a regulator guard when a meter-bar type regulator (either Fisher 254 or American 1213 B) is encountered while performing work on customer premises.
- 7.5.2 The guards (stock code 62 56 266) are for regulators with a $\frac{3}{4}$ " NPT relief vent opening. Ensure that the relief vent outlet and guard threads are the same size before beginning to insert.
- 7.5.3 The installation process for regulator guards is as follows:
 1. Remove and discard the original screen from relief vent opening.
 2. Check both the relief vent opening and the guard opening to ensure there are no obstructions.
 3. Apply a light coating of pipe joint compound to the exposed guard threads.
 4. Using both hands, position the guard beneath the relief vent opening. Hand-tighten the guard until top of guard seats snugly against the vent base.

Over-tightening the guard into the vent base might cause damage to the guard.

5. For a picture of the completed assembly showing regulator guard in the meter bar type regulator, see [Appendix B, Figure B-3](#).

8.0 Records and Retention

- 8.1 File and retain all new inspection records in Click, Maximo, or OAS. However, some historical records may be retained in their paper form.

- 8.2 See the expanded and consolidated summary titled "Meter Test Schedules & Retention Requirements" located in [METR 4](#) under References. (in support of METR 2.2, 2.3, and 2.4).

End of Instructions.

METR 2.2 Metering – Meter Inspection and Testing, December 15, 2021

Revision Notes

Location of Changes	Summary of Changes
Paragraph 7.2.2 – Volt Stick	Updated Stock Code, 60 05 635, for volt stick model NCVT-4IR. Previous Stock Code, 65 36 383, is being directed to new Stock Code.

Appendix A - AC Voltage Potential at Meter Set

A-1. Overview

A-1.1 An AC voltage risk associated with the utility gas system occurs at the connection with customer. Many older homes relied upon the water piping systems for grounding. Over the years, some of these electrical grounds have been disconnected or rendered inoperable by the installation of plastic water lines in and outside the house. In such cases, if an electrical appliance goes to ground it can energize the gas fuel line through the hot water heater, or in the case of a furnace, at the furnace itself. This can cause up to 120 V AC to appear on the fuel line which creates 120V potential between the gas service and the customer fuel line.

A-1.2 If insulated meter spuds are used, the meter and the fuel line can also be at 120 V AC potential difference.

A-2. Code and Standard References Related to AC Grounding and Gas Piping

A-2.1 The NEC specifically prohibits using underground gas piping as a grounding electrode.

250.52 Grounding Electrodes

(B) Electrodes Not Permitted for Grounding: The following shall not be used as grounding electrodes:

- (1) Metal underground gas piping system
- (2) Aluminum electrodes

A-2.2 The National Association of Corrosion Engineers (NACE) has a Recommend Practice RP 0177-2000 that defines a shock hazard as 15 volts AC:

"Shock Hazard: A condition considered to exist at an accessible part in a circuit between the part and ground or other accessible part if the open-circuit AC potential is more than 15 V (root mean square [rms]) and capable of delivering 5 mA or more."

A-2.3 The National Fuel Gas Code Handbook (2009 Edition) (NFPA 54) sections 7.13 *Electrical Bonding and Grounding*, 7.14 *Electrical Circuits*, and 7.15 *Electrical Connections* address the grounding of gas fuel lines. Per this code, gas fuel lines are to be grounded but are not to be used as a grounding conductor.

A-3. AC Voltage Check at Customer Meter Sets

A-3.1 Before performing any work on a gas meter set, use a voltage stick to check for AC voltage on the locations listed below. See [Subsection 7.2](#), AC Voltage on Meter Set.

A-3.1.1 Service riser.

A-3.1.2 Meter.

A-3.1.3 Customer fuel line.

A-3.2 Do not work on the meter set if the measured voltage is 15 volts or higher until the voltage source has been eliminated. See Table 5, under [Subsection 7.3](#), AC Voltage Action Table which addresses voltage found at 1) riser, 2) customer piping, or 3) both the riser and customer piping.

A-4. Measuring AC Procedure (If needed in addition to voltage stick)

A-4.1 Connect leads from Digital Multimeter (DM) as follows:

A-4.1.1 Red lead to volt/ohm terminal.

A-4.1.2 Black lead to common terminal.

A-4.2 Select VAC (volts AC) choice on DM/voltmeter.

A-4.3 Connect clip end of red lead to pipe or structure to be tested.

A-4.4 Connect clip end of black lead to the half-cell.

A-4.5 Remove orange protective cap from reference electrode.

A-4.6 Place the porous plug of electrode into moist soil.

A-4.7 Observe and record reading.

METR 2.3 Meter Inspection and Testing - Shop

1.0 Purpose

This procedure identifies requirements for various testing of Ameren Illinois (AIC) gas meters and testing equipment to meet or exceed accuracy limits and schedules established by the Illinois Commerce Commission (ICC). It includes the various criteria and guidelines governing the testing programs applicable to shop activities.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Prover Certification](#)

[6.0 Bell Prover Testing - Not used by AIC for testing gas meters](#)

[7.0 Transfer Prover Testing](#)

[8.0 New Meter Testing](#)

[9.0 Records and Retention](#)

Appendices

[Appendix A - Meter Flow Rates](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor
- Gas Meter Shop Foreman
- IL Metering and Projects Supervisor

4.0 General

4.1 For related coverage and requirements, see METR 1 as follows:

4.1.1 Definitions and sizing of equipment - [Section 4.0](#).

4.1.2 Care and handling of meters - [Section 5.0](#).

5.0 Prover Certification

5.1 General

5.1.1 Calibrate and certify all sonic-nozzle provers at least every *12 months*.

5.1.2 Recertify all transfer provers at least every *36 months* by either:

1. Sending (in protective crate) to an approved certification service, or
2. Recertify locally by an approved contract service.

UNCONTROLLED IF PRINTED

- 5.1.3 Require all gas meter testing contractors used to repair and test AIC meters to provide *proof annually* that their testing equipment has been *certified within the last 36 months*, or at least every *12 months for sonic-nozzle provers*.

5.2 Verification of Meter Shop Reference Meters

- 5.2.1 Perform a verification test weekly on each transfer prover by using an AL800 reference meter.
- 5.2.2 Perform a verification test weekly on each operating sonic-nozzle prover by using the following non-temperature compensating reference meters:
 1. American AC250: For meters having a badge capacity rating of 275 cfh or less.
 2. American AL425: For meters having a badge capacity rating greater than 275 cfh.

5.3 Documentation of Reference Meter Verifications

- 5.3.1 Record the following test data in MMS for each operating prover that is tested with a reference meter:

1. Date of test.
2. Banner Eye:
 - 2 a. Open rate results (% accuracy).
 - 2 b. Open rate time.
 - 2 c. Check rate results (% accuracy).
 - 2 d. Check rate time.
 - 2 e. Average accuracy (%).
3. AIMS:
 - 3 a. Open rate results (% accuracy).
 - 3 b. Check rate results (% accuracy).
 - 3 c. Average accuracy (% accuracy).

- 5.3.2 From MMS (reports section), run the Reference Meter Test Results Report for each operating meter shop reference meter.

- 5.3.3 Log the results on each prover for a visual reference of the bell or sonic-nozzle prover's accuracy and to assist with determining when corrective actions are required.

- 5.3.4 The Gas Metering Supervisor for each meter shop is responsible to review the reference meter logs weekly and shall initiate appropriate actions to correct accuracy deficiencies.

5.4 Corrective Actions

- 5.4.1 When performing a *weekly reference meter verification test*, corrective action may be required for one or more of the provers being tested. Take corrective actions when any of the following occurs:

1. Percent accuracy of the open rate test or check rate test exceeds $\pm 0.5\%$ from the other provers.
2. Spread between open rate and check rate exceeds 1.0%.

UNCONTROLLED IF PRINTED

3. Average percent accuracy between provers exceeds 0.5%.
 4. Variance between the banner eye and AIMS exceeds 0.5%.
 5. Prover room temperature fluctuates more than 4°F during any 24-hour period.
- 5.4.2 Perform an additional verification test after any corrective actions are taken to verify the provers are operating within established accuracy limits.
 - 5.4.3 Document all corrective actions that are completed on the Weekly Gas Reference Meter [Test] Results Report.
 - 5.4.4 Each meter shop shall document weekly a reference meter verification test for each meter and prover combination.

If there is no meter testing activity during a given week, a reference meter verification test is not required. Complete the Weekly Gas Reference Meter [Test] Results Report to indicate that no meter testing was performed during that week.

6.0 Bell Prover Testing - Not used by AIC for testing gas meters

7.0 Transfer Prover Testing

7.1 General

- 7.1.1 This procedure outlines the testing of meters with a capacity of 630 cfh or greater using a transfer prover.

7.2 "In-testing" Preparation

- 7.2.1 All meters removed from service must be in-tested prior to repair or retirement. Test those meters having a capacity of 630 cfh or greater with a transfer prover or sonic-nozzle prover of required capacity.

If there is an AMR device attached, check to ensure that the battery has been disconnected.

- 7.2.2 Purge and exercise meter prior to testing.

Recommend the prover hose have one loop in the hose when proving rotary meters.

- 7.2.3 Each meter shall be tested at the following flow rates of the meter badge capacity:
 1. Check-flow rate: Must be between 20% and 33%. Use approximately 30% for consistency.

2. Open-flow rate: Must be at approximately 100%.

7.2.4 See [Appendix A](#) for the check-flow rates and open-flow rates, along with the test volume, for each size meter.

7.2.5 For greater than 10,000 cfh capacity meters, the check-flow rate will be 30% of meter capacity, if possible, and open-flow rate will be the maximum prover volume capability.

7.3 In-testing Meters

7.3.1 When a meter is in-tested, complete the following activities:

1. Select the correct preconfigured test.
2. Verify the correct master meter has been selected.
3. Begin the test by selecting "Start" button.
4. Verify the temperature has stabilized. Test will automatically start when stabilized.
5. Ensure all tests are greater than 30 seconds duration.
6. After completing the test, verify the results for inaccuracies. The meter must be retested if it appears the test results are not correct and/or the prover did not function properly.
7. Enter the test results into MMS.

7.3.2 Cap the meter hubs.

7.4 Test Results

7.4.1 Record the following data and enter in MMS:

1. Meter readings.
2. Test results (% accuracy).
3. Differential test results for both the check-flow rate and open-flow rate.

7.4.2 Verify all other information listed in MMS for accuracy.

7.4.3 Record test results for non-registering or damaged meters as 0% on the check-flow rate and open-flow rate. Record this information in the comment column and on the test type.

7.4.4 Meters that are obsolete or damaged can be retired at the receive station, in-test station, or set aside for retirement later.

7.5 Adjust-Testing

7.5.1 When a meter is repaired by AIC or a contractor, it must be "adjust-tested" prior to installation. Complete the adjust-test using the same procedures described previously for in-testing a meter.

7.5.2 Adjust all diaphragm meters to test within $\pm 0.5\%$ of 100% average accuracy and have no more than 1.0% spread between the check-flow rate and open-flow rate tests.

7.5.3 All rotary meters shall have an average adjust-test accuracy of $\pm 0.75\%$ of 100% accuracy and no more than 1.0% spread between the check-flow rate and open-flow rate test results.

UNCONTROLLED IF PRINTED

1. If the initial adjustment test is out of tolerance, adjust meter and re-test until it meets these specifications.
2. Retire meters that cannot be adjusted to specifications.

7.5.4 Check output pulses on rotary meters for proper operation.

7.6 AMR Device Verification

7.6.1 Verify all meters that have an AMR module by the GPREP software to ensure the following items are programmed correctly.

1. Meter serial number.
2. Meter manufacture code.
3. Module ID or LAN ID.
4. Meter constant or drive rate.
5. Reading.
6. Rollover point or reading at which meter will again start at zero.

8.0 New Meter Testing

8.1 General

8.1.1 New gas meters will be tested in accordance with the regulatory requirements of the ICC.

8.2 Diaphragm Meters

8.2.1 Enter all diaphragm gas meters purchased by AIC into MMS per manufacturer's file by the following steps *under the heading "Meter Data"*:

1. Add New Meters.
2. Manufacturer File.
3. Params (tab) - Enter information.
 - 3 a. Query the input file. This will automatically populate the Qty. field.
 - 3 b. Index Reading.
 - 3 c. Meter Code.
 - 3 d. Drive Rate.
 - 3 e. Purchase Date.
 - 3 f. Inventory Status.
 - 3 g. Shop Location.
 - 3 h. Removal Code, required.
 - 3 i. Repair Code.
 - 3 j. Service Center.
 - 3 k. Check Random Sample box.
 - 3 l. Module.
 - 3 m. Select Appropriate File Profile.
 - 3 n. Select OK.

UNCONTROLLED IF PRINTED

4. Preview (tab)

- 4 a. By selecting the "OK" button on the Param tab, the screen shifts to the preview tab and will automatically download the manufacturer's information to MMS.
- 4 b. Review downloaded information on the screen by checking test results, meter numbers, and quantity. Note the lot number that was generated by selecting the Random Sample box.
- 4 c. Select "OK" again to load meters into database.

8.3 Sample Testing Basis - New Diaphragm Meters

- 8.3.1 Randomly sample all new diaphragm meters purchased using ANSI/ASQ Z1.4-2008 single sampling for normal inspections, Inspection Level II with an AQL of 1.0% and accuracy between 99.25% - 100.75%.
- 8.3.2 Evaluate sample lots by using the Kolmogorov-Smirnov (K-S) Test with a (K-S) value of 95%.
- 8.3.3 Use Table 1 to determine the number of meters to be sampled.
- 8.3.4 The reject column identifies the number of meters that must fail the accuracy requirements, differential requirements, and/or spread requirements to reject the entire lot.

Table 1: Meter Sampling

Single Sampling New Meters and Modules		
Lot Size	Sample Size	Reject Number
2 to 8	2	1
9 to 15	3	1
16 to 25	5	1
26 to 50	8	1
51 to 90	13	1
91 to 150	20	1
151 to 280	32	2
281 to 500	50	2
501 to 1200	80	3
1201 to 3200	125	4
3201 to 10,000	200	6
10,001 to 35,000	315	8
This Table is based on ANSI/ASQ Z1.4-2008, General Inspection Level II - Single Sampling Plan for Normal Inspection		

8.4 Sample Selection - New Diaphragm Meters

- 8.4.1 When loading new diaphragm meters in MMS by batch or by manufacturer's file (see [Paragraph 8.2.1](#)), a new sample lot number is produced once the Random Sample box is checked. The lot number is populated in the New Meter Random Selection file.

- 8.4.2 Select this file from the Meter Data menu. Choose the assigned sample lot number. Query this lot number to populate the fields. Select "ANSI/ASQ Z1.4-2008 New Meter" as the sample standard and Inspection Level II.
- 8.4.3 The appropriate sample size should be displayed based on the Lot Size.
- 8.4.4 Check the manual selection box and then select the serial numbers of the meters randomly chosen for sample based upon [Table 1](#).
- 8.4.5 MMS has the capability to randomly select individual meters from the new meter lot.
- 8.4.6 Deselecting the manual selection box and selecting the "Random" button will populate a system generated list of meters randomly chosen.
- 8.5 Testing New Diaphragm Meters (Samples)
 - 8.5.1 Temper the meters in the prover room at table height for a minimum of 12 hours. The gas meters should come from the manufacturer with a Form 120 sticker attached, which includes a bar code.
 - 8.5.2 After the meters have been tempered, test the meters with the appropriate prover testing equipment.
- 8.6 Evaluate New Meter Samples
 - 8.6.1 After all the sample meters have been tested, evaluate the lot by using the "Evaluate New Meter Sample" program in MMS under Meter Data menu.
 - 8.6.2 Select the lot number to evaluate and query.
 - 8.6.3 The evaluation unit for new meters will be "Other" and the evaluation method will be Kolmogorov-Smirnov (K-S) Test.
 - 8.6.4 AIC will evaluate new meters based on the open, check, differential, and spread results, with a K-S% of 95%.
 - 8.6.5 Once these criteria are specified, select the method button to move to the Evaluate tab, where:
 - 1. AQL should be 1.0,
 - 2. Sampling technique will be Attributes, AND
 - 3. Normal inspection.
 - 8.6.6 Set the limits for Proof 99.25% - 100.75%, differential 0.00 - 0.50, and spread 0.00 - 1.00 and evaluate.
 - 8.6.7 Each meter must fall within the limits set for proof, differential, and spread to pass.
 - 8.6.8 The lot will PASS or FAIL based upon the criteria listed in [Table 1](#).
 - 8.6.9 If the lot passes, then, (from the process lot tab) ensure the inventory status, shop location, and service center are all correct.
 - 8.6.10 Select "OK" to accept the evaluation. The inventory status of all meters in the lot will be changed to available.
 - 8.6.11 If the lot fails, a second sample will be performed.
 - 1. If the 2nd sample passes, AIC will accept the meters.

2. If the 2nd sample fails, the manufacturer will be notified of the results and the meters will be shipped back to the manufacturer (freight collect) or AIC will test the entire lot at the manufacturer's expense.

8.7 Rotary and Turbine Meters

- 8.7.1 New rotary and turbine meters may be sample tested following the same procedures as those for diaphragm meters. Depending on the quantity of rotary or turbine meters received, all the meters (in the small lot) may require that each be tested.
- 8.7.2 Meters will be tested in accordance with the Transfer Prover Testing procedure (see [Section 7.0](#)), or the Turbine Meter Testing procedure (see [METR 2.4, Section 6.0](#)).
- 8.7.3 All meters must have accuracy between 99.25% - 100.75% and be within a 1% spread.
- 8.7.4 If a meter (or lot) is found to be outside the acceptable range, manufacturer will be notified, and meter(s) will be shipped to the manufacturer (freight collect).

8.8 Test Results

- 8.8.1 Maintain all test results from the manufacturer or from testing by AIC personnel in MMS or as a paper document.

9.0 Records and Retention

- 9.1 In summary, file and retain all new inspection records in Click, Maximo, or OAS. However, some historical records may be retained in their paper form.
- 9.2 See the expanded and consolidated summary titled "Meter Test Schedules & Retention Requirements" located in [METR 4](#) under References. (in support of METR 2.2, 2.3, and 2.4).

End of Instructions.

METR 2.4 Meter Inspection and Testing - GTS/GCD

1.0 Purpose

This procedure identifies requirements for various testing of Ameren Illinois (AIC) gas meters and testing equipment to meet or exceed accuracy limits and schedules established by the Illinois Commerce Commission (ICC). It includes the various criteria and guidelines governing the inspection and testing programs applicable to Gas Technical Services (GTS) and Gas Control and Dispatch (GCD) activities.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Rotary Meter Differential Testing](#)

[6.0 Turbine Meter Testing](#)

[7.0 Ultrasonic Meter Testing](#)

[8.0 Records and Retention](#)

3.0 Target Audience

- Gas Engineering
- Gas Tech Services (GTS) Supervisor
- Gas Tech Services (GTS) Technicians
- Supervisor, Gas SCADA
- Gas Control Technicians (GCT)
- Gas Meter Supervisor
- Gas Meter Shop Foreman
- IL Metering and Projects Supervisor
- Gas Control and Dispatch

4.0 General

4.1 For related coverage and requirements, see [METR 1](#) as follows:

4.1.1 Definitions and sizing of equipment - [Section 4.0](#).

4.1.2 Care and handling of meters - [Section 5.0](#).

4.1.3 Gas meter locations - [Section 6.0](#).

4.1.4 Installation considerations - [Section 7.0](#).

4.2 For Customer Requested Test, see [METR 2.2, Section 6.0](#).

5.0 Rotary Meter Differential Testing

5.1 General

5.1.1 *Differential pressure testing* is the industry standard for testing rotary gas meters at a service location and is done by measuring the pressure drop across the meter inlet and outlet.

UNCONTROLLED IF PRINTED

5.1.2 Any significant increase in the rotary meter's internal resistance to flow at a known volume and pressure will increase the pressure drop across the meter. Therefore, rotary meter differential test is a prime indicator of meter condition. Items that can cause an increase in the internal resistance of a rotary meter include:

1. Binding of the impellers,
2. Dirt or debris,
3. Worn bearings,
4. Oil too heavy, and/or
5. Incorrect oil level.

5.1.3 Manufacturer test results have shown that an increase of up to 50% in differential pressure can be tolerated without affecting the rotary meter accuracy by more than 1% at flow rates of 10% to 100% of meter capacity.

5.2 Initial Differential Test

5.2.1 Perform a differential test on each new rotary gas meter installation to establish an acceptable differential (and baseline reference) related to individual piping configurations and operating pressures. See [Subsection 5.5](#) for test procedure.

5.2.2 Complete the initial test within *6 months* of the meter's "In Service" date.

5.2.3 Complete the differential test by establishing a minimum flow rate of 10% of the meter capacity.

5.2.4 The initial test will establish the "Last Test Date", which is used to determine when the meter is due for the next periodic meter test.

5.3 Periodic Test

5.3.1 Complete a differential test by establishing a minimum flow rate of 10% of the meter capacity. See [Subsection 5.5](#) for test procedure.

5.3.2 Perform a differential test on in-service rotary meters at least *every 60 months* from the last test date to verify that the differential pressure does not exceed 50% increase over the following:

1. Initial differential test, OR
2. Manufacturer's acceptable limits.

5.3.3 If operating conditions prevent getting a meter differential pressure reading and conditions are properly documented, then verification may be delayed until test can be conducted or 4 months, whichever is shorter.

If verification is delayed due to operating conditions, maintain documentation for 3 years addressing conditions that prevented verification within the required 60 months. If requested, provide documentation to authorized Commission representative.

5.3.4 In lieu of differential pressure testing, an accuracy test may be done on the rotary meter. See [METR 2.3, Section 7.0](#) for transfer prover testing. The average

accuracy is determined by averaging the accuracy at the check flow and open flow rates.

5.4 Equipment

5.4.1 *Differential measurement:* Use an electronic instrument or manometer to measure the differential pressure on all rotary gas meters as follows:

1. Range readable to 0.10 inches water column (W.C.) or 0.10 psig,
2. Pressure rating must be good for the operating pressure of the meter being tested.
3. Examples of acceptable electronic instruments include:
 - 3 a. Meriam Smart Manometer.

- 3 b. Versi-Test Calibrator.

A liquid manometer is an acceptable alternative.

5.4.2 *Timing device:* A clock, stop-watch, or other timing device is required to time the meter for calculating flow rate through the meter. However, an electronic index capable of displaying flow rate could eliminate the need for a separate timing device.

5.4.3 *Pressure gauge:* A calibrating gauge (see [METR 2.6](#)) is required to measure the operating pressure on the meter.

5.4.4 *Computer:* A laptop with current software version installed as applicable:

1. Dresser's Differential Test Acceptance Calculator (dP Calculator) - for Dresser meters,
2. Romet Differential Calculator - for Romet meters, or
3. Manufacturer's factory differential pressure curves - acceptable alternative for reference.

5.5 Differential Test

The following activities are required to provide accurate differential test results:

UNCONTROLLED IF PRINTED

- 5.5.1 Install a calibrating gauge to measure the meter pressure.
- 5.5.2 Install the differential pressure test equipment into the meter inlet and outlet differential taps. Follow the manufacturer's instructions for proper installation and operating procedures.
- 5.5.3 Verify or establish a stable flow through the meter. The minimum flow rate for a proper test must be 10% of the meter capacity.
- 5.5.4 Time/clock the meter or interrogate the meter's electronic index to determine if the minimum test flow requirement is met.
- 5.5.5 Record differential pressure reading, metering pressure, and test flow rate. The flow rate is either calculated or read from an electronic index.
- 5.5.6 Repeat the test to verify an accurate average reading.
- 5.5.7 Compare test data to existing manufacturer's factory differential pressure base-line curves or use laptop software as listed in [Paragraph 5.4.4](#) to determine the condition of the meter (**PASS** or **FAIL**).

Be sure to use dP Calculator software on Dresser meters and Romet Calculator software on Romet meters.

- 5.5.8 Remove all test equipment and confirm the meter is returned to normal operating conditions.
- 5.5.9 Ensure pressure sensing line to the corrector is in open or "On" position.

5.6 Test Record

- 5.6.1 Record the following items to document the differential test:
 - 1. Test date.
 - 2. Employee performing test.
 - 3. Calculated flow rate (cfh).
 - 4. Meter pressure.
 - 5. Differential pressure.
 - 6. Index reading.
- 5.6.2 Show results, as applicable, to manufacturer's acceptable curve, Dresser's Differential Test Acceptance Calculator (dP Calculator), or Romet Differential Calculator for **PASS** or **FAIL** resultant.
- 5.6.3 Any maintenance activities performed on the meter (e.g., meter oil change, flushing meter).

5.7 Follow-up Action

- 5.7.1 Check the recorded differential pressure against the following:
 - 1. Factory Characteristic Accuracy and Differential Curves,
 - 2. dP Calculator,
 - 3. Romet Differential Calculator,

UNCONTROLLED IF PRINTED

4. Prover Test Curves, OR
5. Graphs generated from differential pressure test data obtained during the initial installation.

5.7.2 If differential is more than 50% higher than AIC's initial differential test or manufacturer's differential curve, the meter is not functioning properly.

1. Perform corrective maintenance on the meter in the field to reduce differential pressure to an acceptable level and retest within 7 days, or possibly exchange the meter if the differential pressure cannot be reduced.
2. Corrective maintenance might include:
 - 2 a. Changing the oil, OR
 - 2 b. Cleaning the meter impeller chamber, i.e., flushing with an approved solvent.
3. If the pressure differential cannot be reduced to less than a 50% increase over the original value, then the meter must be replaced within 60 days.

5.7.3 If replacement is required and meter is of sufficient size that portions of customer's structure require modification to remove meter, then AIC will replace the meter within 90 days unless AIC and customer agree to a longer period, not to exceed 180 days.

5.7.4 Send removed meters promptly to the gas meter shop for testing and corrective action.

5.7.5 Schedule corrective maintenance activity or meter replacement if it cannot be accomplished during the initial site visit.

5.8 AMR/AMI Reading Verification

5.8.1 Verify AMR/AMI (automated meter reading / advanced metering infrastructure) reads are in alignment with field meter readings.

5.8.2 AMR/AMI readings lag field readings by 24-48 hours. The 7-day history function on the AMRC screen in OAS can be used to help determine alignment.

5.9 Rotary Meter Records

5.9.1 Maintain the differential test results for life of the meter in MMS.

5.9.2 Historical test results may be maintained in MMS or as a paper record.

6.0 Turbine Meter Testing

6.1 General

6.1.1 Spin testing is the industry standard for testing turbine gas meters at a service location and is done by measuring the time required for the meter rotor to stop spinning.

6.1.2 Accuracy testing of turbine meters shall be done by an actual calibration accuracy test.

6.2 Testing Requirements

6.2.1 Turbine Spin Test

1. If meter is equipped with external lubrication fittings, spin test and, if necessary, lubricate the turbine at least every 12 months.

UNCONTROLLED IF PRINTED

2. If meter is not equipped with external lubrication fittings or external means of verifying meter operation, then spin test every 6 months. The single-rotor turbine meter might require the measurement cartridge be physically removed from the meter body for spin testing.
3. A spin test is not required for a dual-rotor turbine meter if it has an external means of verifying rotor condition, then verify rotor condition at least every 6 months to ensure the rotor performance meets the manufacturer's guidelines.
4. Dual-rotor turbine meters have the technology to perform a "spin-down" test while the rotors are still installed in the meter body.

6.2.2 Turbine Accuracy Test

1. Perform accuracy test on single-rotor turbine meters at least every *60 months*. Complete test as follows:
 - 1 a. Use at least 4 different flow rates when testing atmospherically and 5 different flow rates when testing at the expected operating pressure.
 - 1 b. Test pressure shall fall within the range of 50% less than or 2 times greater than the meter operating pressure.
 - 1 c. Meter can be accuracy tested with natural gas or air. When using air, the test shall account for the Reynolds number equivalent.
2. For a dual-rotor turbine meter that has an external means of verifying meter accuracy, perform an accuracy test at least every *120 months providing*:
 - 2 a. The meter accuracy is verified at least every *6 months*, AND
 - 2 b. Meter performance meets the manufacturer's guidelines.

6.3 Required Equipment

- 6.3.1 A clock, stop-watch, or timing device to measure the time required for the meter rotor to stop spinning.
- 6.3.2 A calibrating gauge (see [METR 2.6](#).) to measure the operating pressure on the meter.
- 6.3.3 Prover equipment with enough capacity to test meter accuracy at a single flow rate between 10% and 105% of the rated capacity.

6.4 Spin Test

The following activities are required to provide accurate spin test results:

- 6.4.1 Check meter pressure.
- 6.4.2 Perform spin test in a draft free area with the measuring cartridge in its normal operating position. Place a wind block on the downstream or outlet side of cartridge.
- 6.4.3 Spin the rotor vigorously.
- 6.4.4 Time or clock the rotor to determine time required for rotor to stop spinning.
- 6.4.5 Repeat test at least 3 times to verify an accurate average reading.
- 6.4.6 Record the spin time.

6.5 Minimum Spin Times

UNCONTROLLED IF PRINTED

6.5.1 Table 1 and Table 2 and Table 3 list the minimum spin times recommended by the manufacturer for out-of-body cartridge assemblies with plastic rotors.

Table 1: American GT Turbo-Meters - Spin Times

Model	3-GT	4-GT	6-GT	8-GT	12-GT
Size (Inches)	3	4	6	8	12
Seconds	50	30	65	90	100

Table 2: Rockwell Mark II Turbo-Meters - Spin Times

Model	T-18	T-30	T-60	T-140
Size (Inches)	4	6	8	12
Seconds	50	140	180	300

Table 3: Sensus Auto-Adjust Turbine Meters – Spin Times
Minimum Spin Times w/o readout at ambient air temperature

Main Rotor							
Meter	Size	Above 59°F (seconds)	59°F to 50°F (seconds)	50°F to 40°F (seconds)	40°F to 30°F (seconds)	30°F to 19°F (seconds)	Below 19°F
A100U45/30	4"	110	108	105	99	94	Do Not Test
A150U45/30	6"	170	167	162	153	145	Do Not Test

Sense Rotor							
Meter	Size	Above 59°F (seconds)	59°F to 50°F (seconds)	50°F to 40°F (seconds)	40°F to 30°F (seconds)	30°F to 19°F (seconds)	Below 19°F
A100U45/30	4"	200	196	190	180	170	Do Not Test
A150U45/30	6"	200	196	190	180	170	Do Not Test
A200U45/30	8"	300	294	285	270	255	Do Not Test
A300U45/30	12"	300	294	285	270	255	Do Not Test

6.6 Spin Test Record

6.6.1 Record the following items to document the spin test:

1. Test date.
2. Employee performing test.
3. Meter pressure.
4. Spin time.
5. Index reading.
6. Meter cartridge number.
7. Comparison to acceptable time for **PASS** or **FAIL** resultant.

UNCONTROLLED IF PRINTED

8. Any maintenance or corrective actions taken as a result of the test.

6.7 Accuracy Test

6.7.1 Perform the following activities to provide accurate test results:

1. Clean meter body and rotor assembly.
2. Lubricate bearings.
3. Run test on meter at a rate between 10% and 105% of the rated capacity.
4. Record accuracy test results.

6.7.2 For turbine meters equipped with a detachable rotor module, test module in either the service meter body or a test meter body.

6.8 Accuracy Test Record

6.8.1 Record the following items to document the accuracy test:

1. Test date.
2. Employee or contract service provider performing test.
3. Flow rates.
4. Accuracy test results.
5. Meter cartridge number.
6. Comparison to acceptable accuracy for **PASS** or **FAIL** resultant.

6.9 Follow-up Action

6.9.1 Check recorded spin time against the factory recommended times.

6.9.2 If spin time is not acceptable (i.e., equal to or greater than the minimum spin time specified by manufacturer), then correct the spin time by cleaning, lubricating, and/or repairing the meter.

6.9.3 Accuracy shall be within acceptable limits of $\pm 1\%$.

6.9.4 If necessary, schedule corrective maintenance activity or meter replacement.

6.10 Turbine Meter Records

6.10.1 Maintain turbine meter test results for life of the meter in MMS.

7.0 Ultrasonic Meter Testing

7.1 General

7.1.1 This procedure provides guidelines for periodically inspecting ultrasonic meters (USM's) and interrogating the associated instrumentation using meter manufacturer's application software to verify proper meter operation.

7.1.2 The *absolute digital time travel* (ADTT) measurement method is used for natural gas based on American Gas Association (AGA) Report No. 9 specifications for custody transfer flow measurement.

7.1.3 Ultrasonic meter parameters were developed by Gas Technology Institute (GTI) on device specific meter modules and spool piece for corrected gas velocity and speed of sound.

7.2 Ultrasonic Meter Inspection Schedule

UNCONTROLLED IF PRINTED

- 7.2.1 Periodically inspect and interrogate (using manufacturer's software) the ultrasonic meters installed as customer meters or the gas storage facilities injection/withdrawal meters at least every *3 months* to verify overall instrument operating condition.
- 7.2.2 At least 2 of the quarterly maintenance reports in a calendar year must be with gas flowing through the meter.
- 7.2.3 With gas flowing through the meter, use manufacturer's software to create a maintenance report that captures *at least 2 minutes of data*. The software uses the captured data to generate reports and graphs detailing the ultrasonic transducer's performance and the overall meter performance. Save the reports to document the current meter condition and to develop diagnostic benchmarks.
- 7.2.4 Perform all the following inspections:
 1. Path velocities.
 2. Gain levels.
 3. Gain limits.
 4. Performance percentage.
 5. Meter output frequency range.
 6. Speed of sound verification.
 7. Verification that the flow computer and USM have the correct settings, including:

Ultrasonic meter pulses represent actual cubic feet (ACF or acf) of flow through the meter.

- 7 a. Meter pulse uncorrected actual per cubic feet factor.
 - 7 b. Internal diameter of pipe.
 - 7 c. Validation of flow computer operation by independent calculation of corrected volume, thermal output, and meter adjustment factors.
- 7.2.5 If transducer performance (e.g., signal-to-noise ratio (SNR), gain values) change over time from the original installation or last inspection, it could be due to build-up of impurities on the transducer face. Take corrective actions per manufacturer's instructions.
- 7.2.6 Verify that the meter frequency output reflects the on-site flow computer frequency input.
- 7.2.7 Confirm that the on-site flow computer uses the same meter factor (pulses per actual cubic feet) as the USM.
- 7.2.8 Flow calibrate multi-path ultrasonic meters at least every *120 months*. Calibration of meter package shall include meter, flow conditioner, thermowells, and meter tubes.
 1. AIC may forego the 120-month flow calibration requirement IF:
 - 1 a. The periodic inspection documents can demonstrate that the meter meets manufacturer's tolerances, AND

UNCONTROLLED IF PRINTED

- 1 b. An internal inspection of the meter body performed at least every 120 months indicates that the meter has not accumulated internal deposits OR incurred other damage that would affect its accuracy

7.3 Transmitter Inspection

- 7.3.1 Verify all transmitters used in conjunction with flow computers for proper operation at least every *6 months*.
- 7.3.2 Verify electronic pressure and temperature transmitters for accuracy according to recommended procedures outlined by the transmitter manufacturer.
- 7.3.3 Verify that the transmitter signals (4 - 20 mA) reflect the corresponding input value to the on-site flow computer.
- 7.3.4 Confirm that the transmitter output scaling matches the on-site flow computer input.
- 7.3.5 Record the verification/inspection for accuracy and calibration adjustments on the AIC Gas Instrument Calibration Data Sheet.

7.4 Gas Chromatograph Operational Check

- 7.4.1 When an online gas chromatograph (GC) is used in the volume computation, verify GC is properly sampling the measured gas stream and that unit calibration is performed at a minimum programmed cycle at least once every 24 hours.
- 7.4.2 If a GC is used in measurement calculation at a natural gas storage facility and the facility is not injecting or withdrawing gas, then AIC may suspend its calibration until resuming injection or withdrawal operation.
- 7.4.3 Confirm that the GC is not in an alarm state or has any unacknowledged alarms.
- 7.4.4 Verify at least every *3 months* that the gas component un-normalized mole % variance is within $\pm 1.5\%$ of the gas contained within the calibration gas cylinder and that the values are being received at the meter and the on-site flow computer.
- 7.4.5 Request assistance if there are large differences in values.
- 7.4.6 Re-certify or replace the calibrated gas reference cylinder at least every *36 months*.

7.5 Inspection Records

- 7.5.1 Complete and save electronic versions of the Gas Instrument Calibration Data Sheets for pressure and temperature transmitters.
- 7.5.2 Save electronic copies of manufacturer's software generated maintenance and/or inspection reports plus software generated meter configuration files. Save maintenance logs and meter configuration files for *equipment life PLUS 3 years*.
- 7.5.3 Send electronic copies of above records to the Gas Meter Engineer - Decatur Central Meter Shop.
- 7.5.4 Maintain all meter configuration files plus calibration, inspection, and maintenance records on the USM SharePoint site or as a paper record for *5 years*.
- 7.5.5 For multi-path ultrasonic meters, maintain documents covering accuracy tests for *10 years*.

7.6 Follow Up Action

UNCONTROLLED IF PRINTED

- 7.6.1 If degradation of the ultrasonic transducer signal quality is noted, then take corrective action such as cleaning or replacing the transducer per manufacturer's instructions.
- 7.6.2 If pressure or temperature transmitter cannot be adjusted within the manufacturer's stated accuracy for span being used during calibration, replace the transmitter.
- 7.6.3 Inspect the physical properties of the meter run for abnormal operations.
- 7.6.4 As applicable, investigate, record findings of, and repair the following deficiencies:
 - 1. Atmospheric corrosion,
 - 2. UV degradation,
 - 3. Flange bolts,
 - 4. External wiring,
 - 5. Meter environment, AND
 - 6. Stresses.

8.0 Records and Retention

- 8.1 In summary (to above qualifications), file and retain all new inspection records in Click, Maximo, or OAS. However, some historical records may be retained in their paper form.
- 8.2 See the expanded and consolidated summary titled "Meter Test Schedules & Retention Requirements" located in [METR 4](#) under References. (in support of METR 2.2, 2.3, and 2.4).

End of Instructions.

METR 2.5 Gas Meter Bypass

1.0 Purpose

This document provides procedure for Ameren Illinois (AIC) to bypass the gas meter and to maintain customer's gas service when the normal supply is temporarily shut-off.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Basic Procedure](#)

[5.0 Using Portable CNG Tank System with Angled-System Bypass Valve](#)

[6.0 Using Portable CNG Tank with Grunsky Apparatus](#)

[7.0 Using Portable CNG Tank with the Mueller Briso Valve](#)

[8.0 Refilling Portable CNG Bottles](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor

4.0 Basic Procedure

4.1 Bypassing meter can be used for the following situations:

4.1.1 Meter exchange.

4.1.2 Meter set repair or replacement.

4.1.3 Regulator repair or replacement.

4.1.4 Meter valve replacement.

4.1.5 Riser replacement.

4.1.6 Gas service line repair or renewal.

4.1.7 Local system pressure monitoring that involves a temporary meter removal.

4.2 Prior to touching gas meter set, check the following with "volt-stick" for possible voltage in accordance with [METR 2.2, Subsection 7.2](#) , AC Voltage on Meter Set:

4.2.1 Riser,

4.2.2 Meter, AND

4.2.3 Customer piping.

4.3 If possible, bypass operation should be done with little or no-load present. If the furnace is operating, consider waiting for it to cycle off to conserve CNG tank pressure.

UNCONTROLLED IF PRINTED

- 4.4 Use a portable CNG tank with a minimum of 600 psig to provide the bypass gas service.
- 4.5 Confirm customer delivery pressure.
 - 4.5.1 Use appropriate delivery pressure from the CNG tank system to ensure uninterrupted service.
 - 4.5.2 DO NOT overpressure customer fuel piping system with an incorrectly set delivery pressure from the CNG tank system.
- 4.6 All reconnected fittings shall be checked for leaks with leak detection fluid or leak detection instrument once gas service is restored.
- 4.7 Following restoration of service, observe the meter index for movement to ensure meter has returned to normal operation,

5.0 Using Portable CNG Tank System with Angled-System Bypass Valve

- 5.1 Crack open CNG bottle valve to purge air from feed line.
 - 5.1.1 Confirm that bottle delivery pressure matches the customer delivery pressure.
 - 5.1.2 Adjust CNG bottle pressure as necessary.
- 5.2 Remove plug fitting from the angled system bypass valve.
- 5.3 Connect CNG bottle hose fitting to the angled system bypass valve.
- 5.4 Loosely connect CNG bottle hose, open the CNG bottle hose valve to purge any remaining air, then tighten hose fitting.
- 5.5 Completely close the angled system bypass valve.
 - 5.5.1 Customer is now being supplied from CNG bottle.
 - 5.5.2 Monitor gauges at tank to ensure correct pressure to the customer is maintained throughout the process.
- 5.6 Meter set riser valve can be shut-off if needed.
- 5.7 To reinstate gas to customer:
 - 5.7.1 Ensure that meter set riser valve is completely opened, then completely open the angled system bypass valve to revert the customer back to metered distribution gas.
 - 5.7.2 Turn off the CNG tank bottle valve.
 - 5.7.3 Remove the CNG tank bottle hose and fitting.
 - 5.7.4 Replace the angled system bypass valve port plug.
 - 5.7.5 DO NOT lock the angled system bypass valve.

6.0 Using Portable CNG Tank with Grunsky Apparatus

- 6.1 Tee must be in proper alignment for CNG system to work.
- 6.2 Loosen plug on the tee being used; do not remove plug.
- 6.3 Place bag with correct size bayonet over tee. See Figure 1 for equipment picture.

Figure 1: Grunsky Apparatus

- 6.4 Open main valve of the CNG tank and hose valve.
- 6.5 Open purge cap on the bag and squeeze bag to get air out.
- 6.6 Remove plug by squeezing bag and grasping plug; loosen with fingers and let plug drop into bag.
- 6.7 Force proper size bayonet into pipe through the tee, locking it with a twisting motion. No gas should be coming from the bag purge cap - signifying a good seal.
- 6.8 Monitor gauges at tank to ensure correct pressure to the customer is maintained throughout the process.
- 6.9 Meter set riser valve can be shut-off, if needed.
- 6.10 To reinstate gas to customer:
 - 6.10.1 With purge cap on bag open, back bayonet out of tee.
 - 6.10.2 Insert plug into tee and snugly tighten by hand. Bag to remain on the tee while replacing plug into tee.
 - 6.10.3 Shut off CNG tank and remove bag.
 - 6.10.4 Back off plug in the tee; do not remove; apply pipe dope to the plug and tighten with a wrench.

7.0 Using Portable CNG Tank System with the Mueller Brisco Valve

- 7.1 Crack open CNG bottle valve to purge air from feed line.
 - 7.1.1 Confirm that bottle delivery pressure matches the customer delivery pressure.
 - 7.1.2 Adjust CNG bottle pressure as necessary.
- 7.2 Remove the bypass plug fitting from the valve.
- 7.3 Connect CNG bottle hose fitting to the valve.
- 7.4 Loosely connect CNG bottle hose, open the CNG bottle hose valve to purge any remaining air, then tighten hose fitting.
- 7.5 Move lockwing 1/4 turn to allow bypass.

Figure 2: Brisco Valve in Bypass Position

- 7.5.1 Customer is now being supplied from CNG bottle.
- 7.5.2 Monitor gauges at tank to ensure correct pressure to the customer is maintained throughout the process.
- 7.6 Meter set riser valve can be shut-off if needed.
- 7.7 To reinstate gas to customer:
 - 7.7.1 Ensure that meter set riser valve is completely opened, then completely open the bypass valve to revert the customer back to metered distribution gas.

Figure 3: Brisco Valve in Normal Open Position

- 7.7.2 Turn off the CNG tank bottle valve.
- 7.7.3 Remove the CNG tank bottle hose and fitting.
- 7.7.4 Replace the angled system bypass valve port plug and inspect for leaks.
- 7.7.5 DO NOT lock the angled system bypass valve.

8.0 Refilling Portable CNG Bottles

- 8.1 When the small CNG bottle's pressure has reduced to 600 psig or below, the bottle should be refilled.
- 8.2 Locate the nearest CNG trailer, which are listed in **EMER 2.9 Subsection 5.0** and contact the Gas Technical Services (GTS) representative for that area.
 - 8.2.1 The CNG trailers should be used to refill the small CNG bottles, by trained GTS employees.
 - 8.2.2 The CNG trailers are pressurized to 3,600 psig and a regulator shall be used when filling the small CNG bottles to a maximum pressure of 2,000 psig.

In accordance with 49 CFR 173.6, the combined gross weight of all Materials of Trade must be less than 440 lbs. transported on any one vehicle.

8.3 Only qualified individuals should refill the small CNG bottles.

8.3.1 Locate the 3,600 PSIG port on the CNG trailer,

8.3.2 Ensure the trailer and small CNG bottle valve are closed,

8.3.3 Connect your hose and regulator assembly kit between the trailer port and threaded bottle connection. This assembly should include:

1. Ralston hose (QTQT-HOS-6ft). – 2 each
2. Concoa Series 493 Regulator.
3. Tee fitting with a valve in line purge.
4. Left-hand threaded connector for bypass tank outlet

8.3.4 Reset the regulator to ensure that outlet pressure does not exceed the maximum of 2,000 PSIG.

8.3.5 Slowly open the trailer valve to pressurize the line.

8.3.6 Set the regulator to the required outlet pressure.

8.3.7 Purge the pressurized line prior to opening the CNG bottle valve to ensure no air is introduced to the CNG bottle.

8.3.8 Slowly open the small CNG bottle valve and allow the pressures to equalize.

8.3.9 Once the bottle has reached its desired pressure, close the trailer and small CNG bottle valves.

8.3.10 Vent and disconnect the hose and regulator assembly.

End of Instructions.

METR 2.6 Pressure Gauges

1.0 Purpose

This document addresses the type or quality of pressure gauges that Ameren Illinois (AIC) uses in establishing and maintaining its high standards for measuring gas or regulating pressures throughout the distribution system. Also, it identifies requirements for periodically verifying the accuracy of the different category gauges.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Gauge Definitions](#)

[6.0 Use of Test Gauges](#)

[7.0 Use of Calibrating Gauges \(Portable Standard\)](#)

[8.0 Verification and Calibration](#)

[9.0 Reference Standard](#)

[10.0 Recordkeeping](#)

Appendices

[Appendix A - Gauge Accuracy Verification](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor
- Gas Meter Shop Foreman

4.0 General

- 4.1 Certain activities require that a specific type of pressure gauge be utilized to ensure an adequate degree of accuracy for that task.
- 4.2 This procedure identifies when a test gauge or calibrating pressure gauge shall be used.
- 4.3 Pressure gauges used during construction and/or maintenance to establish or verify MAOP are addressed in [PTST 1, Section 8.0](#). Test Recording Methods.
- 4.4 All test and calibrating gauges shall be stored and transported in a protective case.
- 4.5 If a test or calibrating gauge is mishandled, dropped, or suspected of showing incorrect readings for any reason, it must be verified for accuracy.

5.0 Gauge Definitions

- 5.1 *Test Gauge* is a designated pressure gauge, ASME Grade 2A or 3A, with accuracy of at least $\pm 0.5\%$ full scale. It is periodically verified for accuracy and used for activities that require reading accuracy.
 - 5.1.1 A spring test gauge usually has features such as definitive zero, mirrored scale, knife-edged pointer, and a serial number.
 - 5.1.2 Face of a spring test gauge normally has "Test Gauge" printed on the face.
 - 5.1.3 A digital gauge that meets the minimum accuracy requirement can be used in lieu of a spring test gauge.
 - 5.1.4 Test gauges are entered and maintained in Maximo.
- 5.2 *Calibrating Gauge* (Aka "Portable Standard") is a designated pressure gauge with an accuracy of at least $\pm 0.10\%$ full scale, Grade 4A.
 - 5.2.1 A calibrating gauge can be used in the field to verify accuracy of an electronic pressure correcting device, calibrating pressure transducers, or in other situations where a high degree of accuracy is required.
- 5.3 *Portable Standards* mean instruments that can be used in the field or the meter shop to test the accuracy of auxiliary and tertiary equipment, transmitters, and other equipment associated with correcting a meter output.
- 5.4 *Reference Standards* mean instruments that are used only for verifying the accuracy of portable standards and whose accuracy is traceable back to the national standard as maintained by the National Institute of Standards and Technology (NIST) or its successor.

Reference Standards are for use in a shop environment only and never taken to the field.

6.0 Use of Test Gauges

- 6.1 "Zero" gauges prior to exposing them to the gas pressure.
- 6.2 Use a test gauge when performing the below activities. However, a calibrating gauge can also be used to perform these functions.
 - 6.2.1 Establishing regulator and relief valve set pressures at a new regulator station.
 - 6.2.2 Adjusting regulator and relief valve set pressures at all existing regulator stations.
 - 6.2.3 Verifying the pressure reading of permanently installed process gauges and pressure recording chart instruments.
 - 6.2.4 Verifying accuracy of process gauges used to record leak and/or strength test that verifies pipe/system MAOP.

7.0 Use of Calibrating Gauges (Portable Standard)

- 7.1 Use a calibrating gauge when performing the more sensitive tasks listed below.
 - 7.1.1 Establishing the regulator set pressure for all new customers metered at an elevated pressure (2 psig or greater).
 - 7.1.2 Performing the annual metering pressure verification for all commercial customers metered at an elevated pressure.

UNCONTROLLED IF PRINTED

- 7.1.3 Adjusting regulator operating pressures for all customers metered at an elevated pressure.
- 7.1.4 Verifying proper operation of electronic correctors, transmitters, other auxiliary and tertiary equipment connected to a meter, plus other equipment associated with correcting a meter output.

8.0 Verification and Calibration

8.1 Test Gauges

- 8.1.1 Verify each test gauge for accuracy once each calendar year, not to exceed 15 months.
- 8.1.2 Verify test gauge accuracy by comparing the test gauge reading to a calibrating test gauge or a dead weight tester at zero, half-scale, and full-scale readings.
- 8.1.3 For successful verification, the difference between gauge readings must be within its given tolerance, based upon the pressure range and accuracy of the test gauge.
- 8.1.4 For Ashcroft Model 1084 gauges, see [Appendix A](#) for the accuracy verification tolerances.
- 8.1.5 If the verification fails, the test gauge must have a 3-point calibration performed using a calibrating gauge or a dead-weight tester.

8.2 Calibrating Gauges

- 8.2.1 Each calibrating gauge shall be verified for accuracy against a certified reference standard at least every *12 months*.
- 8.2.2 For annual calibration/verification, the gauge may be done by a GTS person or sent to a 3rd party service.

9.0 Reference Standard

- 9.1 The reference standard shall be certified at least every *36 months* or by the certification due date.

10.0 Recordkeeping

- 10.1 The verification and calibration history for all test gauges, calibrating gauges, and reference standard shall be maintained in Maximo for *life of the gauge plus 3 years*.

End of Instructions.

Operator Qualification (OQ) Required?

YES

METERING

October 1, 2022

METR 2.7 Gas Metering Corrections**1.0 Purpose**

This procedure identifies electronic correcting equipment for accurate metering and billing of gas by Ameren Illinois (AIC), all in accordance with provisions established by the Illinois Commerce Commission (ICC). It includes installation, operations, and verification of such devices as a critical function in AIC gas metering operations.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Electronic Corrector New Installation, Field Exchange or Transfer Process](#)[6.0 Electronic Corrector Inspection-Verification Schedule](#)[7.0 Pressure Verification](#)[8.0 Temperature Verification](#)[9.0 AMI Reading Verification](#)[10.0 Gas Correcting Edits](#)[11.0 Maintenance Activities](#)[12.0 Atmospheric Corrosion Inspections / Follow-up](#)[13.0 Records](#)

Appendices

[Appendix A - Electronic Corrector Documentation](#)[Appendix B - Electronic Corrector Maintenance](#)[Appendix C - Electronic Corrector Verification Form](#)[Appendix D - Electronic Corrector Inspection Form](#)**3.0 Target Audience**

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor
- Gas Meter Shop Foreman
- IL Metering and Projects Supervisor
- Customer Accounts Department (CAD) Supervisor

4.0 General

- 4.1 An electronic corrector is typically selected and utilized for loads equal to or greater than 15,000 scfh; hence, large volume customers. It must be utilized in instances where the elevated metering pressure is greater than 15 psig.

UNCONTROLLED IF PRINTED

AIC's company use gas meters operating above 15 psig on January 01, 2017 shall be grandfathered and no electronic corrector is required.

- 4.2 This procedure identifies the requirement to periodically inspect/verify the proper operation of electronic correctors on meters to ensure that gas is measured accurately.
- 4.3 This addresses the requirements when an installation, with an elevated metering pressure, is subject to field actions regarding electronic correctors at customer premise as follows:
 - 4.3.1 Recently installed or addition.
 - 4.3.2 Changes.
 - 4.3.3 Removed.
 - 4.3.4 Billing constant changed on an account.

5.0 Electronic Corrector New Installation Field Exchange or Transfer Process

- 5.1 Gas Meter Shop and Gas Technical Services co-workers shall be responsible for programming electronic correctors.
 - 5.1.1 Gas Meter Shop co-workers will preconfigure gas meter/corrector/AMI assemblies for field installations.
 - 1. Verify the corrector parameters are correct for the gas meter combination.
 - 2. Save a copy of the Item File Report to the Gas Meter Data Sheet folder on the O:/drive
 - 5.1.2 Regional gas field personnel will verify the following items when installing a pre-configured assembly from the gas meter shop:
 - 1. Verify the pressure sensing line valve is "Open".
 - 2. Record meter reading and plug in the AMI module.
 - 3. Contact GTS Technician to verify the corrector is programmed and configured correctly if a corrector is transferred from one gas meter to another.
 - 5.1.3 GTS Technician shall complete the following activities:
 - 1. Device Programming Verification:
 - 1 a. Verify the electronic corrector programming for proper configuration to ensure measurement accuracy. Verify Item Codes to include:
 - a. Base Pressure (#3 – 14.73).
 - b. Atmospheric Pressure (#4 – 14.4).
 - c. % Specific Gravity (#53).
 - d. % N2 for Supercompressibility (#54).
 - e. % CO2 for Supercompressibility (#55).
 - f. Corrected Volume Units (#90 – MCF).

- g. Uncorrected Volume Units (#92 – CCF).
 - h. Ch. A Output (#93 CorVol Pulses).
 - i. Meter Index Rate (#98 – specific to meter).
 - j. Fixed Pressure Factor (#109 – 0 or Live)
 - k. Fixed Super Factor (#110 – 0 or Live)
 - l. Fixed Temp Factor (#111 – specific to TC on meter: "Live" if meter is non-TC with no temperature probe. If Temp is fixed, Item #1055 must be "No" and Item 1162 must be "60" on an EC630.).
 - m. Time (#203)
 - n. Date (#204)
 - o. Ch. A Pulse On/Off (#1041 should be Closed – 50 ms NS Open – 250+ ms).
 - p. Ch. A Pulse output (#1193 – 1000CF)
- 1 b. Verification of additional Item Codes may be relevant based upon the specific installation.
- 1 c. Device Installation Verification:
- a. Confirm device is installed properly on the meter or instrument drive.
 - b. Verify pressure sensing line valve is "Open".
 - c. Verify mechanical uncorrected dial index displays the correct units of measure and matches the electronic uncorrected.
- 1 d. Attach a copy of the Item File Report to the GMDS.

6.0 Electronic Corrector Inspection-Verification Schedule

- 6.1 Inspect and verify each new, exchanged, or transferred electronic corrector installed at a customer premise *within 60 days* for proper operation.
- 6.2 During the verification process, the activities and particulars outlined in [Appendix A](#) Electronic Corrector Documentation shall be documented on [Appendix C](#) Electronic Corrector Verification Form.
- 6.2.1 Where possible, a different co-worker than the one that originally completed the corrector installation or transfer should complete the follow-up verification.
- 6.3 Customer Service System (CSS) will automatically initiate the generation of an OAS order (MJ44) immediately after the corrector is installed on an account in CSS, or after being transferred to a gas meter at the premise based upon "set date".
- 6.4 Inspect and verify each electronic corrector installed at a meter installation at least *every 60 months* for proper operation.
- 6.5 The Gas Tech Services (GTS) Supervisor is responsible to schedule the inspections of electronic correctors.

7.0 Pressure Verification

- 7.1 Verify the electronic corrector pressure transducer for proper operation by comparing the corrector pressure reading to a calibrating gauge reading.

UNCONTROLLED IF PRINTED

- 7.1.1 The difference between the calibrating gauge pressure reading and the electronic corrector pressure reading must be within $\pm 1.0\%$. See the pressure verification equation ([Subsection 7.5](#)) that calculates the acceptable verification tolerance for each metering pressure.
- 7.1.2 The transducer pressure shall be verified at zero and flowing pressure.
- 7.2 In addition, verify the pressure transducer reading at zero-reference pressure (atmospheric pressure). If zero-reference pressure is greater than ± 0.2 psig, reset the zero-reference point to zero according to the manufacturer's procedures.
- 7.3 If pressure transducer cannot be verified for proper operation, schedule the electronic corrector for repair or replacement.

Due to the accuracy of electronic corrector pressure transducers, the calibrating gauge utilized for verification must have a full-scale accuracy range of $\pm 0.10\%$ or better.

- 7.4 Document the "As Found" and "As Left" pressure sensing valve position to the corrector.
- 7.5 Pressure Verification Equation.
 - 7.5.1 The equation below identifies the verification tolerance when comparing the electronic corrector pressure reading to a calibrating gauge reading.

$$\text{Metering Pressure} \times 0.01 = \text{Allowable Pressure Variance (Above or Below Metering Pressure)}$$

8.0 Temperature Verification

- 8.1 Verify the electronic corrector temperature transducer for proper operation by comparing the corrector reading to a temperature instrument.
 - 8.1.1 The difference between the temperature instrument and the electronic corrector reading must be within ± 2.5 °F.
 - 8.1.2 Verify temperature at 32 °F (ice bath).
 - 8.1.3 Also, verify temperature in one of 3 ways:
 1. At 75 °F,
 2. Flowing gas temperature, OR
 3. Temperature of gas at the meter.
- 8.2 If temperature transducer or the electronic corrector temperature reading cannot be verified for proper operation during either of these tests, schedule for repair or replacement.

9.0 AMI Reading Verification

- 9.1 Verify AMI (advanced metering infrastructure) reads are in alignment with field meter readings. See [Appendix A, Section A-7](#) for the verification process or [Appendix B, Section B-7](#) for the inspection process.

10.0 Gas Correcting Edits

UNCONTROLLED IF PRINTED

10.1 General

10.1.1 The Gas Correcting Edit process in CSS is intended to monitor the accuracy of electronic correcting devices installed on gas meters.

10.1.2 By proactively monitoring the accuracy of electronic correctors, AIC can maintain accurate metering for large volume accounts and detect events that might negatively impact gas revenues and require billing adjustments.

10.2 Electronic Correcting Device and CSS Setup

10.2.1 Set up electronic correcting devices to display the Corrected Usage, Pressure, and Temperature (when equipped).

10.2.2 Set up each account with an electronic correcting device in CSS to the appropriate "Meter Point Type," which depends on the type of correcting device.

10.2.3 Set up devices capable of correcting gas volumes for pressure only or for both pressure and temperature as "GasCorDev-Illinois".

10.3 Required Data Elements

10.3.1 The following data elements are required to complete the gas correcting edit process. These readings are normally gathered monthly by the meter reading system for each account.

1. Corrected index reading.
2. Uncorrected index reading.

10.3.2 For accounts with the "Meter Point Type" of "GasCorDev-Illinois," use pressure and temperature tables established in CSS to calculate the corrector edits with the corrected and uncorrected index readings provided from the meter.

1. Gas meter pressure.
2. Gas meter temperature.

Although most correcting devices are capable of correcting for temperature, the temperature correction may already be performed by the meter. For temperature compensated meters, correcting device temperature is programmed at a fixed value of 60 °F

10.3.3 The gas correcting edit calculations use the following:

1. Atmospheric pressure of 14.40 psig,
2. Base pressure of 14.73 psig, and
3. Base temperature of 60 °F.

10.4 Gas Correcting Edits Application

10.4.1 The automated gas correcting edits are performed after the monthly reading values are obtained for each account having an electronic gas correcting device installed.

10.5 Gas Correcting Edit Process

10.5.1 The "Meter Point Type" for each account identifies the expected reading types to be retrieved from field for the gas correcting edit calculations.

The process compares the calculated corrected usage (that is derived from the uncorrected readings, pressure, and temperature) versus the actual corrected usage value from the correcting device.

10.5.2 The calculated corrected usage should be:

1. Within $\pm 10\%$ of the corrected value for meters where gas pressure is regulated upstream of the meter, or
2. Within $\pm 30\%$ of the corrected value for meters where gas pressure is regulated downstream of the meter.

10.5.3 If the comparison of calculated corrected usage to the actual corrected usage exceeds the allowable criterion, billing is stopped for that account. This is a "Failed" edit. A CSS WFM is generated for a prompt investigation to be completed before initiating billing.

10.6 Follow-up Actions

10.6.1 Gas correcting edits that "Pass" are provided in a daily Vista "Passed Report" with edit details for review by:

1. Gas Operations and Services.
2. IL Metering and Projects.

10.6.2 Gas correcting edits that "Fail" are provided in a daily Vista "Failed Report" and a WFM is generated to be worked by Customer Accounts Department (CAD).

10.6.3 CAD to initially review account for any obvious meter reading or other data errors. If obvious errors are detected, the WFM can be overridden or CAD can request the meter be re-read. When new readings are obtained, the gas correcting edits are run on new readings to re-determine the pass or fail status.

10.6.4 CAD to create a Miscellaneous Gas Operations Support WFM for any failed edits that require a field investigation. Gas Tech Services investigates the problem and sends a Miscellaneous Customer Accounts WFM back to CAD with follow-up information from the investigation.

10.6.5 For gas correcting edits performed manually, any failed edits should follow a similar procedure. Upon notification of a failed edit, Gas Tech Services will perform an investigation and provide any follow-up information to CAD in case billing adjustments are necessary.

11.0 Maintenance Activities

11.1 When the electronic corrector inspection and verification process indicates a need for maintenance, then complete maintenance activities as outlined on [Appendix B](#) - Electronic Corrector Maintenance, and document the review/actions onto Electronic Corrector Inspection Form. See [Appendix D](#).

12.0 Atmospheric Corrosion Inspections / Follow-up

12.1 See [Appendix B, Section B-6](#), Atmospheric Corrosion Inspection.

- 12.2 Document in ClickMobile those gas metering facilities that have any corrosion control inspection activities marked (Y) for YES. Information will be transferred to Maximo for tracking and scheduling the required follow-up actions.
- 12.3 For required corrective action, follow the procedures identified in [CORR 1, Section 15.0](#), Atmospheric Corrosion. Maximo will track and maintain a record of corrective action.

13.0 Records

- 13.1 Complete the electronic corrector inspection order in OAS.
- 13.2 Document all the electronic corrector verification information on the Electronic Corrector Verification Form. See [Subsection 4.4](#) and [Appendix A](#). For form, see [Appendix C](#).
- 13.3 Document all electronic corrector inspection information on the Electronic Corrector Inspection Form. See [Subsection 10.1](#) and [Appendix B](#). For form, see [Appendix D](#).
- 13.4 The completed forms shall be reviewed by the GTS Supervisor and forwarded to IL Metering.
- 13.5 The inspection information shall be maintained for *10 years*.

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0191: Measure Atmospheric Corrosion
- 0301: Manually Opening and Closing Valves
- 0641: Visually Inspect Pipe and Components Prior to Installation

METR 2.7 Metering: Gas Metering Corrections, October 1, 2020

Revision Notes

Location of Changes	Summary of Changes
2.0 Scope	New Section 5.0 Electronic Corrector New Installation, Field Exchange or Transfer Process Section 9.0 – AMI Reading Verification – Removed AMR
Form 4.4	Removed
Section 5.0 Electronic Corrector New Installation, Field Exchange or Transfer Process	New – Process identifies what tasks are to be performed by Gas Meter Shop personnel, Regional gas field personnel and GTS Technicians,
Subsection 6.2 – Electronic Corrector Inspection-Verification Process	New - During the verification process, the activities and particulars outlined in Appendix A Electronic Corrector Documentation shall be documented on Appendix C Electronic Corrector Verification Form.
Subsection 6.3	New - Customer Service System (CSS) will automatically initiate the generation of an OAS order (MJ44) immediately after the corrector is installed on an account in CSS, or after being transferred to a gas meter at the premise based upon "set date".
9.0 AMI Reading Verification	Removed AMR from title
9.1	Removed references to AMR.
Appendix A Electronic Corrector Documentation – A-1	Added "exchange" along with installation and transfer that require documentation.
A-3 Device Programming Verification	Added A-3.1.8 – Ch. A Output (#93 CorVol Pulses)
A-3 Device Programming Verification	Expanded A-3.1.12 - Fixed Temp Factor (#111 – specific to TC on meter "Live" if meter is non-TC with no temperature probe. If Temp is fixed, Item #1055 must be "No" and #1162 must be "60" on an EC350.)
A-3 Device Programming Verification	Added A-3.1.15 - Ch. A Pulse On/Off (#1014 should be Closed – 50 ms and Open – 250+ ms)
A-3 Device Programming Verification	Added A-3.1.16 - Ch. A Pulse output (#1193 – 1000 CF)
A-7 AMI Reading Verification	Removed AMR A-7.1 – Removed AMR A-7.2 - Removed AMR
Appendix B Electronic Corrector	Removed AMR B-7.1 – Removed AMR

UNCONTROLLED IF PRINTED

Maintenance – B-7	B-7.2 - Removed AMR
Appendix C – Electronic Corrector Verification Form	Update with April 27, 2022 version. AMI replaces AMR Under Device Programming- Added: 93 Ch. A Output 1014 Ch. A Pulse On/Off 1193 Ch. A Pulse output
Appendix D – Electronic Corrector Inspection Form	Updated with April 27, 2022 version. AMI replaces AMR Under Temperature Verification: Removed Temperature Simulator Tolerance Acceptable

Appendix A - Electronic Corrector Documentation

- A-1. *Requirement:* During the follow-up electronic corrector installation, exchange, or transfer verification process, complete the following activities and document on the Electronic Corrector Verification Form. See [Appendix C](#).
- A-2. *Meter Information:* Record the following items as indicated.
- A-2.1 Corrected Reading.
 - A-2.2 Electronic Uncorrected Reading.
 - A-2.3 Mechanical Uncorrected Reading.
 - A-2.4 Meter Index Reading - If available, record the uncorrected meter index reading.
 - A-2.5 Meter Number.
 - A-2.6 Meter Size - Record meter size.
 - A-2.7 Temperature Compensated box - Record Yes or No.
- A-3. *Device Programming Verification*
- A-3.1 Verify the electronic corrector programming for proper configuration to ensure measurement accuracy. Verify Item Codes to include:
 - A-3.1.1 Base Pressure (#13 - 14.73).
 - A-3.1.2 Atmospheric Pressure (#14 - 14.4).
 - A-3.1.3 % Specific Gravity (#53).
 - A-3.1.4 %N₂ for Supercompressibility (#54).
 - A-3.1.5 %CO₂ for Supercompressibility (#55).
 - A-3.1.6 Corrected Volume Units (#90 - MCF).
 - A-3.1.7 Uncorrected Volume Units (#92 - CCF).
 - A-3.1.8 Ch. A Output (#93 CorVol Pulses)
 - A-3.1.9 Meter Index Rate (#98 - specific to meter).
 - A-3.1.10 Fixed Pressure Factor (#109 - 0 or Live).

UNCONTROLLED IF PRINTED

A-3.1.11 Fixed Super Factor (#110 - 0 or Live).

A-3.1.12 Fixed Temp Factor (#111 - specific to TC on meter "Live" if meter is non-TC with no temperature probe. If Temp is fixed, Item #1055 must be "No" and #1162 must be "60" on an EC350.)

A-3.1.13 Time (#203).

A-3.1.14 Date (#204).

A-3.1.15 Ch. A Pulse On/Off (#1014 should be Closed – 50 ms and Open – 250+ ms).

A-3.1.16 Ch. A Pulse output (#1193 – 1000 CF).

A-3.2 Verifications of additional Item Codes may be relevant based upon the specific installation.

A-4. *Device Installation Verification*

A-4.1 Confirm device is installed properly on the meter or instrument drive.

A-4.2 Verify pressure sensing line valve is "Open."

A-4.3 Verify mechanical uncorrected dial index displays the correct units of measure and matches the electronic uncorrected read.

A-4.4 Verify additional items that may be relevant based upon the specific installation.

A-5. *Corrector Information*

A-5.1 Corrector Type - Record type or model.

A-5.2 Corrector Manufacturer.

A-5.3 Corrector Serial Number.

A-5.4 Alarms Displayed - Identify any alarms displayed & record the alarm type.

A-6. *Corrector Edit Calculation*

A-6.1 Verify proper operation of electronic corrector by completing a corrector edit when adequate usage has been registered by the corrector.

A-6.1.1 Edit is completed by comparing the corrected usage determined by the device to the calculated usage.

A-6.1.2 Calculated usage utilizes the raw uncorrected usage multiplied by the total correction factor from the device.

A-6.1.3 Difference should be less than 10% for gas metering installations where the gas is regulated upstream of meter.

A-6.1.4 Difference should be less than 30% for gas metering installations where gas is regulated downstream of meter.

A-7. *AMI Reading Verification*

A-7.1 Verify AMI reads are in alignment with field meter readings.

A-7.2 AMI readings lag field readings by 24-48 hours. The 7-day history function on the AMRC screen in OAS can be used to help determine alignment

A-8. *Follow-up Action/Remarks*

A-8.1 Record any follow-up actions or remarks that are applicable to complete the verification.

UNCONTROLLED IF PRINTED

- A-8.2 Communicate proper notification of potential billing adjustments to CAD (by the GTS Supervisor).

Appendix B - Electronic Corrector Maintenance

- B-1. *Requirement:* When the electronic corrector inspection process indicates a need for maintenance, then complete the below maintenance activities and document the review/actions onto Electronic Corrector Inspection Form. See [Appendix D](#).
- B-2. *Meter Maintenance:* Record the following items as indicated.
 - B-2.1 Corrected Reading.
 - B-2.2 Electronic Uncorrected Reading.
 - B-2.3 Mechanical Uncorrected Reading.
 - B-2.4 Meter Index Reading - If available, record the uncorrected meter index reading.
 - B-2.5 Meter Number.
 - B-2.6 Meter Size.
- B-3. *Corrector Maintenance:* Verify/Record the following items as indicated.
 - B-3.1 Corrector Type - Record type or model.
 - B-3.2 Corrector Manufacturer.
 - B-3.3 Alarms Displayed - Identify any alarms displayed & record the alarm type.
 - B-3.4 Corrector Date Set - Verify date is correct & reset if required (except Mini-P).
 - B-3.5 Corrector Time Set - Verify time is correct & reset if required (except Mini-P).
- B-4. *Battery Maintenance*
 - B-4.1 Main Battery Voltage - Record voltage. Replace battery pack or D-cell batteries if voltage is:
 - B-4.1.1 equal or less than 5.50 volts for the 9-volt replacement pack, or
 - B-4.1.2 equal or less than 4.30 volts for the 6-volt battery receptacle pack.
 - B-4.2 Wake Cycles (Lithium batteries) - Record the main battery wake cycles from Item #59. Replace battery if the wake cycles are:
 - B-4.2.1 greater than 10,000,000 cycles for an ECAT, or
 - B-4.2.2 greater than 40,000,000 cycles for a Mini-AT.
 - B-4.3 Main Battery Replaced - Record if replaced.
 - B-4.4 Memory Battery Voltage - Record the voltage from Item #51. Replace battery if the voltage is:
 - B-4.4.1 equal to or less than 2.10 volts for an ECAT, or
 - B-4.4.2 equal to or less than 3.60 volts for a Mini-AT.
 - B-4.5 Memory Battery Replaced - Record if replaced.
- B-5. *Follow-up Action/Remarks:*
 - B-5.1 Record any follow-up actions or remarks that are required to complete the inspection of the corrector.

B-5.2 Proper notification of potential billing adjustments shall be communicated to CAD by the GTS Supervisor.

B-6. *Atmospheric Corrosion Inspection*: Inspect the gas metering facilities for the following items and indicate (Yes/No).

B-6.1 Atmospheric corrosion (Y/N).

B-6.2 Disbonded coating (Y/N).

B-6.3 Needs paint (Y/N).

B-7. *AMI Reading Verification*

B-7.1 Verify AMI reads are in alignment with field meter readings.

B-7.2 AMI readings lag field readings by 24-48 hours. The 7-day history function on the AMRC screen in OAS can be used to help determine alignment.

METR 2.8 Pressure Factor Metering

1.0 Purpose

This document identifies the means of accounting for pressure on gas sales by applying fixed pressure factors or using electronic correcting equipment, all to provide accurate metering and billing of gas by Ameren Illinois (AIC) in accordance with provisions established by the Illinois Commerce Commission (ICC). It includes application considerations and implementation followed by process verification.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Elevated Metering Pressure Considerations](#)[6.0 Pressure Factor Metering](#)[7.0 Pressure Factors](#)[8.0 Electronic Correctors](#)[9.0 Verification Process](#)[10.0 Other Related Actions](#)[11.0 Records](#)**3.0 Target Audience**

- Gas Engineering
- Gas Supervisors
- Region Gas Engineer
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor
- Gas Meter Shop Foreman
- Gas Operations and Services Supervisor
- IL Metering and Projects Supervisor
- Customer Accounts Department (CAD) Supervisor

4.0 General

- 4.1 Natural gas is normally measured at a standard metering pressure of 0.25 psig (7" w.c.).
- 4.2 Since natural gas is compressible, there is additional gas in each cubic foot at an elevated pressure. Therefore, the measured gas volume must be corrected for the elevated pressure effect when metered above the standard metering pressure.
- 4.3 The volume correction at elevated pressure may be accomplished by applying a pressure factor (billing constant) or using an electronic corrector.
- 4.4 Gas usage of larger volume customers may be measured more efficiently and economically by utilizing an elevated metering pressure.

UNCONTROLLED IF PRINTED

- 4.5 This procedure provides selection guidelines for determining when to use pressure factor metering or an electronic corrector for metering at pressures above the standard metering pressure.

5.0 Elevated Metering Pressure Considerations

- 5.1 Elevated metering pressure is typically provided to large-volume commercial and industrial gas customers when their equipment operates at higher pressure.
 - 5.1.1 AIC may also elect to use an elevated metering pressure in order to install a smaller, more economical meter.
- 5.2 When elevated metering pressure is used, the measured volume displayed on the meter index must be corrected for the additional gas volume in each cubic foot. The resultant is referred to as "corrected" volume.
- 5.3 A residential, commercial, or industrial customer may request a delivery pressure of 2 psig or greater.
 - 5.3.1 The elevated delivery pressure may be provided at AIC discretion based on customer's equipment requirements and AIC's available system pressure.
- 5.4 When a customer requests an elevated delivery pressure of 2 psig or greater, complete the Elevated Delivery Pressure Request Form (see [METR 4](#)).
 - 5.4.1 The customer must sign the form acknowledging the requested pressure.
- 5.5 Prior to approving an elevated metering pressure, Gas Engineering shall verify that the distribution system has enough pressure and capacity to meet the requested delivery requirements.
- 5.6 The Region Gas Engineer should select the lowest possible metering pressure based on the customer's requirements and a typical interior piping design. In addition, design the meter set piping configuration to prevent excessive pressure drop or pressure variation at meter outlet.

6.0 Pressure Factor Metering

- 6.1 First type of elevated metering pressure correction is using a pressure factor, which is subject to the following:
 - 6.1.1 Requires the gas be regulated at a constant pressure prior to entering meter.
 - 6.1.2 Volume of gas measured by the meter is multiplied by a pressure factor (referred to as billing constant in the CSS system) to calculate the corrected volume.
 - 6.1.3 Typically selected for loads less than 15,000 scfh.
 - 6.1.4 Can only be used on elevated metering pressure equal to or less than 15 psig.
 - 6.1.5 Company use gas meters operating above 15 psig on January 01, 2017 shall be grandfathered and installation of an electronic corrector is not required.

Regardless of load size and delivery pressure, pressure factor metering shall not be used at locations where distribution system capacity constraints do not allow a constant delivery pressure to be maintained through the meter.

- 6.2 The approved elevated pressures for pressure factor metering are 2 psig, 5 psig, 10 psig, and 15 psig.
- 6.3 When pressure factor metering is selected, the Region Gas Engineer specifies the meter and regulating equipment.
- 6.4 The regulator that is selected and sized for pressure factor metering must be capable of holding a constant outlet pressure to within $\pm 1.0\%$ of the absolute billing pressure under the anticipated load conditions.
 - 6.4.1 Adjust the regulator to the selected metering pressure with gas flowing.
 - 6.4.2 Attach a metal tag showing the elevated metering pressure, placing it in a visible location near the regulator or meter index.
 - 6.4.3 If a constant pressure cannot be maintained, evaluate installing a different regulator or an electronic corrector.
- 6.5 Use a calibrating gauge to set and verify the metering pressure on all new and existing pressure factor meter sets. See [METR 2.6, Section 5.0](#), Gauge Definitions.
- 6.6 See [Section 7.0](#) for the pressure factor corresponding to the approved elevated metering pressure,
- 6.7 Adjust the gas metering pressure if the "As Found" pressure is found to be greater than ± 0.25 psig from the expected pressure.

7.0 Pressure Factors

- 7.1 Calculate the pressure factors using the following formula:

$$Pf = (Pg + 14.40) / 14.73 \text{ psia}$$

Where:

Pf = Pressure Factor

Pg = Gauge Pressure (psig)

14.40 psia = Average Atmospheric Pressure

14.73 psia = Pressure Base

Table 1: Calculated Pressure Factors

Metering Pressure (psig)	Pressure Factor
2	1.113
5	1.317
10	1.656
15	1.996

8.0 Electronic Correctors

- 8.1 The second type of elevated metering pressure correction is installing an electronic corrector on the meter. The electronic correcting device continuously monitors the metering pressure. It automatically corrects the gas volume for the elevated pressure, flowing gas temperatures, and supercompressibility. Application of an electronic corrector is subject to the following:
 - 8.1.1 Gas flow does not have to be controlled at a constant pressure prior to entering the meter.

- 8.1.2 Typically selected for loads equal to or greater than 15,000 scfh.
- 8.1.3 Specifically used where the elevated metering pressure is greater than 15 psig; however, applications greater than 15 psig shall be approved by Gas Tech Engineering or IL Metering and Projects.
- 8.2 When an electronic corrector is selected, the Region Gas Engineer or Gas Tech Engineer will coordinate with IL Metering and Projects on reviewing and specifying the meter and regulating equipment to be used.
- 8.3 Any meter with metering pressure of 175 psig or greater shall be approved by Gas Tech Engineering and by IL Metering and Projects.

9.0 Verification Process

9.1 General

- 9.1.1 IL Metering and Projects will provide each Region and GTS with a list of gas meters that have a billing constant greater than 1.
 - 1. List to contain customer name, address, meter number, meter pressure, and billing constant.
 - 2. List will be generated annually prior to commencing the verification process that includes verifying CSS records for accuracy plus a site audit of metering pressure for each location.
- 9.1.2 Create investigation orders in OAS for all premises with a factor billed elevated meter pressure.

9.2 Pressure Factor Verification

- 9.2.1 Check the metering pressure for accuracy using a calibrating gauge at the meter outlet. See [METR 2.6, Section 5.0](#), Gauge Definitions.
- 9.2.2 Complete the metering pressure check with gas flowing through the meter. Flow may be due to normal customer operation or can be established by properly venting gas to atmosphere. Flow rate shall be less than 90% of meter capacity at the designated fixed-factor operating pressure.
- 9.2.3 Verify metering pressure at least every 36 months.
 - 1. If pressure check cannot be completed with gas flowing, identify the account as an incomplete verification and re-schedule the pressure check.
 - 2. If conditions that prevent meter verification are documented, verification may be delayed until those conditions cease to exist or for 4 months, whichever is shorter.
- 9.2.4 The employee completing the pressure check shall record the following:
 - 1. "As Found" pressure.
 - 2. "As Left" pressure.
 - 3. Pressure check date.
 - 4. Employee completing pressure check.
 - 5. Index reading.
 - 6. Additional remarks or comments.
 - 7. Any identified discrepancies that require follow-up action (enter under comments).

UNCONTROLLED IF PRINTED

8. Pressure tag installed on the meter (Y/N).

9.2.5 A physical check of gas metering pressure is not required per the pressure factor verification for the following:

1. Residential rate accounts that have an equal to or less than 5 psig metering pressure and have a meter with rated capacity under 700 cfh.
2. Non-residential rate accounts that have an equal to or less than 2 psig metering pressure and have a meter with rated capacity under 700 cfh.

9.3 Pressure Factor Verification with Recording Chart

9.3.1 The Gas Supervisor may determine that the metering pressure of certain customer accounts should be verified over an extended operating period.

9.3.2 This verification method can be done by installing a pressure recording chart (mechanical or electronic) typically for a period of 1-3 days.

9.3.3 The recorded pressure data is then averaged to determine if any adjustments to the metering pressure are required.

9.3.4 This pressure verification step is discretionary, but it should be done if believed that the existing regulator cannot maintain the metering pressure within $\pm 1/4$ psig.

9.4 Possible Billing Adjustments

9.4.1 Notify the Gas Supervisor if the physical check of metering pressure differs from the listed pressure by more than $\pm 1/4$ psig. The Gas Supervisor should verify the correct metering pressure and have the pressure adjusted accordingly by gas field personnel.

9.4.2 Any account on the CSS list that is identified with an incorrect metering pressure and/or billing constant shall be left "As Found" until the Gas Supervisor determines the required follow-up action.

There may have been a pressure change in the field that was not properly updated on the CSS account or the CSS record may be incorrect.

9.4.3 No pressure adjustments are required by the field personnel for metering locations with a mechanical or electronic correcting device. If the metering pressure is different than the listed pressure, it should be identified for follow-up action by the Gas Meter Supervisor.

10.0 Other Related Actions

10.1 The regulator that is used in conjunction with fixed factor billing shall be secured if it is discovered that the pressure setting has been tampering with. The regulator spring cap can be secured by means of installing a seal wire, where possible, or by other means. Twist wire seals are available through the Gas Meter Shop or MDF (Stock Code 62 55 093). Electric department wire seals are also acceptable.

10.2 AMR/AMI Reading Verification

10.2.1 Verify AMR/AMI reads are in alignment with field meter readings.

10.2.2 AMR/AMI readings lag field readings by 24-48 hours. Use the 7-day history function on the AMRC screen in OAS to help determine alignment of readings.

10.3 Corrosion Control Inspections

10.3.1 Complete corrosion control inspection activities on the gas metering facilities as follows:

1. Document atmospheric corrosion inspection in ClickMobile per [CORR 1, Section 15.0](#), Atmospheric Corrosion.
2. Document any disbonded coating and/or painting needs within ClickMobile if follow-up is required.
3. Transfer information to Maximo for scheduling and tracking of any required follow-up actions.

10.3.2 The corrective action work required will follow the procedures identified in [CORR 1, Section 15.0](#), Atmospheric Corrosion. Maximo will track and maintain a record of corrective action.

11.0 Records

11.1 The Gas Supervisor is responsible for reviewing the Gas Meter Data Sheet (GMDS) for pressure factor metering or when an electronic corrector is installed. (See [METR 2.10](#).) These records are required to perform the field verification of elevated metering pressure and to verify the associated pressure factor contained in CSS.

11.2 Distribute the GMDS to the appropriate individuals/departments as shown on the GMDS. (See [METR 2.10, Section 6.0](#), Report Distribution.)

11.3 Transfer any GMDSs that are completed on the paper form to the electronic form for distribution. (See [METR 4](#) for form.)

11.4 File completed Elevated Delivery Pressure Request forms at the Operating Center.

11.5 Retain all pressure factor verification records for 3 years.

End of Instructions.

METR 2.9 Diaphragm Meter Repair

1.0 Purpose

This document addresses procedures and methods for repairing domestic diaphragm meters, other larger meters, and related equipment by Ameren Illinois (AIC), plus use of outside contract services, to ensure accurate and reliable gas measurement to the customers. All repairing is in accordance with code requirements of the Illinois Commerce Commission (ICC).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Meter Repair Procedures](#)

[6.0 Contract Meter Repair - General](#)

[7.0 Contract Meter Repair - Equipment](#)

[8.0 Contractor Repair Specifications](#)

[9.0 Other Terms and Conditions - Contracted Repairs](#)

[10.0 Contractor Quotations](#)

Appendices

[Appendix A - Domestic Meter "Class A" Repair - American & Rockwell](#)

[Appendix B - Domestic Meter "Class B" Repair:](#)

[Appendix B-1 - American & Rockwell Meters](#)

[Appendix B-2 - Sprague Meters](#)

3.0 Target Audience

- Gas Metering Supervisor
- Gas Meter Shop Foreman
- IL Metering and Projects Supervisor
- Purchasing Department

4.0 General

4.1 Criteria for category of diaphragm meter repair are as follows:

4.1.1 *"Class A" repair* is the less extensive repair level and typically involves meters that meet ALL the following criteria:

1. No more than 10 years old,
2. "In-test" average accuracy within +/- 1.5% (i.e., between 98.5% and 101.5%), and
3. Test accuracy spread within 1.2%.

4.1.2 *"Class B" repair* is more extensive repairs typically going beyond the bounds described above for Class A repair.

UNCONTROLLED IF PRINTED

- 4.2 For criteria and procedure for retiring meters, see [METR 2.1, Subsection 5.0](#), Meter Retirements. Some basic criteria for retiring meters include:
 - 4.2.1 Meters over 30 years old.
 - 4.2.2 Leaking diaphragm or tangent arms on diaphragm meters requiring replacement.
 - 4.2.3 Broken parts.
- 4.3 Gas meter contract testing and repair services include AIC gas meters, electronic correcting devices, and related proving equipment.
- 4.4 AIC may choose to utilize contract services to supplement the available AIC resources that perform meter repair and testing activities.
- 4.5 When logistically and economically practical, the meter or device manufacturer shall be utilized for testing and repair services.

5.0 Meter Repair Procedures

- 5.1 Class A Repair:
 - 5.1.1 American Domestic Meter - See [Appendix A](#)
 - 5.1.2 Rockwell Domestic Meter - See [Appendix A](#)
- 5.2 Class B Repair:
 - 5.2.1 American Domestic Meter - See [Appendix B-1](#)
 - 5.2.2 Rockwell Domestic Meter - See [Appendix B-1](#)
 - 5.2.3 Sprague Domestic Meter - See [Appendix B-2](#)

6.0 Contract Meter Repair - General

- 6.1 Contract services may be used for the following purposes:
 - 6.1.1 Repair and "adjust-testing" of diaphragm meters.
 - 6.1.2 Repair of rotary meters.
 - 6.1.3 Accuracy testing and repair of turbine meters.
 - 6.1.4 Re-certification of gas meter proving equipment to meet regulatory requirements.
 - 6.1.5 Repair and/or conversion of electronic correcting devices.
- 6.2 IL Metering and Projects is responsible for:
 - 6.2.1 Identifying suitable contract service providers to meet the respective testing and repair requirements, and
 - 6.2.2 Coordinating with Purchasing Department to secure quotations and award contracts.
- 6.3 Prospective bidders shall furnish a detailed list itemizing all parts and services included under each class and size of meter repair specified by AIC.
- 6.4 Contract testing and calibration of AIC gas meters and devices shall be performed by a contractor in compliance with all AIC procedures as well as Illinois Administrative Code Part 501.
- 6.5 When using a contract service provider, AIC will periodically conduct site inspections and monitor the work being performed on AIC meters (or devices) at the contractor's facilities for quality assurance.

7.0 Contract Meter Repair - Equipment

7.1 Diaphragm Meters

- 7.1.1 Adequate preparations shall be taken to protect diaphragm meters prior to being shipped to a contractor for repair.
- 7.1.2 Following in-testing by AIC, small and large capacity diaphragm meters (that are not retired) shall be prepared for shipping to a predetermined contract testing/repair facility. All meters will be picked up by contractor's freight service.
- 7.1.3 Shipping procedures:
1. Ship small diaphragm meters (425 cfh and smaller) in wire meter baskets, at least 30 meters per basket, with plywood (or OSB) separating the levels.
 2. Where baskets cannot be used, palletize 60 to 100 meters per 3 or 4 level pallets.
 3. Separate pallet levels with plywood (or OSB); shrink-wrap the entire pallet.
 4. Secure larger capacity meters (630 cfh and larger) as required to protect them during shipping.
 5. Multiple meters may be banded together or shrink-wrapped for shipping.
- 7.1.4 Contractor shall pick up all diaphragm meters from, and return them to, the respective AIC gas meter shop locations shown below. Contractor is responsible for returning the meters in the shipped baskets along with the plywood/OSB separators or properly packaged on pallets.

- AIC - Decatur Meter Shop
2655 N MLK Drive
Decatur, IL 62526
Attention: Gas Meter Supervisor

- AIC - Peoria Gas Meter Shop
7064 West US Highway 150
Edwards, Illinois 61528
Attention: Gas Meter Supervisor

7.2 Rotary Meters, Turbine Meters, and Gas Correcting Devices

- 7.2.1 The Gas Metering Supervisor of each meter shop is responsible for securing quotations and shipping instructions from the contractor for meter and equipment services needed and for returning rotary meters, turbine meters, and correcting devices that have been tested and/or repaired.

8.0 Contractor Repair Specifications

- 8.1 Where repairs to small diaphragm gas meters can be economically justified by contract services, AIC will specify the level of work to be done by the Contractor.
- 8.2 In aggregate, the meter maintenance, parts replacement, testing, and calibration activities that AIC believes are economically justified is defined as "Class B" repairs.
- 8.2.1 A Class B repair includes the following activities:
1. In-test (if required).
 2. Remove top.

3. Grind valves.
4. Replace worn pins, bushings, arms, and gears.
5. Replace top gaskets.
6. Test diaphragms for leaks and meter for internal leaks.
7. Pressure test the meter at case pressure to test for external leaks. AMR/AMI module, if equipped, shall be removed if the meter is to be submerged in water for test.
8. Check the index for excess dirt and free movement. Replace as necessary. Manufacturer specific index replacements are as follows:
 - 8 a. American meters - Replace indexes with holes or cotter pins in the "dog" drive. Replace all plastic indexes having black gears.
 - 8 b. Rockwell meters - Replace all plastic indexes having white gears.
 - 8 c. Sprague meters - Replace all indexes having 2 silver rivets and/or the "claw" type drive dog.
9. Prove or calibrate meter to within $\pm 1/2\%$ accuracy, with no more than a 1% spread between the check rate and capacity rate tests. Meters with an AMR/AMI device shall be tested or calibrated with the AMR/AMI module installed.
10. Sandblast, wheelbrute, or wire brush to give the meter a clean appearance.
11. Paint meters with AGA Standard #49 Gray. Cover all indexes during painting activity.

9.0 Other Terms and Conditions - Contracted Repairs

- 9.1 Small diaphragm meters (425 cfh and smaller), requiring more than a Class B repair to meet AIC specifications, shall be identified as "un-repairable" and retired at contractor's facility. See [Subsection 9.4](#) for handling and quality control procedure.
- 9.2 The AMR/AMI module on any meter retired by the contractor shall be returned to AIC.
- 9.3 Contractor shall submit detailed invoices showing the following:
 - 9.3.1 Complete breakdown of all applicable charges, including separate costs for labor and material.
 - 9.3.2 Additional parts required to complete large diaphragm meter repairs at the price identified in the contract quotation / specifications.
 - 9.3.3 "Credit" to AIC for each meter identified as "un-repairable" and retired at contractor's facility. Also, a list of retired meters by manufacturer, meter number, and reason for retiring the unit shall be furnished.
 - 9.3.4 Test results by both hard copy and electronic file (in a format readable by MMS) after the completion of each batch.
 - 9.3.5 Electronic copy of the programming (marriage) and MRB (divorce) files for all meters, where applicable.
- 9.4 Upon return of the repaired lot to AIC, a sample population based on the total number repaired will be pulled.
 - 9.4.1 The sample will be visually inspected and tested to ensure they have been repaired and adjusted to AIC specifications.

UNCONTROLLED IF PRINTED

- 9.4.2 If the sample fails (based on the tests performed on AIC provers), AIC will proceed with the following steps at our discretion.

Based on the results of the visual inspection and test results, Step 1 may be skipped and either Step 2 or 3 immediately executed.

- *Step 1:* AIC will pull a second sample for testing. If the second sample passes, the entire lot will be accepted. If the second sample fails, either Step 2 or 3 will be executed.
- *Step 2:* AIC will return the entire lot to the vendor for retesting, or
- *Step 3:* AIC will test 100% of the lot and adjust the meters as necessary at vendor's expense.

10.0 Contractor Quotations

- 10.1 The quoted prices for testing and repair services shall include, at a minimum, the following items:

- 10.1.1 Itemized prices for testing by meter class.
- 10.1.2 Standard repair parts by repair class
- 10.1.3 Additional non-standard repair parts by repair class.
- 10.1.4 Itemized cost for labor and materials.
- 10.1.5 Preparation of test results files.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

Appendix A - Domestic Meter "Class A" Repair - American & Rockwell

"Class A" repair criteria: 1) ≤ 10 years old; 2) "In-test" average accuracy within $\pm 1.5\%$; AND 3) Test accuracy spread within 1.2%. See [Section 4.0](#).

There is no *"Class A" repair* for Sprague domestic meters

A-1. American & Rockwell Domestic Meters

Following is the procedure for *"Class A" repair* of both American and Rockwell domestic meters, with respective qualification inserted where applicable:

1. Verify the meter age.
 - A. If meter is 30 years old or more (based on meter badge information or MMS), retire meter.
 - B. Verify the meter badge is securely affixed to the meter and that the meter number is legible. Replace/repair if necessary.
2. If at any point more than 1 screw is broken while removing the index cover or hand-hole cover, retire meter.
3. Meters ≤ 8 years old, that are found to have manufacturers defects, should be returned to the manufacturer for warranty repair.
4. Index action:
 - A. For non-AMR/AMI meters, remove the index cover, gasket, and index. If the cover is a vented, tinted, Lexan-style and is in good shape, it may be reused. Dispose of gasket.
 - B. If the meter is AMR/AMI equipped, **do not remove** the AMR/AMI module unless it is damaged or found to be inoperable.
 - C. Check index for excess dirt and free movement.
 - D. Evaluate replacing index as follows:
 - (1) *American*: Replace indexes with holes or cotter pins in the "dog drive."
 - (2) *American*: Replace plastic indexes having black gears.
 - (3) *Rockwell*: Replace plastic indexes having white gears.

UNCONTROLLED IF PRINTED

5. Sandblast the meter, if necessary, to remove excess dirt or debris.
6. Remove hand-hole cover and discard gasket.
7. Blow out the meter with air and check internal mechanism, including tangent, arms, and wheel/gears. Verify that tangent arms are mounted in the correct position. See [Paragraph 4.2.2](#) regarding possible retirement.
8. Inspect adjustment nuts for looseness and inspect solder-point strength. Rotate tangent/arm assembly to check for "fluid" movement of arms and valves. *If meter inspection reveals a problem that requires a "Class B" repair, proceed to the Class B repair procedure.* See [Appendix B-1](#).
9. Sparingly oil tangent and arms.

Excess oil can attract valve dust and debris, impeding movement and registration.

10. Install the hand-hole cover using a new gasket.
 - A. Ensure a tamper screw is properly positioned to seal the index cover, or
 - B. Install a tamper plug cup if the hand-hole cover is not equipped with a tamper screw.
11. Clean spuds with wire wheel, brush, or rag.
12. Pressure test:
 - A. For non-AMR/AMI meters, pressure test the meter using the dry leak test (or dunk tank) to check for leaks.
 - B. For AMR/AMI meters, dry leak test at case pressure to check for leaks.
 - C. Leaks discovered through a dry leak test require the index or AMR/AMI module to be removed and additional leak testing (in dunk tank) to identify leak location. If a leak is found at a case gasket, replace gasket.
13. Clean the meter (or sandblast if necessary) to provide a clean surface for painting.
14. *For non-AMR/AMI meters:* install the index, new gasket, and cover. The old index may be re-used if in good shape (and not replaced in step 4).
 - A. If the current index cover is not the tinted, vented, Lexan-type cover; replace with a new cover and gasket.
 - B. Ensure a tamper screw is properly positioned to seal the hand-hole cover or install a tamper plug.
15. *For AMR/AMI equipped meters:* verify operation of the module by "busting it" to verify transmission and connecting to GPREP to verify the reading.
 - A. If difference between index and module readings is ≥ 4 , exchange the module.
 - B. If difference is ≤ 3 , reprogram the module.
 - C. Install the index (verifying proper movement), correct the module reading or exchange the module as necessary.
 - D. If the index has been replaced, reprogram the module with the new reading.

- E. Place a cover screw/tamper plug kit in the module and install cover.
16. Enter the repair in MMS.
17. Place the meter on a pallet/cart for adjust-testing.

Appendix B - Domestic Meter "Class B" Repair

"Class B" repair is more extensive repairs typically going beyond the bounds described for Class A in [Section 4.0](#).

B-1. American & Rockwell Domestic Meters

Following is the procedure for *"Class B" repair* of both American and Rockwell domestic meters, with respective qualification inserted where applicable:

1. Verify the meter age.
 - A. If meter is 30 years old or more (based on meter badge information or MMS), retire meter.
 - B. Verify the meter badge is securely affixed to the meter and that the meter number is legible. Replace/repair if necessary.
2. If at any point more than 1 screw is broken while removing the index cover, hand-hole cover, or meter top, retire meter.
3. Meters \leq 8 years old, that are found to have manufacturer's defects, should be returned to the manufacturer for warranty repair.
4. Index action:
 - A. For non-AMR/AMI meters, remove the index cover, gasket, and index. If the cover is a vented, tinted, Lexan-style and is in good shape, it may be reused. Dispose of gasket.
 - B. If the meter is AMR/AMI equipped:
 - (1) *American*: Do not remove the AMR/AMI module unless it is damaged or found to be inoperable.
 - (2) *Rockwell*: Remove AMR/AMI module and discard gasket.
 - C. Check index for excess dirt and free movement.
 - D. Evaluate replacing index as follows:
 - (1) *American*: Replace indexes with holes or cotter pins in the "dog drive."
 - (2) *American*: Replace plastic indexes having black gears.
 - (3) *Rockwell*: Replace plastic indexes having white gears.
5. Sandblast the meter, if necessary, to remove excess dirt or debris.
6. Remove hand-hole cover and discard gasket.
7. Remove the meter top and discard the gasket.
8. Check the tangent. Rotate the tangent arm assembly to check for "fluid" movement of arms and valves. Retire meter if it is worn or damaged and requires replacement.

UNCONTROLLED IF PRINTED

9. Inspect adjustment nuts and solder-joint strength.
10. Check diaphragms for leaks. If a diaphragm leak is discovered, retire meter.
11. Grind valves and valve seats. Reinstall valves on meter.
12. Replace worn pins, bushings, and plastic arms as needed. (Rockwell: Retire meter if metal arms are damaged that require replacement.)
13. *Rockwell*: Replace the port seal (exhaust washer).
14. Sparingly oil tangent and arms.

Excess oil can attract valve dust and debris, impeding movement and registration.

15. Inspect axle box seal and wheel. Replace if worn or damaged. Note (Rockwell): If the area around the seal appears green, remove the seal, grease area and re-install seal. Replace seal if it appears worn or damaged. Green discoloration around the seal is an indication of a leak.
16. Clean spuds with wire wheel, brush, or rag.
17. Install new top gasket and install meter top.
18. Install the hand-hole cover using a new gasket.
 - A. Ensure a tamper screw is properly positioned to seal the index cover, or
 - B. Install a tamper plug cup if the hand-hole cover is not equipped with a tamper screw.
19. Pressure test:
 - **American Meter**
 - A. For non-AMR/AMI meters, pressure test meter using the dry leak test (or dunk tank) to check for leaks.
 - B. For AMR/AMI meters, dry leak test at case pressure to check for leaks.
 - C. Leaks discovered through a dry leak test require the index or AMR/AMI module to be removed and additional leak testing (in dunk tank) to identify leak location. If a leak is found at a case gasket, replace gasket.
 - **Rockwell Meter**
 - A. Pressure test meter using the dunk tank to check for leaks.
20. Clean the meter (or sandblast if necessary) to provide a clean surface for painting.
21. For non-AMR/AMI meters; install the index, new gasket, and cover. The old index may be re-used if in good shape (and not replaced in step 4).
 - A. If the current index cover is not the tinted, vented, Lexan-style; replace with a new cover and gasket.
 - B. Ensure a tamper screw is properly positioned to seal the hand-hole cover or install a tamper plug.
22. For AMR/AMI equipped meters, verify operation of the module by "busting it" to verify transmission and connecting to GPREP to verify the reading.

UNCONTROLLED IF PRINTED

- A. If difference between index and module readings is ≥ 4 , exchange the module.
 - B. If difference is ≤ 3 , reprogram the module.
 - C. Install the module and index (verifying proper movement), correct the module reading or exchange the module as necessary.
 - D. If the index has been replaced, reprogram the module with the new reading.
 - E. Place a cover screw/tamper plug kit in the module and install cover.
23. Enter the repair in MMS.
24. Place the meter on a pallet/cart for adjust-testing.

B-2. Sprague Domestic Meters

Following is the procedure for "Class B" repair of the Sprague domestic meter:

- 1. Verify the meter age.
 - A. If meter is 30 years old or more (based on meter badge information or MMS), retire meter.
 - B. Verify the meter badge is securely affixed to the meter and that the meter number is legible. Replace/repair if necessary.
- 2. If at any point more than 1 screw is broken while removing the index cover or hand-hole cover, retire meter.
- 3. Meters ≤ 8 years old, that are found to have manufacturer's defects, should be returned to the manufacturer for warranty repair.
- 4. Index action:
 - A. Remove index cover, gasket, index, and AMR/AMI module (if equipped). Discard the gasket.
 - B. Check index for excess dirt and free movement.
 - C. Replace indexes that have 2 silver rivets or the "claw-type" drive dog.
- 5. Sandblast the meter, if necessary, to remove excess dirt or debris.
- 6. Remove meter top and discard gasket.
- 7. Check diaphragms for leaks. Retire meter if a diaphragm leak is discovered.
- 8. Check worm gear and index drive in the meter top for proper operation.
 - A. Replace worn or damaged parts.
 - B. If needed, replace the top if a spare is available.
 - C. Verify proper height of the valve with new top, if applicable.
- 9. Grind the valve and valve seat.
- 10. Remove pipe dope from adjustment screw hole and remove screw. Clean, replace, and tighten screw.
- 11. Reinstall valve on the meter.
- 12. Inspect IDM synthetic seal and replace if worn or damaged. Replace all "original" white seals (which tend to leak).

UNCONTROLLED IF PRINTED

13. Clean spuds with wire wheel, brush, or rag.
14. Replace top gasket and install meter top.
15. Pressure test the meter using the dunk tank to check for leaks. If a leak is found at the front or back case gasket, replace gasket.
16. Clean the meter (or sandblast if necessary) to provide a clean surface for painting.
17. For non-AMR/AMI meters, install the index (verify proper movement), new gasket, and cover. The old index may be re-used if in good shape (and not replaced in step 4).
 - A. If the current index cover is not the tinted, vented, Lexan-style; replace with a new cover and gasket.
 - B. Install 2 tamper seals.
18. For AMR/AMI equipped meters, verify operation of the module by "busting it" to verify transmission and connecting to GPREP to verify the reading.
 - A. If difference between index and module readings is ≥ 4 , exchange the module.
 - B. If difference is ≤ 3 , reprogram the module.
 - C. Install the module and index (verifying proper movement), correct the module reading or exchange the module as necessary.
 - D. If the index has been replaced, reprogram the module with the new reading.
 - E. Place a cover screw/tamper plug kit in the module and install cover.
19. Enter the repair in MMS.
20. Place the meter on a pallet/cart for adjust-testing.

METERING

October 1, 2022

METR 2.10 Gas Meter Data Sheet**1.0 Purpose**

This procedure provides the instructions for completing and processing the Gas Meter Data Sheet (GMDS) to maintain accurate gas metering records on meter installations. Further, it outlines the verification process to follow for addressing elevated metering pressure facilities. The Sarbanes-Oxley Act of 2002 (SOX) is a federal law passed to help protect investors from fraudulent financial reporting by corporations. At AIC, impacted processes include meter reading and customer billing. Such controls require the GMDS gas meter data sheet to be compared to the account and the CSS WFM cleared within 90 days of the physical transaction.

The 90 days begins on the date of the physical transaction. This requirement makes it critical that every step of completing the orders and data entry are completed with urgency, accuracy, and in a timely fashion.

2.0 Scope

This document addresses the following:

[**3.0 Target Audience**](#)[**4.0 Gas Meter Data Sheet**](#)[**5.0 Completion Instructions**](#)[**6.0 Report Distribution**](#)[**7.0 Gas Metering Review WFM**](#)

Appendices

[**Appendix A - GMDS Completion Instructions**](#)[**Appendix B - Gas Meter Data Sheet**](#)**3.0 Target Audience**

- Gas Engineering
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Supervisor Illinois Meter Shops
- Gas Meter Shop Foreman
- Gas Supervisor
- IL Metering and Projects Supervisor
- IL Customer Accounts
- IL GTClerical

4.0 Gas Meter Data Sheet

4.1 The Gas Meter Data Sheet (GMDS) is a comprehensive document intended to capture all pertinent information for an elevated metering pressure installation that is added, re-

UNCONTROLLED IF PRINTED

moved, or changed in the field. See [Section 5.0](#) and the [Appendix A](#) for instructions to complete the form.

4.1.1 This information is also maintained and utilized for weekly metering verification and pressure factor verification process that is performed annually. See [METR 2.8](#) Pressure Factor Metering

4.2 Gas field personnel shall accurately complete the GMDS for any of the following:

4.2.1 A gas meter set that operates at an elevated metering pressure (greater than 12" w.c.) and is:

1. Installed
2. Exchanged
3. Removed

4.2.2 Elevated metering pressure is increased or decreased, such as:

1. Increase from 7" w.c. to 2 psig
2. Decrease from 5 psig to 2 psig, etc.

4.2.3 Electronic corrector is:

1. Installed
2. Exchanged
3. Removed

4.2.4 Meter Index is changed on any meter with elevated metering pressure.

4.2.5 Data corrections for adjusting metering pressure error and corresponding billing constants in Customer Service System (CSS).

4.2.6 A regulator or relief valve on a meter set operating at an elevated pressure is:

1. Installed
2. Exchanged
3. Modified, i.e., changes in metering or delivery pressure settings

A GMDS is not required when exchanging a regulator and/or relief valve with a "like kind" which does not affect billing accuracy.
Example: Replacing failed 289H relief valve with another relief valve that has the same set pressures as the failed 289H.

4.3 Modifying programming parameters on an electronic corrector that could affect billing adjustments.

4.3.1 Adjusting the pulse output to an AMI module, OR

4.3.2 Change to meter drive rate, etc

4.4 This procedure is not applicable to ultra-sonic meters (USM) installed at a customer's premise.

5.0 Completion Instructions

UNCONTROLLED IF PRINTED

- 5.1 Gas field personnel should check the appropriate option at top of GMDS (form) that describes the need for processing the form. See added qualifications in [Appendix A, Section A-1](#).
- 5.2 While at the customer's premise, applicable pictures will be taken **and** attached to the GMDS including:
 - 5.2.1 Gas meter serial number badge.
 - 5.2.2 Gas meter index.
 - 5.2.3 Pressure gauge reading, if applicable.
 - 5.2.4 Corrector serial number badge.
 - 5.2.5 Corrector item file, if applicable.
 - 5.2.6 Any other appropriate pictures, such as corrected and uncorrected meter readings.
- 5.3 See the following appendices for guidance on completing the GMDS:
 - 5.3.1 [Appendix A](#) - Provides numbered instructions as synchronized references for entering/completing respective items on the GMDS report.
 - 5.3.2 [Appendix B](#) - Shows an open GMDS (form) with tracking numbers in response or data boxes as linked to the numbered instructions outlined in Appendix A.

6.0 Report Distribution

- 6.1 After supervisor approval, a copy of each completed GMDS will be forwarded electronically to the appropriate co-workers/department. An email alert will be sent from ILGMD-SALERT. The GMDS Teams App will automatically route the completed GMDS to the appropriate co-workers/department.
- 6.2 Send GMDS copy electronically to IL Customer Accounts (IL CAD) @PeoriaGasTransportation or MO Customer Accounts (MO CAD) @DLMV90GasMO when the Teams App is not available and:
 - 6.2.1 There are potential billing adjustments,
 - 6.2.2 Account is a gas transportation customer, OR
 - 6.2.3 Meter has a corrector added.
- 6.3 Send GMDS copy on 11M and larger meter installs, exchanges, and removals to @ILGTClerical.

7.0 Gas Metering Review WFM

- 7.1 To facilitate data verification of installations that have an elevated metering pressure, a batch query will run in CSS each week. This query will identify accounts that have had any changes performed in the field and create a "Gas Metering Review Required" WFM (Workflow Manager software). See Table 1.

Table 1: Gas Metering Verification Review

	With Correcting Device	Using Pressure Factor > 1
New Meter Installed	√	√
Meter Exchanged	√	√
Pressure Method Changed	Removed Service - Switched to Constant Pressure Factor	Switched to Correcting Device

UNCONTROLLED IF PRINTED

Exchanged	√	Pressure Change
Removed Meter	√	√
Other		See Note 1.
Note 1: When a CMO to self has been detected on a meter requiring a correcting device.		

- 7.2 The Supervisor Illinois Meter Shops is responsible for completing the "Gas Metering Review Required" WFM. Complete the WFM by verifying that information on the GMDS is consistent with information contained in CSS. The data verification shall include:
 - 7.2.1 Meter point type.
 - 7.2.2 Pressure.
 - 7.2.3 Pressure factor.
 - 7.2.4 Billing constant.
 - 7.2.5 Meter readings.
 - 7.2.6 Number of dials.
- 7.3 Any discrepancies between the GMDS and CSS must be investigated with the appropriate Regional or GTS supervision to identify the appropriate corrective action. All corrections should be completed in CSS and on the GMDS before the WFM is completed in CSS.
- 7.4 Gas Meter Multiplier Changed WFM
 - 7.4.1 The CSS billing constant for most customer accounts typically does not change once established. However, the billing constant is susceptible to being changed unknowingly when completing an OAS order or by someone performing account maintenance. To detect possible billing errors, create a "Gas Meter Multiplier Changed" WFM when a billing constant is changed in CSS.
 - 7.4.2 The Supervisor Illinois Meter Shops is responsible for completing the "Gas Meter Multiplier Changed" WFM. Complete by verifying the correct metering pressure and associated billing constant. If an error is found, send a Miscellaneous WFM to the appropriate Region or GTS Supervisor with detailed instructions identifying the corrective action. Complete all corrections in CSS and on the GMDS before the "Meter Multiplier Changed" WFM is completed in CSS.

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0201: Visual Inspection of Installed Pipe and Components for Mechanical Damage
- 0301: Manually Opening and Closing Valves
- 0641: Visually Inspect Pipe and Components Prior to Installation
- 1161: Installation of Meters and Regulators - Residential and Small Commercial
- 1171: Installing Meters - Large Commercial and Industrial

UNCONTROLLED IF PRINTED

1181: Installing and Maintaining Pressure Regulating, Limiting, and Relief Device - Large Commercial & Industrial

1201: Temporary Isolation of Service Lines and Service Discontinuance

A001: Service Reconnect

A003: Emergency Response

METR 2.10 Metering – Gas Meter Data Sheet, October 1, 2021

Revision Notes

Location of Changes	Summary of Changes
Paragraph 4.1.1	New - This information is also maintained and utilized for weekly metering verification and pressure factor verification process that is performed annually. See METR 2.8 Pressure Factor Metering
Paragraph 4.2.1 Complete GMDS for the following	Changed to metering pressure greater than 12" w.c.
Paragraph 4.2.2 Complete GMDS for the following	Updated - Elevated metering pressure is increased or decreased, such as: 2. Decrease from 5 psig to 2 psig
Paragraph 4.2.5 Data Corrections	Consolidated information - Data corrections for adjusting metering pressure error and corresponding billing constants in Customer Service System (CSS)
Paragraph 4.2.6 Complete GMDS for the following	Deleted "Removed" – GMDS not required when regulator and/or relief valve is removed. Updated: Modified, i.e. changes in metering or delivery pressure settings

UNCONTROLLED IF PRINTED

Paragraph 4.2.6 Complete GMDS for the following	Added NOTE: A GMDS is not required exchanging a regulator and/or relief valve with a "like kind" which does not affect billing accuracy.
Former Subsec- tions 4.3 & 4.4	Removed- Information relocated.
Subsection 4.3	Modifying programming parameters on an electronic corrector that could affect billing adjustments. 4.3.1 Adjusting the pulse output to an AMI module, OR 4.3.2 Change to meter drive rate, etc.
Subsection 4.4	This procedure is not applicable to ultra-sonic meters (USM) installed at a customer's premise.
Subsection 5.2 Completion In- structions – applic- able pictures	Grammatical correction – "and" replaced "too"
Paragraph 5.2.3	Added – "if applicable"
Paragraph 5.2.5	New – Corrector item file, if applicable
Paragraph 5.2.6	Added – such as corrected and uncorrected meter readings
Subsection 6.2 – Report Distribution	Added – when Teams App is not available and:
Subsection 6.3	Removed – and @IL Cust Service Key Account
Appendix A – GMDS Completion Instructions – A-3.5	Added - Also, attach all of the required pictures to the electronic GMDS for the work performed

Appendix A - GMDS Completion Instructions

A-1. General

A-1.1 At top of the GMDS, gas field personnel should check 1 of the 5 options which best describe why the GMDS is being completed.

A.1.1.1 If the choice checked is "Other" provide an explanation in Remarks section on back of the form.

A-1.2 The instructions below are numbered items as synchronized references to an open GMDS (form) with tracking numbers in the response or data entry boxes. See "number flagged" GMDS in [Appendix B](#).

A-2. Installation Information

A-2.1 General Customer Information

1. Date: Enter meter installed or turned on date.
2. Meter #: Enter the 8-digit manufacturer serial number shown on the nameplate or badge. Enter leading "zeros" if the manufacturer's serial number on

UNCONTROLLED IF PRINTED

the meter is less than 8 characters. For legacy CILCO meters, the AIC meter number may be entered, for reference, in the Remarks section on the back of form.

3. CRTS#: Enter the Construction Request Tracking System number provided for gas metering projects from customer related work requests.
4. Legacy Company/Rate Zone: Check the appropriate legacy company or rate zone for the operating area where the customer is located.
5. Action/Reason: Check 1 of the 5 options which best describes why the GMDS is being completed.
6. Customer: Enter customer name.
7. Address: Enter address where gas service is being furnished.
8. OAS#: Enter OAS order number, if applicable.
9. City: Enter the city (town) where the customer is located.
10. Employee Name/ID: Enter the employee name completing the customer order or performing the work.
11. Laptop/Asset#: Enter the company laptop/asset number for the device used to complete any programming or downloading data.
12. Employee Phone#: Enter a phone number where the employee completing the GMDS can be contacted for any necessary follow-up.

A-2.2 Installation Information

13. Meter Size: Enter the actual gas meter size from the meter badge (e.g., 16M175 TC, AL-800).
14. Meter Code: Enter the 5-digit gas meter code (e.g., meter code for 16M175 TC meter is 04361). A listing of gas meter codes is available from the Gas Metering Supervisor.
15. Customer Classification: Mark the appropriate rate class for customer.
16. By-Pass: Identify if the meter installation has a bypass installed; check "Yes" or "No".
17. Meter Drive: Enter the cubic feet per revolution for the meter index test hand that identifies the volume of gas passing through meter each time the test hand completes 1 revolution. Many meters have multiple test hands; so, choose the largest drive-rate value. Mark the appropriate value which will generally be 1 ft, 2 ft, 5 ft, 10 ft, 100 ft, or 1000 ft.
18. Meter temperature compensation: Enter TC or Non-TC.
19. Gas Transportation Customer: Identify if the meter installation is for a gas transportation customer account; check "Yes" or "No".
20. Test Plugs: Identify if test plugs are installed; check "Yes" or "No".
21. Meter Left: Indicate the "As Left" status of meter when leaving site.

A-2.3 Pressure Factor Information (No Corrector/Corrector Removed)

22. Meter Pressure: Enter the approved elevated metering pressure established for the installation. Standard elevated metering pressures for new installa-

tions are 2 psig, 5 psig, 10 psig, and 15 psig. The pressure should be identified and/or verified with a calibrating gauge.

23. Meter Reading: Enter the meter index reading - enter as "right justified" with leading zeros. If no meter index, note such in Remarks section on back of form, or enter "N/A" in the reading field.
24. Meter Pressure Tagged: Identify if the meter has either a stainless steel or brass pressure tag attached; check "Yes" or "No".
25. Number of Dials: Identify the number of dials on the meter index; the number of dials does not include the test hand(s). Check the number of dials, typically 4, 5, or 6.

A-2.4 Auxiliary Equipment Information

26. Manufacturer: Enter the manufacturer of auxiliary equipment being installed (e.g., Mercury, American).
27. Serial Number: Enter the manufacturer's serial number of the auxiliary equipment.
28. Model Type: Enter the auxiliary equipment model type (e.g., Mini-AT100).
29. Meter Pressure: Enter the approved elevated metering pressure established for the installation. Pressure should be identified and/or verified with a calibrating gauge. The pressure should match the pressure displayed on corrector within ± 0.5 psig.
30. Pressure Transducer Range: Enter the pressure range for the pressure transducer that is installed in the correcting device (e.g., 0 - 100 psig, 0 - 60 psig).
31. Programmed Unit of Measure: Enter the unit of gas measurement as programmed into the correcting device. It is generally programmed to display in hundreds of cubic feet (CCF) or thousands of cubic feet (MCF). Therefore, check the appropriate value which is "CCF (100)" or "MCF (1000)".
32. Corrected Reading: Enter the corrected meter reading from the LCD display of the electronic correcting device. Enter reading as "right justified" with leading zeros and a maximum of 6 digits.
33. Corrected Reading Multiplier: Identify the corrected reading multiplier (aka CSS billing constant). The corrected reading multiplier will correspond to the programmed unit of measure for the corrector (see item #29). If the programmed unit of measure is CCF, the corrected reading multiplier will be "1". If programmed unit of measure is MCF, the corrected reading multiplier will be "10". Check the appropriate value; "1" or "10".
34. Uncorrected Reading: Enter uncorrected meter reading from LCD display of the electronic correcting device. Enter reading as "right justified" with leading zeros and a maximum of 6 digits.
35. Instrument Base Mechanical Reading: Enter the uncorrected mechanical reading found at the base of correcting device.
36. Rotary Meter Index Reading: Enter rotary meter index reading for rotary meter installations.
37. Time of Day: Enter the time and check "am" or "pm" corresponding to data downloads.

UNCONTROLLED IF PRINTED

38. LAN ID: Enter 8 characters with leading zeroes, as necessary.
39. Site ID #1: Enter the #1 site ID from the auxiliary equipment (Item 200 programmed with corrector serial number). Note: completely fill each field with 8 digits using leading zeros.
40. Site ID #2: Enter the #2 site ID from the auxiliary equipment (Item 201 programmed with the meter number). Note: completely fill each field with 8 digits using leading zeros.
41. Device Baud Rate: Check the appropriate baud rate for the installed auxiliary equipment.
42. Device Phone #: Enter the phone number necessary to communicate with auxiliary equipment.

A-2.5 Meter Set Regulator/Relief Information

The regulator and relief valve portion of form is to identify the basic equipment for elevated pressure metering installations. Additional information about the regulator and relief equipment may be provided in Remarks section.

43. Regulator Location(s): Identify the locations of all regulators associated with the meter installation. Check all that apply.
44. Regulator Model: Enter the regulator model number (e.g., Fisher 99).
45. Regulator Type: Identify the regulator type; check one.
46. Regulator Body Size: Enter the regulator body size.
47. Orifice Size/Trim Size: Enter the regulator orifice/trim size.
48. Spring Color/Range: Enter the regulator spring range and color.
49. Regulator Set Point: Enter the regulator set point.
50. Relief Model: Enter the relief valve model number (e.g., Fisher 63 EG).
51. Relief Size: Enter the relief valve body size.
52. Delivery Pressure ?: Check if this regulator provides the delivery pressure to customer.
53. Relief Set Point: Enter the relief valve set point.
54. Regulator Model: Enter the regulator model number (e.g., Fisher 99).
55. Regulator Type: Identify the regulator type; check one.
56. Regulator Body Size: Enter the regulator body size.
57. Orifice Size/Trim Size: Enter the regulator orifice/trim size.
58. Spring Color/Range: Enter the regulator spring range and color.
59. Regulator Set Point: Enter the regulator set point.
60. Relief Model: Enter the relief valve model number (e.g., Fisher 63 EG).
61. Relief Size: Enter the relief valve body size.

UNCONTROLLED IF PRINTED

- 62. Delivery Pressure ? : Check if this regulator provides the delivery pressure to customer.
- 63. Relief Set Point: Enter the relief valve set point.
- 64. Supervisor Review Initials: Enter the initials of the supervisor completing the review of completed form.
- 65. Date: Enter date form was reviewed.

A-3. Removal Information (Page 2 of 2)

A-3.1 General Customer Information

- 66. Date: Enter the date the metering equipment was removed.
- 67. Meter #: Enter 8-digit manufacturer serial number shown on the nameplate or badge of meter. Enter leading "zeros" if the manufacturer serial number is less than 8 characters. For legacy CILCO meters, enter the AIC meter number, for reference, in the Remarks section.
- 68. CRTS#: Enter the Construction Request Tracking System number provided for gas metering projects from customer related work requests.
- 69. Customer: Enter the customer name.
- 70. Address: Enter the address where gas metering equipment is being removed.
- 71. OAS#: Enter the OAS order number, if applicable.
- 72. City: Enter the city (town) where the customer is located.
- 73. Employee Name/ID: Enter the name of the employee completing the customer order or performing the work.
- 74. Laptop/Asset#: Enter company laptop/asset number for the device used to complete any programming or downloading data.
- 75. Employee Phone #: Enter a phone number where the employee completing the GMDS can be contacted for any necessary follow-up.

A-3.2 Removal Information

- 76. Meter Size: Enter the actual gas meter size from the meter badge (e.g., 16M175 TC, AL-800).
- 77. Meter Code: Enter the 5-digit gas meter code (e.g., meter code for 16M175 TC meter is 04361). A listing of gas meter codes is available from the Gas Metering Supervisor.
- 78. Customer Classification: Mark the appropriate rate class for customer.

A-3.3 Pressure Factor Information (No Corrector/Corrector Removed)

- 79. Meter Pressure: Enter the approved elevated metering pressure established for the installation. Standard elevated metering pressures for new installations are 2 psig, 5 psig, 10 psig, and 15 psig. The pressure should be identified and/or verified with a calibrating gauge.
- 80. Meter Reading: Enter the meter index reading - enter as "right justified" with leading zeros. If no meter index, note such in Remarks section or enter "N/A" in the reading field.

81. Number of Dials: Identify the number of dials on meter index; the number of dials does not include the test hand(s). Check the number of dials, typically 4, 5, or 6.

A-3.4 Auxiliary Equipment Information

82. Manufacturer: Enter the manufacturer of auxiliary equipment being removed; (e.g., Mercury, American).
83. Serial Number: Enter the manufacturer's serial number of the auxiliary equipment.
84. Model Type: Enter the auxiliary equipment model type (e.g., Mini-AT100).
85. Meter Pressure: Enter the approved elevated metering pressure established for the installation. Pressure should be identified and/or verified with a calibrating gauge. The pressure should match the pressure displayed on corrector within ± 0.5 psig.
86. Programmed Unit of Measure: Enter the unit of gas measurement as programmed into correcting device. It is generally programmed to display in hundreds of cubic feet (CCF) or thousands of cubic feet (MCF). Therefore, check the appropriate value which is "CCF (100)" or "MCF (1000)".
87. Corrected Reading: Enter the corrected meter reading from the LCD display of the electronic correcting device. Enter reading as "right justified" with leading zeros and a maximum of 6 digits.
88. Uncorrected Reading: Enter the uncorrected meter reading from LCD display of the electronic correcting device. Enter reading as "right justified" with leading zeros and a maximum of 6 digits.
89. Instrument Base Mechanical Index: Enter the uncorrected mechanical reading found at the base of correcting device.
90. Rotary Meter Index Reading: Enter rotary meter index reading for the rotary meter removed.

A-3.5 Remarks and Review

91. Remarks: Enter additional information that will assist with completing the order. **Also, attach all of the required pictures to the electronic GMDS for the work performed.**
92. Illinois Distribution List: Identifies the routing of copies for a completed Gas Meter Data Sheet.
93. Missouri Distribution List: Identifies the routing of copies for a completed Gas Meter Data Sheet.
94. Supervisor Review Initials: Enter the initials of the supervisor completing the review of the completed form.
95. Date: Enter the date the form was reviewed.

METERING

October 1, 2021

METR 3.1 Meter Sizing

1.0 Purpose

This standard prescribes the sizing criteria and capacities for gas meters approved for new or existing installations by Ameren Illinois (AIC).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Sizing Criteria](#)[5.0 Approved Meters for New Installations](#)[6.0 Existing Diaphragm Meter Installations](#)[7.0 Existing Rotary Meter Installations](#)

Appendices

[Appendix A - Approved Meters for New Locations](#)[Appendix B - Capacities for Existing Diaphragm Meter Installations](#)[Appendix B-1 - Capacities for American and Rockwell Meters](#)[Appendix B-2 - Capacities for Sprague Meters](#)[Appendix B-3 - Capacities for American Meters at Higher Pressure](#)[Appendix B-4 - NOTES common to all Appendix B Tables](#)[Appendix C - Capacities for Existing Rotary Meter Installations](#)**3.0 Target Audience**

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor
- Gas Tech Engineering (GTE)

4.0 Sizing Criteria

4.1 Contact Gas Tech Engineering for selection and approval of meters larger than:

- 4.1.1 Roots 7M175,
- 4.1.2 Delivery pressure greater than 10 psig, OR
- 4.1.3 A connected load greater than 10,000 scfh.

4.2 Meter Sizing Criteria

4.2.1 Size meters for the maximum load according to the following criteria - meters operating at:

1. Inches delivery (normally considered to be 7 inches w.c.) shall be sized for a maximum differential of 1 inch w.c.

UNCONTROLLED IF PRINTED

2. Pounds delivery (e.g., 2, 5, 10, 15 psig) shall be sized for a maximum differential of at least 2 inches w.c.
3. Distribution line pressure shall be sized for maximum load at minimum distribution pressure.

5.0 Approved Meters for New Installations

5.1 See [Appendix A](#) for approved meters applicable to new gas service installations.

6.0 Existing Diaphragm Meter Installations

6.1 See [Appendix B](#) that lists capacities for existing diaphragm meter installations as follows:

- [Appendix B-1](#) - Capacities for American and Rockwell Meters
- [Appendix B-2](#) - Capacities for Sprague Meters
- [Appendix B-3](#) - Capacities for American Meters at Higher Pressure
- [Appendix B-4](#) - NOTES common to all Appendix B Tables

7.0 Existing Rotary Meter Installations

7.1 See [Appendix C](#) that lists capacities for existing rotary meter installations.

End of Instructions.

Operator Qualification (OQ) Required?

NONE.

Document Rescission

METR 3.1 Metering: Meter Sizing, October 1, 2020.

UNCONTROLLED IF PRINTED

Revision Notes

Location of Changes	Summary of Changes
Appendix A – A-1	AC630: No Fixed Factor billing above 15 psig and corrector cannot be attached to the meter.
Appendix B – B-1	AL425 or AC630: No Fixed Factor billing above 15 psig and corrector cannot be attached to the meter.
Appendix B – B-2	Sprague #3, #4, #5: No Fixed Factor billing above 15 psig and corrector cannot be attached to the meter.

Appendix A - Approved Meters for New Installations

A-1. Capacities for approved new meter installations:

Meter Capacities (CFH) (Notes 1 & 2)							
Meter Type	Metering Pressure						
	7" w.c.	2 psig	5 psig	10 psig	15 psig	20 psig	25 psig
American AC 250 (3)	375	660	750				
American AL 425 10 lb.	640	970	1,100				
American AC 630	910	1,390	1,515	1,710	1,890		
Roots 15C175 (4)	1,500	1,670	2,000	2,500	3,000	3,500	4,000
Roots 3 / 3.5M175 (4)	3,000	3,340	4,000	5,000	6,000	7,000	8,000
Roots 5 / 5.5M175 (4)	5,000	5,570	6,600	8,300	10,000	11,700	13,400
Roots 7M175	7,000	7,790	9,200	11,600	14,000	16,300	18,700

(Yellow Shaded area indicates sizing by Gas Tech Engineering.) **Notes:** (1) Capacities at 7" w.c. metering pressure are for 1" w.c. pressure drop across the meter. (2) Capacities are for 0.60 specific gravity gas. (3) Alternate meter option includes the Sensus R275 AccuWave. (4) Alternate meter options include the American 15C, 3.5M and 5.5M or Romet of comparable sizes.

Appendix B - Capacities for Existing Diaphragm Meter Installations

B-1. Capacities for American and Rockwell meters:

Meter Capacities (CFH) (Notes 1, 2 & 3 - See Section B-4 .)

METERING

April 1, 2023

METR 3.2 Regulator Sizing

1.0 Purpose

This standard prescribes the capacities for gas regulators approved for new installations by Ameren Illinois (AIC) with various delivery pressures ranging from 7 inches w.c. to 10 psig.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Regulator Sizing @ 7" w.c. Delivery Pressure](#)[6.0 Regulator Sizing @ 2 psig Delivery Pressure](#)[7.0 Regulator Sizing @ 5 psig Delivery Pressure](#)[8.0 Regulator Sizing @ 10 psig Delivery Pressure](#)[9.0 Alternative Regulator Sizing @ Various Delivery Pressures](#)

Appendices

[Appendix A - New Regulators for Installation @ 7" w.c. Delivery Pressure](#)[Appendix B - New Regulators for Installation @ 2 psig Delivery Pressure](#)[Appendix C - New Regulators for Installation @ 5 psig Delivery Pressure](#)[Appendix D - New Regulators for Installation @ 10 psig Delivery Pressure](#)[Appendix E - Alternative Regulator Sizing @ Various Delivery Pressures](#)**3.0 Target Audience**

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor
- Gas Tech Engineering (GTE)

4.0 General

- 4.1 The standard covered herein is based on proven and acceptable regulators with tables constructed to show delivery capacities at the operating pressure parameters (i.e., given inlet pressure and established delivery pressure).
- 4.2 Contact Gas Tech Engineering (GTE) for selection and approval of regulators with connected loads greater than 10,000 CFH, delivery pressure greater than 10 psig, and/or inlet pressures greater than 60 psig.
- 4.3 Contact engineering for slam-shut regulator selection when a clearance issue is identified between an ignition source or building vent and the existing gas service regulator relief vent that can't be relocated.

5.0 Regulator Sizing @ 7" w.c. Delivery Pressure

UNCONTROLLED IF PRINTED

- 5.1 See [Appendix A](#) for approved regulators and their respective capacities for new installations to deliver 7" w.c. pressure to the customer.

6.0 Regulator Sizing @ 2 psig Delivery Pressure

- 6.1 See [Appendix B](#) for approved regulators and their respective capacities for new installations to deliver 2 psig pressure to the customer.

7.0 Regulator Sizing @ 5 psig Delivery Pressure

- 7.1 See [Appendix C](#) for approved regulators and their respective capacities for new installations to deliver 5 psig pressure to the customer.

8.0 Regulator Sizing @ 10 psig Delivery Pressure

- 8.1 See [Appendix D](#) for approved regulators and their respective capacities for new installations to deliver 10 psig pressure to the customer.

9.0 Alternative Regulator Sizing @ Various Delivery Pressures

- 9.1 See [Appendix E](#) for possible alternative regulators and their respective capacities for new installations to deliver various pressure to the customer. (i.e., 7" w.c., 2 psig, 5 psig, or 10 psig).
- 9.2 See [Subsection 4.2](#) on contacting Gas Tech Engineering for selection and approval.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

METR 3.2 Regulator Sizing – October 1, 2022

Revision Notes

Location of Changes	Summary of Changes
Subsection 4.2	Gas Tech Engineering (GTE) replaces Gas Tech Services Engineering.
Appendix C – 5 PSIG Delivery Pressure	Contact GTE when 2" Fisher 299H with either 3/8" orifice or 1/2" orifice is proposed when Minimum Distribution Pressure is 80 PSIG or greater. Removed Note (5) that had been added in October 1, 2022
Appendix D – 10 PSIG Delivery Pressure	Contact GTE when 2" Fisher 299H with 3/8" orifice is proposed when Minimum Distribution Pressure is 80 PSIG or greater. Contact GTE when 2" Fisher 299H with 1/2" orifice is proposed when Minimum Distribution Pressure is 60 PSIG or greater. Removed Note (6) that had been added in October 1, 2022
Appendix E – Alternative Regulator Sizing = E-1 – 7" w.c. Delivery Pressure	Updated the Relief Valve for 2" Itron B34R with 1/4" orifice and 3/8" orifice. Added Notes: (8) for 2" Itron B34R with 3/8" orifice – Do Not exceed 125 psig MAOP Inlet Pressure. (9) for 2" Itron B34R with 1/2" orifice – Do Not exceed 75 psig MAOP Inlet Pressure. (10) for 2" Itron B34R with 5/8" orifice – Do Not exceed 60 psig MAOP Inlet Pressure.
Appendix E – E-2 – 2 psig Delivery Pressure	Contact GTE replaced capacity value for 2" Itron B34-2 with 3/8" orifice. Note (6) – Added Itron
Appendix E – E-3 – 5 psig Delivery Pressure	Note (3) – Itron replaces Actaris
Appendix E – E-4 – 10 psig Delivery Pressure	Note (3) – Itron replaces Actaris

Appendix A - Regulators for New Installation @ 7" w.c. Delivery Pressure

(Shaded area with no capacity indicates max operating inlet pressure is exceeded for a given orifice.)

Notes:

- (1) Capacities are for 0.60 specific gravity gas with 1% absolute droop. Relief capacities are calculated using 60 psig inlet and 2 psig customer MEP.
- (2) Itron B42R use Main Spring R17444-B42R (Brown), 6" to 8" w.c. range, set 7" w.c.
- (3) American 1813C use Main Spring 70017P044 (Yellow), 5.5" to 8.5" w.c. range, set 7" w.c. with no vent pipe.
- (4) American 1813C- Engineering Only - **Do not exceed 48 psig MAOP inlet pressure** (limited by internal relief capacity). For MAOP greater than 48 psig, use 1" Fisher 289L Relief Valve with 13A7916X012 Spring, range 12" to 40" w.c., set 14" w.c., maximum buildup @ 2 psig, and capacity 8 MCF. (Stock Code 39 22 037)
- (5) Fisher CS400IR use Main Spring GE30188X012 (Gold), 6 to 8" w.c., set 7" w.c.
- (6) Fisher CS400IR - Engineering Only - Order 1/4" orifice and install in 62 06 175 if extra capacity is necessary. Use Main spring GE30188X012 (Gold), 6 to 8" w.c., set 7" w.c. **Do not exceed 54 psig MAOP inlet pressure** (limited by internal relief capacity). For MAOP greater than 54 psig, use 1" Fisher 289L Relief Valve with

UNCONTROLLED IF PRINTED

- 13A7916X012 Spring, range 12" to 40" w.c., set 14" w.c., maximum buildup @ 2 psig, and capacity 8 MCF. (Stock Code 39 22 037)
- (7) Fisher CS806-IQ use Main Spring GE30338X012 (Black), 5.5" to 8.5" w.c., set 7" w.c. Internal Relief set point 18 - 25" w.c., maximum buildup @ 2 psig. Secondary seat operation = 25" w.c. at full inlet.
- (8) Itron B42R - Engineering Only - Order 1/4" orifice and install in 62 06 187 if extra capacity is necessary. **Do not exceed 28 psig MAOP Inlet pressure** (limited by internal relief capacity). For MAOP over 28 psig, use 1" Fisher 289L Relief Valve with 13A7916X012 Spring, range 12" to 40" w.c., set 14" w.c., maximum buildup @ 2 psig, and capacity 8 MCF. (Stock Code 39 22 037)
- (9) Overpressure protection (slam-shut) reset shall follow manufacturer's recommendations.
- (10) Pietro Fiorentini FE25 use Main Spring (Yellow), 6" to 8" w.c. range, set 7" w.c., relief set at 14" w.c., slam shut set at 28" w.c
- (11) Belgas P100SX use Main Spring (007), 6" to 8" w.c. range, set 7" w.c., relief set at 14" w.c., slam shut set at 28" w.c

Spring (10)	(6)																
----------------	-----	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--	--

(Shaded area shows where max operating inlet pressure is exceeded for a given orifice.)

Notes:

- (1) Capacities are for 0.60 specific gravity gas with 1% absolute droop. Relief capacities are calculated using 60 psig inlet and 2 psig customer MEP.
- (2) All regulators set at 7" w.c. with no vent pipe.
- (3) Use 70017P044 Regulator Spring (yellow), 5.5" to 8.5" w.c. range, set 7" w.c. with no vent pipe.
- (4) *Do not exceed 48 psig MAOP inlet pressure* (Limited by internal relief capacity). For MAOP greater than 48 psig: Use 1" Fisher 289L Relief Valve with 13A7916X012 Spring, range 12" to 40" w.c., setting 14" w.c., maximum buildup 2 psig, and capacity 8 MCF. (Stock Code 39 22 037)
- (5) Use 1" Fisher 289L Relief Valve with 13A7916X012 Spring, range 12" to 40" w.c., setting 14" w.c., maximum buildup 2 psig, and capacity 8 MCF. (Stock Code 39 22 037)
- (6) Use 2" Fisher 289H Relief Valve with 0.5 to 2.25# spring, setting 14" w.c., maximum buildup 2 psig, and capacity 21 MCF. (Stock Code 39 22 048)
- (7) Use 2" Fisher 289P-6365 Relief Valve with 0.5 to 2# spring, setting 14" w.c., maximum buildup 2 psig, and capacity 30.7 MCF. (Stock Code 39 22 095) (spring change required.)
- (8) Do Not exceed 125 psig MAOP Inlet Pressure.
- (9) Do Not exceed 75 psig MAOP Inlet Pressure.
- (10) Do Not exceed 60 psig MAOP Inlet Pressure.

E-2. 2 psig Delivery Pressure

Regulator Capacities (SCFH) (1)											
Regulator Type	Stock No.	Minimum Distribution Pressure (psig)									
		5 psig	10 psig	15 psig	20 psig	30 psig	40 psig	60 psig	80 psig	100 psig	125 psig
1" X 1" American 1813C 1/4" Orifice & (4) (3)	Non-stock	450	750	1,000	1,200	1,700	2,200	2,500			
2" Itron B34R 1/4" Orifice, 1-2 psig Spring	Non-stock	500	1,000	1,025	1,050	2,200	2,700	4,000	4,800	6,400	7,000
2" Itron B34R 3/8" Orifice, 1-2 psig Spring (4)	Non-stock	1,000	1,800	2,050	2,300	3,700	6,000	9,500	12,500	12,800	
2" Itron B34R 1/2" Orifice, 1-2 psig Spring (4)	Non-stock	1,700	2,700	3,950	5,200	7,000	10,800	14,000	16,000	22,000	
2" Itron CL-34-2 1/4" Ori- fice & (6)	Non- (4) stock	800	1,400	1,800	2,100	2,700	3,300	4,600	5,800	7,100	

2" Itron CL-34-2 3/8" Ori- fice & (6)	Non- (4) Stock	2,000	3,300	4,200	4,900	6,300	7,800	10,000	12,800	Con- tact GTE	
2" Itron CL-34-2 1/2" Ori- fice & (6)	Non- (3) Stock	3,500	5,700	7,200	8,500	11,000	13,500	18,500	22,400		

Notes:

- (1) Capacities are for 0.60 specific gravity gas with 1% absolute droop. Relief capacities are calculated using 60 psig inlet and 6 psig customer MEP.
- (2) All regulators set 2 psig with no vent pipe.
- (3) Use 70017P049 regulator spring, 42" w.c. to 2.0 psig range, setting 2 psig with no vent pipe.
- (4) Use 1" Fisher 289H Relief Valve with 1D892327022 Spring, 4 to 15 psig, setting 4 psig, maximum buildup 6 psig, and capacity 15 MCF. (Stock No. 39 22 034)
- (5) Use 2" Fisher 289H relief valve with 1B536927052 spring, 4 to 10 psig, setting 4 psig, maximum buildup 6 psig, capacity 30 MCF. (Stock No. 39 10 398)
- (6) **Itron** CL-34-2 with BROWN main closing spring, GREEN pilot spring, 1.5 to 10 psig control range, set 2 psig.

E-3. 5 psig Delivery Pressure

Regulator Capacities (SCFH) (1)										
Regulator Type	Stock No.	Minimum Distribution Pressure (psig)								
		10 psig	15 psig	20 psig	30 psig	40 psig	60 psig	80 psig	100 psig	125 psig
2" Itron CL-34-2 1/4" Orifice (3) & (4)	Non-stock	1,200	1,700	2,100	2,700	3,300	4,600	5,800	7,100	
2" Itron CL-34-2 3/8" Orifice (3) & (4)	Non-stock	2,800	4,000	4,900	6,300	7,800	10,000	12,800	16,000	
2" Itron CL-34-2 1/2" Orifice (3) & (4)	Non-stock	4,900	6,900	8,500	11,000	13,500	18,500	22,400		

Notes:

- (1) Capacities are for 0.60 specific gravity gas with 1% absolute droop. Relief capacities are calculated using 60 psig inlet and 10 psig customer MEP.
- (2) All regulators set 5 psig.
- (3) **Itron** CL-34-2 with BROWN main closing spring, GREEN pilot spring, 1.5- to 10 psig control range, set 5 psig.
- (4) Use 1" Fisher 289H Relief Valve with 1D892327022 Spring, 4 to 15 psig, setting 7 psig, maximum buildup 10 psig, and capacity 22 MCF. (Stock No. 39 22 034)

E-4. 10 psig Delivery Pressure

Regulator Capacities (SCFH) (1)		
Regulator Type	Stock No	Minimum Distribution Pressure (psig)

UNCONTROLLED IF PRINTED

		15 psig	20 psig	30 psig	40 psig	60 psig	80 psig	100 psig	125 psig
2" Itron CL-34-2 1/4" Ori- fice (3) & (4)	Non- stock	1,300	1,900	2,700	3,300	4,600	5,800	7,100	
2" Itron CL-34-2 3/8" Ori- fice (3) & (4)	Non- stock	3,100	4,500	6,300	7,800	10,000	12,800	16,000	
2" Itron CL-34-2 1/2" Ori- fice (3) & (4)	Non- stock	5,500	7,800	11,000	13,500	18,500	22,400		

Notes:

- (1) Capacities are for 0.60 specific gravity gas with 1% absolute droop. Relief capacities are calculated using 60 psig inlet and 16 psig customer MEP.
- (2) All regulators set 10 psig.
- (3) Itron CL-34-2 with BROWN main closing spring, GREEN pilot spring, 1.5 to 10 psig control range, set 10 psig.
- (4) Use 1" Fisher 289H Relief Valve with 1D892327022 Spring, 4 to 15 psig, setting 13 psig, maximum buildup 16 psig, and capacity 24.7 MCF. (Stock No. 39 22 034)

METERING

April 1, 2023

METR 3.3 Diaphragm Meter Sets

1.0 Purpose

This document provides the standard designs for various diaphragm meter sets as approved and used by Ameren Illinois (AIC).

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Diaphragm Meter Sets](#)

Appendices

(See [Section 4.0](#) for List of Appendices A thru K (11 total))

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Supervisor Illinois Meter Shops

4.0 Diaphragm Meter Sets

The following list summarizes the respective appendices as attached showing 1) the approved standard drawings, 2) related bills-of-material, and 3) instructions for installing the diaphragm meter sets:

[Appendix A](#) - 175/250 Meter, 7" w.c. Delivery, 1-60 psig Inlet

[Appendix B](#) - 175/250 Meter, 2 psig Delivery, 5-60 psig Inlet

[Appendix C](#) - 175/250 Meter, 7" w.c. Delivery, 61-125 psig Inlet

[Appendix D](#) - 175/250 Meter, 2 psig Delivery, 61-125 psig Inlet

[Appendix E](#) - 425 Meter, 7" w.c. Delivery, 1-60 psig Inlet

[Appendix F](#) - 425 Meter, Bypass, 7" w.c. Delivery, 1-60 psig Inlet

[Appendix G](#) - 425 Meter, Bypass, 2 & 5 psig Delivery, 15-60 psig Inlet

[Appendix H](#) - 630 Meter, 7" w.c. Delivery, 1-60 psig Inlet

[Appendix I](#) - 630 Meter, Bypass, 7" w.c. Delivery, 1-60 psig Inlet

[Appendix J](#) - 630 Meter, Bypass, 2, 5, & 10 psig Delivery, 5-60 psig Inlet

[Appendix K](#) - Multiple Meter Installation

End of Instructions.

Operator Qualification (OQ) Required?

NO.

METR 3.3 Diaphragm Meter Sets – October 1, 2022

Revision Notes

Location of Changes	Summary of Changes
Appendix A through D – 175/250 Meter	Grammatical correction only' Material Lists – Item 3 – CCV replaced CVV Installation – 1. CCV replaced CVV

Appendix A - 175/250 Meter, 7" w.c. Delivery, 1-60 psig Inlet

Assembly Number: G4111 ##			
Item	Stock No.	Description	Quantity

UNCONTROLLED IF PRINTED

			01	02
1	19 83 204	3/4" Nipple, Coated, 3" Length	1	
	19 83 200	1" Nipple, Coated, 3" Length		1
2	62 06 187	Regulator, 3/4" FNPT Inlet X 1" FNPT Outlet, Itron B42R or American 1813C, 3/16" Orifice	1	
	62 06 475	Regulator, 1" FNPT Inlet X 1" FNPT Outlet, Itron B42R or American 1813C, 3/16" Orifice		1
3	62 05 161	Bar, Meter, 1" 90-Degree Curved Inlet, 1" Union Outlet with Bypass CCV , 20 Lite Nuts	1	1
	62 05 010	Bar, Meter, 1" 90-Degree Curved Inlet, 1" Union Outlet , 20 Lite Nuts	1(1)	1(1)
4	39 22 632	Valve, Ball, 90-Degree, 3/8" Bypass, 1" Union Nut Inlet x 1" Insulated FNPT Outlet	1(1)	1(1)
	39 01 140	Valve, Plug, Bypass, Straight, 1" FNPT, Non-Insulated, 100 psig, Mueller H-11475, Brisco	1(1)	1(1)

Installation

1. Meter bar, 62 05 161, comes with a bypass **CCV** already installed eliminating the need for the Angle Valve or the Mueller Brisco Valve.
2. Install Angle Valve (Item 4 - 90-Degree Ball Valve) or Mueller Brisco Valve by threading the 1" union nut inlet onto the meter bar.
3. The Angle Valve can be rotated to fit local conditions.
4. Customer piping will be connected to the 1" FNPT outlet.
5. The meter may require additional support. Use a meter stake when conditions do not allow using the riser bracket.
6. The length of the nipple (Item 1) can be altered based on field conditions.
7. Any coating that was damaged during installation shall have paint applied upon completion. See [CORR 2.3, Appendix J](#) for approved paint.
8. The Angle Valve shall be in the closed position for normal operation.
9. Maximum Emergency Pressure (MEP) is 2 psig downstream of meter set.

Appendix B - 175/250 Meter, 2 psig Delivery, 5-60 psig Inlet

Assembly Number:				
Item	Stock No.	Description	Quantity	
			01	02
1	19 83 204	3/4" Nipple, Coated, 3" Length	1

	39 01 140	Valve, Plug, Bypass, Straight, 1" FNPT, Non-Insulated, 100 psig, Mueller H-11475, Brisco	1(1)	1(1)

Installation

1. Meter bar, 62 05 161, comes with a bypass **CCV** already installed eliminating the need for the Angle Valve or the Mueller Brisco Valve.
2. Install Angle Valve (Item 4 - 90-Degree Ball Valve) or Mueller Brisco Valve by threading the 1" union nut inlet onto the meter bar.
3. The Angle Valve can be rotated to fit local conditions.
4. Customer piping will be connected to the 1" FNPT outlet.
5. The meter may require additional support. Use a meter stake when conditions do not allow using the riser bracket.
6. The length of the nipple (Item 1) can be altered based on field conditions.

UNCONTROLLED IF PRINTED

7. Any coating that was damaged during installation shall have paint applied upon completion. See [CORR 2.3, Appendix J](#) for approved paint.
8. The Angle Valve shall be in the closed position for normal operation.
9. Maximum Emergency Pressure (MEP) is 6 psig downstream of meter set.

Appendix C - 175/250 Meter, 7" w.c. Delivery, 61-125 psig Inlet

Assembly Number:				
Item	Stock No.	Description	Quantity	
			01	02
1	19 83 204	¾" Nipple, Coated, 3" Length	1	
	19 83 200	1" Nipple, Coated, 3" Length		1

	39 01 140	Valve, Plug, Bypass, Straight, 1" FNPT, Non-Insulated, 100 psig, Mueller H-11475, Brisco	1(1)	1(1)

Installation

1. Meter bar, 62 05 161, comes with a bypass **CCV** already installed eliminating the need for the Angle Valve or the Mueller Brisco Valve.
2. Install Angle Valve (Item 4 - 90-Degree Ball Valve) or Mueller Brisco Valve by threading the 1" union nut inlet onto the meter bar.
3. The Angle Valve can be rotated to fit local conditions.
4. Customer piping will be connected to the 1" FNPT outlet.
5. The meter may require additional support. Use a meter stake when conditions do not allow using the riser bracket.
6. The length of the nipple (Item 1) can be altered based on field conditions.
7. Any coating that was damaged during installation shall have paint applied upon completion. See [CORR 2.3, Appendix J](#) for approved paint.
8. The Angle Valve shall be in the closed position for normal operation.
9. Maximum Emergency Pressure (MEP) is 6 psig downstream of meter set.

Appendix E - 425 Meter, 7" w.c. Delivery, 1-60 psig Inlet

Assembly Number: G4211##				
Item	Stock No.	Description	Quantity	
			01	02
1	19 83 204	3/4" Nipple, Coated, 3" Length	1	

UNCONTROLLED IF PRINTED

	19 83 200	1" Nipple, Coated, 3" Length		1
2	62 06 187	Regulator, 3/4" FNPT Inlet X 1" FNPT Outlet, Itron B42R or American 1813C, 3/16" Orifice	1	
	62 06 475	Regulator, 1" FNPT Inlet X 1" FNPT Outlet, Itron B42R or American 1813C, 3/16" Orifice		1
3	62 05 122	Bar, Meter, 1 1/4" 180-Degree w/ 1" Inlet, 1 1/4" Union Outlet, 30 Lite Nuts	1	

Installation

1. The meter may require additional support. Use a meter stake when conditions do not allow for the use of the riser bracket.
2. The length of the nipple (Item 1) can be altered based on field conditions.
3. Any coating that was damaged during installation shall have paint applied upon completion.
4. Maximum Emergency Pressure (MEP) is 2 psig downstream of meter set.

Appendix F - 425 Meter, Bypass, 7" w.c. Delivery, 1-60 psig Inlet

The bypass option should consider customer's equipment & application.

14	19 33 666	Cap, Pipe, FNPT, MI, 150#, 1"	1
15	32 23 306	Pipe, Steel, 1", 0.133 Wall, Black	5 Ft.
16	49 22 026	Cap, Rain, 1", Aluminum	1

Installation

1. See [METR 3.2](#) for regulator sizing information.
2. A rigid service riser should be installed 18" from the building wall.
3. The meter should be adequately supported. A meter stake should be used to support the meter bar. Riser bracket should be used whenever possible. On paved surface, a jack-stand (49-22-067) may be used in place of meter stake.
4. The meter set shall be insulated at the meter valve.
5. Length of 1" x 11" inlet nipple can be altered as required by field conditions.
6. Any coating that was damaged during installation shall have paint applied upon completion.
7. The **BYPASS** valve shall be locked in the **CLOSED** position with a barrel lock.
8. **Relief valve** stack shall be locked in the **OPEN** position.
9. Maximum Emergency Pressure (MEP) downstream of meter set is:
 - 6 psig MEP for 2 psig delivery.
 - 10 psig MEP for 5 psig delivery.

UNCONTROLLED IF PRINTED

Installation

1. The meter may require additional support. Use a meter stake when conditions do not allow using the riser bracket.
2. The length of the nipple (Item 1) can be altered based on field conditions.
3. Any coating that was damaged during installation shall have paint applied upon completion.
4. Maximum Emergency Pressure (MEP) is 2 psig downstream of meter set.

Appendix I - 630 Meter, Bypass, 7" w.c. Delivery, 1-60 psig Inlet

The bypass option should consider customer's equipment & application.

Assembly Number: G4312 ##				
Item	Stock No.	Description	Quantity	
			01	02
1	19 83 204	3/4" Nipple, Coated, 3" Length	1	
	19 83 200	1" Nipple, Coated, 3" Length		1
2	62 06 187	Regulator, 3/4" FNPT Inlet X 1" FNPT Outlet, Itron B42R or American 1813C, 3/16" Orifice	1	
	62 06 475	Regulator, 1" FNPT Inlet X 1" FNPT Outlet, Itron B42R or American 1813C, 3/16" Orifice		1
3	62 54 396	Bar, Meter, 1-1/4" 90-Degree w/ 1" Inlet, 1-1/4" Union Outlet, Bypass w/ Valves, 45 Lite Nuts	1	1

Installation

1. The meter may require additional support. Use a meter stake when conditions do not allow using the riser bracket.
2. The length of the nipple (Item 1) can be altered based upon field conditions.
3. Any coating that was damaged during installation shall have paint applied upon completion.
4. The bypass valve shall be locked in the closed position with a barrel lock.
5. Maximum Emergency Pressure (MEP) is 2 psig downstream of meter set.

Appendix J - 630 Meter, Bypass, 2, 5, & 10 psig Delivery, 15-60 psig Inlet

Assembly Number:			
Item	Stock No.	Description	Quantity
1	62 06 487	Regulator, 1"x1" Itron CL-31N, 1-20# Spring, Blue, 1/4" Orifice	1
2	62 54 422	Bar, Meter, 1" x 1-1/4" Straight, AC-630 with Bypass, 45LT nuts, 1-1/4" union outlet.	1
3	19 73 480	Nipple, Pipe, Sch 40, MNPT, 1" x 11"	2
4	19 56 047	Elbow, Pipe, 90-Degree, MI, FNPT, 1" x 1"	1
5	39 22 034	Valve, Relief, 1", Fisher 289H, 4-15# Spring, • Set 4 psig for 2 psig Delivery Pressure • Set 7 psig for 5 psig Delivery Pressure • Set 13 psig for 10 psig Delivery Pressure	1
6	19 58 103	Nipple, Pipe, Sch 40, MNPT, 1" x 4"	4
7	19 56 111	Tee, Pipe, 1" x 1" x 1", Malleable Iron, FNPT	2
8	19 23 022	Coupling, Pipe, Steel, 3000#, FNPT, 1/4"	2
9	19 73 419	Nipple, Pipe, Sch 40, MNPT, 1/4" x 1-1/2"	2
10	39 22 560	Valve, Ball, 1/4", Bronze, 600#	2
11	19 73 514	Plug, Pipe, Black MI, 1/4", Screw	2
12	39 22 150	Valve, Ball, 1", Bronze, 600#, w/ Locking Device	1

UNCONTROLLED IF PRINTED

13	19 58 099	Nipple, Pipe, Sch 40, MNPT, 1" x 2"	1
14	19 33 666	Cap, Pipe, FNPT, MI, 150#, 1"	1
15	32 23 306	Pipe, Steel, 1", 0.133 Wall, Black	5 Ft.
16	49 22 026	Cap, Rain, 1", Aluminum	1

Installation

1. See [METR 3.2](#) for regulator sizing information.
2. A rigid service riser should be installed 18" from the building wall.
3. The meter should be adequately supported. A meter stake should be used to support the meter bar. Riser bracket should be used whenever possible. On paved surface, a jack-stand (49-22-067) may be used in place of meter stake.
4. The meter set shall be insulated at the meter valve.
5. Length of 1" x 11" inlet nipple can be altered as required by field conditions.
6. The **BYPASS** valve shall be locked in the **CLOSED** position with a barrel lock.
7. **Relief valve** stack shall be locked in the **OPEN** position.
8. Maximum Emergency Pressure (MEP) downstream of meter set is:
 - 6 psig MEP for 2 psig delivery.
 - 16 psig MEP for 10 psig delivery.
 - 10 psig MEP for 5 psig delivery.
9. Any coating that was damaged during installation shall have paint applied upon completion.

Appendix K - Multiple Meter Installation

K-1 - 175/250 Class Meter - Single Row

Assembly Number:		
Item	Stock No.	Description

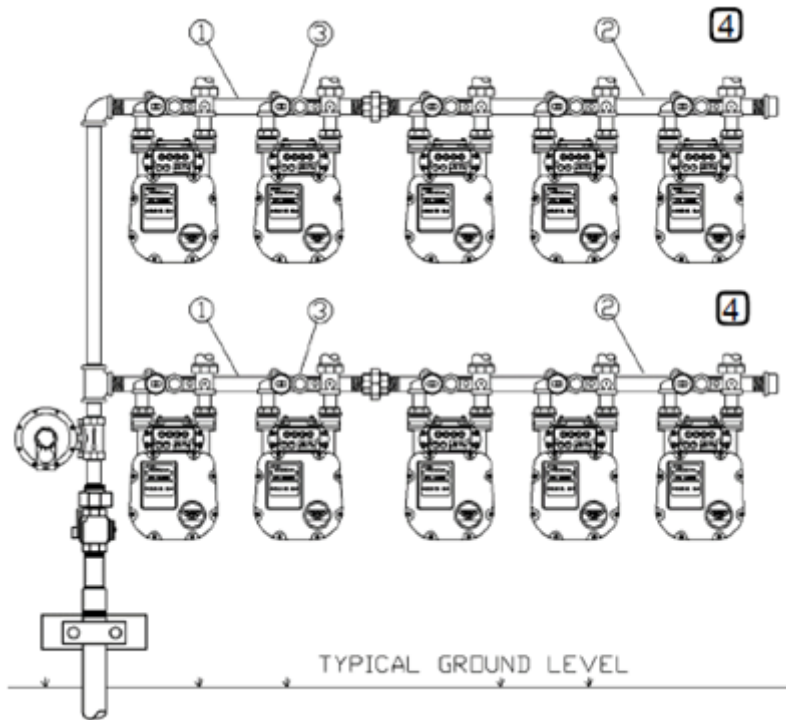

UNCONTROLLED IF PRINTED

1	62 05 021	Header, Multimeter, 1-1/4" x 24" (for two meters)
2	62 05 022	Header, Multimeter, 1-1/4" x 36" (for three meters)
	62 04 321	Header, Multimeter, 1-1/4" x 48" (for four meters)
	62 04 323	Header, Multimeter, 1-1/4" x 72" (for six meters)
3	62 05 011	Bar, Meter, 1" Inlet, 1" Outlet, 20LT, w/ built in valve
4	39 22 632	Valve, Ball, 90-Degree, 3/8" Bypass, 1" Union Nut Inlet x 1" Insulated FNPT Outlet, OR
	39 01 140	Valve, Plug, Bypass, Straight, 1" FNPT, Non-Insulated, 100 psig, Mueller H-11475, Brisco

Installation

1. The regulator and piping up to the header should be sized according to the number of meters and the projected load.
2. All threaded fittings can be replaced with welded fittings.
3. Threaded fittings cannot be back welded.
4. Any coating that was damaged during installation shall have paint applied upon completion.

K-2 - 175/250 Class Meter - Dual Row

Assembly Number:		
Item	Stock No.	Description
1	62 05 021	Header, Multimeter, 1-1/4" x 24" (for two meters)
2	62 05 022	Header, Multimeter, 1-1/4" x 36" (for three meters)
	62 04 321	Header, Multimeter, 1-1/4" x 48" (for four meters)
	62 04 323	Header, Multimeter, 1-1/4" x 72" (for six meters)
3	62 05 011	Bar, Meter, 1" Inlet, 1" Outlet, 20LT, w/ built in valve
4	39 22 632	Valve, Ball, 90-Degree, 3/8" Bypass, 1" Union Nut Inlet x 1" Insulated FNPT Outlet, OR
	39 01 140	Valve, Plug, Bypass, Straight, 1" FNPT, Non-Insulated, 100 psig, Mueller H-11475, Brisco

UNCONTROLLED IF PRINTED

Installation

See **Installation** notes above under [Section K-1](#).

K-3 - 425 Meter

Assembly Number:		
Item	Stock No.	Description
1	62 05 021	Header, Multimeter, 1-1/4" x 24" (for two meters)
2	62 05 022	Header, Multimeter, 1-1/4" x 36" (for three meters)
	62 04 321	Header, Multimeter, 1-1/4" x 48" (for four meters)
	62 04 323	Header, Multimeter, 1-1/4" x 72" (for six meters)
3	62 05 153	Bar, Meter, 1" Inlet, 1" Outlet, w/ built in valve
4	62 54 405	Swivel, Meter, 1", 1-1/4" Offset, 30LT
5	62 54 308	Nut, Meter, 30LT

Installation

See **Installation** notes above under [Section K-1](#).

METR 3.4 Compact and Rotary Meter Sets

1.0 Purpose

This document provides the standard designs for various compact and rotary meter sets as approved and used by Ameren Illinois .

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Appendix List of Gas Meter Sets](#)

Appendices

(See [Section 4.0](#) for List of Appendices A thru H (8 total))

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Technical Services (GTS) Supervisor
- Gas Meter Supervisor
- Gas Tech Engineering (GTE)

4.0 Appendix List of Gas Meter Sets

The following list summarizes the respective appendices as attached showing 1) the AIC approved standard drawings, 2) related bills-of-material, and 3) instructions for installing the compact and rotary meter sets:

[Appendix A - 15C Compact Meter, 7" w.c. Delivery Pressure](#)

[Appendix B - 15C Compact Meter, 2 psig Delivery Pressure](#)

[Appendix C - 15C/3M Meter, 7" w.c. Delivery Pressure](#)

[Appendix D - 15C/3M Meter, 2 psig Delivery Pressure](#)

[Appendix E - 15C/3M Meter, 5 & 10 psig Delivery Pressure](#)

[Appendix F - 5M/7M Meter, 7" w.c. Delivery Pressure](#)

[Appendix G - 5M/7M Meter, 2 psig Delivery Pressure](#)

[Appendix H - 5M/7M Meter, 5 & 10 psig Delivery Pressure](#)

End of Instructions.

Operator Qualification (OQ) Required?

NO.

Appendices

See [Section 4.0](#) for list of Appendices A thru H (8 total).

METR 3.4 Metering: Compact and Rotary Meter Sets, October 1, 2020

Revision Notes

Location of Changes	Summary of Changes
Appendices A through H	Corrected the 2" Adjustable Pipe Support Length to 22 inches from 21 inches per EMPRV and MRC

Appendix A - 15C Compact Meter, 7" w.c. Delivery Pressure

Item	Stock No.	Description	Quantity	
			01	02
1	62 06 180	Regulator, 2", Screwed, Fisher CS806-IQ, 3/8" Orifice	1	1
2	62 05 151	Strainer, Tee, 2", Weld x Flange, 150#, 40-Mesh Filter	1	1
3	19 83 179	Nipple, Pipe, Sch 40, MNPT, 2" x 6", w/ 1/4" Test Port	1	1
4	19 56 474	Elbow, Pipe, 90-Degree, Reducing, MI, FNPT, 2" x 1"	1	
	19 58 486	Elbow, Pipe, 90-Degree, MI, 150", FNPT, 2"		1

UNCONTROLLED IF PRINTED

5	19 58 081	Nipple, Pipe, Sch 40, MNPT, 3/4" x 2"	1	1
6	39 22 139	Valve, Ball, 3/4", Bronze, 600#, w/ Locking Device	1	1
7	19 39 220	Plug, Pipe, Steel, 3000#, MNPT, 3/4"	1	1
8	19 73 419	Nipple, Pipe, Sch 40, MNPT, 1/4" x 1 1/2"	1	1
9	39 22 560	Valve, Ball, 1/4", Bronze, 600#, w/ Locking Device	1	1
10	19 73 514	Plug, Pipe, Steel, 3000#, MNPT, 1/4"	1	1
11	19 33 672	Cap, Pipe, FNPT, MI, 150#, 2"	1	1
12	19 08 420	Flange, Pipe, Weld Neck, 2", 150#, Steel, Flat Face	1	1
13	29 64 487	Gasket, Flange, Ring, 2", 150#, Flat Face	2	2
14	19 58 106	Nipple, Pipe, Sch 40, MNPT, 1" x 6"	1	
	19 58 498	Nipple, Pipe, Sch 40, MNPT, 2" x 6"		1
15	49 22 067	Support, Pipe, 2", Adjustable, 22" Long	1	1
16	19 73 446	Nipple, Pipe, Sch 40, MNPT, 1/2" x 2"	1	1
17	19 73 495	Nipple, Pipe, 2", 6" Long, Threaded One End	2	2
18	19 23 869	Threadolet, 3/4" Outlet, 3000#, Weld x Thread	1	1
19	39 22 232	Valve, Ball, 1/2", Bronze, 600#, w/ Locking Device	1	1

Installation

1. See [METR 3.2](#) for regulator sizing information.
2. Regulator can be oriented in any position provided that the relief vent outlet is pointed downward.
3. A rigid service riser should be installed 18" from the building wall.
4. The meter should be adequately supported. If a stable surface such as a concrete sidewalk or a paved parking lot is not available to support the meter set, a concrete pad or pier should be installed.
5. The meter set shall be insulated at the meter valve.
6. The meter shall be installed using coated bolts provided with the meter. (Dresser Part No. 010044-003, Stock Number 21 54 541)
7. Maximum Emergency Pressure (MEP) is 2 psig downstream of meter set.

	Non-Stock	Uni-strut pipe support (or equivalent) - Field Determined	1	1	1	1

Installation

1. See [METR 3.2](#) for regulator sizing information.
2. Regulator can be oriented in any position provided that the relief vent outlet is pointed downward.
3. A rigid service riser should be installed 18" from the building wall.
4. The meter should be adequately supported. If a stable surface such as a concrete sidewalk or a paved parking lot is not available to support the meter set, a concrete pad or piers should be installed.
5. The meter set shall be insulated at the meter valve.
6. The meter shall be installed using coated bolts provided with the meter. (Dresser Part No. 010044-003, Stock Number 21 54 541)
7. Uni-strut bracing (or equivalent) should be installed on the top of meter loop (as shown) when conditions warrant additional lateral support for the meter set.
8. Bypass valve shall be locked in the **Closed** position
9. Maximum Emergency Pressure (MEP) is 2 psig downstream of meter set.

	Non-Stock	Uni-strut pipe support (or equivalent) - Field Determined	1	1

Installation

1. See [METR 3.2](#) for regulator sizing information
2. A rigid service riser should be installed 18" from the building wall.
3. The meter should be adequately supported. If a stable surface such as a concrete sidewalk or a paved parking lot is not available to support the meter set, a concrete pad or piers should be installed.
4. If an electronic corrector is required, rotate meter 90-degrees for clearance.

UNCONTROLLED IF PRINTED

5. The meter set shall be insulated at the meter valve.
6. The meter shall be installed using coated bolts provided with the meter.
(Dresser Part No. 010044-003, Stock Number 21 54 541)
7. Uni-strut bracing (or equivalent) should be installed on the top of meter loop (as shown) when conditions warrant additional lateral support for the meter set.
8. **Bypass** valve shall be locked in the **Closed** position.
9. The **relief valve** stack shall be locked in the **Open** position.
10. Maximum Emergency Pressure (MEP) downstream of meter set is:
 - 10 psig MEP for 5 psig delivery
 - 16 psig MEP for 10 psig delivery.

Appendix A – Ultrasonic Meter	Transmitter Inspection interval changed to 6 months rather than 3 months

Appendix A - Meter Test Schedules & Retention Requirements

Equipment or Action	Test Requirement	Schedule Requirement	Tolerance or Comments	File Location	Record Retention
Sample Testing (Ref METR 2.2, Sect. 4.0)	Sample "Lot" in 9th service year & every year thereafter	Complete test annually by 12/31	± 3%	MMS	For meter life
<ul style="list-style-type: none"> Requires Plan be filed annually with Form 21 report. Distribute 1st round list in Dec.; Exchange meters by 5/31. Rejected Lots to be 100% removed w/in 24 months after current year sampling. 					
Periodic Testing (Ref METR 2.2, Sect. 5.0) (Meters not included in sample testing program)	• Diaphragm meters ≥ 800 cfh	10-yr interval		MMS (or paper)	For meter life
	• Rotary meters	• Field differential or shop accuracy every 60 months	• Max 50% higher than initial • Clean/retest w/in 7 days • Replace w/in 60 days	MMS (or paper)	For meter life
		For meters impacting structure, see METR 2.4, 5.7.3.			
		Conditions delay test, then do ASAP or by 4 months, whichever is shorter. (See METR 2.4, 5.3.3)		MMS (or paper)	3 yrs - Qualify delay regarding 60-month test
	• Turbine meter	Accuracy test every 60 months	Press. range w/in 50% to 2X operating pressure	MMS (or paper)	For meter life
• Dual-rotor turbine meter	• Accuracy test every 120 mo. if ext. lube • A means to verify accuracy every 6 mo. • Spin test (lubricate?) every 12			MMS (or paper)	For meter life

UNCONTROLLED IF PRINTED

		months • Spin test every 6 mo. if no ext. lube fittings			
	• Ultrasonic meter • Related transmitters	• Interrogate every 3 months • Flow calibrate every 120 months (See METR 2.4, 8.2.8)	Test as pkg w/ other components	MMS (or paper)	5 or 10 Years (See 11.5)
		Verify/calib. every 6 mo.		MMS (or paper)	5 years
Prover Certification (Ref METR 2.3, Sect. 5.0)	• All provers	Calibrate & certify every 36 months		MMS	At least 3 years
	• Sonic-nozzle provers	Calibrate & certify every 12 months		MMS	At least 3 years
	• Meter shop reference meters	Verification test every 3 months	Use AL800 reference meter	MMS	At least 3 years
	• Meter shop sonic-nozzle prover	Verification test weekly	Use non-temp. comp. ref. meter: • American AC250 for ≥275 cfm meters • American AL425 for > 275 cfm meters	MMS	At least 3 years
Gas Metering Supervisor (ea. Shop) to review reference meter logs weekly.			• Typ. ± 0.5% • Spread max 1% • Room temp change max 4°F	Weekly Gas Ref. Meter Results Report	At least 3 years
Transfer Prover (Ref METR 2.3, Sect.7.0) (For meters ≥ 630 cfm rating)			• Check between 20%-33%; typ. 30% • Open flow @ 100% • Ensure >30 sec	MMS	At least 3 years
	Adjust-Tested (Following repair)		• Diaphragm meters w/in 0.5% • Rotary meters w/in 0.75% • Max 1% spread between check-flow & open-flow	MMS	At least 3 years
	AMR Verification		Ensure correctly programmed	MMS	At least 3 years
Rotary Meter Diff. Test (Ref METR 2.4, Sect. 5.0)	Initial test	W/in 6 months after "In-Service" date	Conduct @ 10% capacity	MMS*	For meter life
	Periodic test	• Every 60 months • If conditions delay test, then do AS-AP or by 4 months, whichever is shorter. (See METR 2.4, 5.3.3)	• Conduct @ 10% capacity • Max 50% increase • Do maint. & retest w/in 7 days	MMS* (Historical records may be paper copy)	For meter life
• Alternate test can be accuracy test. • If meter cannot be corrected, must replace w/in 60 days.					
Turbine Meter (Ref METR 2.4, Sect.6.0)	Spin test	• Every 12 months (if ext. lube fittings) • Every 6 mo. (if no ext. lube fit-	Spin 3 times & average (See METR 2.4 Tables 1 & 2 for min. spin times)	MMS	For meter life

UNCONTROLLED IF PRINTED

		tings) • Not req'd for dual-rotor turbine; Verify cond. @ 6 mo.	(See METR 2.4, 6.2.1, 3)		
	Accuracy test	<ul style="list-style-type: none"> • Every 60 months • Test w/in 50% to 200% of meter operating. pressure 	<ul style="list-style-type: none"> • Use 4 flow rates when atm. testing • Run between 10% & 105% of rated capacity • Do 5 flow rates at opr. pressure • Req'd w/in 1% 	MMS	For meter life
	Accuracy test for dual-rotor turbine	<ul style="list-style-type: none"> • Every 120 months • Verify @ 6 months 	(See METR 2.4, 6.2.2, 2)	MMS	For meter life
Ultrasonic Meter (Ref METR 2.4, Sect.7.0)	Multi-path ultrasonic	Verify condition every 3 months	<ul style="list-style-type: none"> • 2 of 4 yearly reports must be w/gas flowing • Min. 2 minutes of data 	USM Share-Point (or paper)	5 years
		Flow calibrate every 120 months		USM Share-Point (or paper)	Accuracy test: 10 years
	Transmitter inspection	Every 6 months		Save electronic copies	Send to Decatur Meter Shop
	Gas Chromatograph operational check	<ul style="list-style-type: none"> • Every 3 months • Recertify/ replace ref cylinder every 36 months 	W/in ± 1.5%	USM Share-Point (or paper)	Equipment life PLUS 3 years
New Meters (Ref METR 2.3, Sect.8.0)	Level II with an AQL of 1.0%	Randomly sample all	<ul style="list-style-type: none"> • W/in 0.75% • Max spread 1% 	MMS (or paper)	For meter life
Customer Requested Test (Ref METR 2.2, Sect.6.0)		Complete test w/in 45 days (See METR 2.2, Sect. 6.0 for Referee test)		MMS	Results to customer w/in 5 business days
Meter Header Inspection (Ref METR 2.2, Sect.7.0)			See METR 2.2, Sect. 7.0 for requirements	ClickMobile Report to Gas Supervisor	At least 3 years

ODORIZATION

April 1, 2023

ODOR 1 Requirements

1.0 Purpose

This document describes specifications for odorant properties and required odorant concentration levels in natural gas transported by Ameren Illinois (AIC).

Odorization of natural gas must meet the minimum requirements of 49 CFR §192.625.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Odorant Properties and Types](#)[6.0 Odorant Concentration](#)[7.0 Monthly Odorization Report](#)**3.0 Target Audience**

- Gas Tech Engineering (GTE)
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Engineering (GTS)
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Field Personnel
- Gas Supervisors
- Gas Control

4.0 General

- 4.1 The primary method for ensuring the safety of the general public and AIC natural gas customers is by introducing the proper amount of odorant into the natural gas transported through AIC gas system. Odorant is introduced into the natural gas provided by AIC pipeline suppliers.
- 4.2 Annually, AIC distributes information to all of their customers explaining why odorant is added to natural gas and how customers should respond if they detect a "rotten egg" smell in or around their home or place of business.

5.0 Odorant Properties and Types

- 5.1 AIC uses a Mercaptan blend which sufficiently odorizes natural gas when added in the proper quantity. The following odorant blends are currently allowed:
- 5.1.1 **80% Tertiary Butyl Mercaptan (TBM) and 20% Methyl Ethyl Sulfide (MES):**
Commonly called S-20.
- 5.1.2 **15% Secondary Butyl Mercaptan (S-Butyl) and 85% Hexane (n-Hexane):**
Commonly called H-85.

H-85 shall only be used in controlled circumstances.
Never use H-85 as a substitute for S-20.

5.2 The odorant blend must meet the following requirements (Table 1):

Table 1: Odorant Requirements

	
It shall have an unpleasant, distinctive odor that is readily identifiable with natural gas ("rotten egg") and is different from other odors in the area.	It must not be harmful to persons, materials, or piping exposed to it in normal concentrations.
It must be capable of maintaining a relatively constant odor level.	It must not lose more than 2.5% of its weight in water.
In normal concentrations, it must be completely combustible in a gas flame.	It must not produce any toxic or corrosive products.

6.0 Odorant Concentration

6.1 Odorant is introduced into the gas system at a rate such that a person with a normal sense of smell can readily detect it in concentrations of 20% (1/5th) of the lower explosive limit (LEL), or approximately 1% gas in air. Ameren's average target odorization introduction rate is:

6.1.1 **S-20 (80/20) blends:** One pound of odorant per million standard cubic feet of corrected gas volume (1 Lb/MMSCF).

6.1.2 **H-85 (15/85) blends:** Four pounds of odorant per million standard cubic feet of corrected gas volume (4 Lb/MMSCF).

6.2 Table 2 shows the target range of acceptable odorant concentration levels for S-20 (80/20) and H-85 (15/85) odorant blends.

6.3 Odorizer type and target injection rates can vary depending on station size, flow rates, and system design. Adjust the odorizer if necessary:

6.3.1 To maintain odorant concentration at recommended levels.

6.3.2 To optimize or supplement odorant concentration at storage fields, during pipeline conditioning (pickling) procedures, and at locations where supply sources do not provide adequate odor intensity.

Table 2: Odorant Concentration Levels

Odorant Blend	Odorant Concentration Levels - Target Range (Pounds of odorant per million standard cubic feet of gas)				
	Out of range 	Target range 			Out of range 
		Minimum	Recommended	Maximum	
S-20	Less than 0.50	0.50	1.0	1.5	Greater than 1.5
H-85	Less than 3.0	3.0	4.0	6.0	Greater than 6.0

UNCONTROLLED IF PRINTED

Response	If intensity test reading is out of range, then verbally notify GTS Supervisor. Take corrective action immediately.	No action required	If intensity test reading is out of range, then verbally notify GTS Supervisor. Take corrective action immediately.
	If calculated usage is out of range, then Maximo will generate an Odorant Injection Rate Investigation. Take corrective action immediately.		If calculated usage is out of range, then Maximo will generate an Odorant Injection Rate Investigation. Take corrective action immediately.

7.0 Monthly Odorization Report

Farm tap odorizers are exempt from monthly checks.

- 7.1 Use the Monthly Odorization Report as a worksheet to calculate the following values each month. See **ODOR 3**.
 - 7.1.1 Odorant usage
 - 7.1.2 Rate of odorization, AND/OR
 - 7.1.3 Odorant reserve (amount of odorant in storage).
- 7.2 Determine odorant injection/usage rate and amount of odorant in storage each month.
 - 7.2.1 Calculate the average odorant usage by measuring the volume of liquid odorant consumed during a specified period of time (normally monthly) and dividing that number by the measured corrected volume of gas during the same period, and enter monthly usage in Maximo.

$$\text{Average Odorant Usage} = \frac{\text{Actual Volume of Odorant Consumed for a specific period [Lbs]}}{\text{Corrected Volume of Gas Delivered for a specific period [MMSCF]}}$$

- 1. If calculated usage is out of range, then Maximo will generate an Odorant Injection Rate Investigation.
 - 1 a. *S-20 (80/20) blends*: Calculated usage is out of range if less than 0.50 OR greater than 1.5 Lbs/MMSCF.
 - 1 b. *H-85 (15/85) blends*: Calculated usage is out of range if less than 3.0 OR greater than 6.0 Lbs/MMSCF.
- 7.2.2 If the warning message is displayed, then:
 - 1. Verbally notify GTS Supervisor or Gas Storage Supervisor.
 - 2. Take corrective action immediately to reestablish odorization rate at target level. Corrective actions may include:
 - 2 a. Increasing, decreasing, stopping or performing "valve-off" of odorizer
 - 2 b. Flaring
 - 2 c. Gas system purging
 - 2 d. Site mitigation
 - 2 e. Verification:

- (i) Performing odorant intensity tests with approved equipment
- (ii) Increasing odorizer operational inspection frequency
- (iii) Other actions as specified by GTS Management

7.3 GTS Supervisor shall conduct an annual review of the average odorant injection rates, by-pass rates, and actual quantities of odorant consumed at each odorizer installation. This review ensures adequate odorization and provides documentation that each odorizer site is configured, adjusted and operating properly and has provided the prescribed odorant-to-gas ratio specific to that site.

7.3.1 Calculate the annual odorant usage rate for each odorizer (odorant absorbed or injected):

$$\text{Average Odorant Usage} = \frac{\text{Actual Volume of Odorant Consumed for a specific period [Lbs]}}{\text{Corrected Volume of Gas Delivered for a specific period [MMSCF]}}$$

End of Instructions.

ODOR 2.1 Odorant Intensity Sampling and Testing

1.0 Purpose

This document describes the requirements for odorant intensity sampling and testing.

The odorization of gas services must meet the minimum requirements of 49 CFR §192.625.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Employee Threshold Testing](#)[6.0 Intensity Test Instruments](#)[7.0 Odorant Intensity Test Sites and Schedule](#)[8.0 Odorant Intensity Testing](#)[9.0 Sniff Tests](#)[10.0 Records](#)

Appendices

[Appendix A - Odorant Intensity Testing Work Flow](#)**3.0 Target Audience**

- Gas Engineering
- Gas Tech Engineering (GTE)
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Service (GTS) Supervisors
- Gas Tech Service (GTS) Personnel

4.0 General

- 4.1 To ensure proper odorization (concentration of odorant), Ameren Illinois (AIC) requires periodic sampling and testing of the natural gas transported within its system. Qualified gas field personnel perform odorant intensity tests and sniff tests.
- 4.1.1 *Odorant intensity tests:* Odorant intensity tests are performed monthly at selected sampling sites, using an approved instrument. The instrument must be capable of determining the percentage of gas in air at which the odor becomes readily detectable to a person with a normal sense of smell. See [Section 8.0](#) Odorant Intensity Testing.
- 4.1.2 *Sniff tests:* Sniff tests are performed in the course of routine gas field work by personnel using their nose. Sniff tests supplement the monthly odorant intensity tests. See [Section 9.0](#) Sniff Tests.
- 4.2 Gas field personnel who perform the odorant intensity tests and sniff tests must be periodically examined to verify that they have a normal sense of smell.

UNCONTROLLED IF PRINTED

4.2.1 A person's normal sense of smell can be affected by smoking, eating spicy foods, chewing tobacco or gum, or the presence of other strong odors. Health-related conditions (e.g., head cold, allergies) can also affect sense of smell.

4.2.2 Avoid prolonged or repetitive exposure to natural gas because the odorant will cause olfactory fatigue.

4.2.3 See [Section 5.0](#) Employee Threshold Testing.

4.3 Gas field personnel must have working knowledge of the odorant sampling instruments and understand manufacturer operating instructions.

5.0 Employee Threshold Testing

5.1 Threshold testing gives a comparative indication of an operator's ability to recognize odorant on any given day.

5.2 Before performing odorant intensity testing, the operator's threshold level should be tested by another employee.

5.2.1 Have the operator and attending employee obtain a threshold detection level on an odorized gas source, typically at the employee's work location.

5.2.2 Report the threshold test in the ClickMobile Comment section for the first intensity test performed for the day.

6.0 Intensity Test Instruments

Always operate odorant intensity instruments in accordance with manufacturer instructions.

6.1 Odorant test instruments use the principle of combining a gas and air sample mixture in a chamber where an operator then uses their nose to rate the odor intensity of the sample.

6.2 AIC uses **2 approved portable air dilution instruments to determine odor intensity:**

6.2.1 Health Odorator 2.

6.2.2 YZ-DTEX Odorant Detection System.

6.3 Perform calibration once each calendar year, not to exceed 12 months. Record results in Maximo.

7.0 Odorant Intensity Test Sites and Schedule

Choosing the proper test point locations is critical to the success of the odorization process.

7.1 Tasks and Responsibilities

7.1.1 *Schedule and locations:* (GTS Supervisor, GTS Engineer OR Gas Engineer) shall establish odorant intensity test schedule and determine test sites. At a minimum, sites will be sampled once per calendar month.

- 7.1.2 *Survey plan:* (Gas Supervisor OR Gas Engineer) shall establish a survey plan which lists pre-determined test sites. Pre-determined test sites will have Test Point IDs established in Maximo for each odorized system.
- 7.1.3 *Annual review:* Sample sites should be reviewed by (GTS Supervisor, GTS Engineer OR Gas Engineer) AND by Operations as part of the annual System Review.

7.2 Test Site Selection

Test points should **not** be established at regulator stations, where soft components (e.g. gaskets and boots) can absorb concentrated gas smells, deceiving or creating a bias in test results.

- 7.2.1 Choose survey test points throughout the system, to test odor levels under a variety of conditions and to provide a baseline for future troubleshooting.
- 7.2.2 The number of sites selected will depend on the size and configuration of the odorized system, location of the delivery points, and locations at end of mains. Consider plotting test points on system maps to allow review as areas of growth or change occur.
- 7.2.3 Consider the following when selecting test point locations:
 - 1. *Endpoints of the system:* If odorant is adequate at the ends of the system, then it is reasonable to assume that there is adequate odorization at all points in between.
 - 2. *Areas of low or changing flow rates, anticipated gas flows in summer and winter months:* Small loads on long, dead-end pipeline systems are more likely to experience odorant fade than large metropolitan areas with considerable gas usage.
 - 3. *Known problem areas, areas known to cause odorant masking or fade:* Typical causes include:
 - 3 a. High liquid levels within the pipeline
 - 3 b. Dust, rust, dry contaminants, or pipeline debris
 - 3 c. Gas processing equipment (especially desulfurization equipment)
 - 4. *New construction:* At the end of recently installed long gas main extension, steel or plastic.
 - 5. *Random locations:* Metering locations with pre-existing quick connect couplings such as at schools, or other public facilities may be chosen depending on their location in the system.

8.0 Odorant Intensity Testing

Abnormal (out-of-range) odorant intensity readings must be immediately verbally reported to the Supervisor so that corrective action can be taken.

- 8.1 Perform odorant intensity testing once each calendar month at sampling sites identified by the Gas Supervisor and designated in Maximo.
- 8.2 Both a Threshold and Readily Detectable Level are required during the monthly odorant intensity test point readings. Gradually increase the gas content of the sample to obtain a Threshold Detection Level (TDL) first and then a Readily Detectable Level (RDL) next.
 - 8.2.1 *Threshold Detection Level*: Percent gas in air reading where the concentration of odorant in the mixture is identified as barely detectable.
 - 8.2.2 *Readily Detectable Level (Olfactory Level)*: Percent gas in air reading where the concentration of odorant in the mixture is identified as readily detectable.
- 8.3 Odorant Intensity Readings
 - 8.3.1 Acceptable odorant intensity readings (Readily Detectable Levels) are from 0.1% up to and including 0.8% gas in air. See Table 1 below.

Table 1 Odorant Intensity

	Odorant Intensity - Readily Detectable Level (RDL)		
	Too Strong 	Acceptable 	Too Weak 
Reading	Less than 0.1% gas in air	0.1% - 0.8% gas in air	More than 0.8% gas in air
Response	Immediately notify GTS Supervisor verbally	No action needed	Immediately notify GTS Supervisor verbally

8.3.2 If the reading is less than 0.1% OR more than 0.8%, then:

1. Immediately notify GTS Supervisor verbally so that required corrective action can be taken.
2. Document corrective actions in ClickMobile and Maximo.
3. Repeat the intensity testing daily (including weekends and holidays) until reading is within the acceptable range.

- 8.4 During the test, pause frequently to breathe fresh air to avoid olfactory fatigue, which desensitizes the sense of smell. Allow a minimum of 15 minutes between odorant intensity and readings.
- 8.5 When a customer is available during the odorant intensity test, ask the customer if they would like to participate in Threshold and Readily Detectable tests. Document the results of the customer's odorant intensity testing.

9.0 Sniff Tests

Daily work on customer premises provides frequent opportunities to ensure that gas odor is readily detectable.

- 9.1 Sniff tests supplement the monthly odorant intensity tests. See [GLOS](#) for definition of sniff test.
- 9.2 Gas field personnel should use their nose to sniff the gas when performing leak investigation work on customer premises. See [LEAK 2.3](#) Leak Investigation Form.

UNCONTROLLED IF PRINTED

9.3 If gas field personnel suspect over-odorized (strong smelling) OR under-odorized (weak smelling) gas that is not readily detectable, then:

9.3.1 Personnel shall immediately verbally contact their Supervisor or other AIC management personnel.

9.3.2 Gas Supervisor will immediately schedule odorant intensity checks in the suspected area to determine the actual intensity value.

9.3.3 All odorization events should be referred to GTS Supervisor or GTS Technician.

10.0 Records

10.1 Odorant Intensity Test records shall be retained in Maximo for a minimum of 5 years.

End of Instructions.

ODORIZATION

October 1, 2022

ODOR 2.2 Odorization Operations and Transportation

1.0 Purpose

This document addresses odorizer location, equipment, operations and inspection along with odorant transfer and transport.

The odorization of gas services must meet the minimum requirements of 49 CFR §192.625.

The transportation of liquid odorant must meet the minimum requirements of 49 CFR Part 172: Subpart D - Marking, Subpart E - Labeling, and Subpart F - Placarding.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Odorization Location](#)

[5.0 Odorization Equipment](#)

[6.0 Odorization Operation and Inspection](#)

[7.0 Liquid Odorant Tank to Tank Transfer](#)

[8.0 Records](#)

3.0 Target Audience

- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators
- Gas Control Personnel

4.0 Odorization Location

- 4.1 Odorizer equipment is typically installed at the point of supplier delivery and the point of withdrawal from a storage field.
- 4.2 Where individual customers are served by an unodorized line, odorization equipment shall be installed.
- 4.3 Odorization equipment is located to ensure that all gas supplied by the Ameren Illinois' (AIC) gas system is adequately odorized so that it is readily detectable by an individual with normal sense of smell.

5.0 Odorization Equipment

- 5.1 Approved types of odorizer equipment include wick, bypass, drip or positive injection.
- 5.2 Odorizers and associated piping must be carefully designed and installed to avoid liquid or vapor leakage.
- 5.3 Odorizer equipment must introduce odorant into the gas stream without wide variations in the level of odorant.

6.0 Odorization Operation and Inspection

UNCONTROLLED IF PRINTED

- 6.1 Adequate odorization requires careful monitoring of the odorizers, odorization rates, odorant consumption, odorant levels, and odorant intensity. See [ODOR 1](#) Requirements.
- 6.2 Remote monitoring of odorization
 - 6.2.1 Odorization equipment may be equipped with remote monitoring of injection rates and usage.
 - 6.2.2 Where applicable, Gas Control will monitor odorizer operations that have remote monitoring capability.
- 6.3 Response to abnormal operating conditions in odorization operations
 - 6.3.1 When Gas Control is remotely monitoring, then:
 - 1. Gas Control will verbally contact the appropriate Gas Technical Services (GTS) OR Gas Storage Supervisor for instructions, OR dispatch a GTS technician or Gas Storage Operator to investigate.
 - 2. GTS technicians OR Gas Storage Operator should contact Gas Control upon arrival at the odorization station.
 - 3. After completing the investigation and/or repair, verbally notify Gas Control of the investigation results and subsequent follow-up action.
 - 4. GTS Technician OR Gas Storage Operator will perform an investigation and document the following:
 - 4 a. As found conditions
 - 4 b. Immediate corrective actions
 - 4 c. As left conditions
 - 4 d. If follow-up action is required.
 - 5. Gas Control will complete and close-out their alarm management documentation.
 - 6.3.2 Un-telemetered odorizers and odor-related issues:
 - 1. GTS Technician OR Gas Storage Operator will perform an investigation and document the following:
 - 1 a. As found conditions
 - 1 b. Immediate corrective actions
 - 1 c. As left conditions
 - 1 d. If follow-up action is required.
- 6.4 Inspections
 - 6.4.1 In-service odorizers
 - 1. Inspect all in-service odorizers at least monthly and enter into ClickMobile. More frequent inspections may be necessary depending on the type of odorizer, means of monitoring odorant storage level, characteristics of gas demand and time of year (e.g., grain drying season).
 - 2. Check the piping connected to the odorizer odorant leaks and atmospheric corrosion and document on the Odorizer Inspection Form in ClickMobile.
 - 6.4.2 Farm tap odorizers

UNCONTROLLED IF PRINTED

1. Inspect annually for condition, operation, usage and refill when required.
2. Perform an annual intensity test to verify gas is odorized.

7.0 Liquid Odorant Tank to Tank Transfer

Natural gas odorant, mercaptan, is a Class 3 flammable liquid designated hazardous by PHMSA Hazardous Material Regulation Guide (HMRG).

7.1 General

- 7.1.1 **Safety is our top priority.** Always follow safe practices when handling, storing, transporting, or disposing of odorant.
- 7.1.2 Mercaptan liquid is lighter than water. Mercaptan vapor is heavier than air.

7.2 Personal Safety and PPE

- 7.2.1 Individuals shall be qualified through appropriate training and experience in handling liquid odorant.
- 7.2.2 Individuals shall be familiar with the location of tank valves and shut-offs before beginning transfer.
- 7.2.3 Use the weather to your advantage. Avoid low atmospheric pressures and unfavorable winds when working with odorant.
- 7.2.4 Ensure that the proper class of fire extinguisher, minimum rating 20-B/C, is on site during the transfer.
- 7.2.5 Wear non-permeable gloves and eye goggles when working on or near pressurized odorant lines. Consider also wearing respirators with organic cartridges and non-static clothing.
- 7.2.6 Have an eye wash solution readily available.

7.3 Preparing to Transport

- 7.3.1 Delivery vehicle is the tank or container of odorant that is brought to the odorizer site for transfer to the odorant storage tank.
- 7.3.2 HAZMAT endorsement (x) is required on CDL to transport hazardous materials in bulk.
 1. Bulk odorant loads of 1001 pounds OR 119 gallons (OR more) must be placarded with identification number 3336 (Mercaptans, Liquid, Flammable) and a hazard class 3 (Flammable Liquid). See Figure 1.
 2. Placard shall be displayed on all four sides of the truck or trailer and be readily visible and unobscured.
 3. Placards must remain displayed on bulk odorant delivery, even when empty.

Figure 1: DOT HAZMAT Placard for bulk odorant loads

7.3.3 Shipping papers are required with hazmat loads that exceed the Material of Trade Exception for a Class 3, Packing Group 1/2/3 material.

7.3.4 Ameren Shipping Paper for Odorant must be properly completed and remain within reach of the driver during transport. Contact GTS for more information. Shipping papers are always required, whether the tanks are empty or full. See [ODOR 3](#) for a template of the Ameren Shipping Paper.

7.4 Transferring Liquid Odorant from Delivery Vehicle to Odorant Storage Tank

7.4.1 General

1. Use closed-loop odorant transfer methods whenever possible.
2. Avoid open pouring or siphoning of liquid odorant **except** when filling wick odorizer(s).

7.4.2 Before beginning transfer

1. Bonding wire between delivery vehicle and odorant storage tank

Failure to maintain the bonding connection creates the risk that static charge can become a source of ignition.

- 1 a. **Always** bond the delivery vehicle and the odorant storage tank by connecting them with a bonding wire. The connection shall be maintained through the entire transfer process to eliminate risk of static charge being a source of ignition.

2. Hoses and fittings

Recommended replacement hoses for liquid odorants are SAE 100R7 or SAE 100R8 hoses with thermoplastic core, polyurethane cover and convoluted stainless steel with braided wrap.

- 2 a. Verify that hoses are compatible with liquid odorant and have the correct pressure rating.
- 2 b. Hoses should be pressure tested annually.
- 2 c. Check hoses and fittings for cracks and damage. If damage is found, then dispose of hoses and fittings properly.

7.4.3 Performing the transfer

UNCONTROLLED IF PRINTED

1. To create adequate differential to move odorant into the storage tank, the delivery vehicle pressure should be 10 to 20 psig greater than the storage tank pressure.
 - 1 a. Delivery vehicle typical pressure is 0-40 psig. **Do not** exceed 40 psig maximum.
 - 1 b. **Do not** fill storage tank to more than 80% of its known volume to allow for thermal expansion of the liquid.
 - 1 c. Pressure in the storage tank may need to be lowered to facilitate a safe transfer of odorant. Storage tank does not need to be blown-down completely, but only low enough to allow for transfer.
 - (i) **Do not** blow down any odorant vessel to the atmosphere.
 - (ii) Use flaring of vapor from the storage tank to avoid migrating gas odors and subsequent complaints from the general public. Before flaring, check environment, wind speed and direction, and the surrounding area for potentially combustible materials.
2. Commercial odorant delivery may use compression or vacuum to transfer the odorant between the storage tank and delivery vehicle.
3. Use a pressure regulated standing pilot flame at the flare to ensure ignition and complete incineration of the odorant vapor and possible hydrocarbons.
4. Use tank-top connections whenever possible. **Do not use** tank-bottom valves or connectors.
5. Use blow-back connections to clear lines of suspended liquid odorant prior to disconnecting and depressurizing.

7.4.4 After completing the transfer

1. Clean all tools and fittings with deodorizing agent to mitigate odors in transit.
2. Avoid public areas. Clothing will likely become permeated and contaminated with odorant, but personnel may not be able to detect odor due to olfactory fatigue.

8.0 Records

- 8.1 Monthly inspections and odorization rates shall be maintained in Maximo for a minimum period of 5 years. Paper documents may be used as supplemental information.
- 8.2 Gas Control maintains electronic SCADA records of monitored odorizer operations.
- 8.3 Ameren Shipping Paper for Odorant transportation has a retention period of 2 years and copies must be filed locally at the OC or saved electronically to a known and discoverable drive.

End of Instructions.

ODORIZATION

October 1, 2021

ODOR 2.3 Emergency Response

1.0 Purpose

This document addresses emergency response guidelines related to liquid odorant spills, vaporized odorant releases, and low/high odorant intensity situations.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Emergency Response Actions](#)[6.0 Odorization Emergency Situations](#)

Appendices

[Appendix A - Odorant Event Report](#)**3.0 Target Audience**

- Gas Engineering
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Operators

4.0 General

- 4.1 Individuals handling odorant shall be trained in accordance with 49 CFR §172.704.
- 4.2 Odorant spill kits are readily available at strategic gate stations located throughout Ameren Illinois operating centers.

5.0 Emergency Response Actions

- 5.1 Emergency response requires immediate, continuous action.
- 5.1.1 Verbally contact:
1. GTS OR Gas Storage Supervisor,
 2. Dispatch, AND
 3. Local AIC Region support.
- 5.1.2 GTS OR Gas Storage Supervisor shall notify Gas Compliance of the emergency event.
- 5.1.3 GTS OR Gas Storage Supervisor should contact Gas Leadership and Team CPR as needed.
- 5.1.4 Initiate and complete the Odorant Event Report. See [Appendix A](#).

6.0 Odorization Emergency Situations

UNCONTROLLED IF PRINTED

6.1 Uncontrolled Release of Odorant (Liquid odorant spills and vaporized odorant releases)

Liquid and vaporized odorant are extremely flammable.

6.1.1 Take the following safety precautions:

1. Establish a Safe Zone around odorant release. Consider the wind direction, weather conditions, and impact on population.
2. Remove/de-energize ignition sources.
3. Use appropriate PPE. A minimum of Level 1 PPE is required when there is pooling, standing, or an uncontrolled release of odorant liquid or vapor. (See [WIGE 2.2](#) Personal Protective Equipment for Level 1 PPE.)

6.1.2 Stop and contain the release

1. Deploy spill kit contents.
2. Cover any liquid odorant release. Use dirt or plastic.
3. Distribute deodorants and odor masking agents.
4. Determine areas affected by odorant release.
5. **Do not** use any type of bleach (including dry, chlorine, hypochlorites or hydrogen peroxides) when addressing odorant spills or release.

6.1.3 Take corrective action to minimize event

1. Consider HazWaste contamination issues and contact Ameren Environmental as needed.
2. Review remaining odorant inventory.
3. If odorant contamination occurs, then take the following actions before leaving site:
 - 3 a. Quarantine personnel and equipment.
 - 3 b. Address personal hygiene.
 - 3 c. Dispose of or contain contaminated clothing in a sealed container.
 - 3 d. Decontaminate exposed equipment.
 - 3 e. Select an exit route for transporting contained clothing and equipment that minimizes exposure to the general public.

6.2 Low/High Odorant Intensity Situations (Odor Intensity is outside the O&M thresholds of 0.1% to 0.8% Gas-In-Air)

- 6.2.1 When possible, obtain more than one opinion on the gas odor's intensity before making decisions.
- 6.2.2 When possible, validate operation of the Odorator, by comparison, to another calibrated Odorator to verify an odorant event.
- 6.2.3 Perform additional odorant intensity testing as needed.
- 6.2.4 Review odorizer valve settings.
- 6.2.5 Review remaining odorant inventory.

UNCONTROLLED IF PRINTED

6.2.6 Determine piping configurations for possible flow channeling.

6.2.7 Consider HazWaste contamination issues. Contact Ameren Environmental as needed.

End of Instructions.

Revision Notes

Location of Changes	Summary of Changes
Entire Document	Format of document has been changed to match the format of October 2022 Issue

1.0 Purpose

- 1.1 This Operator Qualification (OQ) program establishes the requirements and responsibilities for the qualification of individuals who perform covered tasks that may impact the safety or integrity of the pipeline facilities.
- 1.2 The program establishes procedures to ensure that personnel who perform covered tasks are qualified or are working under the direct observation of a qualified individual, within the limits of identified Span of Control.
- 1.3 The program also addresses the requirement that individuals performing covered tasks must have the ability to recognize and react to abnormal operating conditions.
- 1.4 This document meets the federal requirements of 49 CFR Part 192; Subpart N, and Illinois Administrative Code 520.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Program Implementation](#)

[5.0 Identification of Covered Task](#)

[6.0 Abnormal Operating Conditions](#)

[7.0 Evaluation Guidelines, AIC Employees](#)

[8.0 Disqualification, AIC Employees](#)

[9.0 Non-Qualified Individuals, AIC Employees](#)

[10.0 Program Effectiveness](#)

[11.0 Management of Change](#)

[12.0 Documentation & Record Keeping, AIC Employees](#)

[13.0 Training, AIC Employees](#)

[14.0 Refresher Training, AIC Employees](#)

[15.0 Contractors](#)

[16.0 Contractor Review Meeting](#)

[17.0 Mutual Assistance](#)

[18.0 Mergers and Acquisitions](#)

Appendices

[Appendix A - Definitions](#)

3.0 Target Audience

- Gas Supervisors
- Gas Field Personnel
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Operator Qualification Personnel
- Gas Storage Personnel and Supervisors

4.0 Program Implementation

- 4.1 Ameren Illinois (AIC) Gas Operator Qualification (OQ) Department is responsible for the implementation and administration of the OQ Plan and will review the Plan at least once each calendar year, not to exceed 15 months.

5.0 Identification of Covered Tasks

- 5.1 The AIC Covered Task List is based on a review of the ASME B31Q Pipeline Personnel Qualification Standard (2016 Edition), to assist in the determination of covered tasks.
- 5.2 During this review, AIC determines which of the ASME B31Q tasks apply and which do not apply to AIC based on operator specific facilities and procedures.
- 5.3 A task that meets the requirements of the four-part test which is not referenced in the ASME B31Q will be added as an AIC specific covered task. The criteria for the four-part test are as follows:
- 5.3.1 Is the task performed on a pipeline facility?
 - 5.3.2 Is the task an operations or maintenance task?
 - 5.3.3 Is the task performed as a requirement of 49 CFR 192?
 - 5.3.4 Does the task affect the operation or integrity of the pipeline?
- 5.4 Upon revision of the B31Q Standard, AIC Gas OQ Department will review the covered task list in Appendix A of the Standard to determine any:
- 5.4.1 Newly identified tasks to be implemented at AIC as new Covered Tasks.
 - 5.4.2 Revised or removed tasks which result in revision or removal of AIC Covered Tasks.
 - 5.4.3 Tasks that are no longer performed at AIC due to changes in pipeline facilities or procedures. These tasks will be removed from the AIC Covered Task list.
- 5.5 The AIC Covered Task list is found in [OQAL 2.1](#) of this part. Each Covered Task will contain the following:
- 5.5.1 Covered Task Number and Description.
 - 5.5.2 Re-evaluation Interval.
 - 5.5.3 Initial and Subsequent Evaluation Method.
 - 5.5.4 Span of Control.

6.0 Abnormal Operating Conditions (AOC)

- 6.1 An AOC is a condition that may indicate a malfunction of a component or deviation from normal operations that may; (a) indicate a condition exceeding design limits, or (b) result in a hazard(s) to persons, property, or the environment.

- 6.2 AIC has adopted the generic list of AOC's contained in Appendix E of the ASME B31Q Standard as follows:
 - 6.2.1 Unplanned escape of product from a pipeline.
 - 6.2.2 Fire or explosion.
 - 6.2.3 Unexplained/Unplanned pressure deviation (increase, decrease, high, low, absent).
 - 6.2.4 Unexplained/Unplanned flow rate deviation (high flow, low flow, not flow).
 - 6.2.5 Pipeline damage (line hit, lightning strikes, tornado, flood, earthquakes, etc.).
 - 6.2.6 Activation of a safety device (pressure relief, emergency shutdown, high pressure shutdowns, case pressure shutdown, high temperature shutdown, etc.).
 - 6.2.7 Unexplained/Unplanned status change (unit start-up, unit shutdown, valve open, valve close, etc., without being directed to do so).
 - 6.2.8 Communications, control system or power interruption or failure.
 - 6.2.9 Inadequate odorization or reports of gas odor.
- 6.3 AIC maintains task specific AOC's where applicable in the Covered Task Summary documents.

7.0 Evaluation Guidelines, AIC Employees

7.1 Evaluation Criterion

- 7.1.1 The qualification criterion used to qualify an individual to perform a covered task and to determine that the individual is able to recognize and react to AOCs may consist of a number of evaluation materials such as:
 1. ASME B31Q Pipeline Personnel Qualification Standard.
 2. AIC Developed Examinations.
 3. AIC Outsourced Examinations.
 4. Ameren Illinois Operating & Maintenance (O&M) Plan.
 5. Manufacturer's Instructions.

7.2 Evaluator and Proctor Selection and Testing Restrictions

- 7.2.1 Evaluators will be selected based on their knowledge of the covered task. A list of approved evaluators, along with their credentials will be kept on file by AIC Gas OQ Department.
- 7.2.2 Any written or computer-based exams will be taken under the observation of an evaluator or an approved exam proctor. A list of approved proctors will be kept on file by AIC Gas OQ Department.
- 7.2.3 Proctors and Evaluators must ensure that individuals being evaluated do not use cell phones, cameras, or other recording devices during written examinations.
- 7.2.4 The AIC Gas O&M Plan or other pertinent instructions may be referenced during performance evaluations, but only as provided by the AIC Gas OQ Department.

7.3 Evaluation Process

7.3.1 The evaluator will use one or more of the Evaluation Methods and the established evaluation criterion to evaluate an individual's ability to perform a covered task.

7.3.2 An individual who is qualified under the evaluation process will be able to:

1. Perform the covered task.
2. Recognize and react to an AOC.

7.4 Evaluation Process, Initial

7.4.1 The initial evaluation process will be used to evaluate the knowledge, skills and abilities of each employee performing covered tasks and their ability to recognize and react to AOCs

7.5 Evaluation Process, Failure to Qualify 1st Attempt

7.5.1 When an employee is unable to successfully complete a covered task, the following process will be implemented.

1. The failure will be communicated to the employee and to their Supervisor.
2. AIC Gas OQ Staff will recommend remedial training required for the employee. This training may include a review of applicable procedures, supplemental classroom training, Computer Based Training (CBT), and/or additional OJT (on the job training) on the covered task, under the guidance of a qualified employee.
3. The scope of remedial training required will determine the time frame that the employee must wait prior to being re-evaluated for qualification. This will typically be a period of 5 calendar days but may be adjusted depending on the remedial training needs of the employee.

7.6 Evaluation Process, Failure to Qualify 2nd Attempt

7.6.1 When an employee fails the 2nd attempt to qualify on a covered task:

1. The failure will be communicated to the employee and to their Supervisor.
2. A meeting will be arranged by AIC OQ Department and the local Gas Supervision within 30 days of the 2nd failure.
 - 2 a. At that time a field evaluation will be arranged.
 - 2 b. A determination will be made regarding the remedial action to be taken, i.e., retraining or reassignment into another job classification.

7.7 Evaluation Methods

7.7.1 An individual's knowledge, skills and abilities to perform a covered task and to recognize and react to AOCs will be evaluated by a documented process using one or more of the evaluation methods. The qualification methods and the acceptable criteria are as follows:

Evaluation Method	Acceptance Criteria
Written Examination	80%
Oral Examination	80%

Hands-on Examination	Pass/Fail
Field Observation	Pass/Fail

- 7.7.2 Hands-on examinations may involve observation supplemented by appropriate queries that can be made during:
 1. Performance on the job.
 2. On-the-job training.
 3. Field Simulations.
- 7.7.3 Field Observation may include work performed in the field as observed by Gas Quality Assurance (QA) Consultant, Gas OQ staff, or Gas Supervisor.
- 7.7.4 The evaluation processes selected for initial and subsequent evaluations are based on a DIF (Difficult, Importance, Frequency of performance) Analysis for AIC and is documented in the AIC Covered Task List in [OQAL 2.1](#).

7.8 Re-Evaluation Intervals

- 7.8.1 AIC will utilize the DI (Difficulty and Importance) Analysis referenced in the Appendix A of the ASME B31Q Covered Task list, as the basis for establishing re-evaluation intervals.
- 7.8.2 AIC will conduct a Frequency Analysis for each Covered Task to establish a DIF Analysis to determine the proper re-evaluation interval for each Covered Task for AIC.
- 7.8.3 If a change is made to a re-evaluation interval for a Covered Task, the change will be effective for an employee at the time that individual becomes due for and is requalified on the covered task.
- 7.8.4 Subsequent re-evaluation of an individual's qualification to perform covered tasks may not exceed the re-evaluation intervals listed in the Covered Task List plus an additional grace period of 3 months.

7.9 Reasons to Re-evaluate Qualification

- 7.9.1 There may be a reason to believe that an individual is no longer qualified to perform a covered task. Some possible reasons an individual's qualification(s) may need to be reevaluated:
 1. Loss of motor skills, vision, impairment, etc.
 2. Statement from a physician.
 3. Unsatisfactory performance of a covered task.
 4. Off work for more than 12 months.
- 7.9.2 If there is reason to believe that an individual is no longer qualified to perform a covered task, the individual will be re-evaluated in accordance with the Evaluation Process.
- 7.9.3 AIC Gas OQ Department will provide instructions to the Gas Supervisor who has the responsibility for determining when such an evaluation is necessary.

7.10 Reportable Incident Re-Evaluation

UNCONTROLLED IF PRINTED

7.10.1 If there is reason to believe that an individual's performance of a covered task may have contributed to a reportable incident, as defined in [INCD 1](#), the following process is to be used to determine if a reevaluation is required:

1. The individual's qualification will be immediately suspended for the appropriate covered task until an investigation can be conducted to determine if the employee's performance contributed to the incident.
2. An investigation of the incident will be completed according to [INVE 2.1](#).
3. If the investigation indicates that employee's performance did not contribute to the incident, then a re-evaluation of the employee is not required, and the qualification will be reinstated.
4. If the investigation indicates that there is reason to believe that an individual's performance of a covered task contributed to the incident, then the individual will be disqualified, and will require a successful re-qualification for the covered task, as outlined in the Disqualification, AIC Employees section of this procedure.

7.10.2 AIC Gas OQ Staff will review the following for all reportable incidents:

1. Identify the individuals involved.
2. Identify the covered tasks and/or AOCs involved.
3. Determine if all actions taken were in accordance with the AIC O&M Plan.
4. Identify and implement any revisions to the OQ Plan that may prevent a recurrence of the incident.

8.0 Disqualification, AIC Employees

8.1 When an employee is disqualified for a covered task, the OQ Task Disqualification Form (See [OQAL 4](#)) will be completed and promptly communicated with Gas Operations.

8.2 When an employee is disqualified to perform a covered task, the following process will be implemented.

8.2.1 AIC OQ Staff will recommend remedial training required for the employee. This training may include a review of applicable procedures, supplemental classroom training, CBT, and/or additional OJT (on the job training) on the covered task(s), under the guidance of a qualified employee.

8.2.2 The scope of remedial training required will determine the time frame that the employee must wait prior to being re-evaluated for qualification. This will typically be a period of 5 calendar days, but may be adjusted depending on the remedial training needs of the employee.

8.2.3 Re-evaluation for a disqualified employee will be conducted using the same evaluation methods used for the initial qualification.

8.2.4 Remedial training completed will be documented in the Reinstatement section of the OQ Task Disqualification Notice Form, along with the date.

8.2.5 Disqualification and any subsequent requalification of a covered task will be communicated both to the affected employee and to their Supervisor.

9.0 Non-Qualified Individuals, AIC Employees

- 9.1 Non-Qualified individuals are allowed to perform covered tasks under certain circumstances, including, but not limited to, the non-qualified individual's participation in OJT training or when working as part of a crew.
- 9.2 Non-Qualified individuals may perform a covered task if all three of the following conditions are met:
 - 9.2.1 A qualified individual is assigned to direct and observe non-qualified individual(s) during the performance of a covered task. Direct and observe means that the qualified individual must be focused on the task at hand.
 - 9.2.2 A qualified individual is able to recognize and react to an AOC and take immediate corrective action when necessary.
 - 9.2.3 The ratio of non-qualified individuals to a qualified individual shall not exceed the span of control ratio as identified in the Covered Task List in [OQAL 2.1](#).
 - 9.2.4 A Non-qualified individual may not weld on steel pipe, join PE pipe, or perform any other task where the span of control is 1:0.

10.0 Program Effectiveness

- 10.1 At an interval of 3 years not to exceed 39 months, the OQ program shall be reviewed to appraise its effectiveness.
 - 10.1.1 This review shall determine whether the program is being implemented as documented.
 - 10.1.2 Appraise whether it is effective as implemented. AND
 - 10.1.3 Include provisions to update the OQ program based on the results from the implementation and effectiveness appraisals.
- 10.2 Two required measures will be tracked to appraise program effectiveness:
 - 10.2.1 Number of individuals performing covered tasks found to have contributed to an event or action that adversely affects the safety or integrity of the pipeline
 - 10.2.2 Number of pipeline damages/leaks attributed to the performance of damage prevention or excavation activities by employees or contractor employees of Ameren Illinois.
- 10.3 In addition to the two required measures, the following measures should also be considered to appraise program effectiveness:
 - 10.3.1 Effectiveness of the methods of evaluation for individual qualifications.
 - 10.3.2 Number of events or actions that adversely affect the safety or integrity of the pipeline within a specific timeframe.
 - 10.3.3 Number of individuals with qualifications suspended or revoked.
 - 10.3.4 Number of reasonable cause investigations.
 - 10.3.5 Review of feedback received from evaluators, employees, contractors, other affected individuals, and ICC audits regarding:
 - 1. Training.
 - 2. Evaluation issues.
 - 3. Procedural issues.
 - 4. AOC recognition and reaction issues.

5. Subsequent qualification intervals effectiveness.
6. Span of control effectiveness.

10.3.6 Review of the findings of the Quality Assurance program.

10.4 A review of the DIF Analysis for each Covered Task will be conducted during the Program Effectiveness review to determine if any changes are needed to the subsequent evaluation method or interval

11.0 Management of Change

11.1 AIC Gas OQ Department staff will communicate all changes to covered tasks to the individuals performing covered task(s).

11.2 These changes may include, but are not limited to:

- 11.2.1 Revisions to AIC policies or procedures.
- 11.2.2 Changes to State or Federal regulations.
- 11.2.3 New equipment, material and/or technology.

11.3 Changes will be evaluated for impact and communicated to qualified individuals according to the following protocol

11.3.1 Low Impact Change:

1. Low Impact changes, such as grammatical changes, have no impact on the completion of a covered task.
2. No communication of the change is required.

11.3.2 Medium Impact Change:

1. Medium Impact changes include minor company policy changes, or other changes that may impact the performance of a covered task.
2. Requires documented notification to affected individuals, typically through written communication such as Gas Training Updates or Material Updates.

11.3.3 High Impact Change:

1. High Impact changes include Significant Revisions to the Gas O&M Plan Procedures.
2. Requires documented communication to affected individuals before the change is implemented.
3. A record of the review of the communication by AIC Qualified individuals will be maintained electronically in the Insight Learning Management System.

11.4 AIC will communicate to the ICC Pipeline Safety Program when significant OQ written program changes are made. Significant changes include but are not limited to:

- 11.4.1 Increasing evaluation intervals,
- 11.4.2 Increasing span of control ratios,
- 11.4.3 Eliminating covered tasks,
- 11.4.4 Mergers and/or acquisition changes,
- 11.4.5 Evaluation method changes (such as written vs. observation), or
- 11.4.6 Wholesale changes made to the OQ Plan.

12.0 Documentation & Record Keeping, AIC Employees

12.1 AIC will ensure all employees' qualification records are maintained using electronic and/or hard copy. These records will contain:

- 12.1.1 The individual being qualified.
- 12.1.2 The covered tasks the individual is qualified to perform.
- 12.1.3 The method of evaluation per task.
- 12.1.4 Scores of written test.
- 12.1.5 The date qualification was completed.
- 12.1.6 The due date for the next subsequent re-qualification.
- 12.1.7 The name of evaluator.

12.2 Records of prior qualification of individuals including those no longer performing covered tasks shall be retained for a period of up to 8 years, 5 years beyond the expiration of the qualification.

13.0 Training, AIC Employees

13.1 All AIC gas apprentices will be evaluated for qualification on covered tasks as they progress through the AIC Gas Apprentice Training Program.

13.2 AIC Gas Training staff will determine the training requirements based on the job classification requirements, for initial training.

13.3 The initial method of evaluation for each covered task is identified in the Covered Task List in [OQAL 2.1](#).

13.4 Individuals that perform covered tasks will also be trained and evaluated to ensure that they possess the knowledge, skills and abilities to:

- 13.4.1 Follow the requirements of this rule.
- 13.4.2 Carry out the procedures in the AIC O&M Plan including emergency response procedures.
- 13.4.3 Use instruments and equipment related to the covered task they perform.
- 13.4.4 Know all the characteristics and hazards of the gas transported, including flammability range, toxicity, olfactory and corrosive properties.
- 13.4.5 Recognize all potential ignition sources.
- 13.4.6 Recognizing all AOCs that are likely to cause emergencies including gas leaks and equipment or facility malfunction or failure. Predict potential consequences of these conditions and take appropriate corrective steps.
- 13.4.7 Take steps necessary to control any accidental release of gas and to minimize the potential for a fire or explosion.
- 13.4.8 Know the proper use of firefighting procedures and equipment, fire suits and breathing apparatus by utilizing, where feasible, a simulated pipeline emergency condition.

14.0 Refresher Training, AIC Employees

- 14.1 In addition to OQ evaluations, individuals that perform covered tasks will receive refresher training.
- 14.2 This refresher training will focus on core areas of a specific covered task or a group of related covered tasks.
- 14.3 Topics may be chosen by applicability to work groups or based on field performance observations, with at least one refresher training topic covered each calendar year.
- 14.4 In addition, refresher training on Leak Management Procedures will be conducted on an annual basis.
- 14.5 Additional refresher training will be given when it is determined as being necessary.

15.0 Contractors

- 15.1 A contractor performing a covered task that is not operating under the AIC OQ Plan will be required to forward their company Operator Qualification Plan to AIC Gas OQ Department and AIC Construction Services prior to the beginning of any work on AIC property.
- 15.2 AIC OQ staff is responsible for the evaluation of the contractor's OQ Plan. Once the contractor OQ Plan has been evaluated and approved, the contractor's name will be placed on an "Approved Contractor List".
- 15.3 AIC Gas OQ staff will evaluate Contractor OQ plans that use the **Energy World Net (EWN)** industry OQ Consortium as the basis for qualification.
- 15.4 The AIC contractor OQ Plan evaluation will consist of the following items:
 - 15.4.1 Drug and Alcohol Plan - Ensure that the contractor has a compliant Drug and Alcohol Plan and is in a Satisfactory Status.
 - 15.4.2 Environmental/Safety Violation Disclosure Form - Ensure this form has been completed and received by AIC.
 - 15.4.3 Use of Subcontractors - Ensure that any Subcontractors that are used are either qualified under the Contractor's OQ Plan, or that the Subcontractor has their own OQ Plan. All Subcontractor OQ Plans must be submitted to and approved by AIC Gas OQ Department prior to performing work.
 - 15.4.4 Covered Tasks: Ensure that the Contractors Covered Tasks align with the approved OQ Consortium provider and are equivalent to the AIC Covered Task List.
 - 15.4.5 Span of Control: Ensure that the Contactor's Span of Control is aligned with the approved OQ Consortium provider or more stringent.
 - 15.4.6 Requalification Interval: Ensure that the Contractor's requalification intervals are aligned with the approved OQ Consortium provider, or more frequent.
 - 15.4.7 Abnormal Operation Conditions: Ensure that the Contractor's AOCs align with the approved OQ Consortium provider, or the list of AOCs in the AIC OQ Plan.
 - 15.4.8 Disqualification Procedure: Ensure that the Contractor OQ Plan defines when individuals will be suspended or disqualified from performing a covered task.
 - 1. This must include a provision for suspending the qualification of individuals whose performance of a covered task may have contributed to a reportable incident, as defined in **INCD 1**.

2. The Contractor OQ Plan must also specify a minimum duration between evaluation attempts, after a disqualification or failure to qualify. This shall be a minimum duration of 1 day depending on remedial training required.

15.4.9 Management of Change: Ensure that the Contractor's OQ Plan contains a provision for communicating changes in pertinent AIC policies or procedures.

15.4.10 Qualification Records: Ensure that the Contractor's OQ Plan defines a record retention period of at least 5 years for individual's prior qualification records and for those individuals no longer performing covered tasks.

15.4.11 Documentation of the Contractor's OQ Plan Review and approval, including resolution of any gaps noted, will be documented on the AIC Contractor OQ Plan Review Form (See [OQAL 4](#)).

15.5 Hiring Requirements for Contractors Qualified Under the AIC OQ Plan

15.5.1 These requirements apply to the hiring of all contractors who will perform covered task work on AIC gas facilities and are not covered under an OQ plan.

15.5.2 These contractors are working under the AIC OQ Plan/Task List as follows:

1. Typically receiving an Ameren ID # / Badge
2. AIC OQ Staff will confirm training and perform OQ evaluations for these contractors. OQ Credentials will be documented using the AIC Covered Task List.
3. OQ Credentials documented in Insight LMS (where an Ameren ID is issued)
4. The employee who initiates the hiring of these contractors is someone from Region Operations or one of the Gas Services and Operations groups, etc.
5. An example of such contractors would be temporary employees hired through Zempleo/Guidant, or spray-applied painting contractors.

15.5.3 Subsequent OQ requirements will be monitored by the AIC Gas OQ Department.

16.0 Contractor Review Meeting

16.1 An initial review meeting will be conducted by AIC Construction Services prior to the commencement of a new contractor performing work on AIC facilities.

16.2 This meeting will review and identify any required training and testing for the contractor employees on AIC specific requirements.

16.3 In addition, this OQ Review meeting will cover the following:

16.3.1 Covered Tasks:

1. Contractor personnel shall be qualified for the core tasks identified for the work to be performed.

16.3.2 Span of Control:

1. All contractors initially working under Span of Control should work toward qualification after training and OJT.

16.3.3 Suspension or Loss of Qualification:

1. AIC must be notified of any contractor personnel who becomes disqualified to perform a covered task while working for AIC.

2. AIC and the contractor will investigate any incidents that may result in the loss or suspension of qualifications.
3. AIC has the right to determine if an individual will be allowed to continue work on its facilities.

16.3.4 Communication of Change:

1. AIC will notify all contractor personnel of pertinent changes in the same manner as it notifies AIC employees.

16.3.5 Record Keeping

1. Qualification records of all contractor employees shall be sent to AIC Gas OQ Department prior to work beginning on AIC facilities
2. All qualifications records of the contractor's personnel shall be kept by the following:
 - 2 a. AIC Gas OQ Department
 - 2 b. Contractor - OQ Records must be accessible on the job site.

16.3.6 Additional Responsibilities of the Contractor

1. It is the responsibility of the Contractor to notify AIC Construction Services of any individuals that are non-qualified and/or new to the job site.
2. AIC retains the right to allow or disallow any individual(s) or contractor(s) on the property.

17.0 Mutual Assistance

17.1 Employees, contractors, subcontractors and employees of other companies providing mutual aid to AIC as part of a protracted emergency must follow the requirements of the AIC O&M Plan.

17.2 AIC will identify the scope of work for the mutual response and the associated Covered Tasks to be performed.

17.3 AIC will request the following information for individuals responding to a mutual aid request:

17.3.1 List of qualified employees with covered tasks they are qualified to perform.

17.3.2 Evaluation process.

17.3.3 Date of qualifications and expiration dates.

17.4 Upon review of this information, AIC will determine and administer any training and qualification evaluations required for the responding parties prior to beginning work to ensure they have the knowledge, skills, and ability to perform the required work.

18.0 Mergers and Acquisitions

18.1 A. In the event of a merger or acquisition, AIC and the newly merged or acquired company will initially operate under separate OQ Plans until a consolidation review is performed.

18.2 As soon as practical, a consolidation review will be conducted of the OQ Plans for each company to identify if the OQ Plans will remain separate or be merged into one OQ Plan. The review may identify any best practices from the merged or acquired companies which should be incorporated into the AIC OQ Plan.

18.3 If the consolidation review results in a merged OQ Plan, AIC will identify and conduct any supplemental training and qualification evaluations required for all impacted individuals who were previously qualified under a changed OQ Plan as a result of the consolidation.

18.4 Records of prior qualification for qualified individuals who are acquired with the merger or acquisition, including those no longer performing covered tasks, shall be retained for a period of up to 8 years, 5 years beyond the expiration of the qualification.

End of Instructions.

Covered Task	Update: 1061 – Span of Control – 1.2 or Manufacture's Recommendation. Added: 1281 Mobile Gas Leakage Survey - Optical Methane A004 Mobile Gas Leakage Survey: Laser Spectroscopy

Appendix A - Definitions

<u>Term</u>	Definition
Ability	The mental and physical capacity to perform a task.
Abnormal Operating Condition (AOC)	<p>A condition that may indicate a malfunction of a component or deviation from normal operations that may:</p> <ol style="list-style-type: none"> 1. Indicate a condition exceeding design limits; or 2. Result in a hazard(s) to persons, property, or the environment.
Affected Individual	An individual who performs a covered task(s) or who has qualification program implementation responsibility.
Covered Task	<p>An activity, identified by the Operator, that:</p> <ol style="list-style-type: none"> 1. Can affect the safety or integrity of the pipeline. 2. Is performed on a pipeline facility. 3. Is an operations or maintenance task. 4. Is performed as a requirement of 49 CFR 192. 5. Affects the operation or integrity of the pipeline.
Covered Task Summary	Contains task specific information, AOC's and O&M procedure references associated with each covered task.
Commission	To verify that pipeline equipment or components function within specified parameters, prior to or during placing in service.
DI Analysis	An analysis that explores the difficulty (D) and importance (I) of each task.
DIF Analysis	An analysis that explores the Difficulty (D), Importance (I), and Frequency (F), of each task.
Direct and Observe	The process by which a qualified individual oversees the work activities of a non-qualified individual(s), and is able to take immediate corrective action when necessary.
Evaluation	A process established to determine an individual's ability to perform a covered task(s). The term can be used to refer to the process, examination instruments(s) or both. The process may entail one or more evaluation method or one or more distinct evaluation instruments.
Evaluation Criteria	The specific knowledge and skill an individual must possess and demonstrate to be qualified to perform a covered task.

Evaluator	An individual who has the qualifications and has been identified to conduct performance evaluations and written / oral evaluations to determine if the individual is qualified to perform a task(s), and recognize and react to abnormal operating conditions.
Knowledge	A body of information applied directly to the performance of a task.
Mutual Aid	Pipeline operator personnel assistance (aid) provided to another pipeline operator in the performance of covered task(s).
On the Job Training (OTJ)	Instruction at or near the work setting and properly documented in individuals file.
Performance	Demonstration of the knowledge, skill or abilities required for a task(s).
Personnel	Individuals who may perform covered task(s).
Pipeline	All parts of the facility through which gas moves in transportation, including pipe, valves, appurtenances attached to pipe, compressors, metering stations, regulator stations, delivery stations, holders, and fabricated assemblies.
Proctor	An individual selected to administer a written examination.
Qualified	An individual who has been evaluated and can: <ol style="list-style-type: none"> 1. Perform assigned covered task(s); and 2. Recognize and react to abnormal operating conditions.
Safety or Integrity	The state of a pipeline that demonstrates either operational safety (as affected by maintenance, construction, and operating activities) or the ability to withstand the stresses imposed during operations.
Skill	The ability to perform acquired mental and physical activities to perform a task(s).
Span of Control	The maximum number of non-qualified individuals that a qualified individual is allowed to direct and observe.
Subject Matter Resource	An individual(s) that possesses knowledge and experience in the process / discipline and who is recognized as an expert by Ameren Illinois management.

Subsequent Qualification	A process to evaluate / test, an individual(s) who is currently qualified to perform a covered task(s).
Suspension	Temporary cancellation of qualifications of a qualified individual from performing identified covered task(s).
Task	A defined unit of work, having an identifiable beginning and end, and specifications that are observable and measurable.
Training	Instruction designed around tasks and the related knowledge and skills needed for competent performance.
Training Program	The written description, processes, procedures, training materials, evaluations, etc. that establish and document training identified by Ameren Illinois.

Operator Qualification

April 1, 2023

OQAL 2.1 Covered Task List**1.0 Purpose**

This section lists the Covered Task List in order from lowest Task Number to Highest.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Cover Task List](#)**3.0 Target Audience**

- Gas Supervisors
- Gas Field Personnel
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Storage Field Supervisors
- Gas Storage Field Personal
- Gas Operator Qualification Personnel

4.0 Covered Task List

Number	Covered Task	Re-eval Intervals	Initial Method of Evaluation	Subsequent Method of Evaluation	Span of Control
0001	Measure Structure-to-Electrolyte Potential	5 yrs	P&W/O	W/O	1:1
0011	Conduct Close Interval Survey	3 yrs	P&W/O	W/O	1:1
0021	Measure Soil Resistivity	3 yrs	P&W/O	W/O	1:1
0031	Inspect and monitor Galvanic Ground Beds/Anodes	5 yrs	P&W/O	W/O	1:1
0041	Installation and Maintenance of Mechanical Electrical Connections	5 yrs	P&W/O	W/O	1:1
0051	Installation of Exothermic Electrical Connections	3 yrs	P&W/O	W/O	1:1

UNCONTROLLED IF PRINTED

0061	Inspect or Test Cathodic Protection Bonds	5 yrs	P&W/O	W/O	1:1
0071	Inspect or Test Cathodic Protection Electrical Isolation Devices	5 yrs	P&W/O	W/O	1:1
0081	Install Cathodic Protection Electrical Isolation Devices	5 yrs	P&W/O	W/O	1:1
0091	Troubleshoot In-Service Cathodic Protection System	3 yrs	P&W/O	W/O	1:1
0101	Inspect Rectifier and Obtain Readings	5 yrs	P&W/O	W/O	1:1
0111	Maintain Rectifier	3 yrs	P&W/O	W/O	1:1
0121	Collect Sample for Internal Corrosion Measuring	3 yrs	P&W/O	W/O	1:1
0131	Insert and Remove Coupons/Probes for Internal Corrosion Monitoring	3 yrs	P&W/O	W/O	1:1
0141	Visual Inspection for Atmospheric Corrosion	3 yrs	P&W/O	W/O	1:1
0151	Visual Inspection of Buried Pipe and Components when Exposed	3 yrs	P&W/O	W/O	1:1
0161	Visual Inspection for Internal Corrosion	3 yrs	P&W/O	W/O	1:1
0171	Measure External Corrosion	3 yrs	P&W/O	P&W/O	1:1
0181	Measure Internal Corrosion	3 yrs	P&W/O	P&W/O	1:1
0191	Measure Atmospheric Corrosion	3 yrs	P&W/O	P&W/O	1:1
0201	Visual Inspection of Installed Pipe and Components for Mechanical Damage	3 yrs	P&W/O	P&W/O	1:1
0211	Measure and Characterize Mechanical Damage on Installed Pipe and Components	3 yrs	P&W/O	P&W/O	1:1
0221	Inspect Test and Maintain Sensing Devices	3 yrs	P&W/O	W/O	1:1

UNCONTROLLED IF PRINTED

0231	Inspect Test and Maintain Programmable Logic Controllers	3 yrs	P&W/O	W/O	1:1
0301	Manually Opening and Closing Valves	3 yrs	P&W/O	W/O	1:3
0311	Adjust and Monitor Flow or Pressure-Manual Valve Operation	3 yrs	P&W/O	P&W/O	1:1
0321	Valve Corrective Maintenance	3 yrs	P&W/O	W/O	1:2
0331	Valve-Visual Inspection and Partial Operation	3 yrs	P&W/O	W/O	1:2
0341	Valve-Preventive Maintenance	3 yrs	P&W/O	W/O	1:2
0351	Pneumatic Actuator/Operator Inspection and Testing, Preventive and Corrective Maintenance	3 yrs	P&W/O	P&W/O	1:2
0361	Electric Actuator/Operator Inspection and Testing, Preventive and Corrective Maintenance	3 yrs	P&W/O	P&W/O	1:2
0371	Hydraulic Actuator/Operator Inspection and Testing, Preventive and Corrective Maintenance	3 yrs	P&W/O	P&W/O	1:2
0381	Spring Loaded Pressure Regulating Device-Inspection and Testing, Preventive and Corrective Maintenance	3 yrs	P&W/O	W/O	1:1
0391	Pilot-Operated Pressure Regulating Device-Inspection and Testing, Preventive and Corrective Maintenance	3 yrs	P&W/O	W/O	1:1
0401	Controller Type Pressure Regulating Device-Inspection and Testing, Preventive and Corrective Maintenance	3 yrs	P&W/O	P&W/O	1:1
0411	Spring Loaded Pressure Limiting and Relief Device-Inspection and Testing, Preventive and Corrective Maintenance	3 yrs	P&W/O	W/O	1:1
0421	Pilot-Operated Pressure Limiting and Relief Device-Inspection and Testing,	3 yrs	P&W/O	W/O	1:1

UNCONTROLLED IF PRINTED

	Preventive and Corrective Maintenance				
0431	Pneumatic Loaded Pressure Limiting and Relief Device-Inspection and Testing, Preventive and Corrective Maintenance	3 yrs	P&W/O	W/O	1:1
0441	Compressor Start-Up And Shutdown - Manual	3 yrs	P&W/O	W/O	1:1
0461	Compressor Preventive Maintenance	3 yrs	P&W/O	W/O	1:2
0471	Reciprocating Compressor Inspection, Testing and Corrective Maintenance	3 yrs	P&W/O	W/O	1:2
0481	Centrifugal Compressor Inspection, Testing and Corrective Maintenance	3 yrs	P&W/O	P&W/O	1:2
0491	Rotary Compressor Inspection, Testing and Corrective Maintenance	3 yrs	P&W/O	P&W/O	1:2
0551	Explosive Atmosphere Detection and Alarm System Performance Test and Corrective Maintenance	3 yrs	P&W/O	P&W/O	1:1
0561	Pressure Test - Nonliquid Medium-MAOP Less than 100 Psi	3 yrs	P&W/O	W/O	1:2
0571	Pressure Test - Nonliquid Medium-MAOP Greater than or Equal to 100 Psi	3 yrs	P&W/O	W/O	1:2
0581	Pressure Test- Liquid Medium	3 yrs	P&W/O	W/O	1:2
0591	Leak Test at Operating Pressure	3 yrs	P&W/O	W/O	1:1
0601	NDT - Radiographic Testing	3 yrs	P&W/O	W/O	1:3
0611	NDT - Liquid Penetrant Testing	3 yrs	P&W/O	W/O	1:2
0621	NDT - Magnetic Particle Testing	3 yrs	P&W/O	W/O	1:2
0631	NDT - Ultrasonic Testing	3 yrs	P&W/O	W/O	1:2

UNCONTROLLED IF PRINTED

0641	Visually Inspect Pipe and Components Prior to Installation	5 yrs	P&W/O	W/O	1:2
0681	Joining of Plastic Pipe - Stab Fittings	1yr	P&W/O	P&W/O	1:0
0691	Joining of Pipe - Non-Bottom Out Compression Couplings	1yr	P&W/O	P&W/O	1:0
0701	Joining of Pipe - Bottom Out Compression Couplings	1yr	P&W/O	P&W/O	1:0
0721	Joining of Pipe - Threaded Joints	3 yrs	P&W/O	W/O	1:2
0731	Joining of Pipe - Flange Assembly	3 yrs	P&W/O	W/O	1:4
0751	Joining of Plastic Pipe - Butt Heat Fusion: Manual	1yr	P&W/O	P&W/O	1:0
0761	Joining of Plastic Pipe - Butt Heat Fusion: Hydraulic Machine	1yr	P&W/O	P&W/O	1:0
0781	Joining of Plastic Pipe - Electrofusion	1yr	P&W/O	P&W/O	1:0
0801	Welding	1 yr	P&W/O	P&W/O	1:0
0811	Visual Inspection of Welding and Welds	3 yrs	P&W/O	P&W/O	1:1
0821	Tubing & Fitting Installation - Instrument, Control and Sampling	3 yrs	P&W/O	W/O	1:2
0861	Installation of Steel Pipe in a Ditch	3 yrs	P&W/O	W/O	1:5
0871	Installation of Steel Pipe in a Bore	3 yrs	P&W/O	W/O	1:2
0881	Installation of Steel Pipe Plowing/Pull-in	3 yrs	P&W/O	W/O	1:2
0891	Field Bending of Steel Pipe	3 yrs	P&W/O	W/O	1:1
0901	Installation of Plastic Pipe in a Ditch	3 yrs	P&W/O	W/O	1:5
0911	Installation of Plastic Pipe in a Bore	3 yrs	P&W/O	W/O	1:2

UNCONTROLLED IF PRINTED

0921	Installation of Plastic Pipe in Plowing/ Pull-in	3 yrs	P&W/O	W/O	1:2
0931	Installation of Plastic Pipe in Plowing/ Planting	3 yrs	P&W/O	W/O	1:2
0941	Install Tracer Wire	3 yrs	P&W/O	W/O	1:5
0951	Installation of Pipe Above Ground	3 yrs	P&W/O	W/O	1:3
0961	Above Ground Supports and Anchors- Inspection, Preventive and Corrective Maintenance	3 yrs	P&W/O	W/O	1:4
0971	Installation and Maintenance of Cas- ing Spacers, Vents and Seals	3 yrs	P&W/O	W/O	1:3
0981	Backfilling	3 yrs	P&W/O	W/O	1:3
0991	Coating Application and Repair - Brushed or Rolled	3 yrs	P&W/O	W/O	1:5
1001	Coating Application and Repair - Sprayed	3 yrs	P&W/O	W/O	1:5
1011	External Coating Application and Re- pair - Wrapped	3 yrs	P&W/O	W/O	1:5
1020	Perform Electrical inspection of Pipe Coating (Holiday Detection or Jeeping)	3 yrs	P&W/O	P&W/O	1:1
1041	Install Mechanical Clamps and Sleeves - Bolted	3 yrs	P&W/O	W/O	1:2
1051	Fit-Up of Weld Type Repair Sleeve	3 yrs	P&W/O	W/O	1:2
1061	Install Composite Sleeve	3 yrs	P&W/O	W/O	1:2 or Mfr's rec- om- men- dation
1071	Repair of Steel Pipe by Grinding	3 yrs	P&W/O	W/O	1:1

UNCONTROLLED IF PRINTED

1081	Tapping a Pipeline (Tap Diameter 2 Inch or Less)	3 yrs	P&W/O	P&W/O	1:2
1091	Tapping a Pipeline (Tap Diameter Greater than 2 Inch)	3 yrs	P&W/O	P&W/O	1:2
1101	Tapping a Pipeline With a Built-In Cutter	3 yrs	P&W/O	W/O	1:2
1131	Stopper (Stoppie) Pipe	3 yrs	P&W/O	P&W/O	1:2
1141	Squeeze Off Plastic Pipe	3 yrs	P&W/O	P&W/O	1:2
1151	Squeeze Off Steel Pipe	3 yrs	P&W/O	W/O	1:2
1161	Installation of Customer Meters and Regulators - Residential and Small Commercial	3 yrs	P&W/O	W/O	1:1
1171	Installing Customer Meters - Large Commercial and Industrial	3 yrs	P&W/O	W/O	1:1
1181	Installing and Maintaining Customer Pressure Regulating, Limiting, and Relief Device - Large Commercial & Industrial	3 yrs	P&W/O	W/O	1:1
1191	Maintenance of Service Valves Upstream of Customer Meter	3 yrs	P&W/O	W/O	1:1
1201	Temporary Isolation of Service Lines and Service Discontinuance	3 yrs	P&W/O	W/O	1:1
1211	Odorization - Periodic Sampling	5 yrs	P&W/O	P&W/O	1:1
1221	Odorization - Odorizer Inspection, Testing, Preventive and Corrective Maintenance	5 yrs	P&W/O	P&W/O	1:5
1231	Inside Gas Leak Investigation	1 yrs	P&W/O	P&W/O	1:1
1241	Outside Gas Leak Investigation	1 yrs	P&W/O	P&W/O	1:1
1261	Walking Gas Leakage Survey	1 yrs	P&W/O	P&W/O	1:1

UNCONTROLLED IF PRINTED

1271	Mobile Gas Leakage Survey - Flame Ionization	1 yrs	P&W/O	W/O	1:1

QQAL 2.1 Operator Qualifications: Covered Task List, October 1, 2022

Revision Notes

Location of Changes	Summary of Changes
Covered Task	Update: 1061 – Span of Control – 1.2 or Manufacture's Recommendation. Added: 1281 Mobile Gas Leakage Survey - Optical Methane A004 Mobile Gas Leakage Survey: Laser Spectroscopy

OOAL 2.2 Covered Task AOC's

1.0 Purpose

This document lists AIC's Covered Tasks AOC's, in alphabetical order, to comply with 49 CFR Part 192 Subpart N Qualifications of Pipeline Personnel.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Covered Tasks AOC's](#)

3.0 Target Audience

- Gas Supervisors
- Gas Field Personnel
- Gas Tech Services (GTS) Personnel
- Gas Tech Services (GTS) Supervisors
- Operator Qualification
- Gas Storage Field Supervisors
- Gas Storage Field Personnel
- Gas Operator Qualifications Personnel

4.0 Covered Tasks AOC's

Abandonment		Task #	A002
Task Guidance	This task includes the steps necessary to isolate and purge mains and services when taken out of service.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Hazardous air / gas mixture in piping 2. Isolated sections not purged 3. Gas ignition 4. Unplanned loss of service 			

Above Ground Supports and Anchors - Inspection, Preventive and Corrective Maintenance	Task #	0961
--	---------------	-------------

Task Guidance	This task includes verification that the above ground supports and anchors are installed in accordance with specifications, prior to or during placing in service. This task also includes the repair or replacement, alteration or refurbishment of above ground supports and anchors, and actions to keep the above ground supports and anchors functioning as specified.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Damage to pipe 2. Damage to coating 3. Improper pipe support 4. Corrosion 	

Adjust and Monitor Flow or Pressure-Manual Valve Operation		Task #	0311
Task Guidance	This task includes the adjustment of flow or pressure either manually or using the valve actuator at the valve site. It also includes valve identification, notifications and pressure verification.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Inoperable valve 2. Damage to facilities 3. Pressure deviation 4. Interruption of service 5. Gas leak 			

Backfilling		Task #	0981
Task Guidance	This task includes visually inspecting backfill material, installation of pipe protective material (i.e. padding, shading, and rock shield), verification of firm support and placing backfill in lifts or layers as specified.		
Task Specific AOC's			

<ol style="list-style-type: none"> 1. Unsupported pipe 2. Unacceptable backfill materials 3. Damage to pipe 4. Damage to coating
--

Centrifugal Compressor Inspection, Testing and Corrective Maintenance		Task #	0481
Task Guidance	This task includes verification that a new, replaced, or rebuilt compressor is functioning within specified parameters, prior to or during placing in service. This task includes the repair, alteration or refurbishment of compressors. This task does not include maintenance of the compressor driver.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Equipment Malfunction 2. Gas Leak 			

Coating Application and Repair - Brushed or Rolled		Task #	0991
Task Guidance	This task includes the surface preparation and application or repair of coatings using a brush or roller. This task includes painting to inhibit corrosion, and internal or external applications of coatings, on pipes, tanks, etc.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Improper pipe surface preparation 2. Inadequate coverage 			

Coating Application and Repair - Sprayed		Task #	1001
Task Guidance	This task includes the surface preparation and application or repair of coatings using a sprayer. This task includes painting to in-		

	hibit corrosion, and internal or external applications of coatings, on pipes, tanks, etc.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Improper pipe surface preparation 2. Inadequate coverage 	

Collect Sample for Internal Corrosion Monitoring		Task #	0121
Task Guidance	This task includes the collection and handling of samples (gas, liquids, solids) for internal corrosion monitoring and preventing contamination of the sample.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Debris in source valve 2. Water in gas 3. Leak on source valve 			

Compressor Preventative Maintenance		Task #	0461
Task Guidance	This task encompasses actions (e.g., lubrication, adjustment, etc.) to keep compressors operating safely and efficiently. This task does not include maintenance of the compressor driver.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Equipment malfunction 2. Gas Leak 			

Compressor Start-up and Shutdown - Manual		Task #	0441
Task Guidance	This task includes manual startup and shutdown of a compressor, (e.g., reciprocating, centrifugal, rotary) at the driver control panel.		

Task Specific AOC's
<ol style="list-style-type: none"> 1. Equipment malfunction 2. Gas leak

Conduct Close Interval Survey		Task #	0011
Task Guidance	This task includes gathering electrical potential readings along the pipeline at specified intervals and recording data.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. AC Voltage on structure 2. Deficient P.S. reading 3. Broken test wire 4. Bad soil conditions 			

Controller Type Pressure Regulating Device - Inspection and Testing, Preventative and Corrective Maintenance		Task #	0401
Task Guidance	This task includes verification that the pressure regulating device is functioning within specified parameters, after installation, and prior to or during placing in service. This task also includes the repair or replacement, alteration or refurbishment of pressure regulating device, and actions to keep the pressure regulating device operating safely and efficiently.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Failure to lock up 2. Lost pressure to control regulator 3. Lost mv signal to regulator 4. Inability to increase or decrease pressure 5. Excessive droop 			

Damage Prevention During Excavation Activities by or on Behalf of the Operator		Task #	1321
Task Guidance	This task includes assuring the performance of damage prevention activities during excavation activities (e.g., verifying underground pipelines are marked, providing required notifications, use of spotter/swamper to guide equipment operator, probing, hand digging, pot holing to verify location of bore-head, etc.).		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. No locates 2. Missed locates 3. Not following proper JULIE procedures 			

Damage Prevention During Third Party Excavation or Encroachment Activities as Determined Necessary by Operator		Task #	1331
Task Guidance	When an operator inspects third party excavations or encroachment activities, this task includes the inspection or those activities and actions to protect the operators' facilities such as work stoppage and requiring proper support for operators' pipeline facility. (Watch and Protect)		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damage to facility 2. Facilities not properly supported 3. Gas leak 			

Direct Examination Techniques		Task #	1421
Task Guidance	This task includes direct examination (e.g., ultrasonic examination, coating holiday testing, visual examination, etc.).		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Equipment malfunction 			

2. Holiday in coating

Electric Actuator/Operator Inspection and Testing, Preventive and Corrective Maintenance		Task #	0361
Task Guidance	This task includes verification that the actuator/operator is functioning within specified parameters, after installation, and prior to or during placing in service. This task also includes the repair, replacement, alteration or refurbishment of actuator/operator, and actions to keep actuator/operator operating safely and efficiently.		
Task Specific AOC's			
1. Equipment malfunction			

Emergency Response		Task #	A003
Task Guidance	This task includes the necessary guidance to insure the safety of the Public, Gas Customers and Company Employees during Natural Gas Emergencies.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Hazardous Gas Concentration Indoors, Outdoors or in Sanitary Sewers 2. Major Leaks or Line Breaks 3. Fire, Ignition or Explosion - Gas Related 4. Explosion / Fire near Gas Pipeline Facilities 5. High Pressure Situation 			

Explosive Atmosphere Detection and Alarm System Performance Test, and Corrective Maintenance		Task #	0551
Task Guidance	This task includes verification that the permanently installed explosive atmosphere detection and alarm system is functioning within specified parameters, after installation, and prior to or during placing in service. This task also includes the performance test, and the repair or replacement of fixed explosive atmosphere detection and alarm system.		

Task Specific AOC's
<ol style="list-style-type: none"> 1. Explosive atmosphere detected 2. Equipment malfunction

External Coating Application and Repair - Wrapped		Task #	1011
Task Guidance	This task includes the surface preparation and application or repair of coatings using cold wrap or wax wrap. This task includes the surface preparation and application or repair of coatings using hot wrap.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damage to existing wrap/coating 2. Improper pipe surface preparation 3. Improper installation of wrap 			

Field Bending of Steel Pipe		Task #	0891
Task Guidance	This task includes the field bending of steel pipe as specified and inspection of completed field bends.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damaged or kinked pipe 2. Damaged coating 3. Bend beyond minimum allowed radius 			

Fit-Up Weld Type Repair Sleeve		Task #	1051
Task Guidance	This task includes the preparation and fit-up of weld type repair sleeves.		

Task Specific AOC's
<ol style="list-style-type: none"> 1. Improper selection of material on sleeve. 2. Incorrect electrode selection. 3. Improper cleanliness of pipe. 4. Failure to UT pipe for wall thickness.

Hydraulic Actuator/Operator Inspection and Testing, Preventive and Corrective Maintenance		Task #	0371
Task Guidance	This task includes verification that the actuator/operator is functioning within specified parameters, after installation and prior to or during placing service. This includes the repair, replacement, alteration or refurbishment of the actuator/ operator and actions to keep the actuator/operator operating safely and efficiently.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Equipment malfunction 			

Insert and Remove Coupons/Probes for Internal Corrosion Monitoring		Task #	0131
Task Guidance	This task includes inserting and removing coupons/probes for internal corrosion monitoring and preventing contamination or damage of the coupons/probes		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Missing coupon 2. Damage to coupon holder 3. Gas leak 4. Internal Corrosion 			

Inside Gas Leak Investigation	Task #	1231
-------------------------------	--------	------

<p>Task Guidance</p>	<p>This task includes the investigation of reported or discovered leaks inside a building in relation to emergency response. This also includes initiation of precautionary actions (make safe). Repairing and proving the integrity of customer piping and lighting customer utilization equipment is not included.</p>
<p>Task Specific AOC's</p>	
<ol style="list-style-type: none"> 1. Gas leak 2. Gas concentrations 10% LEL or more 3. Gas related fire or explosion 4. Damaged distribution facilities 5. Material defects on distribution facilities 6. Equipment malfunction on distribution facilities 	

<p>Inspect and Maintain a Pipeline Heater</p>		<p>Task #</p>	<p>1671</p>
<p>Task Guidance</p>	<p>This task includes verification that the pipeline heater is functioning within specified parameters. This task also includes actions to keep the pipeline heater operating safely and efficiently. This task does not include inspecting, testing, and maintaining pressure-regulating and pressure-relief devices as addressed in:</p> <ol style="list-style-type: none"> 1. Task 0381, Inspect, Test, and Maintain Spring-Loaded, Pressure-Regulating Device. 2. Task 0411, Inspect, Test, and Maintain Spring-Loaded, Pressure-Limiting of Pressure-Relief Device. 		
<p>Task Specific AOC's</p>			
<ol style="list-style-type: none"> 1. Corrosion 2. Glycol Leakage 3. Inoperable Safety Equipment 4. Poor Burner Operation / Improper Temperature 5. Re-lighter Failure 			

Inspect and Monitor Galvanic Ground Beds/Anodes		Task #	0031
Task Guidance	This task includes inspecting and monitoring the electrical potential of galvanic ground beds/anodes		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Broken wire 2. Dry soil 3. Depleted anodes 			

Inspect or Test Cathodic Protection Bonds		Task #	0061
Task Guidance	This task includes inspecting the physical integrity and testing of cathodic protection bonds		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Broken bond 2. Damaged Components 3. Stray Current 			

Inspect or Test Cathodic Protection Electrical Isolation Devices		Task #	0071
Task Guidance	This task includes inspecting the physical integrity and testing electrical isolation devices.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Deteriorated isolation device 2. Device does not provide electrical isolation 3. Gas leak 			

Inspect Pipeline Surface Conditions - Patrol Right of Way or Easement		Task #	1311
Task Guidance	This task includes performing right-of-way or easement patrol (e.g., walking, flying or driving) to visually identify signs of leaks, encroachments, conditions of the right of way, or any other signs of potential impact to pipeline safety or integrity. This includes reporting an emergency condition.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Encroachments 2. Potential dangers to pipeline 3. Poor condition or access to right of way 4. Damage to facilities 5. Gas Leaks 			

Inspect Rectifier and Obtain Readings		Task #	0101
Task Guidance	This task includes inspecting the rectifier for damage and deterioration and obtaining readings as specified.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Equipment failure 2. Damage to Rectifier 3. Debris inside cabinet 4. AC Voltage detected on Rectifier case 			

Inspect, Test and Maintain Liquid Knockout (Dehydration) System		Task #	1681
Task Guidance	This task includes verification that the liquid knockout system is functioning within specified parameters after installation and prior to or during placement in service. This task also includes actions to keep the system operating safely and efficiently.		
Task Specific AOC's			

1. Improper dump valve level controller operation
2. Pressure relief valve relieving on vessel
3. Dump valve leaking by to liquid storage tank system

Inspect, Test and Maintain Glycol Dehydration System		Task #	1691
Task Guidance	This task includes verification that the glycol dehydration system is functioning within specified parameters after installation and prior to or during placement in service. This task also includes the repair or replacement, alteration, or refurbishment of the dehydration system and actions to keep the system operating safely and efficiently.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Glycol Pump failure 2. Leaks anywhere on the system 3. High or low glycol temperature in the re-boiler section of the regenerator unit 			

Inspect, Test and Maintain Mole Sieve Dehydration System		Task #	1701
Task Guidance	This task includes verification that the mole sieve (dry-bed) dehydration system is functioning within specified parameters after installation and prior to or during placement in service. This task also includes the repair or replacement, alteration, or refurbishment of the dehydration system and actions to keep the system operating safely and efficiently.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. High or low gas temperatures 2. Gas valve misalignment 3. No or low gas flow through the system on regeneration process 			

Inspect, Test and Maintain Programmable Logic Controllers		Task #	0231
--	--	---------------	-------------

Task Guidance	This task includes verification that the PLC is functioning within specified parameters, after a PLC has been installed, and prior to or during placing in service. This task also includes actions to repair or replace PLCs and components, and adjusting set points or output as specified.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. No power to unit 2. Incorrect Calibration 3. Loss of Communication 	

Inspect, Test and Maintain Sensing Devices		Task #	0221
Task Guidance	This task includes verification that the sensing device is functioning within in specified parameters, after a sensing device has been installed and prior to or during placing in service. This task also includes action to repair or replace sensing devices and adjust set points or output.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Incorrect calibration 2. Equipment malfunction 3. Power interruption 			

Inspect Water Crossing		Task #	1285
Task Guidance	This task includes using visual inspection by divers, and/or instrumented detection equipment (sonar, probing, etc.) to inspect underwater pipeline facilities and crossing conditions. This task does not include the items addressed in Task 1481, Diving: Perform Temporary Marking of Underwater Pipeline.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Missing or damage markers 2. Missing or outdated warning sticker on marker 			

3. Gas leak

Install and Maintain Pipeline Markers		Task #	1301
Task Guidance	This task includes determining the location, placing and maintaining permanent pipeline markers.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Missing or damage of markers 2. Missing or outdated warning sticker on marker 			

Install Cathodic Protection Electrical Isolation Devices		Task #	0081
Task Guidance	This task includes the installation of electrical isolation devices.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Device does not provide electrical isolation 2. Gas leak 			

Install Composite Sleeve		Task #	1061
Task Guidance	This task includes preparation and installation and of composite sleeves.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Improper surface preparation 2. Improper sleeve installation 3. Gas leak 			

Install Mechanical Clamps and Sleeves - Bolted		Task #	1041
---	--	---------------	-------------

Task Guidance	This task includes the preparation, installation and inspection of bolted mechanical clamps and sleeves.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Equipment malfunction 2. Gas leak 	

Install Tracer Wire		Task #	0941
Task Guidance	This task includes the installation of a tracer wire with plastic pipe including verification of continuity. Electrical connections are addressed in: ASME 0041 - Installation and Maintenance of Mechanical Electrical Connections; and ASME 0051 - Installation of Exothermic Electrical Connections.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damaged wire 2. Damaged wire insulation 3. Wire lacks electrical continuity 			

Installation and Maintenance of Casing Spacers, Vents and Seals		Task #	0971
Task Guidance	This task includes the installation of casing spacers, vents and seals. This task also includes the evaluation, repair or replacement, of casing vents and seals.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Pipe insulator failure 2. Blocked casing vent 3. Missing or incorrect signage 4. Gas leak 			

Installation and Maintenance of Mechanical Electrical Connections		Task #	0041
Task Guidance	This task includes making the mechanical connections and repair of tracer wire, test leads, bonds, shunts, etc.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damaged or broken wire 2. Loose connection 3. Corroded connectors 			

Installation of Customer Meters and Regulators - Residential and Small Commercial		Task #	1161
Task Guidance	This task includes locating, and hanging/setting the meter. Attaching a meter bracket does not require qualification as long as a qualified individual completes the installation in accordance with the steps in this task. Proving the integrity of customer piping and lighting customer utilization equipment is not included. The removal and replacement of a meter is a job made up of at least this task and ASME 1201 - Temporary Isolation of Service Lines and Service Discontinuance. As such, a covered task has not been identified for the removal and replacement of residential and small commercial meters and regulators.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Improper location 2. Damaged meter 3. Pressure variances 4. Regulator does not lock-up. 5. Improperly supported piping & components 6. Gas leak 			

Installation of Exothermic Electrical Connections		Task #	0051
--	--	---------------	-------------

Task Guidance	This task includes making exothermic (e.g., thermit, cadweld and pin-brazing) connections of tracer wire, test leads, bonds, shunts, etc.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Hazardous environment/ ignition source 2. Possible damage to pipe 3. Loose connection 4. Gas leak 	

Installation of Pipe Above Ground		Task #	0951
Task Guidance	This task includes the handling and installation of pipe above ground for Transmission, Main, Service and Hazardous Liquid Pipelines to prevent damage.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Improper pipe support 2. Gas leak 			

Installation of Plastic Pipe in a Bore		Task #	0911
Task Guidance	After boring is completed, this task includes the handling, pulling in and inspection of exposed pipe. The installation of a tracer wire is addressed in ASME 0941 - Install Tracer Wire.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Material defect 2. Damage to pipe 3. Improper burial depth 4. Damaged tracer wire 5. Stress on Pipe 			

Installation of Plastic Pipe in a Ditch		Task #	0901
Task Guidance	After excavation is completed, this task includes the handling, lowering in, and fitting of plastic pipe in a ditch to prevent damage and to assure firm support under and around pipe. The installation of a tracer wire is addressed in ASME 0941 - Install Tracer Wire. This task does not include material inspections as addressed in ASME 0641 - Visually Inspect Pipe and Components Prior to Installation.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Material defect 2. Damage to pipe 3. Improper burial depth 4. Stress on pipe 			

Installation of Plastic Pipe in Plowing/Planting		Task #	0931
Task Guidance	This task includes the handling, plowing/planting of plastic pipe, and inspection of exposed pipe. The installation of a tracer wire is addressed in ASME 0941 - Install Tracer Wire.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Material defect 2. Damage to pipe 3. Improper burial depth 4. Damaged tracer wire 5. Stress on pipe 			

Installation of Plastic Pipe in Plowing/Pull-In		Task #	0921
--	--	---------------	-------------

Task Guidance	This task includes the handling, plowing/pull-in of plastic pipe, and inspection of exposed pipe. The installation of a tracer wire is addressed in ASME 0941 - Install Tracer Wire.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Material defect 2. Damage to pipe 3. Improper burial depth 4. Damaged tracer wire 5. Stress on pipe 	

Installation of Steel Pipe in a Bore		Task #	0871
Task Guidance	After boring is completed, this task includes the handling, pulling in and inspection of exposed pipe and coating for Transmission, Main, Service and Hazardous Liquid Pipelines to prevent damage. This task does not include material inspections as addressed in ASME 0641 - Visually Inspect Pipe and Components Prior to Installation.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damage to pipe 2. Damage to coating 3. Improper burial depth 4. Stress on pipe 			

Installation of Steel Pipe in a Ditch		Task #	0861
Task Guidance	After excavation is completed, this task includes the handling, lowering in, and fitting of steel pipe to a ditch for Transmission, Main, Service and Hazardous Liquid Pipelines, to prevent damage and to assure firm support under and around pipe.		
Task Specific AOC's			

<ol style="list-style-type: none"> 1. Stress on pipe 2. Improper burial depth 3. Damage to pipe 4. Damage to coating
--

Installation of Steel Pipe Plowing/Pull-In		Task #	0881
Task Guidance	This task includes the handling, plowing/pull-in of steel pipe, and inspection of exposed pipe and coating for Transmission, Main, Service and Hazardous Liquid Pipelines to prevent damage. This task does not include material inspections as addressed in ASME 0641 - Visually Inspect Pipe and Components Prior to Installation.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damage to pipe 2. Damage to coating 3. Improper burial depth 4. Stress on pipe 			

Installing and Maintaining Customer Pressure Regulating, Limiting, and Relief Device - Large Commercial and Industrial		Task #	1181
Task Guidance	This task includes installing and maintaining pressure regulating, limiting, and relief device. It also includes locating vent and installation of vent piping.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Gas leak 2. Pressure variances 3. Regulator will not lock up 4. Lacks proper support 			

Installing Customer Meters - Large Commercial and Industrial		Task #	1171
Task Guidance	<p>This task includes locating, and hanging/setting the meter. Attaching a meter bracket/support does not require qualification as long as a qualified individual completes the installation in accordance with the steps in this task. Proving the integrity of customer piping and lighting customer utilization equipment is not included. The removal and replacement of a meter is a job made up of at least this task and ASME 1201 - Temporary Isolation of Service Lines and Service Discontinuance. As such a covered task has not been identified for the removal and replacement of large commercial and industrial meters and regulators.</p>		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Improper location 2. Damaged meter 3. Pressure variances 4. Regulator does not lock-up 5. Unsupported piping & components 6. Gas leak 			

Joining of Pipe - Flange Assembly		Task #	0731
Task Guidance	<p>This task includes the assembly of flanges, bolting in sequence and torque, as specified.</p>		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damaged pipe or components 2. Gas leak 3. Improper flange rating for pressure application 			

Joining of Pipe - Non-Bottom Out Compression Couplings		Task #	0691
---	--	---------------	-------------

Task Guidance	<p>This task includes the joining of pipe 2 in. (50 mm) and less, with nonbottom-out compression couplings and inspection of completed joints. A nonbottom-out compression coupling is one that requires tightening to a specified torque or number of turns.</p>
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Improper installation 2. Gas leak 	

Joining of Pipe - Threaded Joints		Task #	0721
Task Guidance	<p>This task includes the joining of threaded pipe with threaded fittings, and the inspection of completed joints. The joining of components with threaded connections is addressed in the component covered task.</p>		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damaged pipe or components 2. Gas leak 3. Improper Joint Compound 			

Joining of Plastic Pipe - Bottom Out Compression Coupling		Task #	0701
Task Guidance	<p>This task includes the joining of pipe 2 inch and less with bottom out compression couplings and inspection of completed joints. A bottom out compression coupling is one that is designed to prevent over tightening by contact (bottoming out) of the nut with a square shoulder or mating surface.</p>		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Improper installation 2. Gas leak 3. Not bottoming out 			

Joining of Plastic Pipe - Butt Heat Fusion: Hydraulic Machine		Task #	0761
Task Guidance	This task include the assembly and joining of plastic pipe by butt heat fusion using a hydraulic machine and inspection of completed joints.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Misaligned pipe 2. Unacceptable melt /joint 3. Contaminated pipe 			

Joining of Plastic Pipe - Butt Heat Fusion: Manual		Task #	0751
Task Guidance	This task includes the assembly and joining of plastic pipe by butt fusion and inspection of completed joints.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Pipe contaminated 2. Unacceptable melt / joint 3. Pipe misaligned 			

Joining of Plastic Pipe - Electrofusion		Task #	0781
Task Guidance	This task includes the assembly and joining of plastic pipe by electrofusion and inspection of completed joints.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Contaminated pipe or fitting 2. Not scrapped properly 3. Fitting not centered 			

<ol style="list-style-type: none"> 4. Error code on box 5. Equipment malfunction
--

Joining of Plastic Pipe - Stab Fittings		Task #	0681
Task Guidance	This task includes the joining and inspection of plastic pipe with stab fittings and inspection of completed joints.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Improper stab depth 2. Gas leak 			

Launching and or Receiving Internal Devices (Pigs) for Lines In-Service		Task #	1641
Task Guidance	This task consist of isolating pipeline barrels, relieving pressure, inserting or removing internal devices (pigs), pressurizing barrel, and launching/receiving internal devices (pigs).		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Improperly sized device (pig) 2. Exceeding MAOP 3. Improper valve sequence 4. Device (pig) signal failure 5. Stuck device (pig) 			

Launching and or Receiving Internal Devices (Pigs) with a Temporary Launcher or Receiver for Lines Out of Service		Task #	1631
Task Guidance	This task consist of inserting or removing internal devices (pigs) on pipeline systems not in service.		
Task Specific AOC's			

1. Improperly sized device (pig)
2. Exceeding MAOP
3. Improper valve sequence
4. Device (pig) signal failure
5. Stuck device (pig)

Leak Test at Operating Pressure		Task #	0591
Task Guidance	This task includes the detection of leaks at operating pressure with leak detection fluid.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Leak test failure/ Gas leak 2. Equipment malfunction 			

Locate Underground Pipelines		Task #	1291
Task Guidance	This task includes locating underground pipelines utilizing maps, records, and locating equipment. It also includes placing temporary markers or markings.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Equipment malfunction 2. Facilities difficult to locate 3. False signals 			

Maintain Rectifier		Task #	0111
Task Guidance	This task includes verification that the rectifier is functioning within specified parameters, after a rectifier has been hung and AC power connected, and prior to or during placing in service. This task		

	also includes actions to repair or replace in service rectifiers or components.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Equipment failure 2. Damage to Rectifier 3. Debris inside cabinet 4. AC Voltage detected on Rectifier case 	

Maintenance of Service Valves Upstream of Customer Meter		Task #	1191
Task Guidance	This task includes removing, replacing and maintaining service valves upstream of customer meter.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damaged component 2. Valve does not operate 3. Valve is not accessible (buried) 4. Gas leak 			

Manually Opening and Closing Valves		Task #	0301
Task Guidance	This task includes manually opening and closing valves, (e.g., pipeline start up and shutdown, flow direction, pigging, tank switching, etc.), at the valve site, either manually or using the valve actuator. It also includes valve identification, notifications and pressure verification.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Inoperable valve 2. Damage to facilities 3. Pressure deviation 			

<ol style="list-style-type: none"> 4. Gas leak 5. Interruption of service

Measure and Characterize Mechanical Damage on Installed Pipe and Components		Task #	0211
Task Guidance	This task includes activities to measure and characterize mechanical damage (e.g., dents, gouges, cracks) on installed pipe and components, including investigation to determine the extent of damage and recording data.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damaged coating 2. Damage to pipe or component 3. Gas leak 4. Interruption of service 5. Pressure variances 			

Measure Atmospheric Corrosion		Task #	0191
Task Guidance	This task includes activities to measure and characterize atmospheric corrosion, including investigation to determine the extent of corrosion and recording data.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Pit depth exceeds limits 2. Gas leak 			

Measure External Corrosion		Task #	0171
Task Guidance	This task includes activities to measure and characterize external corrosion, including investigation to determine the extent of corrosion and recording data.		

Task Specific AOC's	
<ol style="list-style-type: none"> 1. Pit depth exceeds limits 2. Gas leak 	

Measure Internal Corrosion		Task #	0181
Task Guidance	This task includes activities to measure and characterize internal corrosion, including investigation to determine the extent of corrosion and recording data.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Foreign substance in pipe 2. Pit depth exceeds limits 3. Gas leak 			

Measure Soil Resistivity		Task #	0021
Task Guidance	This task includes using measurement equipment to measure soil resistivity and recording data		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Poor soil conditions 2. Buried metallic structures in the area 3. Incorrect resistivity calculations 4. Defective equipment 5. Inaccurate locates 			

Measure Structure-to-Electrolyte Potential		Task #	0001
---	--	---------------	-------------

Task Guidance	This task includes using measurement equipment to take a reading of the potential between the structure (pipe, tanks, etc.) being tested and the soil and recording data.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. AC Voltage on Structure 2. Deficient P/S reading 3. Unfavorable soil surface conditions 4. Damaged test station 	

Mobile Gas Leakage Survey: Flame Ionization		Task #	1271
Task Guidance	This task includes conducting a mobile (other than walking) gas leakage survey utilizing leak-detection survey equipment (e.g., flame ionization, optical methane, and laser), documentation, and reporting a condition.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Gas Leak 2. Equipment malfunction 3. Damaged facilities 4. Unfavorable weather conditions 			

Mobile Gas Leakage Survey: Laser Spectroscopy		Task #	A004
Task Guidance	This task includes conducting a mobile (other than walking) gas leak survey utilizing Laser Spectroscopy (Advanced Mobile Leak Detection) survey equipment, documentation and reporting an emergency condition.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Gas Leak 2. Equipment malfunction 			

- 3. Unfavorable weather conditions
- 4. Damaged Facilities

Mobile Gas Leakage Survey - Optical Methane		Task #	1281
Task Guidance	This task includes conducting a mobile (other than walking) gas leak survey utilizing optical methane detection survey equipment, documentation and reporting an emergency condition.		
Task Specific AOC's			
<ul style="list-style-type: none"> 1. Gas Leak 2. Equipment malfunction 3. Unfavorable weather conditions. 4. Damaged Facilities 			

NDT - Liquid Penetrate Testing		Task #	0611
Task Guidance	This task includes liquid dye penetrate testing and evaluation of test results.		
Task Specific AOC's			
<ul style="list-style-type: none"> 1. Pipe or component contamination 2. Deterioration or material defect 			

NDT - Magnetic Particle Testing		Task #	0621
Task Guidance	This task includes magnetic particle testing and evaluation of test results.		
Task Specific AOC's			
<ul style="list-style-type: none"> 1. Pipe or component contamination 			

2. Deterioration or material defect

NDT Radiographic Testing		Task #	0601
Task Guidance	This task includes radiographic testing and evaluation of testing results.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Pipe or component contamination 2. Deterioration or material defect 			

NDT - Ultrasonic Testing		Task #	0631
Task Guidance	This task includes ultrasonic testing and evaluation of test results. This task excludes wall thickness determination with a UT wall thickness device.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Pipe or component contamination 2. Deterioration or material defect 			

Odorization - Odorizer Inspection, Testing, Preventive and Corrective Maintenance		Task #	1221
Task Guidance	This task includes verification that the odorizer is functioning within specified parameters after installation or replacement and prior to or during placing in service. This task includes the repair, replacement, alteration or refurbishment of the odorizer and actions to keep the odorizer operating safely and efficiently.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Over or Under Odorization 2. Gas leak 			

<ol style="list-style-type: none"> 3. Equipment malfunction 4. Odorant leak / spill

Odorization - Periodic Sampling		Task #	1211
Task Guidance	This task includes the periodic sampling of gas to verify concentration of odorant by use of instrumentation or verification of presence of odor by sniff test.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Odorization level too low 2. Gas leak 3. Equipment malfunction 			

Operate Gas Pipeline – System Control Center Operations		Task #	1371
Task Guidance	This task includes the remote control operations of a gas pipeline (e.g., monitor operating parameters, notifications, remotely adjusting and maintaining pressure, remotely starting and stopping compressors, etc.)..		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Overpressure situation 2. Under pressure situation 			

Operate Gas Pipeline - Local Facility Remote-Control Operations		Task #	1381
Task Guidance	This task includes the local facility remote control operations of a gas pipeline (e.g., monitor operating parameters, notifications, remotely adjusting and maintaining pressure, remotely starting and stopping compressors, etc.).		
Task Specific AOC's			

1. Overpressure situation
2. Under pressure situation

Outside Gas Leak Investigation		Task #	1241
Task Guidance	This task includes the investigation of reported or discovered outside leaks of the operators' lines. Task also includes initiation of precautionary actions (make safe).		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Gas related fire or explosion 2. Blowing gas 3. Hazardous Environment 4. Damaged components 5. Material defect 6. Equipment malfunction 			

Perform Electrical inspection of Pipe Coating (Holiday Detection or Jeeping)		Task #	1020
Task Guidance	This task includes the electrical inspection of pipe coating (i.e., holiday detection, jeeping)		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Equipment malfunction 2. Holiday in coating 			

Pilot Operated Pressure Regulating Device - Inspection and Testing, Preventative and Corrective Maintenance		Task #	0391
Task Guidance	This task includes verification that the pressure-regulating device is functioning within specified parameters after installation and prior to or during placing in service. This includes repair or replacement, alteration or refurbishment of the pressure-regulating de-		

	vice and actions to keep the pressure-regulating device operating safely and efficiently.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Pressure Above or Below expected value 2. Pressure exceeding MAOP 3. Failure to lock up 4. Gas leak 	

Pilot-Operated Pressure Limiting and Relief Device - Inspection and Testing, Preventative and Corrective Maintenance		Task #	0421
Task Guidance	This task includes verification that the pressure limiting or relief device is functioning within specified parameters, after installation, and prior to or during placing in service. This task also includes the repair or replacement, alteration or refurbishment of pressure limiting or relief device, and actions to keep the pressure limiting or relief device operating safely and efficiently.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Pressure Above or Below expected value 2. Pressure Exceeding MAOP 3. Failure to reseal 4. Gas leak 			

Pneumatic Actuator/Operator Inspection and Testing, Preventative and Corrective Maintenance		Task #	0351
Task Guidance	This task includes verification that the actuator/operator is functioning within specified parameters, after installation, and prior to or during placing in service. This task also includes the repair, replacement, alteration or refurbishment of actuator/operator, and actions to keep actuator/operator operating safely and efficiently.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Equipment malfunction 			

2. Gas Leak

Pneumatic Loaded Pressure Limiting and Relief Device - Inspection and Testing, Preventative and Corrective Maintenance		Task #	0431
Task Guidance	This task includes verification that the pressure limiting or relief device is functioning within specified parameters, after installation, and prior to or during placing in service. This task also includes the repair or replacement, alteration or refurbishment of pressure limiting or relief device, and actions to keep the pressure limiting or relief device operating safely and efficiently. (Pressure or Flow Controllers)		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Pressure Above or Below expected value 2. Pressure exceeding MAOP 3. Gas leak 			

Pressure Test - Liquid Medium		Task #	0581
Task Guidance	This task includes achieving test pressure and durations, and record keeping.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Pressure test failure 2. Equipment failure 3. Excessive water left in pipe 			

Pressure Test - Non-liquid Medium - MAOP Greater Than or Equal to 100 Psi		Task #	0571
Task Guidance	This task includes achieving test pressure and durations, and record keeping.		

Task Specific AOC's	
<ol style="list-style-type: none"> 1. Pressure test failure 2. Equipment failure 	

Pressure Test - Non-liquid Medium - MAOP Less Than 100 Psi		Task #	0561
Task Guidance	This task includes achieving test pressure and durations, and record keeping.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Pressure test failure 2. Equipment failure 			

Provide or Assure Adequate Pipeline Support During Operator Initiated Excavation Activities		Task #	1341
Task Guidance	This task includes the actions necessary to provide or assure adequate pipeline support during excavation activities (e.g., installing bridging, bracing, etc.).		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damage to pipeline 2. Pipeline not properly supported 3. Gas leak 			

Purge- Flammable or Inert Gas		Task #	1651
Task Guidance	This task includes actions to be taken to safely purge pipeline facilities using natural gas, inert gas or air.		
Task Specific AOC's			

1. Hazardous gas/air mixture
2. Isolated sections not purged
3. Gas Ignition
4. Unplanned loss of service

Reciprocating Compressor Inspection, Testing and Corrective Maintenance		Task #	0471
Task Guidance	This task includes verification that a new, replaced, or rebuilt compressor is functioning within specified parameters, prior to or during placing in service. This task includes the repair, alteration or refurbishment of compressors. This task does not include maintenance of the compressor driver.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Equipment malfunction 2. Gas leak 			

Repair of Steel Pipe by Grinding		Task #	1071
Task Guidance	This task includes the verification of minimal wall thickness requirements and removal of defects by grinding.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Excessive removal of wall. 2. Too aggressive of sanding pad on buffing wheel. 3. Inadequate grinding/buff. 			

Rotary Compressor Inspection, Testing and Corrective Maintenance		Task #	0491
Task Guidance	This task includes verification that a new, replaced, or rebuilt compressor is functioning within specified parameters, prior to or during placing in service. This task includes the repair, alteration or		

UNCONTROLLED IF PRINTED

	refurbishment of compressors. This task does not include maintenance of the compressor driver.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Equipment malfunction 2. Gas leak 	

Service Reconnect		Task #	A001
Task Guidance	This task includes reinstatement of gas service to customer equipment. This task may include inspection and relighting customer equipment.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Gas leak 2. Damage to components 3. Codes/hazards with customer facilities 4. Faulty equipment 5. Failed appliance safety 6. Meter does not register flow 			

Spring Loaded Pressure Regulating Device - Inspection and Testing, Preventive and Corrective Maintenance		Task #	0381
Task Guidance	This task includes verification that the pressure regulating device is functioning within specified parameters, after installation, and prior to or during placing in service. This task also includes the repair or replacement, alteration or refurbishment of pressure regulating device, and actions to keep the pressure regulating device operating safely and efficiently.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Regulator does not lock up 2. Pressure deviation 			

- | |
|---|
| <ol style="list-style-type: none"> 3. Missing vent screen / adjustment cap 4. Vent improperly oriented 5. Gas leak |
|---|

Spring-Loaded Pressure Limiting and Relief Device - Inspection, Testing, Preventive and Corrective Maintenance		Task #	0411
Task Guidance	This task includes verification that the pressure limiting or relief device is functioning within specified parameters, after installation, and prior to or during placing in service. This task also includes the repair or replacement, alteration or refurbishment of pressure limiting or relief device, and actions to keep the pressure limiting or relief device operating safely and efficiently.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Relief valve will not open 2. Relief valve will not reseal 3. Over-pressurization 4. Gas leak 			

Squeeze Off Plastic Pipe		Task #	1141
Task Guidance	This task includes the squeeze off of plastic pipe. This also includes the selection, installation and removal of squeeze off tools and monitoring pressure to assure system pressure requirements are maintained.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damage to pipeline 2. Exceeding squeeze down and release rates. 3. Loss of system pressure 4. Gas leak 			

Squeeze Off Steel Pipe		Task #	1151
Task Guidance	This task includes the squeeze off of steel pipe. This also includes the selection, installation and removal of squeeze off tools and monitoring pressure to assure system pressure requirements are maintained.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Loss of system pressure 2. Gas leak 			

Station Emergency Shutdown (ESD) system - Inspection, Testing and Corrective Maintenance		Task #	1361
Task Guidance	<p>This task includes verification that the station emergency shutdown system is functioning within specified parameters after installation and prior to or during placing in service</p> <p>This task also includes the repair or replacement, alteration, or refurbishment of the station emergency shutdown system and actions to verify operation and maintain the station emergency shutdown system.</p>		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Inoperable valves 2. Hazardous environment 3. Pressure deviation 4. Wrong sequence of valves to shut down 			

Stopper (Stopp) Pipe		Task #	1131
Task Guidance	This task includes the insertion and removal of a stopper (stopple). It also includes pressure verification and monitoring pressure to assure system pressure requirements are maintained.		
Task Specific AOC's			

1. Equipment failure
2. Interruption of service
3. Inadequate stop-off
4. Gas leak

Tapping a Pipeline (Tap Diameter 2 Inch or Less)		Task #	1081
Task Guidance	This task includes performing tapping including the installation of the isolation valve and tapping equipment, and removal of isolation valve, as specified. Installation of fittings is addressed in: ASME 0801 - Welding; and ASME 1041 - Install Mechanical Clamps and Sleeves - Bolted.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damage to pipeline 2. Equipment malfunction 3. Release of kinetic energy 4. Interruption of Service 5. Gas leak 			

Tapping a Pipeline (Tap Diameter Greater Than 2 Inch)		Task #	1091
Task Guidance	This task includes performing tapping including the installation of the isolation valve and tapping equipment, and removal of isolation valve, as specified. Installation of fittings is addressed in: ASME 0801 - Welding; and ASME 1041 - Install Mechanical Clamps and Sleeves - Bolted.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damage to pipeline 2. Equipment malfunction 3. Release of kinetic energy 4. Interruption of Service 			

5. Gas leak

Tapping a Pipeline With a Built-In Cutter		Task #	1101
Task Guidance	This task includes tapping a pipe with an installed fitting that contains a built-in cutter. Installation of fittings is addressed in: ASME 0771 - Joining of Plastic Pipe - Sidewall Heat Fusion; ASME 0781 - Joining of Plastic Pipe - Electrofusion; ASME 0801 Welding; and ASME 1041 - Install Mechanical Clamps and Sleeves - Bolted.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Material defect 2. Equipment malfunction 3. Damage to pipeline 4. Gas leak 			

Temporary Isolation of Service Lines and Service Discontin- ance		Task #	1201
Task Guidance	This task includes closing and locking service valves upstream of the customer meter or installation of a mechanical device or fitting to prevent the flow of gas.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Damaged components 2. Gas leak 			

Troubleshoot in-Service Cathodic Protection System		Task #	0091
Task Guidance	This task applies to operational Cathodic Protection Systems and includes activities to determine why the CP system and components are not functioning and the identification of corrective action.		

Task Specific AOC's
<ol style="list-style-type: none"> 1. Damaged or defective components 2. Corrosion 3. Short on system 4. Stray current 5. Gas leak

Tubing and Fitting Installation - Instrument, Control, and Sampling		Task #	0821
Task Guidance	This task includes the preparation, bending, joining, and installation of instrument, control and sampling line tubing and fittings containing product.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Improper Connection 2. Gas Leak 3. Non-compatible Material 			

Valve - Preventive Maintenance		Task #	0341
Task Guidance	This task encompasses actions (e.g., lubrication, winterization, packing adjustment, etc.) to keep valves operating safely and efficiently.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Inoperable valve 2. Grease will not penetrate valve 3. Damage to facilities 4. Gas leak 			

Valve - Visual Inspection and Partial Operation		Task #	0331
Task Guidance	This task includes visual inspection, partial operation (function test), and lubrication of valves.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Inoperable valve 2. Damaged valve 3. Gas leak 4. Pressure deviation 5. Customer loss 			

Valve Corrective Maintenance		Task #	0321
Task Guidance	This task includes the repair, replacement, alteration or refurbishment of valves.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Grease will not penetrate valve 2. Inoperable valve 3. Damaged valve 4. Pressure deviation 5. Gas leak 			

Vault Inspection and Maintenance		Task #	1351
Task Guidance	This task applies to the inspection and maintenance of vaults housing pressure regulating and pressure limiting equipment, having a volumetric internal content of 200 cubic feet or more. It includes inspection of ventilating equipment, vault cover, sufficient drainage and structural integrity. Investigation to identify product leakage is addressed in: ASME 1231 - Inside Gas Leak Investiga-		

	tion; ASME 1241 - Outside Gas Leak Investigation; and ASME 1251 - Hazardous Liquid Leak Investigation.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Gas leak 2. Structural deterioration of vault 3. Ventilating system not working 4. Insufficient drainage 	

Visual Inspection for Atmospheric Corrosion		Task #	0141
Task Guidance	This task includes the inspection of pipe and pipeline components exposed to the atmosphere for the purpose of detecting atmospheric corrosion.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Defective coating 2. Atmospheric corrosion 3. Damage to components 4. Gas leak 			

Visual Inspection for Internal Corrosion		Task #	0161
Task Guidance	This task includes the inspection of the internal surface of pipe and pipeline components, including tapping coupons, when exposed for the purpose of detecting internal corrosion.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Internal corrosion 2. Foreign substance in pipe 3. Gas Leak 			

Visual Inspection of Buried Pipe and Components When Exposed		Task #	0151
Task Guidance	This task includes the inspection of buried pipe and pipeline components when exposed for the purpose of detecting external corrosion and evaluating coating integrity.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Unsatisfactory coating 2. Corrosion on pipe 3. Damaged components 4. Gas leak 			

Visual Inspection of Installed Pipe and Components for Mechanical Damage		Task #	0201
Task Guidance	This task includes activities associated with the inspection of installed pipe and components for the purpose of detecting mechanical damage (e.g., dents, gouges, cracks).		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Unsatisfactory coating 2. Damage to pipe or components 3. Gas leak 4. Fire or Explosion 5. Pressure Variances 6. Interruption of service 			

Visual Inspection of Welding and Welds		Task #	0811
Task Guidance	This task includes inspection of the welding process (e.g., equipment set up, material fit-up/alignment, handling of welding materials) inspection of welds to identify visually detectable defects. This task should be performed by a person qualified in accordance with API 1104 or other acceptable standard or practice.		
Task Specific AOC's			

<ol style="list-style-type: none"> 1. Arc strikes 2. Unacceptable weld profile 3. Improper Welding Procedure Specification

Visually Inspect Pipe and Components Prior to Installation		Task #	0641
Task Guidance	This task includes the visual examination of pipe and pipeline components, prior to installation, to identify visually determinable damage and defects.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Mechanical damage 2. Material defects 3. Unacceptable Coating 			

Walking Gas Leakage Survey		Task #	1261
Task Guidance	This task includes conducting a walking gas leak survey utilizing gas detection survey equipment, documentation, and reporting an emergency condition.		
Task Specific AOC's			
<ol style="list-style-type: none"> 1. Gas leak 2. Corrosion 3. Damage to facilities 4. Improper Installation 5. Equipment malfunction 			

Welding	Task #	0801
----------------	---------------	-------------

Task Guidance	This task includes the assembly and joining of steel pipelines by welding, and repair of welds, in accordance with welding procedures. This task should be performed by a person qualified in accordance with API 1104 or other acceptable standard or practice.
Task Specific AOC's	
<ol style="list-style-type: none"> 1. Excessive cap height or insufficient fill to form a cap. 2. Unacceptable weld profile. 3. Improper Welding Procedure Specification 	

End of Instructions.

1.0 Purpose

This document provides general information and contact information that is to be used where oily liquid hydrocarbons are present or suspected to be present in Ameren Illinois (AIC) pipeline facilities, gas storage field facilities or customer owned facilities.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General Information](#)

[5.0 Contact Information](#)

[6.0 Testing](#)

[7.0 Disposal](#)

3.0 Target Audience

- Gas Supervisor
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisor
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisor
- Gas Storage Field Personnel
- Gas Meter Shop Personnel
- IL Safety Supervisor
- Manager Environmental Support & Waste Management

4.0 General Information

- 4.1 Oily liquid hydrocarbons shall be treated as containing more than 49 ppm Polychlorinated Biphenyls (PCBs) until proven otherwise through testing or system knowledge.
- 4.2 PCB sampling equipment is the same as that used by the Electric Department and is available through local Operating Center storerooms or the MDF.
- 4.3 Sample of the oily liquid hydrocarbon should be sent to the Ameren Laboratory Services, 1530 Singleton St., St Louis, MO 63103, phone number 314-554-4257.
- 4.4 PCBs do not readily evaporate so airborne levels are expected to be low so respiratory protection is usually not required.
- 4.5 Prior to performing any inspection or work on gas facilities or meters which contain, or expected to contain, oily liquid hydrocarbons that could be contaminated with PCBs, personnel should be familiar with the information in the **PCB section of the** Ameren Illinois (AIC) Safety Manual.
- 4.6 Primary potential route of exposure is through contact with the skin so the appropriate PPE, rubber or nitrile gloves and coveralls should be worn as necessary.
 - 4.6.1 Wash hands after working with the facilities and before eating or drinking.
 - 4.6.2 Clean tools and equipment after the work

- 4.7 Normal work clothing and PPE can be worn when working with gas equipment or facilities where liquids are totally enclosed and not subject to spillage.
- 4.8 **Personal** Protective Equipment (PPE) can be found through: Co-Worker Connect, Business Segments/Ameren Illinois/IL Safety/PPE & Safety Equipment/PCB Equipment/Pigging and PCB PPE.
- 4.9 A designated Staging area at the Operating Center should be established where collect items can be inspected for **potential** sampling and for disposal **of collected equipment**.

5.0 Contact Information

- 5.1 Gas field personnel, Gas Tech Services (GTS) personnel or gas storage field personnel shall immediately notify their supervisor when:
 - 5.1.1 Oily liquid hydrocarbons could be found in:
 1. AIC gas transmission or distribution mains or service lines.
 2. AIC regulator stations and valve stations
 3. Gas storage field piping and equipmentOr
 4. Customer piping,
 5. Customer gas appliance controls.
- 5.2 Gas Supervisor, GTS Supervisor or Gas Storage Supervisor shall immediately contact their Supervisor who will make the following personnel aware of the situation:
 - 5.2.1 Operations Management,
 - 5.2.2 AIC Safety Supervisor,
 - 5.2.3 Ameren Environmental Support and Waste Management personnel.
 1. Contact information can be found at <https://ameren.sharepoint.com/sites/Environmental/Waste>
- 5.3 Ameren Environmental Support and Waste Management personnel will provide guidance on:
 - 5.3.1 Sampling procedures.
 - 5.3.2 Cleanup procedures.
 - 5.3.3 Necessary PPE.
 - 5.3.4 Need for further inspection.
 - 5.3.5 Disposal process

6.0 Testing

- 6.1 Ameren Laboratory Services will provide information on how samples should be prepared and shipped to the lab for analysis.

Ameren Laboratory Services, 1530 Singleton St., St Louis, MO 63103. Phone number is 314-554-4257

- 6.2 Samples of oily liquid shall be shipped to Ameren Laboratory Services
- 6.3 The Sampling Inspection Form should accompany the samples.
- 6.4 Ameren Laboratory Services will send back the final analysis:
 - 6.4.1 If analysis shows less than 50 ppm, the liquid is considered a Non-PCB waste.
- 6.5 Facilities where test results indicate the oily liquid is PCB contaminated, 50 ppm or greater, Environmental Support and Waste Management may specify additional inspection **requirements**.

7.0 Disposal

- 7.1 The laboratory test analysis will determine the appropriate disposal process.
- 7.2 If the analysis shows 50 ppm or greater, the liquid is PCB contaminated and shall be handled as a PCB **regulated** waste.

Environmental Support and Waste Management shall be notified. They will make the arrangements for pickup and proper disposal of PCB liquid.

- 7.2.1 The PCB contaminated liquid shall be placed in a steel drum and labeled Caution PCB. Liquid would need to be drained from the equipment and placed in drums.
- 7.2.2 The equipment that contained the PCBs shall be placed in plastic bags and label PCB Contaminated Waste. Place bags in drums if possible, otherwise double bag and label.

Gas Meter Shop shall be notified that the gas meter contained PCB's and is scheduled for disposal.

- 7.2.3 The drum label must indicate:
 - 1. Item that oil came from. i.e. gas meter, gas pipeline, gas regulator
 - 2. Location where item was located.
 - 3. Date item was removed.
 - 4. Estimated weight of the oil in lbs.
- 7.2.4 Drums and bags to be disposed shall be stored in a specified location awaiting pickup.

7.3 If the analysis shows less than 50 ppm the liquid is **considered** non-PCB and **the associated waste may be** handled as a **non-hazardous** waste material.

7.3.1 The collected liquids, materials, equipment, disposable PPE and cleanup material should be bagged and placed into drums, if possible.

7.3.2 Drums/bags should be labeled Waste Material.

7.3.3 Drums/bags shall be stored in a specified location awaiting pickup.

7.3.4 Gas meters shall be drained of liquids and returned to the Gas Meter shop in the normal manner.

End of Instructions.

Document Rescission

PCBH 1 PCB Handling: Requirements, May 15, 2022

Revision Notes

Location of Changes	Summary of Changes
Subsection 4.5	PCB section of Ameren Illinois (AIC) Safety Manual replaced Ameren Illinois (AIC Safety Manual, Section 19.2.
Subsection 4.8	Grammatical correction – "personal" replaced "personnel"
Subsection 4.9	Inserted "potential" – inspected for potential sampling. Added of "collected equipment" – disposal of collected equipment.
Subsection 6.5	"requirements" replaced "is needed" – specify additional requirements.
Subsection 7.2	"regulated" replaced "hazards" – PCB regulated waste.

UNCONTROLLED IF PRINTED

Subsection 7.3	Revised – If the analysis shows less than 50 ppm the liquid is considered non-PCB and the associated waste may be handled as a non-hazardous waste material.
Paragraph 7.3.2	Spelling correction – "labeled" replaces "label"

PCBH 2.0 Sampling Liquid from Gas Piping Systems

1.0 Purpose

This document provide methods for sampling oily liquid hydrocarbons that are present in gas meters or gas piping systems including those in gas storage field., including items such as; regulators, valves or pig launchers/receivers.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General Information](#)

[5.0 Equipment](#)

[6.0 Sampling Liquids in Pipeline Facilities](#)

[7.0 Sampling Liquids Contained in Equipment](#)

[8.0 Testing](#)

3.0 Target Audience

- Gas Supervisor
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisor
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisor
- Gas Storage Field Personnel
- Gas Meter Shop Personnel
- Manager Environmental Support & Waste Management

4.0 General Information

4.1 Oily liquid hydrocarbons may accumulate at:

- 4.1.1 Low points in the gas transmission or distribution system,
- 4.1.2 Gas meters,
- 4.1.3 Gas regulator station equipment,
- 4.1.4 Gas storage field piping systems,
- 4.1.5 Gas storage field facilities,
- 4.1.6 Customer piping or appliance controls

If possible, gas flow should be shut-off prior to accessing the facility for sampling.

4.2 Sampling procedures assumes the oily liquid hydrocarbon contains more than 49 ppm of PCBs.

- 4.3 Surfaces around the sampling location shall be protected from contamination due to spillage.

5.0 Equipment

- 5.1 The following equipment will need to be available when sampling:
 - 5.1.1 Inspection Form – See [PCBH 3](#).
 - 5.1.2 PPE – Safety glasses, disposable nitrile or latex gloves (one pair per sample).
 - 5.1.3 40 ml volatile organic analysis vial with Teflon (TFE) lined 1 ml caps.
 - 5.1.4 Disposable 10 ml pipettes and bulbs.
 - 5.1.5 Secondary sample container bags and labels.
 - 5.1.6 Disposable adsorbent pads, plastic sheeting or paper towels.
 - 5.1.7 Plastic disposable bags.
 - 5.1.8 Camera

6.0 Sampling Liquids in Pipeline Facilities

- 6.1 Prior to beginning sampling, inspect the area around or beneath the pipe, if there is evidence of spillage of an oily liquid, the Supervisor shall call Ameren Spill Hot Line 314-554-2683 to report evidence of a potential release of oily liquids.
- 6.2 Record appropriate information and observations about sample location on the Inspection Form. See [PCBH 3](#).
- 6.3 Photo document the sample area.
- 6.4 Put on PPE, nitrile or latex gloves, safety glasses and long sleeve shirt in addition to routine PPE.
- 6.5 Place plastic sheeting under pipeline at the sampling location if there is a possibility spillage.
- 6.6 Place absorbent pads on the sheeting.
- 6.7 Slowly open access point to determine if oily liquid hydrocarbon is present.
- 6.8 If pipeline is pressurized:
 - 6.8.1 Collect 25 to 20 ml of the oily liquid into container.
 - 6.8.2 Clean plastic container may be used to collect the sample.
 - 6.8.3 Transfer the collect liquid to the 40 ml vial.
- 6.9 If sampling a drip leg:
 - 6.9.1 Use pipette to collect sample the oily liquid that accumulates in base of cap.
 - 6.9.2 Empty pipette into 40 ml vial.
- 6.10 Label the oily liquid samples and complete Inspection Form.

NOTE:	Supervisor shall notify Ameren Environmental Support and Waste Management if an oily liquid is found or there is evi-
--------------	---

UNCONTROLLED IF PRINTED

dence of an oily liquid. Refer to **PCBH 1 Paragraph 5.2.3** for contact information.

- 6.11 Store samples out of direct sunlight, cool to 40 degrees F.
- 6.12 Wipe up spills from the sample area or fold up the plastic sheeting ensure no liquid escapes.
- 6.13 Place the removed contaminated equipment, piping and material in separate plastic bags for further inspection and possible sampling.
- 6.14 Ensure bags are securely sealed.
- 6.15 Place disposable PPE and cleanup materials in a plastic bag.
- 6.16 Place and secure bags and drums in the cargo area of a Company truck for delivery to the designated Staging area for the Operating Center.
- 6.17 Bags should be placed in drums if possible.
- 6.18 Label the drums or bags for off-site disposal.
- 6.19 Store drums at in a designated Staging area until lab results are received.

7.0 Sampling Liquids Contained in Equipment

- 7.1 When the presence of liquids in a gas meter, regulators or other equipment is recognized the following steps should be taken.
 - 7.1.1 Put on PPE, nitrile or latex gloves, safety glasses and long sleeve shirt in addition to routine PPE.
 - 7.1.2 Area under and around the equipment shall be checked for evidence of pre-existing spill.
 1. Look for visible signs of a spill.
AND
 2. Smell for the presence of mercaptan.
 3. Immediately

Gas Supervisor shall call Ameren Spill Hot Line 314-554-2683 to report evidence of a release of oily liquids.

- 3 a. Collect soil samples from beneath the meter and the disconnect points.
- 3 b. If hard surface is beneath the meter set a wipe sample may need to be taken for analysis. Refer to **PCBH 2.4 Section 5.0** Wipe Sampling

UNCONTROLLED IF PRINTED

- 7.1.3 Prior to removing the meter or equipment protect the area against any potential spill by:
 - 1. Installing plastic sheeting beneath the meter set or equipment.
 - 2. Taping plastic sheeting on the adjacent wall of the structure.
 - 3. Placing absorbent pads on the sheeting beneath the meter or equipment.
 - 4. Having plastic lined containers available to collect any oily liquids.
- 7.1.4 Shut-off gas flow to the meter or equipment
- 7.1.5 Disconnect meter or equipment from piping.
- 7.1.6 If possible, verify the presence of liquids without tipping the meter or equipment to remove liquids.
- 7.1.7 Cap, plug or seal the inlet and outlet of the meter or equipment.
- 7.1.8 Place the meter or equipment in a plastic bag.
- 7.1.9 A sample of liquid can be obtained at this point or at the Staging Area.
- 7.1.10 Check the connecting piping for evidence of an oily liquid hydrocarbon.

Gas Supervisor shall notify Ameren Environmental Support and Waste Management if an oily liquid is found or there is evidence of an oily liquid. Refer to [PCBH 1 Paragraph 5.2.3](#) for contact information.

- 7.1.11 Pipe, regulator or valve that have evidence of an oily liquids hydrocarbon shall be removed and placed in plastic bags for possible testing at the Staging Area.
- 7.2 Complete a Gas Meter Removal order in OAS/EDGE
- 7.3 Place disposable PPE and cleanup materials a plastic bag
- 7.4 Place and secure bags and drums in the cargo area of a Company truck for delivery to the designated Staging area for the Operating Center
- 7.5 Bags should be placed in drums if possible
- 7.6 Label the drums or bags for off-site disposal
- 7.7 Store drums in a designated Staging area at the Operating Center until lab results are received.

8.0 Testing

- 8.1 Refer to [PCBH 1 Section 6.0](#) Testing

Revision Notes

Location of Changes	Summary of Changes
Entire Document	Reformatted

1.0 Purpose

This document provides the instructions on what actions are to be taken based on the laboratory results of the oily liquid samples.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General Information](#)

[5.0 Positive PCB Detection](#)

[6.0 Non-PCB Detection](#)

[7.0 Inspection of Customer's Facilities](#)

3.0 Target Audience

- Gas Supervisor
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisor
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisor
- Gas Storage Field Personnel
- Gas Meter Shop Personnel
- Manager Environmental Support & Waste Management

4.0 General Information

- 4.1 Laboratory results of 50 ppm or higher is the positive indication the oily liquids contain PCBs and are to be considered a PCB contaminated material.
- 4.2 Laboratory results of less than 50 ppm, the oily liquids is considered to be non-PCB.

5.0 Positive PCB Detection

- 5.1 Ameren Environmental Support and Waste Management shall be immediately notified that PCBs have been positively detected by a laboratory analysis.
- 5.2 Operations Management shall be notified that PCBs has been positively detected.
- 5.3 The Supervisor, (Gas, Gas Tech Services or Storage Field), shall provide the following information:
 - 5.3.1 Copy of the laboratory report.
 - 5.3.2 Gas facility sampled.
 - 5.3.3 Location of gas facility sampled.
 - 5.3.4 Additional facilities that could be affected.
 - 5.3.5 Potential impact on customer facilities.

- 5.3.6 Any indication of spillage on unprotected surfaces.
 - 5.3.7 Actions taken if there was indication of spillage.
 - 5.3.8 Was indication of spillage reported to the Spill Hot Line [PCBH 2.0 Subsection 6.1](#).
- 5.4 Ameren Environmental Support and Waste Management will determine:
- 5.4.1 If additional sampling is needed.
 - 5.4.2 What additional inspections should be performed?
 - 5.4.3 What actions should be taken by Operations personnel?
 - 5.4.4 What actions should be taken by Environment Contractor?
- 5.5 If spillage on unprotected surfaces was indicated, Ameren Environmental Support and Waste Management will evaluate and provide the spill response procedures.
- 5.6 The Supervisor, (Gas, Gas Tech Services or Storage Field), shall ensure the removed facilities where the samples were taken are properly prepared for disposal. See [PCBH 1 Section 7.0](#) Disposal.

6.0 Non-PCB Detection

- 6.1 Ameren Environmental Support and Waste Management shall be notified the laboratory results indicated a non-PCB oily liquid as present.
- 6.2 Operations Management shall determine if additional inspections are warranted.
- 6.3 The Supervisor, (Gas, Gas Tech Services or Storage Field), shall ensure the removed facilities where the samples were taken are properly prepared for disposal. See [PCBH 1 Section 7.0](#) Disposal.

7.0 Inspections of Customer's Facilities

- 7.1 If the laboratory results indicate the presence of PCBs in a gas meter, additional inspection of a customer's piping and facilities may be justified.
- 7.2 Gas Superintendent and Regional Management with input from Ameren Environmental Support and Waste Management will make that decision.
- 7.3 Ameren Environmental Support and Waste Management may provide additional information or instructions to follow during the inspection.
- 7.4 Gas Superintendent will ensure the appropriate AIC Public Relations personnel are made aware that inspection of customer facilities is being scheduled.
- 7.5 Inspection process will be as follows:
 - 7.5.1 Customer will be contacted and informed that an inspection of their facilities need to be inspected to ensure PCBs have not migrated pass the gas meter.
 - 7.5.2 Provide customer with copy of the PCB Fact Sheet. See [PCBH 3](#).
 - 7.5.3 Schedule an inspection time with the customer.
 - 1. Customer must be present at time of inspection.
 - 2. Customer must allow access to their gas facilities.

UNCONTROLLED IF PRINTED

- 7.5.4 Inspection of the facilities shall follow the same procedures for protecting the customer's premises from unintentional contamination as described in **PCBH 2.0** Sampling Liquids from Gas Piping Systems.
- 7.5.5 If oily liquid hydrocarbon is found in the customer's facilities, the item shall be removed, placed in plastic bag, transported to and sampled at the Staging Area.
1. Removed item shall be replaced.
 2. Sampling of item for PCBs shall be in accordance with **PCBH 2.0**
 3. Disposal of the item will be in accordance with **PCBH 1 Section 7.0** Disposal
- 7.5.6 The following materials that may be needed would include such items as:

Materials
Pan
5-gallon bucket (22 08 272)
Plastic sheeting (49 06 201)
Pipe caps
Pipe nipples
Lables
Duct tape
Meter Exchange Tags
Absorbent pads

PCBH 2.1 PCB Handling: Positive PCB Detection, October 1, 2021

Revision Notes

Location of Changes	Summary of Changes
Paragraph 5.3.8	Reference link to Spill Hot Line phone number added: PCBH 2.0 Subsection 6.1.

PCBH 2.2 Staging Area and Disposal Protocol

1.0 Purpose

This sections provides information and procedures for handling collected material at the Staging Area and the Disposal pickup location.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General Information](#)

[5.0 Staging Area Protocol](#)

[6.0 Disposal Area Protocol](#)

3.0 Target Audience

- Gas Supervisor
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisor
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisor
- Gas Storage Field Personnel
- Gas Meter Shop Personnel
- Storeroom Personnel
- Manager Environmental Support & Waste Management

4.0 General Information

- 4.1 Staging Area is a designated location at the Operating Center or Gas Storage Field where the removed equipment and material collected during the sampling operations are to be stored until the results of the laboratory analysis are received.
- 4.2 GTS Supervisors should either utilize an Operating Center's designated Staging Area or designate their own Staging Area.
- 4.3 Sampling of oily liquids contained in the equipment may be required at the Staging Area.
- 4.4 The laboratory results will dictate how the collected samples are to be handled for disposal.
 - 4.4.1 50 ppm PCB or greater is a PCB contaminated waste requiring licensed waste hauler to a licensed disposal site.
 - 4.4.2 Less than 50 ppm PCB can be disposed of as general waste.
- 4.5 Operating Center Supervisor, GTS Supervisor and Gas Storage Field Supervisor will consult with the AIC Storeroom Supervisor as to the location of the disposable material pick-up site for.
 - 4.5.1 PCB contaminated waste.

4.5.2 Non-PCB waste.

- 4.6 Stores personnel will coordinate with Environmental Support & Waste Management on the pick-up of the PCB contaminated waste.

5.0 Staging Area Protocol

- 5.1 Items collected and bagged at the worksite should be placed in 55 gallon steel drums with lids.
- 5.2 The drums are to be labeled as to their content.
- 5.3 Material items such as pipe, drip leg and fittings should be placed in a separate drum than disposable PPE, plastic sheeting, absorbent pads and clean-up materials.
- 5.4 Gas meters containing liquids will need to be placed in a separate drum after samples of the liquid are obtained.
- 5.5 Sampling of the oily liquid hydrocarbon shall follow the sampling procedures in [PCBH 2.0](#) Sampling Liquid from Gas System.

Ensure area is protected from any spillage prior to beginning sampling operations.

- 5.6 The results of laboratory analysis will determine how the Staging Area material will be handled.
- 5.6.1 Laboratory analysis results show 50 ppm or more of PCB:
1. Item is considered contaminated with PCBs.
 2. The drums containing the sampled item along with all the material collected at the site shall have an Ameren Caution Contains PCB label.
 3. Gas Supervisor, GTS Supervisor or Gas Storage Field Supervisor shall notify Manager Environmental Support and Waste Management that PCB contaminated material will be delivered to the designated Disposal pick-up location.
 4. If a gas meter is found contain PCB liquid, contact Gas Meter Shop.
 - 4 a. Gas Supervisor shall advise Gas Meter Shop Supervisor that the gas meter is to be disposed.
 - 4 b. Obtain the instructions on the required steps to have the meter removed from meter inventory.
 5. Gas Supervisor shall notify local Storeroom Supervisor as when the contaminated material will be delivered.
- 5.6.2 Laboratory analysis results show less than 50 ppm of PCB.
1. Item is considered non-PCB.
 2. The drums containing the sampled item along with all the material collected at the site shall be labeled as Waste Material.

3. Gas Supervisor, GTS Supervisor or Gas Storage Field Supervisor shall notify Manager Environmental Support and Waste Management that non-PCB material will be delivered to the designated Disposal pick-up location.
4. Gas Supervisor shall notify Gas Meter Shop supervisor that the gas meter did not contain PCB liquids. Refer to [PCBH 1 Paragraph 7.3.4](#).

6.0 Disposal Area Protocol

- 6.1 The drums containing the PCB contaminated material shall be delivered to the designated waste pick-up location.
 - 6.1.1 Gas Supervisor, GTS Supervisor or Gas Storage Field Supervisor shall confirm with Storeroom personnel and Environmental Support the pick-up location and delivery of the material.
 - 6.1.2 Environmental Support will arrange and coordinate the pick-up with a licensed hazardous waste hauler.
- 6.2 Refer to [PCBH 1 Section 7.0](#) Disposal for more details.

End of Instructions.

Document Rescission

PCBH 2.04 – Liquid Inspection Protocol Staging Area, January 1, 2011

Revision Notes

Location of Changes	Summary of Changes
Entire Document	Reformatted

UNCONTROLLED IF PRINTED

1.0 Purpose

This document provides procedures to follow if oily liquids are released from a meter, appliance drip leg or gas piping facilities either during routine work or when conducting an inspection.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 PPE for Liquid Release Cleanup](#)

[5.0 Inside Home Release](#)

[6.0 Outside Release](#)

3.0 Target Audience

- Gas Supervisor
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisor
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisor
- Gas Storage Field Personnel
- Gas Meter Shop Personnel
- Manager Environmental Support & Waste Management

4.0 PPE for Liquid Release Cleanup

4.1 All or part of the listed PPE may be worn depending on the release size:

- 4.1.1 Nitrile or latex gloves.
- 4.1.2 Safety glasses.
- 4.1.3 Tyvek suit.
- 4.1.4 Disposable PVC boots.
- 4.1.5 Face shield or goggles if splashing liquids is possible.

5.0 Inside Home Release

5.1 If the oily liquid is released into a bucket, onto plastic sheeting or absorbent pads, gas field personnel shall do the following:

- 5.1.1 Seal the item from which the oily liquid was released.
- 5.1.2 Release into bucket:
 1. Close the plastic bag, if one is in the bucket, or

2. Place bucket in a plastic bag and close the bag
3. Carry the bucket out of the house and secure in the cargo area of a Company truck.

Remove from the house as soon as possible to minimize indoor odors

5.1.3 Release onto plastic sheeting or absorbent pads:

1. Carefully wrap them up in the plastic sheeting ensuring not to spill any of the liquid.
2. Place in a bucket or a plastic bag.
3. Carry the bucket or plastic bag out of the house and secure in the cargo area of a Company truck.

5.1.4 Place the disposable PPE in a plastic bag and secure in the cargo area of a Company truck.

5.1.5 Take the items to the designated location at the Operating Center and place them in 55 gallon drums. Refer to [PCBH 1 Subsection 4.9](#) Staging area.

5.1.6 Obtain sample of liquid. Refer to [PCBH 2.0 Subsection 7.2](#) Sampling the oily liquid.

5.1.7 No additional cleanup or environmental testing will be necessary.

5.2 If the oily liquid is released onto unprotected surfaces inside the home, gas field personnel shall do the following:

5.2.1 Contact Gas Supervisor and provide details of the situation.

5.2.2 Put on the appropriate PPE to prevent direct contact with the liquid. Refer to [Subsection 4.1](#).

1. If appropriate PPE is not readily available:
 - 1 a. Contact Supervisor to have PPE brought to site.
 - 1 b. Keep everyone away from the area.
 - 1 c. If possible, take necessary steps to keep liquids from entering floor drains.

5.2.3 Immediately place absorbent pads on the spilled liquid.

5.2.4 Place absorbent pads around floor drains, where applicable.

5.2.5 Gas Supervisor shall:

1. Immediately call Ameren Spill Hotline, [PCBH 2.0 Subsection 6.1](#), to report the spill.
2. Contact Ameren Environment Support and Waste Management to report the release. Refer to [PCBH 1 Paragraph 5.2.3](#) for contact information.
3. Ameren Environment Support and Waste Management personnel will advise Gas Supervisor as to actions that should be taken.

UNCONTROLLED IF PRINTED

- 5.2.6 Soak up and wipe up the spilled material as best as possible.
- 5.2.7 If permanent cleanup cannot be immediately performed:
 - 1. Cover the area with absorbent pads.
 - 2. Cover the pad and area with plastic sheeting to prevent tracking.
 - 3. Ask homeowner to avoid the area until permanent cleanup is performed.

Depending on the size and quantity of the release, Ameren Environmental Support and Waste Management may schedule a qualified spill contractor to perform the permanent cleanup

- 5.2.8 Place cleanup materials and disposable PPE in a plastic bag and place in the cargo area of a Company truck.
- 5.2.9 Take the items to the designated location at the Operating Center and place them in 55 gallon drums. Refer to [PCBH 1 Subsection 4.9](#) Staging area.
- 5.2.10 Gas Supervisor shall consult with Environmental Support and Waste Management on how to clean-up materials should be sampled.

6.0 Outside Release

- 6.1 If the oily liquid is released onto a protected outside surface such as into a bucket, onto plastic sheeting or onto absorbent pads the gas field personnel shall do the following:
 - 6.1.1 Seal the item from which the oily liquid was released.
 - 6.1.2 Release into bucket:
 - 1. Close the plastic bag, if one is in the bucket, or
 - 2. Place bucket in a plastic bag and close the bag
 - 3. Place the bucket and secure in the cargo area of a Company truck.
 - 6.1.3 Released onto plastic sheeting or absorbent pads:
 - 1. Carefully wrap them up in the plastic sheeting ensuring not to spill any of the liquid.
 - 2. Place in a bucket or a plastic bag.
 - 3. Carry the bucket or plastic bag out of the house and secure in the cargo area of a Company truck.
 - 6.1.4 Place the disposable PPE in a plastic bag and secure it in the cargo area of a Company truck.
 - 6.1.5 Take the items to the designated location at the Operating Center and place them in 55 gallon drums. Refer to [PCBH 1 Subsection 4.9](#) Staging area.
 - 6.1.6 Obtain sample of liquid. Refer to [PCBH 2.0 Subsection 7.2](#) Sampling the oily liquid.
 - 6.1.7 No additional cleanup or environmental testing will be necessary.

- 6.2 If the oily liquid is released on unprotected outside surface, gas field personnel shall do the following:
- 6.2.1 Contact Gas Supervisor and provide details of the situation.
 - 6.2.2 Put on the appropriate PPE to prevent direct contact with the liquid. Refer to [Subsection 4.1](#).
 - 1. If appropriate PPE is not readily available:
 - 1 a. Contact Supervisor to have PPE brought to site.
 - 1 b. Keep everyone away from the area.
 - 1 c. If possible, take necessary steps to keep liquids from entering floor drains.
 - 6.2.3 Immediately place absorbent pads on the spilled liquid.
 - 6.2.4 Place absorbent pads around floor drains, where applicable.
 - 6.2.5 Gas Supervisor shall:
 - 1. Immediately call Ameren Spill Hotline, [PCBH 2.0 Subsection 6.1](#), to report the spill.
 - 2. Contact Ameren Environment Support and Waste Management to report the release. Refer to [PCBH 1 Paragraph 5.2.3](#) for contact information.
 - 3. Ameren Environment Support and Waste Management personnel will advise Gas Supervisor as to actions that should be taken.
 - 6.2.6 Soak up and wipe up the spilled material as best as possible.
 - 6.2.7 Follow the instruction provided by Environment Support and Waste Management personnel on how to remove or treat the spill area.
 - 6.2.8 Place cleanup materials and disposable PPE in a plastic bag and place in the cargo area of a Company truck.
 - 6.2.9 Take the items to the designated location at the Operating Center and place them in 55 gallon drums. Refer to [PCBH 1 Subsection 4.9](#) Staging area.

Revision Notes

Location of Changes	Summary of Changes
Paragraph 5.2.5	Hyperlink PCBH 2.0 Subsection 6.1 , replaces the Spill Hot Line phone number.
Paragraph 6.2.5 – Item 1.	Hyperlink PCBH 2.0 Subsection 6.1 , replaces the Spill Hot Line phone number.

PCBH 2.4 Wipe and Soil Sampling**1.0 Purpose**

This section provides the instructions for collecting Wipe Samples and Surface Soil Samples for analysis of PCB contamination

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General Information](#)[5.0 Wipe Sampling](#)[6.0 Soil Sampling](#)**3.0 Target Audience**

- Gas Supervisor
- Gas Field Personnel
- Gas Tech Services (GTS) Supervisor
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisor
- Gas Storage Field Personnel
- Gas Meter Shop Personnel
- Manager Environmental Support & Waste Management

4.0 General Information

- 4.1 Solid or soil surfaces that have been exposed to oily liquid hydrocarbons may need to be sampled to determine if they are PCB contaminated.
- 4.2 Solid surfaces such as metal, concrete or asphalt will require a wipe sample.
- 4.3 The wipe sample is accomplished by using a sterile pads or filter paper, saturated with a hexane solution, to wipe the surface. A template with a cutout area of 10 cm x 10 cm will define the area to be wiped.

Hexane is flammable, no smoking or open flames are allowed during sampling.

- 4.4 Wipe sampling should be performed in a well-ventilated area.
- 4.5 Surface soil samples typically involved shallow sampling, up to 3 inches in depth, of the soil.
 - 4.5.1 Samples are obtained using hand tools to collect the samples. A clean disposable nitrile or latex glove should be worn for sample collection.
 - 4.5.2 Clean shovels, trowels or other tools may be used to initially loosen the soil from around the perimeter of the area to be sampled.

- 4.5.3 The tools used to loosen the soil should not come in contact with the soil being sampled.

5.0 Wipe Sampling

5.1 The following equipment will be needed:

- 5.1.1 Sampling Form. Refer to [PCBH 3](#).
- 5.1.2 PPE – Safety glasses, disposable nitrile or latex gloves (one pair per sample).
- 5.1.3 Wipe Kits – Provided by Ameren Laboratory Services. Refer to [PCBH 1 Section 6.0](#).
 - 1. Sample container.
 - 2. Hexane solvent.
 - 3. Sterile pads.
 - 4. Sampling template.
- 5.1.4 Sampling template with 10 cm x 10 cm cutout , and masking tape.
- 5.1.5 Secondary sample container bags and labels.
- 5.1.6 Plastic disposable bags.
- 5.1.7 Camera.

5.2 The following procedures should be followed as closely as possible depending on the surface being sampled.

- 5.2.1 Record the appropriate information and observations of the sampling location on the Sampling Form. Refer to [PCBH 3](#).
- 5.2.2 Photo document the sample area.
- 5.2.3 Open the Sampling Kit.
 - 1. Prepare a blank sample:
 - 2. Saturate a sterile pad with the hexane solution.
 - 3. Place the saturate sterile pad in the sampling container.
 - 4. Label as Blank Sample.

Blank sample is used to identify potential introduction of contaminants through the sampling methods, the pad, solvent of sample container

- 5.2.4 Place the sampling template over the area and secure with the masking tape.
- 5.2.5 Put on a new pair of disposable nitrile or latex gloves.
- 5.2.6 Saturate a sterile pad with the hexane solution.
- 5.2.7 Wipe the template area using firm strokes:
 - 1. Use only one side of the sterile pad to wipe the area.

UNCONTROLLED IF PRINTED

2. Wipe the sample area vertically twice with the sterile pad, then,
3. Wipe the sample area horizontally twice with the same sterile pad.

Insure the sample area has been completely wiped.

4. Place the sterile pad in the sample container and close.
 5. Label the sample and complete the documentation on Sampling Form.
 6. Store out of direct sunlight, cool to 40 degrees F.
- 5.3 If additional wipe samples are needed on the same item, follow the above process for each wipe sample except a Blank Sample is not required unless the sampling extends beyond one day.
- 5.4 Refer to [PCBH 1 Section 6.0](#) Testing for information on sending samples to Ameren Laboratory Services.

6.0 Soil Sampling

- 6.1 The following equipment will be needed:
- 6.1.1 Sampling Form. Refer to [PCBH 3](#).
 - 6.1.2 PPE – Safety glasses, disposable nitrile or latex gloves (one pair per sample).
 - 6.1.3 Laboratory cleaned 4 oz. sample containers available from Ameren Laboratory Services. Refer to [PCBH 1 Section 6.0](#).
 - 6.1.4 Secondary sample container bags and labels
 - 6.1.5 Clean shovel or stainless steel trowels.
 - 6.1.6 Plastic disposal bags.
 - 6.1.7 Camera
- 6.2 The following procedures should be followed as closely as possible depending on the surface being sampled.
- 6.2.1 Single use disposable nitrile or latex gloves and sampling tools.
 - 6.2.2 Sampling tools shall be clean and free of dirt or other contaminants. A clean stainless steel trowels is an acceptable sampling tool.
 - 6.2.3 Record appropriate information and observations about the sampling location on the Sampling Form. Refer to [PCBH 3](#).
 - 6.2.4 Photo document the selected sample area.
 - 6.2.5 If necessary, a clean spade or trowel may be utilized to loosen the soil around the perimeter of the sample area prior to sample collection.

The spade and trowel used to loosen the soil shall not be used to collect the sample and should avoid contact with the soils to be collected for analysis.

6.2.6 Put on new pair of disposable nitrile or latex gloves.

6.2.7 Collect soil sample using hand collection method and place in the laboratory provided container. A clean tool should be used to assist in the collection.

1. Remove and discard any of the following from the soil sample:

1 a. Large rocks.

1 b. Organic material such as roots, twigs, insects, worms, etc.

6.2.8 Label the sample and complete the documentation on Sampling Form.

6.2.9 Store the sample out of direct sunlight.

6.3 If additional soil samples are needed from the same area, follow the above process for sample.

6.4 Refer to [PCBH 1 Section 6.0](#) Testing for information on sending samples to Ameren Laboratory Services.

End of Instructions.

PIGG 0 Pigging: Table of Contents, July 1, 2020.

UNCONTROLLED IF PRINTED

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

PIGG 1 Requirement

1.0 Purpose

This procedure provides requirements for pigging in accordance with 49 CFR §§ 192.493 and 192.750.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Requirements](#)

3.0 Target Audience

- Gas Tech Engineering (GTE)
- Gas Integrity Management (IM)
- Supervisor Corrosion Control
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel

4.0 Requirements

- 4.1 Gas Tech Engineering (GTE) and Gas Integrity Management (IM) shall prepare written project specific pigging plan with procedures to safely complete the planned operation.
- 4.1.1 In-line inspection (ILI) project plan procedures shall be in accordance with Ameren Illinois (AIC) Pipeline Integrity Management In-Line Inspection Procedures. These procedures shall be in comply with the references listed in 49 CFR §192.493.
- 4.1.2 The plan shall be reviewed with the project personnel prior to beginning pigging operations.
- 4.2 Each new transmission line and each section of a transmission line where the pipe, valve, fitting, or other component is replaced, must be designed and constructed to accommodate the passage of an instrumented ILI tool.
- 4.2.1 This requirement does not apply to the following:
1. Manifolds.
 2. Station piping at regulator stations or meter station.
 3. Piping associated with natural gas underground storage facilities unless the piping is a continuous run of transmission line between storage facilities.
 4. Crossovers.
 5. An ILI tool is not commercially available for the size of pipe being installed.
- 4.2.2 Construction of new or replaced transmission line to accommodate an ILI tool is not required if:
1. An emergency is encountered.
 2. Unforeseen construction problems arise.
 3. Construction time restraints exists.

4. Operator determines it is impractical.

Within 30 days after discovering one of the above conditions exist, AIC Pipeline Integrity Management shall petition PHMSA for approval, in accordance with 49 CFR §190.9. If petition is denied within 1 year of submittal, AIC shall modify that section to accommodate passage of an ILI.

4.2.3 Any launcher or receiver used after July, 2021 shall be equipped with a device capable of safely relieving pressure in the barrel before removal or opening.

4.2.4 Launchers and receivers shall be pressure tested to at least the MAOP of the line being pigged. Refer to [PTST 1.1 Appendix E](#) Fabricated Unit/Assembly or Short Sections of Pipe.

End of Instructions.

PIGG 1 Pigging: Requirements, July 1, 2020.

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

PIGG 2.1 Pigging Operation

1.0 Purpose

This procedure provides the instructions for activities related to pigging of transmission pipeline facilitates.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Pigging Process](#)

[5.0 Types of Pigs](#)

[6.0 Launching and Receiving Process](#)

[7.0 Safety and Environmental](#)

[8.0 Natural Gas Pipeline Materials](#)

[9.0 Personal Protective Measures](#)

[10.0 Disposal of Waste Material or Clean PPE After Use](#)

3.0 Target Audience

- Gas Tech Engineering (GTE)
- Gas Integrity Management (IM)
- Supervisor Corrosion Control
- Gas Control
- Gas Construction Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel

4.0 Pigging Process

4.1 Pigging refers to the practice of using internal pipeline tools called "pigs" to perform maintenance or inspection activities on pipelines without disrupting its operation.

4.2 Pigging activities can be one or more of the following:

4.2.1 Removal of debris from pipelines such as:

1. Mill scale.
2. Rust.
3. Dirt.
4. Fluids.

4.2.2 In-line inspection (ILI) of the the pipe to gather information that may include:

1. Corrosion.
2. Cracks.
3. Pipe deformation.
4. Wall thickness variations.

4.2.3 Establishing a baseline for future comparison for integrity purposes.

4.3 A pig is normally propelled through the pipeline using available gas pressure, compressed air, water, remote controlled robotic technology, or tethered application. See [Figure 6](#).

4.3.1 The pig must travel the length of inspectable pipeline at steady and controllable speeds.

4.3.2 The pig will be an acceptable obstruction and will need a positive pressure behind it (the differential pressure) to cause it to move.

4.3.3 Any variation in the amount of obstruction (i.e., debris, liquids, etc.) will change the differential pressure necessary to move the pig.

1. This may result in a stop-start motion, known as speed excursions, which should be avoided.

4.4 Average pressure required for pigging will vary depending on the type of pig and the pipeline outside diameter and length.

The pressure shall not exceed the maximum allowable operating pressure (MAOP) of the line.

4.5 Launching and receiving pig traps are required.

4.5.1 A launcher is required at the upstream end of the section to be pigged to introduce the pig into the pipeline.

4.5.2 A receiver is at the downstream end of the pipeline section being pigged to land the pig.

4.5.3 All launcher or receiver pig traps shall be equipped with a pressure relief device. Before inserting or removing pigs, relieve pressure in the barrel to prevent opening of the pig traps while under pressure.

5.0 Types of Pigs

5.1 Pigs typically used at Ameren Illinois (AIC) include the following.

5.1.1 Poly / Foam Pigs

1. Soft and made out malleable foam (See [Figure 1](#)):
2. Generally used for pipe cleaning prior to maintenance and inspection.

Figure 1: Foam Cleaning Pig

5.1.2 Brush or Scraper Pigs (See [Figure 2](#)):

1. Used for aggressive cleaning.

Figure 2: Brush Cleaning Pig

5.1.3 Gauging Pigs (See Figure 3 and 4):

1. Used to confirm a minimum internal pipeline diameter.
2. A gauge plate attached to a brush or scraper pig sized slightly smaller than the pipeline diameter is used to determine the minimum internal pipeline diameter.
3. Deflections to the gauge plate can be measured to identify if a smart pig can successfully pass through the pipeline.

Figure 3: Gauging Pig

Figure 4: Bent Gauge Plate

5.1.4 Smart or Intelligent pigs (ILI Tool): (See Figure 5)

1. ILI tools for geometry or metal loss will be particular to the ILI vendor and specific capabilities may vary.

Figure 5: Combination Smart Pig and Cleaning Pig

6.0 Launching and Receiving Process

- 6.1 The written pigging plan shall include procedures for performing the following activities which are common with all types of pigs. See Figure 6 for a schematic of pig launching and receiving facilities.
- 6.2 Typical activities conducted during launching operations:
 - 6.2.1 Isolate launching trap.
 - 6.2.2 Drain and depressurize the launching trap.
 1. If ILI pig is to be launched, ensure all tool diagnostic checks are complete and operational (ready to load).
 - 6.2.3 Load the pig until front cups or discs are firmly seated into the reduced section of the trap.
 1. Open equalizing valve between the launching trap and the pipeline to ensure the pig does not unseat.

Damage may occur if the ILI tool hits the trap isolation valve before or when being launched.

- 6.2.4 Contact Gas Control to ensure the desired inspection flow rate is achieved.
- 6.2.5 Open the trap isolation valve.
- 6.2.6 Launch the pig by diverting and increasing flow through the kicker line (see [Figure 6](#)) while isolating the normal operations valve.
- 6.2.7 Restore launching trap to original state.
- 6.3 Typical activities conducted during receiving operations:
 - 6.3.1 Set up the receiving trap by ensuring valve settings are appropriate as outlined in pigging procedure.

If using ILI tool, damage may occur if the tool hits the trap isolation valve or receiver closure door.

6.3.2 Receive the pig:

1. If using ILLI tool, ensure pig has cleared the isolation valve otherwise damage may occur when attempting to isolate trap by closing valve.

6.3.3 Open mainline valve.

6.3.4 Close the kicker line/bypass valve.

6.3.5 Close the receiver trap valve.

6.3.6 Drain and depressurize the receiving trap.

Be aware of the pressure which may be trapped between the tool modules.

6.3.7 Ensure area behind the receiving trap closure door is clear of personnel and equipment (line of fire).

6.3.8 Per environmental guidelines, be prepared to capture any line debris.

6.3.9 Open receiver trap closure door.

6.3.10 Remove the pig.

6.3.11 Restore the receiving launcher to original state.

Figure 6: Pig Launching and Receiving Schematic

7.0 Safety and Environmental

7.1 Contact AIC Safety Supervisor with questions regarding:

7.1.1 Safe work procedures.

7.1.2 PPE, or

7.1.3 Arrangements for additional screening for radiation.

7.2 Contact Ameren Environment Services prior to beginning the pigging operation with questions about:

7.2.1 Testing.

7.2.2 Appropriate handling and/or disposal.

7.3 Significant and detailed planning efforts shall be taken to ensure the safety of workers, public and property during each pigging operation.

UNCONTROLLED IF PRINTED

- 7.3.1 All unauthorized individuals and public shall be kept away from launcher and receiving areas.
 - 7.3.2 AIC personnel shall monitor pressure to ensure pipeline pressure does not exceed the pipeline MAOP.
 - 7.4 Pigging plan shall address environmental issues which can be anticipated:
 - 7.4.1 AIC personnel shall follow guidelines for safe handling, sampling and disposal of solids and/or fluids.
 - 7.4.2 Solids and fluids removed from the pipeline shall be considered for sampling and testing for PCBs or other hazardous or detrimental constituents. Refer to [PCBH 2.0](#).
 - 7.4.3 Pipeline scale and sludge may contain low levels of iron sulfide.
 - 1. Iron sulfide can be an eye, skin, and respiratory irritant.
 - 2. Iron sulfide carries the risk of spontaneous combustion when dry.
- Iron sulfides removed from a pipe must be kept wet or stored in a sealed barrel to prevent combustion and harm to personnel.
- 7.4.4 Specific testing and waste handling may be required depending on the waste sampling profiles
 - 7.4.5 Results of the testing will be evaluated for determining the appropriate waste disposal method.
 - 1. Cleaning pigs (foam and/or cups, discs, etc.) may need to be disposed of in a similar manner as the solids and fluids.
 - 2. Containment and storage for these pigs should be considered.

8.0 Natural Gas Pipeline Materials

- 8.1 Natural gas materials may contain low levels of:
 - 8.1.1 Naturally Occurring Radioactive Materials (NORM)
 - 8.1.2 Iron sulfide
 - 8.1.3 Polychlorinated Biphenyls (PCBs).
- 8.2 NORM may be present in natural gas as a result of geological formations where the gas was extracted.
 - 8.2.1 NORM exists in the form of particulate radionuclides in sludge or scale, as well as radon gas.
 - 8.2.2 The scale and sludge can be unpredictable in form (wet or dry).
 - 8.2.3 Radiation content in the scale/sludge is generally very low, and is short-lived, returning to background levels within 24 hours of removal of the gas source.
 - 8.2.4 NORM presents a risk only if it is ingested or inhaled.
 - 8.2.5 The potential risk of inhalation is considered low.
- 8.3 Pipeline scale and sludge may contain low levels of iron sulfide. Refer to section [7.4.3](#).

9.0 Personal Protective Measures

- 9.1 The primary potential routes of exposure to these materials are:
- 9.1.1 Through the skin, or
 - 9.1.2 Through inadvertent ingestion, such as eating food with contaminated hands.
 - 9.1.3 Airborne exposure to these materials is also possible, however the risk is considered very low, due to the nature of the materials.
 - 9.1.4 Exposure protection primarily involves:
 - 1. Prevent skin contact by wearing appropriate PPE and good hygiene.
 - 2. Limit work areas to personnel who have the required training and PPE.
 - 9.1.5 Respirator use is voluntary.
 - 1. If respirators are worn, they shall be NIOSH-approved with tight-fitting face pieces and P100/organic vapor cartridges
 - 2. Users must be medically qualified and trained for respirator use.

10.0 Disposal of Waste Material or Clean PPE After Use

- 10.1 Prior to removing material from the pipeline:
- 10.1.1 It may be necessary to cover ground surfaces with plastic sheeting to prevent contamination.
 - 10.1.2 Approved waste containers shall be available, if needed.
 - 10.1.3 Any contact with clothing or body parts contaminated with internal pipeline liquids or debris shall be cleaned with soap and water before eating, drinking, or other activities.
 - 10.1.4 Clean tools and equipment as necessary.

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0151: Visual Inspection of Buried Pipe and Components when Exposed
- 0201: Visual Inspection of Installed Pipe and Components for Mechanical Damage
- 0301: Manually Opening and Closing Valves
- 0311: Adjust and Monitor Flow or Pressure - Manual Valve Operation
- 0321: Valve Corrective Maintenance
- 0331: Valve - Visual Inspection and Partial Operation
- 0341: Valve - Preventive Maintenance
- 1371: Operate Gas Pipeline - System Control Center Operations
- 1411: Indirect Inspection Techniques
- 1421: Direct Examination Techniques

PIPELINE MARKERS

April 1, 2023

PMRK 1 Requirements

1.0 Purpose

This document specifies the requirements for the installation and maintenance of markers and signage for gas pipeline facilities.

Installed pipeline markers and signs must meet the minimum requirements of 49 CFR §192.707.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Maintenance](#)[5.0 Line Marker Warning](#)[6.0 Placement](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel
- Gas Storage Field Supervisor
- Gas Storage Field Personnel

4.0 Maintenance

- 4.1 Pipeline facilities must be properly marked and maintained.
- 4.2 Gas Supervisor or Gas Storage Field Supervisor is responsible for ensuring that all gas pipeline facilities have the proper type and amount of signage.
- 4.3 Inspect signs and line markers during routine patrols.

Repair and replace deteriorated signs and line markers.

- 4.4 All pipeline markers and signs installed on pipeline facilities, regulator stations, odorization stations, and storage fields must have the Ameren Illinois logo and phone number. See [Section 5.1, Figure 1](#).
- 4.5 If a marker or sign is found without the Ameren Illinois (AIC) logo and phone number and it cannot be immediately corrected, then follow these steps:
 - 4.5.1 Document in Click Mobile as "Pipeline Marker / Signage Issue".
 - 4.5.2 Replace marker or sign within 30 days.

5.0 Line Marker Warning

UNCONTROLLED IF PRINTED

5.1 Pipeline markers shall have the following warning message written legibly on a background of a sharply contrasting color:

5.1.1 **"Warning", "Caution" or "Danger"** followed by **"Gas Pipeline"**. Letters must be at least 1-inch high with ¼-inch stroke. See Figure 1 for an example.

Figure 1: Sample Pipeline Marker

5.1.2 Company name, **"Ameren Illinois"**

5.1.3 Company telephone number, **1-800-755-5000**.

5.1.4 One-Call contact info.

6.0 Placement

6.1 *Class 1 and Class 2 locations*: Pipeline markers and/or signs must be placed as close as practical over each buried transmission line, high pressure distribution main or distribution main, without encroaching on the integrity of the line or main, and at the following locations:

6.1.1 Public road crossings

6.1.2 Railroad crossings

6.1.3 Fence lines, where practical

6.1.4 New cathodic protection test stations, where possible

6.1.5 At locations and intervals that clearly identifies the pipeline route and readily warns the public of the presence of a buried gas pipeline.

6.1.6 AIC gas facilities, such as:

1. Storage fields

2. Odorizer stations

UNCONTROLLED IF PRINTED

3. Pipeline valve stations

- 6.2 *Class 3 and Class 4 locations*: Pipeline markers and/or signs must be placed **as close** as practical over each transmission line without encroaching on the integrity of the line, unless placement of the pipeline marker or sign is impractical.
- 6.3 *Above ground transmission lines, high pressure distribution mains and/or distribution mains*: Facilities that are accessible to the public must have pipeline markers and/or signs placed along each section.
- 6.3.1 This includes unfenced facilities such as:
1. Regulator stations
 2. Valve stations
 3. Bridge crossings
- 6.3.2 Consider installing pipeline markers at farm taps located in areas where vegetation growth may inhibit visibility.
- 6.4 *Waterway crossings and other deep ravines*: Navigable water crossings must have a **"Do Not Anchor or Dredge"** sign. See [GLOS](#) for definition of Navigable waterways.
- 6.5 *Other locations designated by the Gas Supervisor*: To reduce possibility of damage or for HCA identification.
- 6.6 *Regulator stations*: Shall be identified with pipeline markers or signs as per [REGS 2.1](#) where practical.

End of Instructions.

Operator Qualification (OQ) Required?

PMRK 2 Pipeline Markers: Pipeline Facility Markers, October 1, 2021

Revision Notes

Location of Changes	Summary of Changes
Appendix B-4 – River Crossing Sign	3a. - Illinois was missing - Illinois River

Appendix A - Pipeline Markers

A-1. COTT Pipeline Markers

General

- A. See [Figure 1](#) for COTT pipeline markers are approved for installation.
- B. Each COTT marker requires 2 labels, one on each side.

Marker Type	7-foot Marker	6-foot Marker with Finklet	6-foot Marker with Big Fink	Replacement Label (2)
Stock No.	16-02-630	16-02-628	16-02-629	16-14-049

Figure 1: COTT Pipeline Markers

Installation

1. Refer to [Figure 2](#) for typical installation of COTT marker.
2. Dig 4-1/2 inches diameter hole 2-3 feet deep.
3. If marker contains a cathodic protection test point, bring lead wire up through post and connect before installing marker.
4. Rest marker assembly on top of hole with plastic anchor in place.
5. Push marker assembly to bottom of hole.
6. Align marker straight in hole, then backfill and tamp.

In areas where the marker posts are susceptible to damage by activities such as mowing, agricultural operation or construction activities, a COTT marker can be placed over a steel post. Note that this installation method will differ from [Figure 2](#) as it will not be necessary to set the marker 2-3 feet into the ground and use the flexible plastic anchor.

Figure 2: COTT Pipeline Marker Installation (Typical)

A-2. Carsonite Pipeline Markers

General

- A. See [Figure 3](#) for Carsonite pipeline markers are approved for installation.
- B. Each Carsonite pipeline marker requires 2 labels, one on each side.

Item	Replacement Label (2)	Carsonite Marker (78" Length)
Stock No.	16 04 993	16 04 832

Figure 3: Carsonite Pipeline Markers

Installation

1. See [Figure 4](#) and [Figure 5](#) for Carsonite pipeline marker installation.

Figure 4: Pilot Hole Driver Installation

Figure 5: Pipeline Marker Post Driver Installation

A-3. Rhino TriView Pipeline Markers

General

- A. See [Figure 6](#) for Rhino TriView pipeline markers approved for installation.
 1. The basic TriView XL (formerly TriView 400) Marker is 66 inches tall.
 2. The TriView Extension is 120 inches tall, and must be used for areas with high vegetation or crops.

- B. Each Rhino pipeline marker requires 3 labels, one on each face of the triangular shaped post.

Installation

1. TriView XL (formerly TriView 400) was designed to slide over flat fiberglass but it can also be buried or placed over U-channel and round metal posts, up to 2" IPS. See [Figure 7](#) for example placement over an existing post.
 - A. TriView XL (formerly TriView 400) can be direct buried by digging an 18-inch deep hole, inserting the marker and backfilling with dirt. Marker must be straightened and soil backfill tamped frequently.

Item	Rhino TriView XL (formerly TriView 400) (66" Length)	Rhino TriView Extension (120" Length)
Stock No.	16 02 685	16 02 687

Figure 6: Rhino TriView Markers

Figure 7: Rhino TriView Marker Installation over Existing Post

2. TriView Extension Marker was designed for areas where high vegetation or crops can obscure visibility or marker is susceptible to damage. See [Figure 8](#) for installation example.
 - A. Extension marker is 120 inches tall but comes in two (2) sections for ease of handling and installation.
 - B. Extension marker is designed for installation over U-channel or other metal post.
 - C. Extension marker includes mounting post and connectors.

Slide part A over a u-channel or other post and fasten at the bottom.
Then fit part B on top and fasten in the middle.

Figure 8: Rhino TriView Extension Marker Installation

Appendix B - Pipeline Marker Signs

General

1. See [Figure 9](#) for vertical pipeline marker signs and [Figure 10](#) and [Figure 11](#) for horizontal pipeline marker signs that can be used instead of Carsonite, COTT or Rhino pipeline markers to mark natural gas pipeline presence.
2. Pipeline marker signs can be attached to a steel post.

B-1. Vertical Pipeline Marker Signs

Item	Vertical Pipeline Marker Sign (10" H x 8" W)
Stock No.	16 02 409

Figure 9: Vertical Pipeline Marker Sign

B-2. Horizontal Pipeline Marker Signs

Item	Horizontal Pipeline Marker Sign (10" H x 14" W)
Stock No.	16 02 605

Figure 10: Horizontal Pipeline Marker Sign

B-3. Replacement Horizontal Pipeline Marker Signs

1. Pipeline marker sign shown above in [Appendix B-2](#) is valid until existing supply is depleted and existing signs need replacement.

Item	Replacement Horizontal Pipeline Marker Sign (10" H x 14" W)
Stock No.	16 02 700

Figure 11: Replacement Horizontal Pipeline Marker Sign

B-4. Navigable Water Crossing Sign: (Stock Code 16 02 606)

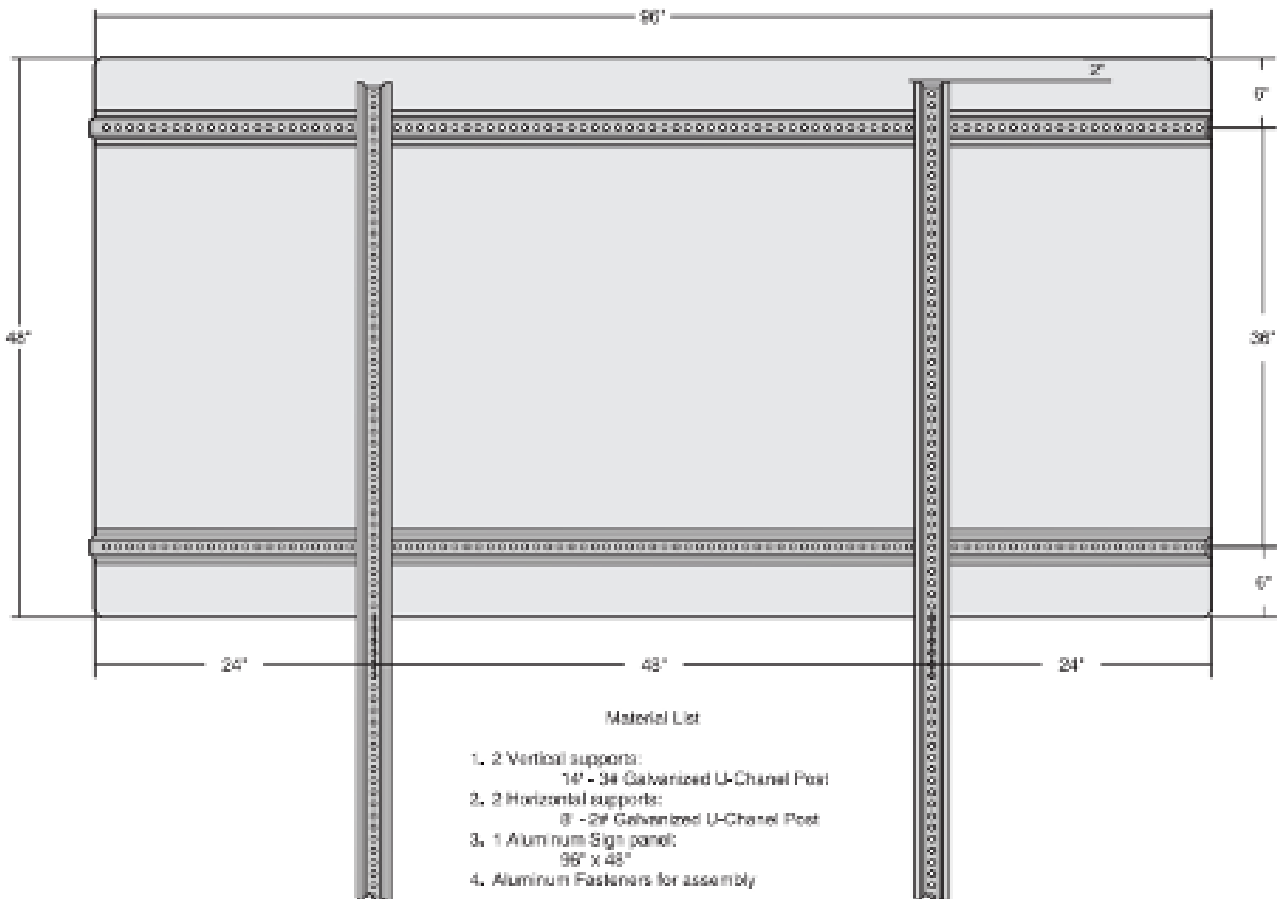

1. Sign is to be installed so that it is readable from the waterway and will be installed on both sides of the channel if required by the governing agency.
2. Existing signs remain valid until they are replaced by this new sign.
3. Navigable waterways in Illinois are:
 - a. Illinois River
 - b. Mississippi
 - c. Lower portion of Kaskaskia River

Sign – 96" x 48"

- a. Aluminum sign panel.
- b. Mounting holes are drilled during the installation process.

5. Mounting Kit

UNCONTROLLED IF PRINTED

- a. Two vertical supports: 14 feet long, 3# Galvanized U-Channel Post
- b. Two horizontal supports: 8 feet long, 2# Galvanized U-Channel Post
- c. Assembly Kit
 - i.) Two 96 inch zee bars
 - ii.) Four sets of U-Channel to zee bar hardware
 - iii.) Sixteen sets of mounting hardware
- d. Gas Tech Engineering will provide information on foundation requirement for the vertical supports

6. Mounting holes drill pattern

- a. Four corner holes are located approximately six inches from each edge of the sign.
- b. Top and bottom row of holes are approximately twelve inches apart.

POLY 2.1 Section 4.0	Design Pressure replaces Design Formula

POLYETHYLENE PIPE

October 1, 2020

POLY 1 Requirements

1.0 Purpose

The purpose of this document is to prescribe the requirements for designing, installing, storing and handling, and joining polyethylene (PE) pipe for gas mains and service lines.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Design Criteria](#)[5.0 Installation](#)[6.0 Storage and Handling](#)[7.0 Joining](#)[8.0 Squeeze-Off](#)[9.0 Metal Alloy Fittings](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 Design Criteria

4.1 For PE pipe design criteria and stock coded PE pipe tables, see [POLY 2.1](#) Design Pressure.

5.0 Installation

- 5.1 PE pipe shall be inspected for external damage before it is installed.
- 5.2 For PE pipe installation requirements, see [POLY 2.3](#) Installation Requirements.

6.0 Storage and Handling

- 6.1 Improper handling or installation of PE material can damage piping, compromise system performance, and result in injury. Always unload and handle PE material with proper handling procedures and equipment.
- 6.2 For specific handling and storage requirements, see [POLY 2.10](#) Storage and Handling PE Material.

7.0 Joining

- 7.1 PE pipe shall only be joined by butt fusion ([POLY 2.4](#)) or electrofusion ([POLY 2.5](#)), with the exceptions shown below:
- 7.1.1 Mechanical joining is permitted for PE pipe 1 inch and smaller. See [POLY 2.6](#) for acceptable installations.

8.0 Squeeze-Off

8.1 For PE pipe squeeze-off procedures, see [POLY 2.2](#) Squeeze Off.

9.0 Metal Alloy Fittings

9.1 As a practice, Ameren (AIC) does not install electrically isolated metal alloy fittings in plastic pipeline systems.

9.2 If it is necessary to install an electrically isolated metal alloy fitting, Corrosion Control personnel shall be contacted before installing the fitting. See [CORR 1 Paragraph 7.4.1](#). Requirements for Cathodic Protection of New and Replaced Pipeline Facilities.

End of Instructions.

Operator Qualification (OQ) Required?

YES

0641: Visually Inspect Pipe and Components Prior to Installation

0901: Installation of Plastic Pipe in a Ditch

0911: Installation of Plastic Pipe in a Bore

0921: Installation of Plastic Pipe Plowing/Pull-in

0931: Installation of Plastic Pipe in Plowing/Planting

Appendices

POLYETHYLENE PIPE

April 1, 2023

POLY 2.1 Design Pressure**1.0 Purpose**

This document provides the design formula, design parameters and typical values applicable to plastic pipe design, in accordance with 49 CFR §192.121.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Design Pressure](#)[5.0 Hydrostatic Design Basis](#)[6.0 MAOP Limitations for PE Pipe](#)

Appendices

[Appendix A - Stock Coded PE Pipe](#)**3.0 Target Audience**

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 Design Pressure

4.1 The design pressure for plastic pipe is determined in accordance with either of the following formulas:

$$P = 2S \frac{t}{(D-t)} 0.32 \quad \text{OR} \quad P = \frac{2S}{(SDR-1)} 0.32$$

NOTE:

For CTS pipe use: $P = 2S (t/(D-t)) (DF)$ formula.
CTS pipe does not have a published SDR value.

where

P = Design pressure (psi)

S = Hydrostatic Design Basis (HDB) (psi) (see [5.1](#) below)

t = Wall thickness (inches)

D = Outside diameter (inches)

SDR = Standard Dimension Ratio (Nominal Outside Diameter / Minimum Wall Thickness)

4.2 Ameren Illinois (AIC) used the DF= 0.32 (§192.121) for all PE pipe installations prior to October 1, 2021.

4.3 PE 4710 pipe installation on or after October 1, 2021, a DF = 0.40 can be used as long as:

UNCONTROLLED IF PRINTED

- 4.3.1 The Design Pressure does not exceed 125 psig,
 - 4.3.2 The pipe designation is PE 4710,
 - 4.3.3 The pipe has a nominal size of 24 inches IPS or less, and
 - 4.3.4 The pipe was manufactured on or after January 22, 2019.
 - 4.3.5 AIC's PE 4710 pipe meets or exceeds the minimum wall thickness required for a DF = 0.40
- 4.4 The Design Pressure for AIC's PE 2708 pipe installation shall continue to use a DF = 0.32 and a maximum Design MAOP of 60 psig.

MAOP of a PE pipe segment or system must be established prior to placing the segment or system into service. PE pipe system's MAOP cannot be updated without taking the system or segment out of service and then testing.

5.0 Hydrostatic Design Basis

- 5.1 The following Hydrostatic Design Basis (HDB) values shall be used when calculating the design pressure for Performance Pipe's DriscoPlex 6500 Series PE 2708 and DRISCOPIPE 8300 Series PE 4710.

Table 1: HDB Values

Design Temperature (°F)	HDB Value (psi)	
	DriscoPlex 6500 Series PE 2708	DRISCOPIPE 8300 Series PE 4710
73°	1250	1600
100°	1000	1250
120°	1000	1000
140°	800	1000

- 5.2 The following design temperatures shall be used when determining which HDB value (S) value to use in the Design Pressure.

Hydrostatic Design Basis (S) for plastic pipe is **not** the same quantity as Yield Strength (S) for steel pipe.

Table 2: Design Temperatures for HDB Value

Nominal Pipe Size (inches)	Design Temperature (°F)	Notes
½" CTS	120°	Use 120°F temperature due to service line riser exposure to sun.
1" CTS	120°	
1 ¼" IPS	120°	
2" IPS	120°	

2" IPS	73°	Use 73°F temperature for buried gas pipe with short term above ground or uncovered exposure during testing.
3" IPS	73°	
4" IPS	73°	
6" IPS	73°	
8" IPS	73°	
12" IPS	73°	

5.3 [Appendix A](#) provides the values for wall thickness (t), outside diameter (D) and the SDR for the PE pipe stock coded at Ameren Illinois (AIC).

6.0 MAOP Limitations for PE Pipe

6.1 The MAOP for all PE 2708 mains and service lines shall be limited to 60 psig.

6.2 The MAOP for all PE 4710 mains and service lines installed prior to October 1, 2021 shall be limited to 100 psig.

6.3 The MAOP for PE 4710 main and services lines installed on or after October 1, 2021 shall be limited to a maximum of 125 psig.

End of Instructions.

Document Rescission

POLY 2.1 Polyethylene Pipe: Design Pressure, October 1, 2022

Revision Notes

Location of Changes	Summary of Changes
Appendix A-1 – PE2708 Pipe	Removed 1/2" CTS PE2708 pipe. AIC no longer purchasing this pipe. PE4710 pipe is used for all 1/2" CTS service lines.

Appendix A - Stock Coded PE Pipe

A-1. PE 2708 Pipe (Medium Density)

Nominal Pipe Size (inches)	SDR	Outside Diameter (inches)	Wall Thickness (inches)	Length	Stock No.
1" CTS	Equal to 11.4	1.125"	0.099"	500' Coil	32 05 003
1 ¼" IPS	10.0	1.660"	0.166"	500' Coil	32 05 004
1 ¼" IPS	10.0	1.660"	0.166"	20' Stick	32 22 023
2" IPS	11.0	2.375"	0.216"	500' Coil	32 05 001
2" IPS	11.0	2.375"	0.216"	20' Stick	32 05 024
3" IPS	11.5	3.500"	0.304"	40' Stick	32 05 016
4" IPS	11.5	4.500"	0.391"	500' Coil	32 05 033
4" IPS	11.5	4.500"	0.391"	40' Stick	32 05 008
6" IPS	11.5	6.625"	0.576"	500' Coil	32 05 034
6" IPS	11.5	6.625"	0.576"	40' Stick	32 05 017
8" IPS	13.5	8.625"	0.639"	40' Stick	32 05 018

Notes:

1. CTS pipe print line contains the minimum wall thickness. It does not show a SDR rating. The SDR shown in this table is a calculated equivalent SDR.
2. 1 ¼" PE 2708 is only to be used for inserting service lines and mains or the repair of existing facilities.
3. 3" PE 2708 is only to be used for main insertions or the repair of existing facilities.
4. PE 2708 risers are the same SDR as the pipe.

A-2. PE 4710 Pipe (High Density)

Nominal Pipe Size (inches)	SDR	Outside Diameter (inches)	Wall Thickness (inches)	Length	Stock No.
½" CTS	Equal to 7.0	0.625"	0.090"	500' Coil	32 22 018
1" CTS	Equal to 11.1	1.125"	0.101"	500' Coil	32 22 019
2" IPS	11.0	2.375"	0.216"	500' Coil	32 22 020
2" IPS	11.0	2.375"	0.216"	40' Stick	32 22 031
4" IPS	11.0	4.500"	0.409"	40' Stick	32 22 021
4" IPS	11.0	4.500"	0.409"	500' Coil	32-05-042

UNCONTROLLED IF PRINTED

6" IPS	11.0	6.625"	0.602"	40' Stick	32 22 022
8" IPS	11.0	8.625"	0.784"	40' Stick	32 05 047
12" IPS	11.0	12.750"	1.159"	40' Stick	32 05 049

Notes:

1. CTS pipe print line contains the minimum wall thickness. It does not show a SDR rating. The SDR shown in this table is a calculated equivalent SDR.
2. PE 4710 services, 1/2" CTS, 1" CTS and 2" IPS require a SDR 7.0 riser.
3. Use SDR 7.0 with Design Temperature of 120°F to calculate maximum design pressure for 1/2" CTS, 1" CTS and 2" IPS PE 4710 service line pipe.

POLYETHYLENE PIPE

April 1, 2023

POLY 2.2 Squeeze Off

1.0 Purpose

This document prescribes the requirements for squeezing off polyethylene (PE) pipe.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Operation](#)[6.0 Above Grade Squeeze](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Services Personnel

4.0 General

- 4.1 Gas flow in PE pipe can be controlled by squeezing the pipe with a squeeze off tool marked ASTM F1563 or is certified as complying with ASTM F1563.

ASTM F1563 is Standard Specification for Tools to Squeeze-off PE Gas Pipe.

- 4.2 Before squeezing a line, refer to [PRES 2.1](#) Potential Over Pressurization or Service Interruption.
- 4.3 All squeeze-off tools are required to be grounded when squeezing PE pipe.
- 4.4 Squeeze-off tool manufacturer's information is in [POLY 4](#) Reference Materials.

5.0 Operation

Over-squeezing and excessive squeeze-off time will damage the PE pipe.

- 5.1 Before Starting Squeeze-Off

- 5.1.1 Keep squeeze tools in good working order and examine before each use. The tool shall have the proper diameter squeeze bar and pipe gap stops for the size of pipe being squeezed.

1. **Do not** use squeeze tools without the proper pipe gap stops.

- 2. Hydraulic squeeze tools shall have locks to prevent accidental release.
- 5.1.2 Inspect the pipe for damage and clean the area where the squeeze is to be made.
 - 1. **Do not** squeeze if there is a scratch deeper than 10% of wall thickness.
 - 2. Dirt or grit in the squeezing area can damage the pipe.
- 5.1.3 Prevent the build-up of static electricity charge in PE pipe by:
 - 1. Grounding the squeezing tool, AND
 - 2. Spraying the 1-1/4 inch and larger pipe with Ionix Static Suppressor, **low temperature formula (-20°F) (49 22 507)** or wrapping the pipe with wet or soapy non-synthetic rags near the point of cutting or repairs. The rags shall be kept wet during the squeeze off.

NOTE:	When using above grade squeeze-off tool refer to Section 6.0 for the exact use of a static suppressor or wet rags.
--------------	--

5.2 Squeeze Off Tool Location and Operation

- 5.2.1 Select and set the correct squeeze bar and pipe gap stops on the squeeze tool.
- 5.2.2 Locate squeeze tool a minimum of 3 pipe diameters from: See Table 1.
 - 1. Any fusion joint, or
 - 2. Saddle fusion fitting, or
 - 3. Mechanical connection, or
 - 4. Previous squeeze off location, or
 - 5. Second squeeze tool.

NOTE:	Use blocks to support hydraulic or other heavy squeeze tools.
--------------	---

Table 1: Minimum Distance For Squeeze Tool.		
Pipe Size	Pipe OD	Minimum Distance
1/2" CTS	0.625"	1-7/8"
3/4" IPS	1.050"	3-3/16"
1" CTS	1.125"	3-3/8"
1" IPS	1.315"	4"
1-1/4" IPS	1.660"	5"
2" IPS	2.375"	7-1/8"

UNCONTROLLED IF PRINTED

3" IPS	3.500"	10-1/2"
4" IPS	4.500"	13-1/2"
6"IPS	6.625"	19-7/8"
8" IPS	8.625"	25-7/8"
10" IPS	10.750"	32-1/4"
12" IPS	12.750"	38-1/4"

5.2.3 Center the squeeze tool on and square to the pipe.

5.2.4 Operate the screw operated or hydraulic operated tool in a slow continuous manner, with a compression rate of approximately 2 inches per minute based on the pipe's outside diameter, to allow stress relaxation in the pipe. See Table 2 – Approximate Squeeze-off and Release Times.

NOTE:	If air temperatures is below freezing, squeeze rate should be slowed to approximately 1 in per minute of pipe's outside diameter.
--------------	---

Table 2 - Approximate Squeeze-off and Release Times

Pipe Size (inches)	Pipe OD (inches)	Approximate Squeeze-Off Time	Approximate Release Time
1/2 CTS	0.625	20 seconds	75 seconds
3/4 IPS	1.050	32 seconds	2 minutes 6 seconds
1 CTS	1.125	34 seconds	2 minutes 15 seconds
1 IPS	1.315	40 Seconds	2 minutes 38 seconds
1-1/4 IPS	1.660	50 seconds	3 minutes 20 seconds
2 IPS	2.375	1 minute 12 seconds	4 minutes 45 seconds
3 IPS	3.500	1 minute 45 seconds	7 minutes
4 IPS	4.500	2 minute 15 seconds	9 minutes
6 IPS	6.625	3 minute 20 seconds	13 minutes 15 seconds
8 IPS	8.625	4 minute 20 seconds	17 minutes 15 seconds
10 IPS	10.750	5 minute 25 seconds	21 minutes 30 seconds
12 IPS	12.750	6 minute 25 seconds	51 minutes

1. **Do not** over-squeeze the pipe.
 - 1 a. The correct stops limit the minimum gap to 70% times twice the wall thickness of the PE pipe for screw and hydraulic operated squeeze-off tool.
 - 1 b. The 1" CTS PE 2708 pipe requires a pipe gap stop for 0.099 inches wall thickness.
 - 1 c. The 1" CTS PE 4710 pipe requires a pipe gap stop for 0.101 inches wall thickness.

5.2.5 Operate the hand squeeze tool for PE pipe 2 inches or smaller in accordance with manufacturer's instructions.

1. The correct stops limit the minimum gap to 85% times twice the wall thickness of the PE pipe for a hand squeeze-off tool such as a Timberline TC1-S.

The wall thickness of the 1" CTS PE 2708 is thinner than the wall thickness of the PE 4710 pipe, requiring a different squeezer or different gap stop setting.

1" PE 2708 requires a squeezer marked: wall thickness of 0.099".

1" PE 4710 requires a squeezer marked: wall thickness of 0.101".

The wall thickness of the other PE pipe sizes is the same for PE 2708 and PE 4710. Refer to [POLY 2.1 Appendix A](#).

5.2.6 If 100% shut-off is required, it may be necessary to install a second at least 3 pipe diameters from the first squeezer.

1. **Do not** remove or alter the gap stops, or place anything (rags, sticks, etc.) between the squeeze bars and the pipe.

5.2.7 **Do not** leave squeeze off tools on the pipe for more than 8 hours. Excessive squeeze off time may damage the pipe.

5.3 Squeeze Off Tool Removal

5.3.1 When placing pipe back in service, slowly release the screw operated or hydraulic operated squeezer at approximately 0.5 inches per minute of the pipe's outside diameter to allow the pipe to relax.

1. If air temperature is below freezing, release rate should be slowed to approximately 0.25 inches per minute.

5.3.2 Hand squeeze tool shall be released in accordance with the manufacturer's instructions.

5.3.3 After removing the squeeze tool:

1. Examine the pipe surface for evidence of damage.
2. Check for possible leaks.
3. If there are any leaks, cracks, cuts or other indications of damage in the squeeze area, then cut out and replace the damaged section. Refer to [REPR 1 Section 9.0](#) Polyethylene (PE) Pipe Repair.

5.3.3 If necessary, the pipe may be re-rounded.

1. After the tool has been completely opened, rotate the tool 90° on the pipe.
2. Slowly re-round the pipe by partially closing the tool until the pipe is circular.
3. It may be necessary to close the tool somewhat past circular, so that the pipe is round when the tool is again released.
4. The re-rounding closure rate should not exceed the closure rate.
5. The pipe should not be completely flattened.

UNCONTROLLED IF PRINTED

- 5.3.4 After removing the squeeze tool, identify the squeeze off location by wrapping the pipe with electrical tape. **Do not** squeeze off the pipe again at that location.

6.0 Above Grade Squeeze

- 6.1 PE pipe can be squeezed, without requiring gas field personnel to enter the excavation, by using a long handle squeeze tool with gap stops specific for the size of pipe and wall thickness to be squeezed.
- 6.2 Since personnel are not entering the excavation to apply the squeezer, cleaning and applying Ionix Static Suppressor to eliminate static charge of the pipe are not required.
- 6.3 The squeeze off tool shall be grounded.
- 6.4 If the squeeze off is to be performed in a hazardous gas environment, gas field personnel should follow procedures in [WIGE 2.1](#) Hazardous Environment.

End of Instructions.

Operator Qualification (OQ) Required?

YES

POLY 2.2 Polyethylene Pipe: Squeeze Off, October 1, 2022

Revision Notes

Location of Changes	Summary of Changes
---------------------	--------------------

UNCONTROLLED IF PRINTED

Subsection 5.1	Grammatical – added hyphen – Squeeze-Off
Paragraph 5.1.3, Item 2	AIC now purchasing the low temperature formula (-20°F) Ionix Static Suppressor stock code 49 22 507. Cancelling the standard formula Ionix spray..
Paragraph 5.1.3, Item 2.	Added – NOTE: When using above grade squeeze-off tool refer to Section 6.0 for the exception on the use of a static suppressor or wet rags.
Paragraph 5.2.2 Table 1 – Minimum Distance for Squeeze Tool	Fractions for minimum distance calculated based on 3 times the pipe outside diameter.

POLYETHYLENE PIPE

October 1, 2021

POLY 2.3 Installation Requirements

1.0 Purpose

The purpose of this document is to prescribe the requirements for installing polyethylene (PE) pipe for gas mains and service lines.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Jobsite Handling](#)[6.0 Support \(49 CFR §192.321\)](#)[7.0 Clearances from Thermal Sources \(49 CFR §192.325 \(c\)\)](#)[8.0 Thermal Expansion and Contraction](#)[9.0 Minimum Bending Radius](#)[10.0 Weak Link \(49 CFR §§ 192.329 \(b\) and 192.376 \(b\)\)](#)[11.0 Tracer Wire](#)[12.0 Damage During Construction](#)[13.0 Buried Pipe Examination](#)**3.0 Target Audience**

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 General

- 4.1 PE pipe shall be inspected for external damage before it is installed.
- 4.2 For additional construction requirements, see the [MAIN](#) and [SERV](#) sections of the O&M Plan.

5.0 Jobsite Handling

- 5.1 Check the print line on the pipe.
 - 5.1.1 If the print line is not legible, the pipe shall not be installed.
 - 5.1.2 PE 2708 (MDPE) shall be installed within 3 years from the manufactured date printed on the pipe.
 - 5.1.3 PE 4710 (HDPE) shall be installed within 10 years from the manufactured date printed on the pipe.
- 5.2 Coils of PE pipe may be sequence banded to permit controlled uncoiling of pipe.

UNCONTROLLED IF PRINTED

- 5.3 Do not cut all bands at once and extra precautions shall be taken when cutting the final band.
- 5.4 When installing 4 inch and larger coiled pipe:
 - 5.4.1 The pipe shall be run through straightening and re-rounding equipment as the pipe is being removed from the pipe trailer. See [POLY 4](#) for McElroy Line Tamer instructions.
 - 5.4.2 Anchor or restrain the ends of the pipe to prevent them from spring back.
 - 5.4.3 Straighten and re-rounding equipment do not recommend installing 4 inch and larger coiled pipe when the temperature is below 32° F for an extended period of time.
 - 5.4.4 Stick pipe 4 inch and larger should be considered when extended temperatures are below 32° F.

6.0 Support (49 CFR §192.321)

- 6.1 For permanent installation, PE pipe shall be installed below ground.
- 6.2 PE pipe shall be installed so as to minimize shear and tensile stresses.
 - 6.2.1 Whenever PE pipe is exposed, consider providing support to minimize stresses due to excessive sagging.
- 6.3 Protective sleeves shall be installed on the outlet of service tees in accordance with [SERV 1 Appendix B](#) and on steel-to-plastic transition fittings in accordance with [MAIN 3.1](#) and [MAIN 3.2](#). See [POLY 3.1](#) for protective sleeves and transition fittings.

7.0 Clearances from Thermal Sources (49 CFR §192.325 (c))

Temperatures greater than 100°F can impair serviceability of PE pipe.

- 7.1 PE pipe shall be installed with sufficient clearance, or insulated, from any source of heat (e.g., steam pipes).
- 7.2 Typically, 12 inches is considered sufficient clearance.

8.0 Thermal Expansion and Contraction

- 8.1 PE pipe will expand or contract at a rate of approximately 1 inch per 1,000 feet for each degree of temperature change.
- 8.2 MDPE and HDPE pipe have the same expansion and contraction coefficients.
- 8.3 Examples:
 - 8.3.1 1,000 feet of 2 inch PE pipe, heated to 100°F in the sun, can contract 3 feet when buried in 60°F soil.
 - 8.3.2 100 feet of ½ or 1 inch PE pipe, heated to 100°F in the sun, can contract 4 inches when buried in 60°F soil. Thus, slack in the service line should be left near the service tee.
- 8.4 In order to avoid unnecessary tension stress in the pipe, consider:
 - 8.4.1 Cutting the pipe slightly longer than needed.

UNCONTROLLED IF PRINTED

8.4.2 "Snaking" the pipe in the bottom of the trench.

8.4.3 Allowing pipe to adjust to ground temperature before completing any final tie-ins.

9.0 Minimum Bending Radius

9.1 The flexibility of PE pipe lends itself to easy bends for changes in direction.

9.1.1 Bend shall have a smooth contour.

9.1.2 Bend shall have at least the minimum bending radius shown in [Table 1](#).

1. Use fittings to make changes in direction on PE pipe that has a radius smaller than the recommended minimum.
2. Butt fusion joints are **not** considered a fitting.

9.1.3 Bend shall be free of buckles, cracks, or other evidence of damage.

9.2 See [Table 1](#) and [Figure 1](#) for minimum bend radius.

9.2.1 "Pipe WITHOUT Fittings" indicates the minimum bend radius for pipe where there are no fittings present within the bend.

9.2.2 "Pipe WITH Fitting within Bend" (100 times Pipe Diameter) indicates the flatter radius required where a fitting is present or will be installed within the bend.

1. This bend radius should be maintained for a distance of about 5 pipe diameters on either side of the fitting location.

Table 1: Permanent Minimum Bend Radius

PE Pipe Size (inches)	PE Pipe OD (inches)	SDR		Permanent Minimum Bend Radius	
		MDPE	HDPE	Pipe WITHOUT Fittings (Fig. 1)	Pipe WITH Fitting within Bend (100 times Pipe OD)
½" CTS	0.625"	7	7	13"	63"
1" CTS	1.125"	11.5	11.4	28"	125"
1 1/4" IPS	1.660"	10	N/A	42"	166"
2" IPS	2.375"	11	11	59"	238"
3" IPS	3.500"	11.5	N/A	88"	350"
4" IPS	4.500"	11.5	11	113"	450"
6" IPS	6.625"	11.5	11	166"	663"
8" IPS	8.625"	13.5	11	233"	863"
12" IPS	12.750"	N/A	11	318"	1275"

Table 2: Allowable Cold Bending Radius

Pipe WITHOUT Fittings in Bend	SDR 9 or less	SDR greater than 9 and less than 13.5	SDR 13.5 or greater
		20 times pipe OD	25 times pipe OD
Pipe WITH Fitting or Flange in Bend	All SDR's - 100 times the pipe OD		

Figure 1: Permanent Minimum Pipe Bend Radius (Pipe WITHOUT Fittings)

10.0 Weak Link (49 CFR §§ 192.329 (b) and 192.376 (b))

10.1 Precautions shall be taken to ensure that the pipe is not overstressed by excessive forces when PE pipe is installed using pull-in methods for trenchless excavations such as:

10.1.1 Insertion

10.1.2 Boring

10.1.3 Plowing

10.1.4 Pulling pipe in by hand through the ground or casing.

10.2 Installation options to protect the pipe from damage include the following.

10.2.1 PE pipe sizes 1" CTS or smaller:

1. A weak link may be created by physically removing approximately 50% of the pipe wall by cutting approximately half of the diameter of the pipe.

Tape over the cut prior to pulling the pipe.

UNCONTROLLED IF PRINTED

Scoring or drilling are **not** acceptable methods for reducing wall thickness.

2. Install a commercially available manufactured weak link designed for the pipe size being installed.
3. Weak link is required when pulling pipe by hand through the ground or casing.

10.2.2 PE pipe sizes larger than 1" CTS:

1. Install commercially available manufactured weak link designed for pipe size being installed.

10.3 Cumberland Products Weak Link

10.3.1 Cumberland Projects Weak Link is designed to yield before reaching the pipe's standard safe pull strength to protect the pipe from overload.

10.3.2 The Cumberland Weak Links are stock coded and available through the MDF storeroom.

10.3.3 Contact Gas Standards & Procedures if a larger size weak link is needed.

Table is 3: Cumberland Products Weak Links - Medium Density, Yellow Plastic

Stock Code	Size	Material: Medium Density, Yellow Plastic
32 22 036	1" CTS	
32 22 037	1-¼" IPS	
32 22 038	2" IPS	
32 22 039	4" IPS	
32 22 040	6" IPS	
32 22 041	8" IPS	

Table 4: Cumberland Products Weak Links - High Density, Black Plastic

39 22 642	1/2" CTS	
32 22 032	1" CTS	
32 22 033	2" IPS	
32 22 034	4" IPS	
32 22 035	6" IPS	

10.4 Condux Swivel

The swivels should not be used for applications where the link breaking could cause injury from the cable flying back.

10.4.1 A commercial break-away swivel is installed ahead of the pipe and is sized to match the pipe size as listed in [Table 3](#) and [Table 4](#).

10.4.2 The Condux swivel ([Figure 2](#)) is shown in the Gas Standards & Materials Share-Point site under [Tools & Equipment Page](#). See [POLY 4](#) for Condux manual.

Figure 2: Condux Swivel
(Information available online [here](#).)

Table 5: Condux Swivel Part Numbers for PE 2708 (MDPE)

PE 2708							
Size	SDR	Max Tensile Load (lbs)	Swivel Part #	Size	Break Load (lbs)	Replacement Pin Part #	Pin Color
1/2" CTS	7.0	115	n/a	n/a	n/a	n/a	n/a
1" CTS	11.5	242	8021020	7/8"	200	8018306	Green / Orange
2" IPS	11.0	1,128	8021110	7/8"	1,100	8018905	White / Yellow
4" IPS	11.5	3,888	8076100	1-1/4"	3,400	8076105	Blue / Yellow
6" IPS	11.5	8,428	8027900	1-5/8"	8,000	8027905	Yellow
8" IPS	13.5	12,340	8029600	2-1/2"	12,000	8029605	White

Note: Consult engineering for Maximum Allowable Tensile Load for the following bore lengths:

- Greater than 500 feet for 1/2" CTS and 1" CTS PE pipe
- Greater than 1,500 feet for 2" through 8" PE pipe

Table 6: Condux Swivel Part Numbers for PE 4710 (HDPE)

PE 4710							
Size	SDR	Max Tensile Load (lbs)	Swivel Part #	Size	Break Load (lbs)	Replacement Pin Part #	Pin Color

1/2" CTS	n/a	144	n/a	n/a	n/a	n/a	n/a
1" CTS	11.0	301	8021025	7/8"	250	8018005	Blue / White
2" IPS	11.0	1,387	8021130	7/8"	1,300	8019105	Brown / Yellow
4" IPS	11.0	4,981	8019900	1-3/8"	4,500	8019905	Slate / Yellow
6" IPS	11.0	10,797	8029400	2"	10,000	8029405	Green

Note: Consult engineering for Maximum Allowable Tensile Load for the following bore lengths:

- Greater than 500 feet for 1/2" CTS and 1" CTS PE pipe
- Greater than 1,500 feet for 2" through 8" PE pipe

11.0 Tracer Wire

11.1 [Table 7](#) indicates approved and stock coded tracer wires to be used for PE installation:

Table 7: Tracer Wires

Stock Code	Description	Spool Length	Tensile Strength
18 66 208	#12 Solid Soft Drawn Copper	500 ft.	198 lbs.
18 66 369	#12 Solid Soft Drawn Copper	1,500 ft.	198 lbs.
18 52 049	#10 Stainless Steel Stranded	530 ft.	1,260 lbs.
18 52 050	#10 Stainless Steel Stranded	1,000 ft.	1,260 lbs.

Note: #14 solid soft drawn copper tracer wire (18 66 677) is approved for service line insertion only if there is insufficient space for #12 tracer wire.

11.2 The tracer wire should not be wrapped around or taped to the pipe.

11.3 Contact with the pipe should be minimized but is not prohibited.

11.4 If wire breakage is a concern when boring or plowing, two tracer wires may be pulled. The wire ends should be connected.

11.5 Consider using stainless steel tracer wire for long and/or difficult directional bores or plow-ins.

11.6 When stainless steel wire is installed with main:

11.6.1 Bring up a test station at the location where the stainless wire meets the copper wire.

11.6.2 A lead from each wire should be run up and terminated in the test station.

11.6.3 If installation of a test box is not possible or feasible, the stainless and copper tracer wires can be connected in the same manner as copper service line tracer wire is connected to stainless steel main line tracer wire.

11.7 When connecting PE service line copper tracer wire to the PE main stainless steel tracer wire:

11.7.1 The wires can be connected with a stock coded split bolt connector.

11.7.2 Coat the connection with TL101 Corrosion Inhibitor (31 59 733), then encapsulate in gel box.

11.8 The tracer wire shall have continuity throughout the plastic system.

11.9 The tracer wire should be joined with a stock coded split-bolt connector and the connection protected by a splice box. See [Table 8](#).

Table 8: Split-Bolt Connector and Splice Box

Stock Code	Description
17 54 842	Connector, Split Bolt, Copper
17 54 959	Connector, Split Bolt, Stainless Steel
49 62 001	Box, Splice, Plastic, (Raychem GHFC-1-SBC-OF)

11.10 When the wires are joined together or connected to steel risers, mains or service lines, the connection shall be wrapped or coated with an approved coating. See [CORR 2.3](#) Coatings.

11.11 Five pound magnesium anodes should be installed approximately every 1,000 feet and at the ends of the tracer wire. The anode will cathodically protect the tracer wire and aid in locating the main ends.

11.12 Consider installing test lead box or pipeline marker with fink station as tracer wire access points when service line connections are not available.

12.0 Damage During Construction

12.1 Each PE pipe segment containing an imperfection or damage that would impair the serviceability of the pipe shall be removed.

12.2 Any nick, gouge or indentation that is greater than 10% of the wall thickness is considered a defect and shall be cut out.

12.3 To determine wall thickness loss of PE pipe, see [POLY 2.7](#) Evaluating PE Pipe Damage.

12.4 For repair requirements, see the [REPR 1 Section 9.0](#) PE Pipe Repair.

13.0 Buried Pipe Examination

13.1 A Buried Pipe Examination form shall be completed within ClickMobile whenever existing buried gas carrying plastic main or service is exposed and will be left in service. See [CORR 1](#) for inspection instructions.

End of Instructions.

POLYETHYLENE PIPE

October 1, 2021

POLY 2.4 Butt Fusion

1.0 Purpose

This document describes the requirements for joining polyethylene (PE) pipe and fittings by manual and hydraulic butt fusion.

Joining procedures must meet the minimum requirements of 49 CFR §§ 192.281 and 192.283.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Definitions](#)[5.0 General](#)[6.0 Safety - Before Starting Fusion Operation](#)[7.0 Adverse Weather Conditions](#)[8.0 Joint Assembly](#)[9.0 Hydraulic Machine Fusion](#)

Appendices

[Appendix A - Butt Fusion Fittings](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 Definitions

- 4.1 Cool Time: Time required before the fitting or pipe may be removed from the butt fusion machine.
- 4.2 Fusion Bead: Size of bead required for an acceptable joint when fusion is complete.
- 4.3 Fusion Force: Force to be applied and maintained between the fitting and pipe after removing the heating iron and melt bead is formed, to complete fusion joint.
- 4.4 Heating Force: Force to be applied and maintained between the fitting or pipe and the heating iron.
- 4.5 Manual Hold Time: Time that operator manually holds fusion pressure after which the locking cam will maintain pressure.
- 4.6 Total Fusion Pressure Hold Time: Total time, including Manual Hold Time, that fusion pressure must be applied to the fitting or pipe after heating iron is removed.
- 4.7 Melt Bead: Bead size required before the heating iron can be removed from the fusion area.

UNCONTROLLED IF PRINTED

- 4.8 Work Time: Additional cool down time before subjecting the fused joint to pulling, installing, pressure testing, rough handling or backfilling.

5.0 General

- 5.1 Butt fusion is **not** allowed when connecting two pipe sections with a wall thickness difference that exceeds one SDR value (e.g., SDR 7.0 vs SDR 11.0) OR if one section of pipe is Aldyl A.
- 5.2 MDPE and HDPE pipe and fittings can be butt fused together.

6.0 Safety - Before Starting Fusion Operation

Direct application of open flame devices, such as torches, for heating polyethylene pipe is strictly prohibited.

- 6.1 To ensure a uniform and consistent butt fusion joint, the pipe preparation and process used are critical.
- 6.2 Inspect the pipe lengths and fittings for unacceptable cuts, gouges, deep scratches or other external defects. See [POLY 2.7](#) - Evaluating PE Pipe Damage.
- 6.3 Tools used to make butt fusion joints shall be specifically designed and correctly sized for the joint being made. The required tools are:
- 6.3.1 Pipe cutter
 - 6.3.2 Pyrometer or electronic temperature indicating instrument
 - 6.3.3 Butt fusion machine
 - 6.3.4 Clean non-synthetic cloth, wooden tool or paper towels
 - 6.3.5 Heating iron with insulated bag
- 6.4 Check heating faces to ensure they are clean and free of damage.
- 6.4.1 Clean non-synthetic cloth or paper towels can be used to clean faces.
- 6.5 Check heating iron for proper temperature (range 400-450°F):
- 6.5.1 Verify temperature with a pyrometer or infrared thermometer each day before the first fusion.

Infrared pyrometers should have an emissivity setting of 0.95.

- 6.5.2 Temperature shall be checked in the fusion zone on both heating faces at approximately 12 o'clock, 3 o'clock, 6 o'clock, and 9 o'clock positions.
 - 6.5.3 Temperature readings should not vary by more than 20 degrees. All shall be in 400-450°F range.
- 6.6 Inspect the butt fusion machine.
- 6.6.1 The jaws, insert serrations, and clamp knob eyebolts should be clean and free of dirt.
 - 6.6.2 The facing blades shall be sharp and free from nicks.

UNCONTROLLED IF PRINTED

- 6.6.3 The machine should move freely on the guide rods.
- 6.6.4 Lubricate the machine as needed.
- 6.6.5 Install the correct shell liners for the size pipe being joined.

7.0 Adverse Weather Conditions

- 7.1 Protect joining operations from wind, rain, or snow. High wind, rain, snow, and cold temperatures can affect the quality of fusion joints.
- 7.2 At temperatures below 32°F, it may be necessary to use longer heating cycle to get a proper melt bead.
 - 7.2.1 **Do not** increase the heating tool surface temperature.
 - 7.2.2 **Do not** increase butt fusion joining pressure.

8.0 Joint Assembly

- 8.1 Inspect the pipe ends.
 - 8.1.1 Ensure pipe ends are clean prior to placing in the butt fusion machine. If needed, clean with water, alcohol solution or clean rag/towel.
 - 8.1.2 Factory ends of stick pipe may be necked-down.
 - 1. Two necked-down factory ends may be butt fused together.
 - 2. **Do not** butt fuse a necked-down factory end to a pipe that has been field cut. Remove the necked-down portion of pipe.
 - 8.1.3 Remove any flattened or damaged ends.
- 8.2 Place pipe (fitting) ends into fusion machine clamps.

Overtightening of the clamps can flare the pipe ends, resulting in poor alignment.

- 8.2.1 Ends should extend approximately 1" past alignment clamps for facing.
- 8.2.2 With four-clamp machines, the outer clamps should be securely tightened to prevent pipe slippage. Inner clamps can be looser to allow easier high/low alignment adjustment.
- 8.2.3 In the case of coiled pipe, it may be necessary to "S" the pipe into the fusion machine to accomplish alignment.
- 8.2.4 Check for alignment and slippage.
- 8.3 Insert facing unit.
 - 8.3.1 Close pipe (fitting) ends against rotating facing blades and machine pipe (fitting) ends to smooth, flat surfaces.
 - 8.3.2 Long continuous shavings will indicate proper facing of pipe ends.
 - 8.3.3 Continue facing until facer contacts stop and check for high-low alignment.
 - 8.3.4 When using an electric (powered) facer, hold pressure closed until the facer stops completely.

Electric (powered) facers shall be turned off before removal.

8.4 Remove facer unit.

8.4.1 Move jaws apart.

8.4.2 Remove facer.

8.4.3 Remove any cuttings with a clean paper towel.

8.4.4 **Do not** touch the faced ends of the pipe.

8.4.5 If facing is incomplete, repeat steps [8.2](#) (place pipe (fitting) ends into fusion machine clamps) and [8.3](#) (insert facing unit).

Alcohol, denatured alcohol and other solvents shall **not** be used to clean the pipe after facing.

8.5 Check alignment.

8.5.1 Bring pipe ends together.

8.5.2 If high-low alignment exists, adjust by tightening the high side clamp and reface the pipe. Do not loosen the low side clamp.

8.5.3 If slippage occurs, return to step [8.2](#) (place pipe (fitting) ends into fusion machine clamps).

8.5.4 Make a final check for proper alignment and detectable gaps.

8.6 Clean heating faces with non-synthetic cloth or paper towels.

8.7 Insert heating iron between pipe ends.

8.7.1 Close pipe ends against heater faces strongly enough to ensure full contact.

8.7.2 Reduce the pressure to contact pressure only.

If excessive pressure of the pipe against the iron is maintained during the melting time, melt will be squeezed away from the pipe end. This will result in a weakened joint after fusion.

8.8 Hold pipe ends in contact with heater.

8.8.1 During the heating cycle, the melt bead will form and expand as the plastic melts.

8.8.2 Refer to [Table 1](#) for proper melt bead size.

8.8.3 When the proper melt bead is formed, quickly separate the ends.

8.8.4 Remove the heating tool, being careful not to displace melt.

8.9 Inspect the pipe ends for complete melt.

- 8.9.1 If there is a concave appearance, it indicates excessive pressure during the heating cycle. Remove the pipe and start over.
- 8.9.2 Manual machines may require quick-snapping actions to open the pipe ends and remove the heater.
- 8.10 Bring the pipe ends together quickly. Do not slam together as this may cause excessive displacement of the melt, resulting in a poor quality joint.
 - 8.10.1 Use enough pressure to roll the melt beads over to the pipe surface. Hand hold pressure for 10 seconds minimum (Manual Hold Time) after which the locking cam will maintain the pressure.
 - 8.10.2 Ensure locking cam mechanism is set and the pressure is maintained for the Cooling Time listed in [Table 1](#).
 - 8.10.3 The double bead width should be about 2 to 2½ times its height, and uniform in size and shape around the joint. See [Figure 1](#).

Figure 1

Failure to follow proper heating procedures, contact pressure, and cool time will result in a bad joint.

- 8.11 After the required cooling time, the joint may be carefully removed.
- 8.12 Perform bead inspection after the joint cools and the pressure is taken off the butt fusion machine. The joint needs to be removed from the machine in order to inspect the full circumference of the joint.
 - 8.12.1 Visually inspect all butt fusion joints to ensure the joint is acceptable. If unacceptable, then cut the joint out and start over. [Figure 2](#) shows visually acceptable and unacceptable beads.
 - 8.12.2 Note the following characteristics of *acceptable* beads:
 1. When butt fusing to a molded fitting, the fitting side bead may have an irregular appearance due to the molded part cooling and knit lines, provided the pipe side bead is correct.

2. MDPE bead may be larger than HDPE bead when fusing two dissimilar materials. Both bead sizes must be uniform around their respective pipes.

8.13 After the required cooling time and work time, the pipe may be rough handled or pressure tested.

Table 1: Melt Bead Size and Minimum Cooling and Work Times

Pipe Size	Temperature	Melt Bead Size	Cooling Time		Work Time
			Manual Hold Time	Total Fusion Pressure Hold Time (includes Manual Hold Time)	
½" CTS	400 - 450°F	1/32"	10 seconds	3 minutes	10 minutes
1" CTS	400 - 450°F	1/32"	10 seconds	3 minutes	10 minutes
1 1/4" IPS	400 - 450°F	1/32"	10 seconds	3 minutes	30 minutes
2" IPS	400 - 450°F	1/16"	10 seconds	3 minutes	30 minutes
4" IPS	400 - 450°F	3/16"	10 seconds	5 minutes	30 minutes
6" IPS	400 - 450°F	3/16"	10 seconds	7 minutes	30 minutes
8" IPS	400 - 450°F	3/16"	15 seconds	8 minutes	30 minutes
12" IPS	400 - 450°F	1/4"	15 seconds	13 minutes	30 minutes

8.13.1 Example: For 4" IPS, Total Fusion Pressure Hold Time is 5 minutes and includes Manual Hold Time of 10 seconds, after which the locking cam will maintain the pressure. Wait 30 minutes (Work Time) before subjecting the fused joint to pulling, installing, pressure testing, rough handling or backfilling.

1.0 Purpose

This document describes the requirements for joining polyethylene (PE) pipe and fittings by electrofusion.

Joining procedures must meet the minimum requirements of 49 CFR §§ 192.281 and 192.283.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Common Requirements](#)

[5.0 Safety - Before Starting Fusion Operation](#)

[6.0 Electrical Equipment Requirements](#)

[7.0 Out of Roundness](#)

[8.0 Pipe Surface Preparation](#)

[9.0 Peeling](#)

[10.0 Joint Assembly](#)

[11.0 Electrofusion Tapping Tee Repair Kit Instructions](#)

[12.0 Fusion](#)

[13.0 Pressure Testing](#)

[14.0 Re-Fusing](#)

[15.0 Tapping](#)

Appendices

[Appendix A - Electrofusion Fittings](#)

[Appendix B - Manufacturer Cooling Times](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Services Personnel

4.0 Common Requirements

The following requirements are applicable to all electrofusion processes.

4.1 Application

- 4.1.1 Electrofusion couplings shall **not** be installed onto butt fusion fittings, caps, elbows or in-line tees.

4.1.2 Electrofusion couplings can be installed on PE ball valves, provided the stub length on the valve is long enough for peeling with a rotating peeler.

4.1.3 Electrofusion is required when joining:

1. PE pipe with different wall thickness that exceeds one SDR value (e.g., SDR 7.0 vs SDR 11),

OR

2. PE pipe with different chemical properties (e.g. Aldyl-A to MDPE).

4.2 Handling and Storage

4.2.1 Electrofusion fittings are packaged in sealed plastic bags or boxes for protection from dust, dirt and contamination.

1. Remove fitting from the bag/box when ready to install.

2. If the fitting is exposed to dust, dirt or any other possible contaminate, then clean with alcohol solution or discard.

3. All alcohol used on PE pipe shall be at least 96% isopropyl alcohol.

When working in colder temperatures, be cautious of isopropyl alcohol frosting on pipe or not drying as expected.

4.2.2 All markings on PE pipe shall be made with a non-petroleum-based permanent marker in a color that is clearly visible on the pipe.

4.3 Fusion and Re-Fusion

4.3.1 Electrofusion fittings can be re-fused **only** in the event of an input power interruption. See [Section 14.0](#) Re-Fusing.

4.3.2 Electrofusion fittings that fault for any other termination causes shall be removed or abandoned and replaced with new fittings.

4.3.3 After the fusion cycle is complete, all electrofusion joints shall be visually inspected and accepted before being placed in service. If joint is unacceptable, then cut the joint out and start over.

4.4 Electrofusion Repair Kit for Aldyl-A Tapping Tee Caps

4.4.1 Installation procedures are in [Section 11.0](#) Electrofusion Tapping Tee Repair Kit Instructions

5.0 Safety - Before Starting Fusion Operation

Electrical equipment used for electrofusion is a potential source of ignition.

5.1 **Do not** use electrical equipment in a hazardous environment. Locate generator, control box and supply line junction out of the trench.

5.2 **Do not** connect any other equipment to generator during the fusion process.

- 5.3 **Turn off** auto idle on generator, if equipped, so that it will not kick down during fusion process.
- 5.4 In inclement weather, protect equipment and fusion surfaces by a temporary shelter. Follow wet weather precautions around electrical equipment.

6.0 Electrical Equipment Requirements

- 6.1 A 120-volt 30-amp power source is recommended to operate the electrofusion control box.
 - 6.1.1 The 30-amp twist lock connection is required when fusing fittings 3" and larger.

Figure 1: Twist Lock Connection

- 6.1.2 If 30-amp plug is not available, then use a pigtail adapter to convert a 30-amp twist lock plug to a 15-amp straight blade plug.

Figure 2: Pigtail Adapter

- 1. If needed, use pigtail adapter only when fusing the following fittings:
 - 1 a. *Tapping tees*: All sizes
 - 1 b. *Fittings 2" and smaller*: Couplings, elbows, reducers, end caps
- 6.2 Receptacles must be fitted with Ground Fault Circuit Interrupter Breakers (GFCI).
- 6.3 A 3500-watt (or larger) generator/inverter OR an appropriate 120-volt wall outlet must be used to power the electrofusion processors.
- 6.4 If an extension cord is used, then refer to Table 1 to select the maximum length and size based on the processor's specifications.

Table 1: Extension Cord Requirements

Processor	Extension Cord Maximum Length & Size		
	25 ft. - #10/3	50 ft. - #8/3	100 ft. - #8/3
Central Plastics Easy Fuse and MSA 340	25 ft. - #10/3	50 ft. - #8/3	
IPEX Genesis F3	25 ft. - #12/3	50 ft. - #10/3	100 ft. - #8/3
Friamat	100 ft. - #10/3	200 ft. - #8/3	
Kerotest Diane and Charlotte	100 ft. - #10/3	200 ft. - #8/3	

6.5 Refer to Table 2 for the manufacturer's operating temperature ranges for some processors used at AIC.

Table 2: Electrofusion Processor Operating Temperature Range

Processor	Operating Temperature Range
Central Easy Fuse	10 to 120°F
Central MSA 340	-10 to 120°F
IPEX Genesis F3	0 to 140°F
Phoenix Battery Box	0 to 120°F
Friamat	-4 to 122°F
Kerotest Diane	-20 to 120°F
Kerotest Charlotte	14 to 120°F

6.6 Electrofusion processors shall be maintained at intervals that meet the manufacturer's minimum requirements. See [POLY 2.11](#), Maintenance of Fusion Equipment. Maintenance records will be maintained in Maximo.

7.0 Out of Roundness

7.1 Since PE pipe is flexible, storage, coiling, stacking, and soil loading can affect the roundness of the pipe. "Out of roundness" is the difference between the outside height and outside width of the pipe, measured with a tape measure or caliper.

Figure 3: Diameter measurement diagram

7.2 Table 3 shows maximum out of roundness for PE pipe:

Table 3: Maximum Out of Roundness

Pipe Size (IPS)	d1-d2
3"	1/8"
4"	1/8"
6"	3/16"
8"	3/16"
10"	1/4"
12"	1/4"

7.3 Re-rounding of PE pipe

- 7.3.1 2" IPS and smaller: Is flexible enough that couplings and alignment clamps will provide necessary rounding forces to re-round the pipe.
- 7.3.2 Larger than 2" IPS: May require re-rounding clamps to be installed on either side of the electrofusion fitting.

8.0 Pipe Surface Preparation

8.1 Couplings, Caps, Elbows, and Saddle Fittings

- 8.1.1 For the initial pipe cleaning, remove mud, dirt, and other foreign material with a clean paper towel or cloth with water or alcohol solution. Do not use detergents to clean pipe.
- 8.1.2 Inspect pipe and remove damaged pipe and neck down pipe ends.
- 8.1.3 Cut pipe ends squarely for couplings, caps, and elbows.
 - 1. The gap between two pipe ends should not exceed 2 times the maximum gap shown in the table. See Table 4.

Table 4 Maximum Allowable Gap from Square

Pipe Size	Central Plastics	Innogaz/Friatec
1/2" - 1" CTS	1/8"	1/16"
1-1/4"	1/8"	1/16"
2" IPS	3/16"	1/8"
3"	5/16"	3/16"
4"	5/16"	1/4"
6" IPS	1/2"	3/8"
8" IPS	3/4"	1/2"
10" IPS	7/8"	
12" IPS	1"	

- 8.1.4 Refer to Table 5 for the limits of the area to be cleaned and peeled.
 - 1. Pipe shall be initially cleaned of dirt, boring mud or other foreign material prior to marking the area to be cleaned with alcohol. Water and paper towels/ clothes can be used for this initial cleaning.
 - 2. Mark the limits of the area to be cleaned. If there is insufficient space to get 3 times the fitting length, then clean the available exposed area.
 - 3. Clean within marked area with alcohol wipes or a paper towel with alcohol solution. Wipe in one direction and do not clean beyond the marks. Allow the alcohol to dry and keep this area free from any contamination. Discard the wipe or towel; do **not** reuse.
 - 3 a. Marks shall be visible.
 - 3 b. Remaining fusion activity shall be kept within this marked area to avoid dragging contaminated material into the fusion area.
 - 4. Mark the limits of the area to be peeled.
 - 5. Scribe Witness Marks in the area to be peeled using a crisscross pattern at regular intervals around the pipe and fitting.

Table 5: Pipe Surface Area Preparation

Fitting	Area to be cleaned	Area to be peeled
Couplings and caps	3 times the fitting length	Half the fitting length. If the full coupling is to be slid onto the pipe, then mark the full length on the first pipe.
Elbows	3 times the insertion depth (Note that insertion depth of Central Plastic's 2" elbow is 2¼")	Insertion depth
Tees	Full length of tee outlet	Insertion depth
EFVs	Full length of EFV outlet	Insertion depth
Saddles	3 times the width of the saddle	Slightly wider than the base of the saddle

9.0 Peeling

- 9.1 The only tools to be used for electrofusion surface preparation are those specifically designed to peel the pipe surface to a controlled depth.

Hand scraping is allowed only when the use of a rotating peeler is not feasible and must be approved by the Gas Supervisor.

- 9.2 Use an approved peeler for pipe ends, EFV ends, tee outlets and saddle connections.
- 9.2.1 1-1/4" and 2" IPS pipe may require the use of insert stiffener to straighten and round the pipe.
- 9.2.2 The 1" and 2" PE 4710 service riser pigtails are SDR 7.0 and require a different insert stiffener than the 1" CTS (SDR 11.1) and 2" IPS (SDR 11.0) PE 4710 pipe.
- 9.3 Electrofusion cap insert
- 9.3.1 If the insertion cap remains inside the coupling, do **not** peel the insertion cap.
- 9.3.2 If the insertion cap does **not** remain inside the coupling, then clean the insertion cap and insert into the coupling.
- 9.4 Inspect Peeler
- 9.4.1 Ensure tool is operating properly. Replace worn or defective parts.
- 9.4.2 Ensure tool is clean of contaminating material such as grease, mud or other debris.
- 9.4.3 Check condition of blades. Replace if dull or damaged.
- 9.5 Peeling
- 9.5.1 Note the number of passes allowed with the peeler.
1. Pipe 2" IPS and smaller: One pass
 2. Pipe 3" and larger: Two passes

- 9.5.2 Completely peel the marked area to expose clean, virgin material. Ribbon material should be uniform.
- 9.5.3 Break shavings or guide them away to prevent them from wrapping around the peeled area of the pipe surface.
- 9.5.4 Ensure all Witness Marks have been removed. If marks remain, then remove that section of pipe and start over.
 - 1. Peeling at end of pipe: Remove that section of pipe and start over.
 - 2. Peeling within pipe segment: Move to a new location and start over. Tape over the previously peeled section to indicate tapping of the section shall be avoided in the future.
- 9.5.5 Central Plastics electrofusion coupling, ½"-1" only: Kerotest rotating peelers will not peel the entire marked area due to the blade configuration. The peeler is still acceptable since the full electrofusion area of the coupling is peeled.
- 9.5.6 If there is a possibility the peeled area has been contaminated, then clean with alcohol wipes or solution. Use the wipes and towel only once, then discard. Avoid touching cleaned surfaces.
- 9.5.7 Allow peeled surface to dry before fusing.

10.0 Joint Assembly

10.1 Couplings, Caps, and Elbows

- 10.1.1 Re-mark the stab depth if the initial marking is not visible.
- 10.1.2 Slide the fitting onto the first pipe to the insertion depth. Insert the second pipe into the fitting.
 - 1. Couplings: If necessary, slide the full length of coupling on to the first pipe. Butt the second pipe up to the first pipe and slide the coupling onto the second pipe to the insertion mark.
- 10.1.3 Insertion depth mark should be visible on both ends of the fitting.
- 10.1.4 Select the proper clamp and secure the fitting in proper alignment.
 - 1. Caps: Mark the spigot on the outside of the fitting to ensure spigot does not move.

10.2 Saddle Fittings (Service tees, high volume tees, repair saddles)

- 10.2.1 Place the fitting onto the pipe within the peeled area. There should be visible peeled area at both ends of the saddle.
- 10.2.2 Select the proper clamp.
 - 1. Fittings with integrated bolt on clamps: Tighten clamp so that the tee or saddle is held securely in place with equal pressure.
 - 2. Fittings with external, reusable clamps (under-clamp, strap or top loading clamp):
 - 2 a. Center the clamp on the fitting.
 - 2 b. Apply the proper pressure to securely hold the fitting on the pipe.
 - 2 c. Lock the clamp in place.

- 10.2.3 To eliminate stress during the fusion process, it may be necessary to support connections to service tees or high volume tees

11.0 Electrofusion Tapping Tee Repair Kit Instructions

- 11.1 After exposing tapping tee, remove residual dirt or soil from the stack to prevent damaging the peeler. If necessary, use clean water or a minimum 96% alcohol solution for initial cleaning of tee. Wipe dry with a clean paper towel before peeling.
- 11.2 Peel outside diameter of the Aldyl-A tapping tee stack down to the intersection of tee outlet.
- 11.2.1 The Kerotest peeler is a double-bladed peeler with “A” and “B” ends. Begin the peeling operation with end “A”.
- 11.2.2 Once the peeler bottoms out on end “A”, flip the peeler over to complete peeling with “B” end.
- 11.3 After peeling the tee stack, clean the stack using a minimum 96% alcohol solution wipe, or clean paper towel with a minimum 96% alcohol solution and allow to dry.
- 11.4 Remove the repair kit from the bag.
- 11.5 Because gas may be leaking, remove plug from the repair fitting until completing the electrofusion of coupling and insert repair fitting to the tapping tee.
- 11.6 Before performing electrofusion, clean the diameter of the insert repair fitting. Use a wipe/clean paper towel that contains a minimum 96% alcohol solution. Allow to dry.

It is not necessary to peel the outside diameter of the base fitting.

- 11.6.1 If the insert repair fitting becomes contaminated during the assembly process, clean the insert fitting with the minimum 96% alcohol solution and reinsert into the repair fitting.
- 11.7 Install insert repair fitting into the electrofusion coupling until the fitting shoulder stops against the end of the electrofusion coupling.
- 11.8 Install the electrofusion coupling over the Aldyl-A tee stack until it “bottoms out” on the tee outlet.
- 11.9 Screw insert holding tool into the threaded end of insert repair fitting.
- 11.10 Connect fusion processor leads to the electrofusion coupling and fuse coupling and insert assembly to the Aldyl-A tapping tee with standard fusion procedures.
- 11.11 When electrofusion is complete, remove processor cables and allow the electrofusion coupling and insert fitting assembly to cool for a minimum of 10 minutes before completing further assembly work.
- 11.12 Verify that the O-ring seal on the plug repair fitting is lubricated. If not, lightly lubricate with Dow Corning Silicone Grease #111, or equivalent.
- 11.13 After allowing proper cooling time, remove insert holding tool from the insert repair fitting.

- 11.14 Using a standard ½-inch square drive, screw the plug repair fitting with O-ring seal into the insert repair fitting until it bottoms out. Top of plug should be flush with the top of repair fitting.
- 11.15 Soap test the completed repair kit assembly for leakage.
- 11.16 See Figure 1 for illustration of the repair kit assembly.

Figure 1: Repair Kit Assembly

12.0 Fusion

- 12.1 Connect fusion control box leads to the coupling. Once the coupling has been connected, do **not** handle output leads or connectors until fusion is complete.
- 12.2 Ensure fusion time is correctly set for fitting (bar code scan, manual input, or auto-read).
- 12.3 Activate fusion cycle.
- 12.4 Once the controller indicates fusion is complete, the outlet leads may be disconnected.
- 12.5 Allow proper cooling time before removing fitting from the clamp. Refer to fitting tag, processor, or [Appendix B - Manufacturer Cooling Times](#) for individual fitting fusion, cooling and work times.
- 12.6 At the end of the fusion operation, disconnect the electrofusion processor's power cable from the generator.
- 12.7 Shut off the generator.

13.0 Pressure Testing

- 13.1 The fused fitting cannot be pressure tested until after the required cooling time and the clamp is removed. See [Appendix B - Manufacturer Cooling Times](#).

14.0 Re-Fusing

14.1 Re-fusing a fitting is permitted **only** under circumstances of an input power interruption. Events which could cause an interruption include:

14.1.1 Generator power loss to control box.

14.1.2 Accidental disconnection of fusion cables from the fitting during the fusion cycle

14.2 Prepare to re-fuse:

14.2.1 Allow the fitting and pipe to cool completely to ambient temperature.

14.2.2 Use a pyrometer to verify that the fitting and surrounding pipe temperature have equalized.

14.2.3 Read pipe temperature at least 2 feet from the fitting.

14.3 Re-start the fusion. Fuse for the entire fusion cycle prescribed for the fitting. **Do not** subtract time based on the first fusion attempt.

15.0 Tapping

15.1 Electrofusion service and high volume tees shall be pressure tested *before* being tapped.

If the service tee(s) is being tested with the main, then it shall be tapped *before* being pressure tested.

15.2 Electrofusion service and high volume tees can be tapped only after the required cooling time is complete.

See [Appendix B - Manufacturer Cooling Times](#).

15.3 Remove cap from the tee.

For Innogaz tees with no fixed backstop, use of the safety cap is optional. If the safety cap is used for an Innogaz tee, then the safety cap must be removed before installing the tee cap.

15.3.1 Insert tapping tool into top of tee to the cutter.

15.3.2 Turn perforator clockwise until it bottoms out.

15.3.3 Tap the PE pipe. Press and secure the pipe coupon into the inside of the cutter.

15.3.4 Unscrew perforator (counterclockwise) until it comes in contact with backstop or flush with top of tapping tee.

15.3.5 Install the cap according to the manufacturer's specifications.

15.3.6 Check the assembly for leakage.

Service tees that are pressure tested with the main are exempt from this requirement since a successful leak test will document no leakage.

End of Instructions.

Operator Qualification (OQ) Required?

YES

Revision Notes

Location of Changes	Summary of Changes
Paragraph 9.5.4 – Witness marks not removed	Added: 1. Peeling at end of pipe: Remove that section of pipe and start over. 2. Peeling within pipe segment: Move to a new location and start over. Tape over the previously peeled section to indicate tapping that section shall be avoided.
Appendix A – Electrofusion Fittings	Added –Electrofusion fittings listed below are PE4710.

Appendix A - Electrofusion Fittings

Note: Since Ameren Illinois has gone to single source provider, majority of the fittings listed below are Central Plastic's fittings. However, the formerly stock coded Friatec and Innogaz electrofusion fittings remain approved and can be used until the supply has been depleted. If there is a supply issue with Central Plastic, AIC will order needed fittings from Friatec, Innogaz, or other approved manufacturer.

Electrofusion fittings listed below are PE4710.

A-10 Kerotest Repair Kit of Aldyl-A Tapping Tee Caps (Refer to [REPR 2.3](#) for kit components and required tools)

Stock Code	Description
19 72 134	Kit for standard tapping tee, used 1.25 inch IPS electrofusion coupling and insert.
19 72 153	Kit for non-standard tapping tee, used a 40mm electrofusion coupling and insert.

Appendix B - Manufacturer Cooling Time

The following tables contain cooling times published by each manufacturer for their electrofusion fittings. All cooling times begin at the end of the fusion cycle.

B-1. Central Plastics

Fitting	Size	Cooling Time in Clamped Position (minutes)	Total Cooling Time Before Pressure/Tap (minutes)	Total Cooling Time Before Rough Handling (minutes)
Couplings	½" CTS	5	15	30
	½" CTS x ¾" IPS	5	15	30
	½" CTS x 1" CTS	5	15	30
	¾" IPS x 1" CTS	5	15	30
	1" CTS	5	15	30
	1-¼" IPS	10	20	30
	2" IPS	10	20	30
	3" IPS	15	30	35
	4" IPS	15	30	35
	6" IPS	20	40	45
8" IPS	20	40	45	
Caps	½" CTS	5	15	30
	¾" IPS	5	15	30
	1" CTS	5	15	30
	1 ¼" IPS	10	20	30
	2" IPS	10	20	30
	3" IPS	15	30	35
	4" IPS	15	30	35
	6" IPS	20	40	45
8" IPS	20	40	45	
Elbow	2" IPS	5	20	30
Reducers	¾" IPS x ½" CTS	5	15	30
	1" CTS x ½" CTS	5	15	30
	1" CTS x ¾" IPS	5	15	30

	1-1/4" IPS x 1" CTS	10	20	30
	2" IPS x 1" CTS	10	20	30
	2" IPS x 1-1/4" IPS	10	20	30
Tapping Tees	1-1/4" IPS to 8" IPS	10	20	30
High Volume Tapping Tees	2" IPS to 6" IPS	10	25	30
	8" IPS to 12" IPS	20	30	40

Notes:

1. Rough handling is considered putting pipe in the ditch and backfilling.
2. Example for 2" IPS coupling: Wait 10 minutes before removing clamp, wait another 10 minutes before pressure testing or tapping, then wait another 10 minutes before rough handling the pipe. Total cooling time from end of fusion cycle to rough handling pipe is 30 minutes.

B-2. Friatec

Fitting	Size	Total Cooling Time Before Handling (minutes)	Total Cooling Time Before Pressurizing (minutes)
Couplings	1/2" CTS	5	10
	1/2" CTS x 1" CTS	5	10
	1" CTS	5	10
	1-1/4" IPS	10	25
	2" IPS	10	25
	3" IPS	10	40
	4" IPS	10	40
	6" IPS	20	75
Tapping Tees and High Volume Tapping Tees	1-1/4" IPS	15	20
	2" IPS	15	20
	3" IPS	20	30
	4" IPS	20	30
	6" IPS	30	45
	8" IPS	50	60

Notes:

1. Example for 2" IPS coupling: Wait 10 minutes before removing clamp or handling, wait another 15 minutes before pressure testing or tapping. Total cooling time from end of fusion cycle to pressure testing/tapping is 25 minutes.

B-3. Innogaz

Fitting	Size	Cooling Time Before Removing Clamps (minutes)
Couplings	½" CTS	3
	½" CTS x 1" CTS	4
	1" CTS	6
	1-¼" IPS	6
	2" IPS	20
	3" IPS	8
	4" IPS	10
	6" IPS	14
	8" IPS	18
Tapping Tees	1-¼" IPS to 8" IPS	10
High Volume Tapping Tees	2" IPS to 8" IPS	16

1.0 Purpose

This document describes the requirements for joining polyethylene (PE) pipe and fittings by mechanical connection.

Joining procedures must meet the minimum requirements of 49 CFR §§ 192.281 and 192.283.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Stab Fittings](#)

[6.0 Perfection PERMASERT/PERMASERT 2.0](#)

[7.0 Compression Fittings](#)

Appendices

[Appendix A - Stab Fittings](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Services Personnel

4.0 General

- 4.1 Mechanical fittings, including both compression and stab type fittings, installed after January 22, 2019 shall be classified Category 1 meeting ASTM D2513 requirements.
- 4.2 When using a mechanical fitting on PE pipe, a rigid metallic internal stiffener shall be used.
- 4.3 If scratches or gouges are visible on the end surface of the PE pipe, then remove the defective area.
- 4.4 When installing a service header adapter, follow manufacturer's installation instructions.

5.0 Stab Fittings

- 5.1 Stab fittings shall only be used on ½" through 1" PE pipe sizes.
 - 5.1.1 Use stab couplings only to:
 1. Repair service lines, ½" through 1" CTS PE
 2. Cap end of service lines, ½" through 1" CTS PE, may include
 - 2 a. Retirements
 - 2 b. Seal ends temporarily during installation

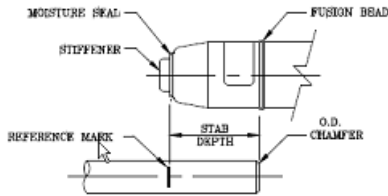

- 2 c. Temporary bypass
- 3. Cap end of purge cap pigtail, during test and upon completion of test
- 5.1.2 Stab elbows and in-line tees are used on 1/2" through 1" CTS pipe.
- 5.1.3 An electrofusion coupling is required to connect 1" CTS PE 4710 pipe to the service riser pigtail on 1/2" through 1" PE service lines.

The 1" CTS PE 4710 stab coupling internal stiffener is sized for 1" CTS, SDR 11.5 pipe. It is **not** compatible with the 1" CTS PE 4710 service riser pigtail, which is SDR 7.0 and has a thicker wall.

- 5.2 Only Perfection PERMASERT/PERMASERT 2.0 stab fittings are approved at Ameren Illinois (AIC). See [Appendix A - Stab Fittings](#). As the supply of Permasert fittings are depleted they are being replaced by Permasert 2.0 fittings.
- 5.3 Use the appropriate chamfering tool to chamfer the PE pipe end. See Table below ([Section 6.0](#)) for chamfering tools stock code numbers.
 - 5.3.1 Permasert 2.0 fittings require chamfering both the outer and inner surface of the pipe. Only the Permasert 2.0 chamfering tool is designed to perform that task.
 - 5.3.2 The dual size Permasert chamfering tool only chamfers the outer pipe surface and **cannot** be used for Permasert 2.0 fittings.
 - 5.3.3 The Permasert 2.0 chamfering tool can be used to chamfer pipe ends for the older Permasert fittings.

6.0 Perfection PERMASERT/PERMASERT 2.0

Procedure	Permasert	Permasert 2.0
Clean Pipe	Wipe clean with dry cloth	Wipe clean with dry cloth
Pipe Preparation	Square Cut Pipe	Square Cut Pipe
Inspect Pipe End, minimum 6" from end	Inspect for scratches or gouges	Inspect for scratches or gouges
Damage Found:	Remove and start over	Remove and start over
Chamfer End of Pipe	<p><i>Chamfer Tool: Stock Code Perfection Tool</i></p> <p>85 36 200 for 1/2" & 1" CTS 85 36 219 for 1/2" & 3/4" IPS OR <i>Honeywell Tool</i> 83 06 179 for 1/2" CTS 83 06 181 for 1" CTS 83 06 178 for 3/4" IPS Continue chamfering until tool bottoms out</p>	<p><i>Chamfer Tool: Stock Code Perfection Tool</i></p> <p>83 06 179 for 1/2" CTS 83 06 181 for 1" CTS 83 06 178 for 3/4" IPS Continue chamfering until tool bottoms out</p> <p>NOTE: Do not use Permasert tool to chamfer Permasert 2.0 fitting</p>

<p>Mark Stab Depth:</p>		<p>Mark when tool bottoms out</p> 
<p>If stab cap is used as a coupling, cut off the solid end</p>	<p>Using a plastic pipe cutter, cut on the dotted line to remove the solid end.</p>	<p>Using a plastic pipe cutter, cut on the dotted line to remove the solid end.</p>
<p>Mark Stab Depth:</p>	<p>Mark from fusion bead to cut</p>	
<p>Stab Pipe into Coupling</p>	<p>Reference mark should be within 1/8" of the moisture seal of the coupling.</p>	<p>Reference mark should be within 1/8" of the moisture seal of the coupling.</p>
<p>Pressure Test completed joint in accordance with PTST 1.1 Table A</p>	<p>Reference mark can move outward up to an additional 3/8" during pressure testing.</p>	<p>Reference mark can move outward up to an additional 3/8" during pressure testing.</p>

7.0 Compression Fittings

- 7.1 AIC approved compression fittings are installed above ground only.
- 7.2 AIC does not allow compression fittings to be installed below ground, but there are legacy fittings still in service.

End of Instructions.

Operator Qualification (OQ) Required?

YES

- 0641: Visually Inspect Pipe and Components Prior to Installation

1.0 Purpose

This document prescribes the requirements and procedures for evaluating damage to polyethylene (PE) pipe.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Pipe Pit Gauge](#)

[6.0 Maximum Defect Depth](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Services Personnel

4.0 General

- 4.1 Any imperfection or damage found in a PE pipe segment shall be evaluated to determine whether it would impair the serviceability of the pipe.
- 4.2 Any nick, gouge or indentation that is greater than 10% of the PE pipe wall thickness is considered a defect and must be cut out.

5.0 Pipe Pit Gauge

- 5.1 A pipe pit gauge, digital or manual, shall be used to determine if more than 10% of the PE pipe wall thickness has been removed.
- 5.2 *Digital Pit Gauge*: Digital pit gauges shall be used and calibrated in accordance with the manufacturer's instructions. The accuracy of digital gauges shall be ± 0.001 inches.
 - 5.2.1 A couple of styles of digital gauges are pictured below (Figure 1). See [POLY 4](#).

Western Instruments N88-4-D

NDT Supply DPG-2

Figure 1: Digital Pit Gauges

5.2.2 Ordering information for these two pit gauges is shown in the Gas Standards & Procedures SharePoint site [here](#).

5.3 Manual Pit Gauge: A manual pit gauge typically used to measure corrosion pits on steel pipe can be used to measure defects in PE pipe. See Figure 2.

UNCONTROLLED IF PRINTED

Figure 2: Manual Pipe Pit Gauge (AG-1151, Stock Code 61 12 168)

5.3.1 Instructions

1. Clean area adjoining to the damage.
2. Place gauge lengthwise on the pipe and align with the center of the pipe.

To ensure accurate depth measurement, ensure that gauge is placed flush with the OD of the PE pipe, **not** on top of any flared polyethylene material that may have resulted from the damage.

3. Push the arm down until the stylus touches the pipe.
4. Read the depth indicated by the top of the indicator arm.
5. Measure damaged area until deepest cavity is found.

5.4 If depth of defect is greater than the maximum value listed in [Table 1](#), then remove the segment of PE pipe.

5.5 If measuring the depth of damage to plastic pipe is unsuccessful, then cut out and replace the damaged segment of PE pipe.

6.0 Maximum Defect Depth

6.1 Table 1 indicates the maximum defect depth for stock coded PE pipe sizes.

Table 1: Maximum Defect Depth

Pipe Size	PE 2406		PE 3408	
	Minimum Wall Thickness (inches)	Maximum Defect Depth (inches)	Minimum Wall Thickness (inches)	Maximum Defect Depth (inches)
½" CTS	0.090	0.009	0.090	0.009
1" CTS	0.099	0.009	0.101	0.010
1 ¼" IPS	0.166	0.017	Not applicable	Not applicable
2" IPS	0.216	0.022	0.216	0.022

POLYETHYLENE PIPE

October 1, 2020

POLY 2.8 Sale of Polyethylene Pipe

1.0 Purpose

This document describes Ameren Illinois' (AIC) policy on third-party requests for polyethylene (PE) pipe.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Requests from the Public](#)

[6.0 Requests from Qualified Contractors, Other Gas Utilities or Municipals](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 General

4.1 To ensure safe operations, polyethylene pipe must be installed and tested by qualified personnel utilizing specialized tools and equipment.

5.0 Requests from the Public

5.1 AIC will **not** sell, donate, lend or otherwise transfer polyethylene pipe, including related fittings and materials, to the general public.

5.1.1 At the discretion of the Region Director, AIC may provide polyethylene materials and allow the use of equipment for charitable installations for civic groups, churches, etc. Donated polyethylene pipe and associated fittings must be installed by an employee qualified to install polyethylene pipe.

5.2 AIC will **not** lend or rent the tools and equipment used for joining polyethylene pipe.

5.3 AIC will **not** assist, advise, train or qualify private individuals in the techniques of joining or installing polyethylene pipe.

5.3.1 If asked, AIC Gas Supervisors or Gas Field Personnel may, to the extent of their knowledge, answer questions concerning sources of polyethylene pipe and qualified installers.

6.0 Requests from Qualified Contractors, Other Gas Utilities or Municipals

6.1 AIC maintains pipe and material inventories sufficient for its own needs.

6.2 On an emergency basis, AIC may sell polyethylene pipe and related fittings and materials to other gas utilities, municipal gas system operators, or to contractors known to have personnel qualified to join polyethylene pipe.

End of Instructions.

POLYETHYLENE PIPE

December 1, 2020

POLY 2.9 Plastic Fusion Qualification

1.0 Purpose

This document prescribes the requirements for qualification of Ameren Illinois (AIC) personnel to perform plastic fusion (heat fusion on polyethylene (PE) pipe) in accordance with 49 CFR §192.285.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Fusion Qualification](#)[6.0 Testing of Plastic Fusion Joints](#)[7.0 Regualification](#)[8.0 Records](#)**3.0 Target Audience**

- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel

4.0 General

- 4.1 All gas field personnel performing plastic fusion must be trained and Operator Qualified (OQ) to make fusion joints.

5.0 Fusion Qualification

- 5.1 Fusion qualification shall be conducted under the supervision of the AIC Gas Operator Qualification Department.
- 5.2 Qualification will consist of a written exam and fabrication of specimen joints which are subjected to destructive testing.
- 5.3 A specimen joint shall be made by each Qualified Individual, as applicable, for each of the following fusion methods:
- 5.3.1 Butt Fusion-Manual
 - 5.3.2 Butt Fusion-Hydraulic
 - 5.3.3 Electrofusion-Coupling and Service Tee

6.0 Testing of Plastic Fusion Joints

- 6.1 The assembly of the specimen joint shall be observed to ensure that it is prepared in accordance with approved fusion procedures.
- 6.2 The completed fusion joint shall be examined visually and compared to a reference joint of acceptable quality.

UNCONTROLLED IF PRINTED

6.3 The following steps will be taken to test Butt Fusion Joints:

6.3.1 After allowing the joint to cool for a minimum of one hour, the joint shall be cut into three sample longitudinal straps, each approximately 1 inch wide.

6.3.2 Bend the sample straps by bringing the ends of the sample together and examine the entire fusion area.

1. A joint is considered satisfactory if all bent sample straps are completely free of cracks or voids in the fusion area.
2. If any separation, cracks, or voids are observed, then the fusion will be considered defective.

6.4 The following steps will be taken to perform a crush test on Electrofusion Joints:

6.4.1 Allow a minimum of one hour for joint to cool:

6.4.2 The following steps will be performed for testing coupling fusion joints:

1. Cut the pipe and coupling in half, as close as possible to the centerline of the pipe and coupling.
 - 1 a. *For pipe 2 inches and smaller:* It is desirable to have at least 3 inches of pipe at each end of the coupling.
 - 1 b. *For pipe larger than 2 inches:* It is desirable to have at least 8 inches of pipe at each end of the coupling.
2. Place a specimen half in a vise or hydraulic press so that the outermost wire of the fusion zone is approximately 1-1/4 inches from the jaws.
3. Close the jaws until the pipe walls meet.
4. Repeat the above process for each end of both halves of the coupling.
5. Inspect the crushed specimens for separation of the pipe and fitting in the fusion zone.
6. There should be no separation at the fusion interface of the pipe and fitting beyond the 15% at the outermost edges.

6.4.3 The following steps will be taken to perform a crush test on saddle fusion joints:

1. Leave the tapping tees intact.
2. Cut the pipe near the edge of the base of the saddle fitting.
3. Place the pipe and fitting into a vise or hydraulic press so that the jaws are within 1/2 inch of the bottom of the saddle.
4. Close the jaws until the inner pipe walls meet.
5. Inspect the crushed specimen for separation of the pipe and fitting in the fusion zone.
6. There should be no separation at the fusion interface of the pipe and fitting beyond the 15% at the outer most edges.

7.0 Requalification

7.1 All gas field personnel performing plastic fusion at AIC shall be requalified on each fusion method once per calendar year not to exceed 15 months.

- 7.2 Any gas field personnel who makes a production plastic pipe joint that is found to be unacceptable during pressure testing shall immediately report the failure to the Gas Supervisor.
 - 7.2.1 That individual shall **not** perform any additional plastic pipe joining until requalified in the failed process.
 - 7.2.2 The Gas Supervisor shall notify AIC Gas Operator Qualification Department to coordinate any remedial training needed, and requalification.

8.0 Records

- 8.1 Plastic fusion qualification will be recorded on the Plastic Fusion & Joining Annual Qualification form. See [POLY 4](#).
- 8.2 Plastic fusion qualification records shall be retained for a minimum period of 5 years.

End of Instructions.

POLYETHYLENE PIPE

October 1, 2020

POLY 2.10 Storage and Handling PE Material

1.0 Purpose

This document prescribes the storage and handling requirements for polyethylene (PE) material for use on natural gas systems.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Receipt Inspection](#)

[5.0 Handling](#)

[6.0 Unloading](#)

[7.0 Storage](#)

3.0 Target Audience

- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel
- AIC Storeroom Personnel

4.0 Receipt Inspection

- 4.1 PE material shall be inspected upon receipt to verify the accuracy of the material and manufacture date and to ensure there is no damage.
- 4.2 Ameren Illinois (AIC) will not accept receipt of pipe that is more than 1 year past the manufacture date on the print line.
- 4.3 If the print line is not legible, the pipe shall not be accepted.
- 4.4 Print line designation for PE pipe shall include at least: PE 2708 for MDPE and PE 4710 for HDPE.
- 4.5 PE fittings shall have designations:
- 4.5.1 *MDPE*:
1. PE 2406/2708, or
 2. PE 2406, or
 3. PE 2708
- 4.5.2 *HDPE*:
1. PE 3408/4710, or
 2. PE 3408, or
 3. PE 4710

5.0 Handling

UNCONTROLLED IF PRINTED

- 5.1 PE pipe coils and silos can be stretch wrapped or strapped. Strapping shall be non-adhesive type plastic or other non-metallic material.
- 5.2 Unload and store PE pipe in an area that is relatively level.
- 5.3 Pipe should not be set down on gravel, rock or any other surface that could damage the pipe surface.
- 5.4 Do not use PE material that is damaged during handling, transportation or storage.

6.0 Unloading

- 6.1 Follow all applicable safety guidelines and procedures when unloading PE material.
 - 6.1.1 If PE material is not on a pallet, then use protective barrier to cover metal forks to transport or lift the pipe.
 - 6.1.2 When transporting or unloading pipe, take care to protect the pipe from dragging or scraping against the ground or sharp objects.
 - 6.1.3 Use fabric slings to unload PE material, if needed. Inspect slings before use.
 - 6.1.4 **Do not** use material handling equipment to push or pull the load off the trailer.
 - 6.1.5 **Do not** drop PE material.
- 6.2 Ensure the load has not shifted and will remain stable before removing the trucker's straps from the load.
 - 6.2.1 *Stick pipe is loose loaded:*
 1. Before moving the load, ensure chocks are secured to both ends of the timbers. If not, nail a chock or wedge into position.
 2. Untie and unload the individual pipe lengths.
 3. Position fork lift near the center of the pipe so that the pipe is balanced on the forks.
 4. Pipe ends shall not be dragged across the ground as it is being moved.
 - 6.2.2 *Stick pipe is bundled:*
 1. Check straps restraining the bundled pipe to ensure bundle is secure.
 2. If fork lift is used to remove the bundle:
 - 2 a. Position fork lift near the center of the bundle so that the bundle is balanced on the forks.
 - 2 b. Forks should be long enough to safely support the bundle.
 3. If crane is used to remove the bundle:
 - 3 a. Place slings at the balance point of the bundle.
 - 3 b. Tag lines may be connected to the end of the bundle to assist in controlling the removal and placement of the bundle.
 - 6.2.3 *Coiled pipe silo on pallet:*

A silo refers to a wrapped package of several individually wrapped coils of pipe. The silo is transported on a pallet.

1. Check to make sure the silo banding is not broken and silo is secured on pallet.
2. Forks should be long enough to safely support the pallet.
3. Move the pallet as a whole unit.
4. If the silo banding is broken:
 - 4 a. Unload each coil individually, or
 - 4 b. Strap the silo prior to moving the pallet.

7.0 Storage

7.1 PE pipe has limited shelf life.

7.1.1 *PE 2708 (MDPE)*: Shelf life shall not exceed 3 years from the manufacture date printed on the pipe.

7.1.2 *PE 4710 (HDPE)*: Shelf life shall not exceed 10 years from the manufacture date printed on the pipe.

7.2 Store and protect PE material from:

7.2.1 Heat sources, such as steam pipes, heaters or radiators.

7.2.2 Contact with chemicals, salts or any substance that can degrade the material.

7.2.3 Direct contact with sharp objects or abrasive surfaces that can damage the material.

7.3 Unbundled stick length PE pipe shall be stacked according to the manufacturer's guidelines.

7.4 **Do not** stack PE pipe silos higher than 8 feet.

End of Instructions.

POLYETHYLENE PIPE

October 1, 2020

POLY 2.11 Maintenance of Fusion Equipment

1.0 Purpose

This document prescribes the general maintenance requirements for the electrofusion and butt fusion equipment used in heat fusion of PE pipe.

These general requirements meet the requirements of 49 CFR §192.756 and shall be used in conjunction with those published by equipment manufacturers.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Electrofusion Equipment Maintenance](#)

[5.0 Butt Fusion Machine Maintenance](#)

[6.0 Peelers](#)

[7.0 Clamps](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Services Personnel

4.0 Electrofusion Equipment Maintenance

Under no circumstance shall the electrofusion processor enclosure be opened for service in the field by unauthorized personnel.

- 4.1 Maintenance work required on electrofusion processors shall be only performed by the manufacturer's authorized service personnel or service center. See [POLY 4](#) for manufacturers' manuals.
- 4.2 Electrofusion processors shall be maintained at intervals that meet the minimum requirements specified in manufacturer's instructions. Maintenance records shall be maintained in Maximo.
- 4.3 Perform the following inspection on a regular basis on equipment that is being used:
 - 4.3.1 Clean processor's housing with a damp cloth. **Do not** spray with water or compressed air.
 - 4.3.2 Clean processor digital display screens with industrial alcohol. **Do not** use solvents or Trichlor products.
 - 4.3.3 Inspect the power cables for damage and replace damaged cables.
 - 4.3.4 Inspect and clean fitting adapters.

UNCONTROLLED IF PRINTED

4.3.5 Ensure fitting adapters fit tightly. Replace loosely fitting adapters.

4.3.6 Keep barcode scanner wand clean.

4.3.7 Keep area around the sensors clean and free of obstructions.

4.4 Store processors in a clean, dry and protected environment.

5.0 Butt Fusion Machine Maintenance

5.1 Manufacturer's detailed maintenance procedures for the McElroy and Connectra machines can be found in [POLY 4](#).

5.2 The following are general maintenance procedures and should be performed on a regular basis on equipment that is being used:

5.2.1 Keep mechanical portion of the machine clean of mud and contaminating material.

5.2.2 Remove heater and facer before washing the machine.

5.2.3 Remove oily dirt build up on guide rods.

5.2.4 Lubricate guide rods if they are not self-lubricated.

5.2.5 Check pivot pins and shafts and apply a drop of oil.

5.2.6 Remove dirt from jaws and clamp knob.

5.2.7 Clean clamp knob eyebolt threads.

5.2.8 Check all nuts, bolts and snap rings to ensure they are secure and in place.

5.2.9 Check heater surfaces and clean if necessary.

5.2.10 Inspect facer blades for damage and sharpness. Replace damaged or dull blades.

5.2.11 Clean facer guides with clean dry cloth.

5.2.12 Check locking cam for wear and damage, if equipped.

5.3 The butt fusion machines will have an inspection performed every other year. The inspection will be recorded and tracked in Maximo.

6.0 Peelers

6.1 Peelers should be free of dirt and/or any substance that could contaminate the fusion area.

6.2 Inspect peeler blades for sharpness and damage. Replace if necessary.

6.3 Indication of dull or damaged blades may include:

6.3.1 Incomplete removal of witness markings.

6.3.2 Non-uniform thickness of ribbon material being removed.

6.3.3 Gouges in the peeled surface.

6.4 If applicable, check wheels to ensure they rotate smoothly and have not been damaged. Replace if necessary.

7.0 Clamps

7.1 Clamps should be clean.

7.2 Inspect clamps for damage and replace if necessary.

7.3 Ensure clamps are holding fitting securely in-place, replace if not.

End of Instructions.

Operator Qualification (OQ) Required?

NO.

POLY 3.1 Transition Fittings and Protective Sleeves

1.0 Purpose

This document describes the requirements for:

- Transition fittings used to make plastic-to-steel connections
- Protective sleeves

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 Transition Fittings](#)[5.0 Protective Sleeves](#)

Appendices

[Appendix A - Transition Fittings](#)[Appendix B - Protective Sleeves](#)

3.0 Target Audience

- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Gas Construction Services Personnel

4.0 Transition Fittings

- 4.1 The use of transition fittings is the only approved method at Ameren Illinois (AIC) for making a plastic-to-steel connection. **The use of mechanical compression couplings is no longer approved.**
- 4.2 [Appendix A](#) shows transition fittings approved for use at AIC. Note that each fitting comes with a protective sleeve.
- 4.3 Installation
- 4.3.1 Weld the steel end of the fitting to steel pipe using an approved welding procedure.
- 4.3.2 Wrap the transition portion of the fitting with wet rags. Do not remove rags until the weld has cooled, approximately 10 minutes.
- 4.3.3 Position the protective sleeve over the transition portion of the fitting. If necessary, tape the sleeve in place.
1. Protective sleeve is required for fittings less than 2 inch.
 2. Protective sleeve is optional for fittings 2 inch and larger.

Protective sleeve shall be installed as one solid piece and not split in half.

UNCONTROLLED IF PRINTED

4.3.4 Make heat fusion weld to plastic pipe using approved procedures.

5.0 Protective Sleeves

5.1 [Appendix B](#) shows protective sleeves approved for use at AIC.

PRESSURE MONITORING

October 1, 2020

PRES 1 Requirements**1.0 Purpose**

This procedure outlines the requirements for monitoring the pressure in the Ameren Illinois (AIC) gas distribution and transmission systems to meet the requirements of Illinois Administrative Code Section 501.510 Pressure Surveys and 49 CFR §192.741 Pressure limiting and regulating stations: Telemetry or recording gauges.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)**[4.0 General](#)****[5.0 Pressure Monitoring Locations](#)****[6.0 Pressure Monitoring as Early Warning Agent](#)****3.0 Target Audience**

- Gas Engineering
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services Personnel
- Gas Control Personnel
- Pipeline Integrity Management Personnel

4.0 General

- 4.1 Each gas distribution and transmission system has a defined maximum allowable operating pressure (MAOP).
- 4.2 Electronic pressure recorders, that continuously monitor pressure, shall be installed on those systems that require monitoring.

5.0 Pressure Monitoring Locations (49 CFR §192.741)

- 5.1 Install electronic pressure recording devices on:
- 5.1.1 Each distribution system supplied by *more than one* district regulator station.
- 5.1.2 Each distribution systems supplied by *a single* district regulator station **IF** the customer count, based on the most recent Gas Study, is in the range of 950 to 1100 customers and greater.
- 5.2 Location of pressure recording devices depends on the design of the system. Select locations that would best indicate an abnormal operating condition (AOC).

Recording devices can be installed at distribution regulator stations where transmission or high pressure distribution inlet pressures can be monitored along with outlet system pressure.

- 5.3 Gas Control monitors system pressures which have supervisory control data acquisition (SCADA) capability and Electronic Recorder (ERX) alarms.

UNCONTROLLED IF PRINTED

- 5.4 Additional recording devices (electronic recorders, manual chart recorders or pressure gauges) can be installed, at the discretion of the Gas Supervisor or at the request of Gas Tech Support or Gas Engineering, to identify suspected pressure control inadequacies or verify modeling results.
 - 5.4.1 Consider installing pressure recording devices at various locations within the distribution system to assist in maintaining system pressure within allowable limits.
 - 5.4.2 These pressure recording devices should remain until their purpose has been fulfilled.

The data compiled or derived from these recording devices will assist in determining the adequacy of system pressure control.

6.0 Pressure Monitoring as Early Warning Agent

- 6.1 Monitoring of pressure or flow can be used as an early warning agent to disclose system failures or malfunctions.
- 6.2 Consider the following parameters to determine whether monitoring of the system is feasible and practical:
 - 6.2.1 Response time of operating personnel to the source of the recording device.
 - 6.2.2 The magnitude of pressure drop or flow increase which would indicate a system failure.
 - 6.2.3 Design limits of the recording device to properly respond to a system failure.
 - 6.2.4 Recognition of possible failures to which the recording device would not respond.
 - 6.2.5 Seasonal changes in normal pressure or flow requirements, which will require Gas Technical Services (GTS) to provide Gas Control with new alarm limits.

End of Instructions.

Operator Qualification (OQ) Required?

PRESSURE MONITORING

October 1, 2021

PRES 2.1 Potential Over Pressurization or Service Interruption**1.0 Purpose**

This procedure provides guidance response to potential over pressurization or service interruption. This procedure meets the minimum requirements of 49 CFR §191.23.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Pressure Monitoring While Performing Work Activities](#)[6.0 Low Pressure Systems \(4 inch to 14 inches water column\)](#)[7.0 Gas Control](#)[8.0 Activities Requiring an Operational Checklist](#)[9.0 Activities Requiring an Operational Checklist and Written Procedure](#)[10.0 Overpressure Reporting](#)

Appendices

[Appendix A - Sample Operation Checklist](#)[Appendix B - Sample Written Procedure Outline](#)**3.0 Target Audience**

- Gas Engineering
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Engineering (GTE)
- Gas Tech Services Personnel (GTS)
- Gas Control Personnel
- Pipeline Integrity Management Personnel
- Gas Control

4.0 General

- 4.1 There are certain activities performed while operating and maintaining the gas system which present the potential for over pressurization or an unintentional interruption of gas service to our customers.
- 4.2 At a minimum these activities require pressure monitoring. However, some work activities warrant additional planning and written procedures.
- 4.3 This section identifies the activities that require pressure monitoring, an operational checklist and/or a written procedure prior to performing the work activity.

5.0 Pressure Monitoring While Performing Work Activities

- 5.1 Pressure monitoring shall be required when performing work activities that could result in an unintentional gas service outage or an over pressure situation above the maximum allowable operating pressure (MAOP) of the system.
- 5.2 Work activities that require pressure monitoring of the system include activities such as:

UNCONTROLLED IF PRINTED

- 5.2.1 Manual by-passing operations.
- 5.2.2 Isolating a regulator station.
- 5.2.3 Closing or opening system valves that depend upon a two-way feed to supply the system.
- 5.2.4 Increasing or decreasing normal system operating pressure.
- 5.2.5 Stopping or squeeze-off operations that depend upon a two-way feed to supply the system.
- 5.2.6 Installing pipe that connects two systems together.
- 5.2.7 Replacement work affecting a low pressure distribution gas system.
- 5.2.8 Regulator station maintenance work on a low pressure distribution gas system.
- 5.3 Pressure monitoring shall include:
 - 5.3.1 Installing pressure gauges or recording devices upstream and downstream of the work activities.
 - 5.3.2 Monitoring existing pressure chart recorders/gauges.
 - OR
 - 5.3.3 Requesting Gas Control to monitor electronic pressure recorders.

6.0 Low Pressure Systems (4 inch to 14 inches water column)

- 6.1 Pressure monitoring on low pressure system(s) requires a designated individual to constantly observe the downstream pressure during work activities. See Table 1 for low pressure systems within the Ameren Illinois (AIC) distribution network.

Table 1 - Low Pressure Systems

Town	System ID	System Name
Peoria	X436	Glen Brook Apartments

7.0 Gas Control

- 7.1 Contact Gas Control when planning and prior to beginning any major operation that could potentially:
 - 7.1.1 Affect the gas flow in a transmission or high pressure distribution main that is remotely monitored.
 - 7.1.2 Affect the operating pressures in a system.
 - 7.1.3 Result in an unintentional loss of gas service to a portion of a system.
- 7.2 Issues to discuss with Gas Control:
 - 7.2.1 Potential for the need to redirect gas flow.
 - 7.2.2 Will gas supply need to be obtained from a different supplier?
 - 7.2.3 Lead time required for necessary adjustments?
 - 7.2.4 Notify Gas Control of projected pressure limits and new alarm settings.
 - 7.2.5 Establish a communications plan between Gas Control and appropriate gas personnel at the jobsite.
- 7.3 Notify Gas Control when work has been completed.

UNCONTROLLED IF PRINTED

7.3.1 If applicable, notify Gas Control as to what alarm settings should be set, changed, or left as is.

7.3.2 If applicable, verify that the pressure readings at the monitored location are being accurately received by Gas Control

8.0 Activities Requiring an Operational Checklist

8.1 During the normal course of operating and maintaining the gas system, there are tasks performed which could temporarily interrupt the normal flow of gas.

8.2 The operational checklist form shall be used when performing the following tasks (See [PRES 3](#) and [Appendix A](#)):

8.2.1 Tapping and stopping performed on low pressure mains, distribution mains or transmission lines that will interrupt the normal flow of gas to customers.

8.2.2 Operating (opening or closing) system valves when performing scheduled construction or maintenance work that will interrupt the normal flow of gas.

8.2.3 Squeezing PE when performing scheduled construction or maintenance work that will interrupt the normal flow of gas.

8.2.4 When multiple tie-ins/cut-offs are required for system maintenance or replacement:

1. Gas Engineering shall develop a written sequence of operations to ensure actions taken will not affect system supply.
2. Gas Engineering shall review the construction sequence with the Gas Supervisor and the Construction Inspector where applicable.
3. If the scope of the field work changes, the plan shall be modified and approved by Gas Engineering.

8.3 The operational checklist is **not** required:

8.3.1 When there are no customers downstream of an operation such as squeezing and cutting off a cap in order to extend a main, or installing a stopper fitting to retire a section of main.

8.3.2 When performing Operational and Primary regulator station inspection.

8.3.3 When specific written sequence of operations is provided by engineering.

The operational checklist can be used in an emergency situation such as third party damage; however, it is not required.

9.0 Activities Requiring an Operational Checklist and Written Procedure

9.1 The following require an operational checklist and a written procedure:

9.1.1 Uprating system pressure. Refer to [UPRT 1](#) - Uprating.

1. Converting low pressure systems (4" to 14" w.c.) to distribution pressure.
2. Increasing the MAOP of a system.

9.1.2 Abandoning facilities. Refer to [ABND 2.1](#) for specific details.

UNCONTROLLED IF PRINTED

- 9.2 Gas Engineering personnel or GTE shall develop the written procedure. The Written procedure shall be approved by the Supervising Engineer or Gas Superintendent. See [Appendix B](#) for sample procedure outline.
- 9.3 The written procedure shall include the following:
- 9.3.1 Operational checklist.
- 9.3.2 Required information for the task being performed:
1. Abandonment plans. Refer to [ABND 2.1](#).
 2. Upgrading or increasing system pressure. Refer to [UPRT 1](#).
- 9.4 A pre-job meeting shall be held to review the written procedures.

10.0 Overpressure Reporting

10.1 Procedure

- 10.1.1 In case of any equipment malfunction or operating error that causes the pressure in a system to exceed the Maximum Emergency Pressure (MEP), the Gas Supervisor shall be verbally contacted immediately.
- 10.1.2 The Gas Supervisor will immediately contact:
1. Gas Compliance personnel and Gas Tech Services.
 2. Integrity Management group if a transmission system was over pressurized.
 3. See [FORW](#) for department contacts.
- 10.1.3 When the MEP is exceeded on transmission facilities, a Gas Transmission MAOP Exceedance Report must be filed with PHMSA within five calendar days of the occurrence. Refer to [SAFT 1](#).
- 10.1.4 GTS Supervisor shall contact Gas Control to see if affected system is remotely monitored.
1. If it is, have Gas Control review their data to verify an over-pressurization occurred. Gas Control shall provide GTS Supervisor with copy of available data to be included in the Gas Transmission MAOP Exceedance report.
- 10.1.5 The GTS Supervisor should also report the following information in writing to Manager - Pipeline Safety Compliance within three working days:
1. Date and times of occurrence.
 2. Names, job title and phone number of person(s) who determined the condition.
 3. Pressure system identification and station identification (including a physical address) if a regulator malfunction occurs.
 4. Normal operating pressure, MAOP and MEP of the system, and the highest actual pressures observed exceeding the MEP.
 5. Description of the overpressure protection devices and their operation.
 6. The apparent cause of the overpressure condition
 7. The corrective action taken (including reduction of pressure or shutdown) to date and any planned follow-up of future corrective action, including the anticipated schedule for starting and concluding such action.

UNCONTROLLED IF PRINTED

10.1.6 Gas Compliance shall notify PHMSA of the event by email to InformationResourcesManager@dot.gov and concurrently notify the Illinois Commerce Commission, Pipeline Safety Department, within five days of the occurrence.

10.1.7 When over-pressurization occurs within a transmission system, GTS Supervisor will provide Integrity Management group in Decatur with a copy of the Gas Transmission MAOP Exceedance report.

End of Instructions.

Operator Qualification (OQ) Required?

YES

0311: Adjust and Monitor Flow or Pressure - Manual Valve Operation

1371: Operate Gas Pipeline - System Control Center Operations

UNCONTROLLED IF PRINTED

OPERATIONAL CHECKLIST TO MITIGATE THE OVER PRESSURIZATION OR UNINTENTIONAL INTERRUPTION OF GAS SERVICE

DOJM / WO # _____

Area Affected – Describe the area affected and consider the following:

- Main Segments
- Adjacent Gas Systems
- Customers Affected
 - o Residential
 - o Commercial
 - o Industrial
 - o Critical such as Hospital, School, Restaurants

(Details) _____

Isolation Points – Identify the location(s) where the normal flow will be interrupted:

- Tapping/Stopping
- System Valves
- Squeeze Off

(Details) _____

System Pressures – Identify the system MAOP, normal operating and the minimum pressure to maintain gas service.

- MAOP _____ Psig
- Normal Pressure _____ Psig
- Minimum Pressure _____ Psig

(Other Details for Multiple Systems) _____

Maintaining Flow – Identify the method(s) that will be utilized to supply gas to the area affected.

- By-Pass Installation
- By-Pass Through Stopper Equipment
- CNG Trailer
- Alternate System Feed
- Line Pack

(Details) _____

Pressure Monitoring – Identify method(s) to be utilized to monitor system pressure.

- Gauge Points
- Pressure Charts
- Electronic Recorders
- Gas Control/SCADA

(Details) _____

Pressure Monitoring Plan- Identify the location of pressure monitoring points including adjacent systems, the monitoring schedule, the expected pressures and acceptable range of pressure at each point. When establishing the monitoring plan consider the time of year, system loads, and system line pack.

1. Identify locations to monitor pressures
2. Identify expected pressures and acceptable ranges at each location(s)
3. Identify pressure monitoring scheduled (i.e. once, hourly, continuously, etc)
4. Record pressures during monitoring activities

Monitoring Point	Expected Pressure	Acceptable Range	Monitoring Schedule	Actual Pressure

(Details) _____

Public Notification – Identify public contacts to be notified prior to performing work activities.

- Fire / Police / City
- Residential Customers
- Commercial Customers
- Industrial Contact Center
- Critical Customers (i.e. Hospital, Nursing Home, School)
- Other _____

Contingency Action – Identify any contingency action(s) to be performed in the event of a high pressure or low pressure situation.

High Pressure

Low Pressure

Attach any additional documentation. Review and approval of the Gas Supervisor is required.

SUPERVISING ENGINEER _____ DATE _____

GAS SUPERINTENDENT _____ DATE _____

Final Verification that all written procedures have been performed prior to increasing system pressure.

NAME _____ DATE _____

UNCONTROLLED IF PRINTED

1.0 Purpose

This document provides procedures for reviewing electronic and mechanical pressure recorder data and responding to abnormal pressure results. This procedure meeting the requirements of 49 CFR §192.741.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Electronic Recorders](#)

[5.0 Mechanical Chart Recorders](#)

3.0 Target Audience

- Gas Engineering
- Gas Field Personnel
- Gas Supervisors
- Gas Tech Services Personnel (GTS)
- Gas Control Personnel
- Pipeline Integrity Management Personnel

4.0 Electronic Recorders

4.1 General

4.1.1 This section outlines procedures for using Electronic Recorders (ERX) for transmission and distribution systems. These procedures do not apply to the ERX's used for a different function at the gas storage fields. See Figure 1.

Figure 1: Mercury Electronic Recorder (ERX)

4.2 Reviewing Electronic Recorder Data

- 4.2.1 Gas Control shall monitor Electronic Recorder (ERX) and SCADA alarms.
- 4.2.2 Gas Control shall notify the Gas Technical Services (GTS) personnel, or Gas Supervisor and/or the pipeline supplier if the alarm notification system indicates a pressure outside the established pressure limits.

UNCONTROLLED IF PRINTED

4.2.3 The GTS technician shall investigate the situation and correct any deficiencies.

1. Notify Gas Control before starting any investigative work at the ERX or SCADA site.
2. Report corrective action taken to Gas Control and ensure alarm is cleared before leaving the ERX/SCADA site.

1. Historical data base with all of the recorder data is maintained in Gas Control's record system.
2. Gas Control sends out a weekly ERX Report to GTS Supervisors which lists alarms along with other operating data for each ERX being monitored in AIC operating areas.

4.2.4 The weekly ERX Report shall include a list of ERXs that are not communicating with the host computer.

1. GTS Supervisor shall dispatch GTS technician to the location to determine why the unit had lost communication and if possible, remedy the situation.
2. If the situation cannot be corrected at that time, the GTS technician shall collect and review weekly data until the unit resumes communicating with the host.

4.3 Calibration of Electronic Recorders.

4.3.1 Transmission and distribution system electronic pressure recorders shall be checked for accuracy and calibrated as necessary once each calendar year not to exceed 15 months.

4.3.2 Electronic pressure recorders shall be calibrated in accordance with manufacturer's instructions

4.3.3 The GTS Supervisors shall ensure the date of the calibration is documented in Maximo.

4.4 Records

4.4.1 Gas Control shall e-mail a weekly ERX Report GTS Supervisors and providing the following information from the previous week:

1. A summary of pressure readings;
2. Alarms;
3. Abnormalities recorded.

Gas Control maintains a historical electronic record or data base of recorded pressures for electronic pressure recorders.

4.4.2 The recorded pressure data shall be maintained for a minimum of two years.

5.0 Mechanical Chart Recorders

5.1 General

- 5.1.1 This section outlines procedures for using mechanical chart recorders.
- 5.1.2 Mechanical chart recorders are used to supplement electronic recorders for pressure monitoring in such instances as:
 - 1. An electronic recorder malfunctions and a replacement electronic recorder is not available.
 - 2. Pressure within the system needs temporarily monitored. Refer to [PRES 1 5.4](#).
- 5.1.3 Mechanical chart recorders are used as pressure recording devices. Refer to [PTST 1 Paragraph 8.1.2](#).

5.2 Changing Mechanical Recorder Charts

- 5.2.1 GTS personnel shall change the chart at the chart recording interval (i.e. daily or weekly).
 - 1. The following information shall be entered on the chart:
 - 1 a. Town and/or location of the chart recorder.
 - 1 b. Date and time when chart was installed.
 - 1 c. Date and time when chart was removed.
 - 1 d. Normal operating pressure.
 - 1 e. Initials of gas field personnel changing the chart.

5.3 Mechanical Chart Recorder Accuracy Check

- 5.3.1 Pressure recorders calibration shall be checked once each calendar year not to exceed 15 months.
- 5.3.2 The calibration checks shall be maintained in Maximo.
- 5.3.3 The calibration date shall be labeled on the chart recording device.
- 5.3.4 Pressure checks shall be made at zero and operating pressure, by comparison to an appropriate test gauge of known accuracy.
 - 1. If accuracy issues are detected, then take corrective action.

5.4 Records

- 5.4.1 The GTS Supervisor shall ensure the charts, for Mechanical chart recorders installed in regulator stations, are filed and retained for 2 years.

End of Instructions.

Operator Qualification (OQ) Required?

PRESSURE MONITORING

October 1, 2021

PRES 2.3 ERX Alarm Change Request

1.0 Purpose

This document provides instructions on making pressure change and ERX Alarm change requests.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 ERX Alarm Change Request](#)

[5.0 Pressure Change Request to Pipeline Supplier](#)

Appendices

[Appendix A - Sample Forms](#)

[Appendix B - Pressure Change Request Workflow Diagram](#)

3.0 Target Audience

- Gas Tech Engineering (GTE)
- Gas Control
- GTS Supervisor
- Gas Tech Services (GTS) Superintendent
- Gas Tech Services (GTE) Technicians

4.0 ERX Alarm Change Request

4.1 General

4.1.1 AIC has electronic pressure recorders (ERX) installed at various locations throughout their operating areas that monitor operating pressure on various gas systems and facilities.

Many ERXs are programmed with alarm settings that are remotely monitored by Gas Control. The alarm settings provide an indication of possible problems within the system.

4.1.2 Gas Control has established protocols for addressing alarms and notifying the appropriate gas personnel to investigate. See [PRES 2.2](#).

Protocols are contained in Control Room Management Procedures maintained at Gas Control.

4.1.3 Gas Control shall not change any alarm setting without written approval by the appropriate GTS Supervisor/Superintendent or GTE Engineer.

UNCONTROLLED IF PRINTED

4.1.4 ERX alarm change request will be submitted electronically on Gas SCADA Alarm Limit Change Request form. See [Appendix A-2](#) and [PRES 3](#).

4.2 Alarm Change Request

4.2.1 Use the Gas SCADA Alarm Limit Change Request form to submit an alarm change request (temporary or permanent) to authorized Approver.

4.2.2 The Gas SCADA Alarm Limit Change Request form will handle one ERX.

4.2.3 The approved Gas SCADA Alarm Limit Change Request form should be submitted electronically to Outlook's @ERX by Approver.

4.2.4 Temporary pressure alarm change will be placed in an electronic file that alerts regularly until it is canceled by:

1. A follow-up Gas SCADA Alarm Limit Change Request to "return to normal alarm set-point"

OR

2. A new permanent alarm set-point request is received by @ERX.

4.2.5 Approved permanent alarm change will be loaded into the ERX database as the new alarm setting.

4.2.6 Only the authorized Approver should submit the completed Gas SCADA Alarm Limit Change Request electronically to Gas Control.

1. The Approver shall send the completed form under their e-mail sign-in as a means of documentation.

4.3 Situations Requiring Gas SCADA Alarm Limit Change Request Form

4.3.1 Operating pressure change may be needed to meet operational needs such as:

1. Tapping
2. System upgrades/downgrades
3. Pipeline repairs
4. Pipeline relocations
5. Maintenance on pressure control stations.

4.3.2 GTS personnel will know if these changes will be outside of the alarm settings for the ERX.

4.3.3 Activity requiring a change in operating pressure when the GTS personnel cannot remain on the jobsite.

1. Submit a completed and approved Gas SCADA Alarm Limit Change Request form to Gas Control before leaving the jobsite.

4.3.4 Activity requiring a change in operating pressure that extends beyond the GTS personnel's shift.

1. Submit a completed and approved Gas SCADA Alarm Limit Change Request form to Gas Control before the end of shift.

4.3.5 The Gas SCADA Alarm Limit Change Request can be completed in two ways:

1. GTS personnel can complete the form on their Mobile Data Terminal (MDT) and send it to their supervisor for approval

OR

2. GTS personnel can call their supervisor and have them complete the form.

4.4 Situations Not Requiring Gas SCADA Alarm Limit Change Request Form

- 4.4.1 GTS personnel are on the jobsite throughout the activity and are in contact with Gas Control before adjusting pressure and at the end of the activity to ensure a return to normal operating parameters.

Being on the jobsite does not require the Gas Technical Services personnel to be gauging pressure at each ERX location.

- 4.4.2 Activities such as calibration, inspection, or forcing a test call.
- 4.4.3 An activity where the adjusted operating pressure is within the ERX's alarm settings.
- 4.4.4 Performance of an activity that is not related to or causing an Abnormal Operating Condition (AOC). See [GLOS](#).

5.0 Pressure Change Request to Pipeline Supplier

5.1 General

- 5.1.1 Ameren Illinois (AIC) occasionally request Pipeline Suppliers to change the delivery pressure into the AIC gas system.

1. These changes could be due to an increase or decrease in demand or maintenance activities being performed in the system.

- 5.1.2 This section describes the formal process for requesting Pipeline Suppliers to change set point, temporarily or permanently, for gas being delivered into the AIC gas system.

5.2 Requests for Gas Suppliers to Change Set Points

- 5.2.1 GTS Superintendent shall review and approve requests for a Pipeline Gas Supplier to change pressure set points for gas delivered to AIC.
- 5.2.2 GTS personnel shall coordinate evaluation of the request with Gas Control, GTE, and Planning.
- 5.2.3 Gas Operations Support personnel shall prepare the Ameren Pressure Change Request form. See [PRES 3](#).
- 5.2.4 GTS Superintendent shall approve and electronically submit the Ameren Pressure Change Request to the appropriate Pipeline Supplier.
 1. Pipeline Supplier shall not make any changes to delivery pressure without this written approval from the GTS Superintendent.
- 5.2.5 Pipeline Supplier shall review, sign and electronically return the Ameren Pressure Change Request which validates the Supplier's actions in accordance with AIC's request.
- 5.2.6 If the requested change is temporary, then a subsequent Ameren Pressure Change Request shall be submitted to the Pipeline Supplier to reinstate normal delivery pressure setting.

UNCONTROLLED IF PRINTED

5.2.7 GTS shall provide, at a minimum, the following information on the Ameren Pressure Change Request form (see [Appendix A-1](#) and [PRES 3](#)):

1. Location name and address of the pipeline delivery point
2. Pipeline Supplier;
3. AIC representative;
4. Effective date for changing set point;
5. If the change is permanent or temporary;
6. If change is temporary, estimated duration of change;
7. Current AIC system MAOP;
8. Newly established AIC system MAOP, if applicable;
9. Current operating pressure;
10. Requested operating pressure.

5.2.8 GTS Superintendent shall distribute copies of completed Ameren Pressure Change Request form to:

1. Gas Control
2. GTE - Planning
3. GTE - Engineering
4. GTE - Operations

5.2.9 The workflow diagram in [Appendix B](#) outlines this process.

5.3 Records

5.3.1 GTS Superintendent shall see that all Ameren Pressure Change Request forms signed by the Pipeline Supplier are filed in a central file maintained by GTS.

End of Instructions.

Operator Qualification (OQ) Required?

YES

1371: Operate Gas Pipeline - System Control Center Operations

1381: Operate Gas Pipeline - Local Facility Remote -Control Operations

Revision Notes

Location of Changes	Summary of Changes
Not applicable.	This is a new document.

1.0 Purpose

This document prescribes requirements and frequency for patrolling gas transmission, high pressure distribution, and distribution pipelines in Ameren Illinois' (AIC) operating areas.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 Critical Area Patrols](#)

[5.0 Transmission Line Patrols \(49 CFR §192.705\)](#)

[6.0 Distribution Patrols \(49 CFR §192.721\)](#)

[7.0 Patrol Methods](#)

[8.0 Records](#)

3.0 Target Audience

- Gas Compliance Personnel
- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Contract Leak Surveyor
- Gas Integrity Management Personnel
- Gas Tech Engineering (GTE) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Personnel
- Gas Construction Services Supervisors

4.0 Critical Area Patrols

- 4.1 See [PTRL 2.2](#) for definition of critical areas and patrolling and recordkeeping procedures.
- 4.2 Critical areas on transmission, high pressure distribution, and distribution pipelines shall be identified and maintained in Maximo.
- 4.3 [Table 1](#) prescribes frequency and intervals between Critical Area Patrols.
- 4.3.1 *Business Districts*: Critical areas identified on transmission, high pressure distribution or distribution pipelines in business districts shall be patrolled a minimum four times each calendar year at intervals not exceeding 4 1/2 months.
- 4.3.2 *All other critical areas*: Critical areas identified on transmission, high pressure distribution or distribution pipelines shall be patrolled a minimum two times per calendar year at intervals not exceeding 7 1/2 months.

Table 1: Frequency of Critical Area Patrols

Location	Frequency
Critical areas within a Business District	Four times per calendar year; maximum interval of 4 1/2 months

All other critical areas	Two times per calendar year; maximum interval of 7 1/2 months
--------------------------	---

5.0 Transmission Line Patrols (49 CFR §192.705)

- 5.1 AIC shall have a patrol program to observe surface conditions on and adjacent to the transmission line right-of-way for indications of leaks, construction activity, and other factors affecting safety and operations. Refer to [PTRL 2.1](#) for transmission line patrolling methods, reporting and documentation.
- 5.2 Frequency and intervals between transmission patrols may not exceed those prescribed in Table 2, in accordance with 49 CFR §192.705.

Table 2: Frequency and Maximum Interval Between Transmission Patrols

Class Location	At Highway or Railroad Crossings	All Other Locations
1	Two times per calendar year; maximum interval of 7 1/2 months	One time per calendar year; maximum interval of 15 months
2	Two times per calendar year; maximum interval of 7 1/2 months	One time per calendar year; maximum interval of 15 months
3	Four times per calendar year; maximum interval of 4 1/2 months	Two times per calendar year; maximum interval of 7 1/2 months
4 Note (1)	Four times per calendar year; maximum interval of 4 1/2 months	Four times per calendar year; maximum interval of 4 1/2 months
<p>Notes:</p> <p>(1) AIC does not have any Class 4 Locations within its operating areas.</p> <p>(2) AIC will conduct patrolling for a pipeline in a tunnel at intervals similar to a pipeline in a casing.</p>		

- 5.3 For critical areas identified on transmission pipelines, see [Section 4.0](#) for Critical Area Patrols requirements and patrol frequency.

6.0 Distribution Patrols (49 CFR §192.721)

- 6.1 Distribution mains in places or on structures where anticipated physical movement or external loading could cause failure or leakage shall be patrolled. See Table 3.

Table 3: Frequency of Distribution Patrols (Non-Critical Areas)

Location	Frequency
Areas within a Business District	Four times per calendar year; maximum interval of 4 1/2 months
Areas outside of the Business District	Two times per calendar year; maximum interval of 7 1/2 months

- 6.2 For critical areas identified on distribution and high-pressure distribution pipelines, see [Section 4.0](#) for Critical Area Patrols requirements and patrol frequency.

7.0 Patrol Methods

- 7.1 Refer to [PTRL 2.3](#) for patrol methods. Transmission and distribution lines can be patrolled by:
 - 7.1.1 Walking the line, or
 - 7.1.2 Driving along the line, or
 - 7.1.3 Aerial patrol (flying) over the pipeline alignment, or
 - 7.1.4 Other appropriate means of traversing the right-of-way.

8.0 Records

- 8.1 The results of the pipeline facility patrols shall be updated following a patrol and maintained in Maximo. See Table 4 for record retention requirements.

Table 4: Record Retention

Facility	Retention
Transmission Mains	Life of the facility
High Pressure Distribution Mains (Critical areas)	6 years
High Pressure Distribution and Distribution Mains (Critical areas)	6 years

PIPELINE PATROLS

October 1, 2020

PTRL 2.1 Transmission Patrols

1.0 Purpose

This document specifies procedures for gas transmission pipeline patrols, data processing and recordkeeping.

All procedures meet minimum requirements of 49 CFR §§ 192.705 and 192.709.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Transmission Main Patrol](#)[6.0 Patrol Requirements](#)[7.0 Processing Data](#)**3.0 Target Audience**

- Gas Compliance Personnel
- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Contract Leak Surveyor
- Gas Integrity Management Personnel
- Gas Tech Engineering (GTE)
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Personnel
- Gas Construction Services Supervisors

4.0 General

- 4.1 The purpose of pipeline patrols is to observe surface conditions on and adjacent to pipeline rights-of-way for indications of leaks, encroachments, construction activity other than that performed by Ameren Illinois, and any other factors affecting safety and operation of the AIC pipeline.
- 4.2 Any indication of gas leakage must be investigated in accordance with procedures in [LEAK 2.2](#).

5.0 Transmission Main Patrol

- 5.1 Acceptable methods include:
 - 5.1.1 Walking.
 - 5.1.2 Driving.
 - 5.1.3 Aerial.
 - 5.1.4 Other appropriate means of traversing the right-of-way.
- 5.2 At least one transmission line patrol per calendar year shall be a land patrol.
- 5.3 Class locations, HCA's, MCA's, and patrol designation will be stored on the appropriate electronic maps.

UNCONTROLLED IF PRINTED

- 5.4 See [PTRL 1 Table 2](#) for transmission patrol frequency.
- 5.5 Pipeline facility patrols and critical area patrols may be performed in conjunction with the leak surveys. However, they must be documented separately within ClickMobile for their respective tasks.

6.0 Patrol Requirements

- 6.1 The following items, at a minimum, should be observed when performing the patrol by foot, vehicle, or aerial within the class location and class location buffer. See [PTRL 2.3](#) for additional items.
 - 6.1.1 Surface conditions on and adjacent to the pipeline facility right-of-way.
 - 6.1.2 Status of vegetation and tree growth within and adjacent to the pipeline right-of-way.
 - 6.1.3 Potential obstructions for accessibility to pipeline.
 - 6.1.4 Exposed transmission pipeline segments.
 - 6.1.5 Construction or recent excavation activities other than those performed by Ameren Illinois.
 - 6.1.6 Structures located over the pipeline.
 - 6.1.7 Demolition activities over or adjacent to pipeline.
 - 6.1.8 Visual indications of leaks.
 - 6.1.9 The presence of gas at casing vents and the general condition of highway and railroad crossings.
 - 6.1.10 Any condition that is or could be detrimental to the pipeline facilities.
 - 6.1.11 Any indication of hazardous or potentially hazardous conditions
 - 6.1.12 Construction activities such as a new subdivision, school, or business that may change the class location, MCA's, or HCA's along a transmission main.
- 6.2 Document within ClickMobile any condition that requires immediate notification to Gas Supervisor and follow-up action, such as:
 - 6.2.1 Hazardous or potentially hazardous conditions.
 - 6.2.2 Indication of gas coming from casing vents. If noted, then initiate a leak investigation within ClickMobile.
 - 6.2.3 Potential of structure located over pipeline ("over build") that has not been previously reported and investigated.
 - 6.2.4 Inaccessible segments of transmission line due to flooding, vegetation, difficult terrain, etc.

If completion of the transmission patrol is anticipated to be delayed beyond the compliance date due to inaccessibility, then notify Gas Compliance prior to the compliance date for special consideration.

- 6.3 Document within ClickMobile locations:

- 6.3.1 Exposed transmission pipeline segment(s) are observed.
- 6.3.2 Pipeline markers need to be installed or replaced.
- 6.3.3 Pipeline markers or signs that need correct Company name and phone number information. See [PMRK 1](#).
- 6.3.4 Atmospheric corrosion needing corrective action.
- 6.3.5 Casing vents need repair.
- 6.3.6 Casing vents need bug screens or warning signs replaced.
- 6.3.7 Corrosion control test station has been damaged.
- 6.3.8 Areas needing mowing and/or vegetation removal.
- 6.3.9 Any other deficiencies in items listed in [PTRL 2.3](#) or that gas field personnel deem as requiring follow-up action.
- 6.3.10 Any corrective action taken during the patrol process.

7.0 Processing Data

- 7.1 Gas Supervisor will notify Gas Integrity Management and Gas Tech Engineering if any of the following are noted:
 - 7.1.1 New building construction or demolition of existing buildings which could indicate possible changes in class locations, MCA's, or HCA's.
 - 7.1.2 Exposed section transmission pipeline.
 - 7.1.3 Occurrences or deficiencies that might affect the serviceability of the transmission main.
- 7.2 Following a field review of Class Location/HCA/MCA study by Pipeline Integrity Management, changes in class location and patrol may require the reviewer to:
 - 7.2.1 Create new patrols for new transmission mains.
 - 7.2.2 Update existing patrols for new highway crossings.
 - 7.2.3 Update existing patrols frequency for class location changes from Class 1 or 2 to Class 3 or 4.
 - 7.2.4 Update maps/aerial photos to reflect a change in class location.
 - 7.2.5 Provide the new or updated patrols information to the appropriate personnel for updating main segment(s) attributes within the GTECH mapping system.
 - 7.2.6 Notify Gas Supervisor of updated class locations, MCA's, HCA's and requirements.
- 7.3 Document completed Pipeline Patrol tasks in ClickMobile and maintain in Maximo.
- 7.4 Document any deficiencies noted during the Pipeline Patrol in ClickMobile.
- 7.5 If available, compare the current patrol conditions against conditions observed on previous patrols.

End of Instructions.

PIPELINE PATROLS

October 1, 2020

PTRL 2.2 Critical Area Patrols

1.0 Purpose

This document defines critical areas along transmission, high pressure distribution, and distribution pipelines in Ameren Illinois' (AIC) operating areas and specifies procedures for critical area patrols, reporting and documentation, and recordkeeping.

All procedures meet minimum requirements of 49 CFR §§ 192.705, 192.709 and 192.721.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Critical Areas](#)[6.0 Critical Area Patrols](#)[7.0 Reporting and Documentation](#)[8.0 Records](#)

3.0 Target Audience

- Gas Compliance Personnel
- Gas Engineers
- Gas Supervisors
- Gas Field Personnel
- Contract Leak Surveyor
- Gas Integrity Management Personnel
- Gas Tech Engineering (GTE)
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Personnel
- Gas Construction Services personnel

4.0 General

- 4.1 This section outlines critical areas along transmission, high pressure distribution and distribution pipeline segments that are required to be patrolled to ensure conditions have not deteriorated, putting the gas facilities in danger of damage or leakage, and the consequent hazards to public safety.
- 4.2 When performing the patrol, evaluate conditions which required classifying the patrol as critical to verify the condition or serviceability of the pipeline has not worsened.

5.0 Critical Areas

- 5.1 Critical areas along transmission, high pressure distribution and distribution pipeline include:
 - 5.1.1 Exposed segments of pipeline.
 - 5.1.2 Pipeline attached to bridges.
 - 5.1.3 Pipeline attached to structures where physical movement could cause failure or leakage.

- 5.1.4 Areas of external loading such as a rock quarry, strip mine, or gravel pit where heavy loaded trucks cross over pipeline facilities on unsupported gravel or dirt roads.
- 5.1.5 Pipeline within 100 feet of blasting operations.
- 5.1.6 Pipeline identified as exposed or undermined after periods of heavy rains or flooding.

6.0 Critical Area Patrols

- 6.1 See [PTRL 1](#) for patrol frequency of Critical Area Patrols. When critical areas are identified during leak surveys, a critical area patrol shall be created within 3 months and patrolled in accordance with the required intervals.

7.0 Reporting and Documentation

- 7.1 Document within ClickMobile any changes in conditions that could adversely affect the integrity of the gas facilities.
- 7.2 Notify Gas Supervisor of any changes in conditions where follow-up action is required.
- 7.3 Notify Gas Integrity Management and Gas Tech Engineering (GTE) when Critical Area Patrol(s) are needed for transmission and high-pressure distribution lines.
- 7.4 Contact Gas Compliance for assistance in creating a Critical Area Patrol when conditions listed above are discovered and are not covered by an existing Critical Area Patrol.
- 7.5 If available, compare the current condition with conditions noted on previous critical area patrols.

8.0 Records

- 8.1 Refer to [PTRL 1](#) for patrol record requirements.

End of Instructions.

Operator Qualification (OQ) Required?

PIPELINE PATROLS

October 1, 2020

PTRL 2.3 Patrol Methods

1.0 Purpose

This document describes methods for patrolling gas transmission, high pressure distribution, and distribution pipelines in Ameren Illinois' (AIC) operating areas.

All procedures meet minimum requirements of 49 CFR §§ 192.705, 192.709 and 192.721.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Foot Patrol \(Walking\)](#)[6.0 Vehicular Patrol \(Driving\)](#)[7.0 Aerial Patrol \(Flying\)](#)[8.0 Other Means](#)**3.0 Target Audience**

- Gas Compliance Personnel
- Gas Engineering
- Gas Supervisors
- Gas Field Personnel
- Contract Leak Surveyor
- Gas Integrity Management Personnel
- Gas Tech Engineering (GTE) Personnel
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Field Supervisors
- Gas Storage Field Personnel
- Gas Construction Services Supervisors

4.0 General

4.1 Transmission and distribution lines can be patrolled by:

- 4.1.1 Foot patrol (walking the line), or
- 4.1.2 Vehicular patrol (driving along the line), or
- 4.1.3 Aerial patrol (flying over the pipeline alignment), or
- 4.1.4 Other appropriate means of traversing the right-of-way.

5.0 Foot Patrol (Walking)

5.1 Foot patrol consists of personnel walking along the route of the pipeline and inspecting the area for the following conditions, in addition to those listed in [PTRL 2.1](#):

- 5.1.1 Depressions caused by earth settling around pipeline.
- 5.1.2 Washouts at stream crossings or hillsides.
- 5.1.3 Highway and railroad crossing vents for gas leakage. Also check for missing vents, warning signs, and bug screens.

UNCONTROLLED IF PRINTED

- 5.1.4 Visual check of any atmospheric corrosion on above ground gas facilities associated with the pipeline, including farm taps.
- 5.1.5 Agricultural field tilling operations in vicinity of the pipeline.
- 5.1.6 Condition of line markers, correct Ameren Illinois identification, and correct phone number. See [PMRK 1](#).
- 5.1.7 Houses within 220 yards of pipeline or playgrounds, recreation areas, or buildings that are occupied by at least 20 people 5 days per week, 10 weeks per year, within 100 yards of pipeline.

6.0 Vehicular Patrol (Driving)

- 6.1 Pipelines can be patrolled by driving along the route or over the pipeline and observing the right-of-way for the following conditions, in addition to those listed in [PTRL 2.1](#):
 - 6.1.1 Depressions caused by earth settling around pipeline.
 - 6.1.2 Washouts at stream crossings or hillsides.
 - 6.1.3 Highway and railroad crossing vents for gas leakage. Also check for missing vents, warning signs, and bug screens.
 - 6.1.4 Visual check of any atmospheric corrosion on above ground gas facilities associated with the pipeline, including farm taps.
 - 6.1.5 Agricultural field tilling operations in vicinity of the pipeline.
 - 6.1.6 Condition of line markers, correct Ameren Illinois identification, and correct phone number. See [PMRK 1](#).
 - 6.1.7 Houses within 220 yards of pipeline or playgrounds, recreation areas, or buildings that are occupied by at least 20 people 5 days per week, 10 weeks per year, within 100 yards of pipeline.
- 6.2 Some lines will be patrolled by a combination of foot patrol and vehicular patrol.

7.0 Aerial Patrol (Flying)

- 7.1 An aerial patrol consists of low-level flying along the route of the pipeline and observing the right-of-way for the following conditions, in addition to those listed in [PTRL 2.1](#):
 - 7.1.1 Depressions caused by earth settling around pipeline.
 - 7.1.2 Washouts at stream crossings or hillsides.
 - 7.1.3 Agricultural field tilling operations in vicinity of the pipeline.
 - 7.1.4 Presence and condition of aerial line markers.
 - 7.1.5 Houses within 220 yards of pipeline or playgrounds, recreation areas, or buildings that are occupied by at least 20 people 5 days per week, 10 weeks per year, within 100 yards of pipeline.
- 7.2 Report all suspected, observed, or questionable conditions to the Gas Supervisor for follow-up investigation of existing maps or by foot patrol to determine if there has been a change that affects patrol designation or frequency.

8.0 Other Means

- 8.1 Other means may be taken to access the pipeline route which will enable the operator to inspect the right-of-way.

- 8.1.1 Drones may be used to remotely inspect the right-of-way in a similar manner as aerial patrol.
 - 8.1.2 ATV's could be used to inspect the right-of way in a similar manner as foot patrol.
 - 8.1.3 Water craft may be needed to patrol pipelines that are underwater, either permanently or intermittently.
 - 8.1.4 There could be other methods that would allow an operator to be able to inspect right-of-way condition along a pipeline.
- 8.2 Report all suspected, observed, or questionable conditions to the Gas Supervisor for follow-up investigation of existing maps or by foot patrol to determine if there has been a change that affects patrol designation or frequency.

End of Instructions.

PRESSURE TESTING

April 1, 2023

PTST 1 Requirements

1.0 Purpose

This document describes pressure testing requirements for mains, services, pipeline facilities, fabricated units/assemblies, and farm taps in accordance with 49 CFR 192 Subpart J.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)[4.0 General](#)[5.0 Safety](#)[6.0 Roles and Responsibilities](#)[7.0 Test Medium](#)[8.0 Test Recording Methods](#)[9.0 Design MAOP](#)[10.0 Testing](#)[11.0 Plastic Pipe Testing](#)[12.0 Tie-In Joints](#)[13.0 Components and Fabricated Units/Assemblies](#)[14.0 Test Records](#)**3.0 Target Audience**

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel
- Gas Tech Engineering (GTE)
- Gas Tech Services (GTS) Supervisors
- Gas Tech Services (GTS) Personnel
- Gas Storage Engineers (GSE)
- Gas Storage Field Supervisors
- Gas Storage Field Personnel

4.0 General

- 4.1 All newly installed segments of a pipeline shall be pressure tested to identify any hazardous leaks and establish a design maximum allowable operating pressure (Design MAOP).
- 4.2 All new distribution, high pressure distribution, and transmission mains shall be pressure tested at 1.5 times the Design MAOP.
- 4.3 Testing segments of a pipeline to establish the Design MAOP shall be done after the pipe is in its final location, except for pre-tested short segments (i.e., typically a double random length approximately 40 to 45 feet or shorter) OR fabricated assemblies where post construction tie-in testing is not practical.

UNCONTROLLED IF PRINTED

- 4.4 Pre-tested pipe can be used for replacement, relocation, or repair where post installation testing is not practical. Pre-tested pipe shall be tested to meet or exceed the Design MAOP for the location it is being installed.
- 4.5 All required nondestructive testing (NDT) - such as x-ray inspections, including the necessary welding repairs identified by NDT - shall be completed before subjecting a segment of a pipeline to any leak or strength testing. If the final tie-in welds require NDT as specified in [WELD 1, Section 10.0](#) Nondestructive Testing, then NDT shall be completed prior to pressurizing the segment of a pipeline.
- 4.6 Bypasses that use steel or PE pipe attached to existing pipe with welded or fusion fittings shall be tested in the same manner as a new main. The pressure test should be documented on the as-built construction prints.
- 4.7 Bypasses connected to tapping and stopping equipment shall be made up of fittings, hose, or pre-tested pipe that are rated or tested for at least the maximum pressure encountered during the stopping operations. The pipe would need to be tested to at least 1.5 times the maximum pressure.
- 4.8 **Do not** apply test pressures against a closed valve. This does not apply to testing against a closed meter valve as long as test pressure does not exceed pressure rating of the valve. In-line valves should be tested in the open position unless otherwise specified in the project procedures.
- 4.9 **Do not** pressure test against a service tee, high volume tee, punch tee, valve tee, or 3-way tee that has been tapped on a pipe pressurized with natural gas unless natural gas is being used as test medium.

5.0 Safety

Precautions shall be taken to protect employees and the general public during any pressure test.

- 5.1 Avoid positioning anyone in the "line-of-fire" of any end caps, test caps, or fittings associated with the test.
 - 5.1.1 *Dresser and Normac compression style end caps or couplings* can only be used as a pressure test cap on pipe 1-inch nominal diameter or smaller and with an MAOP of 60 psig or less. Fittings shall be equipped with pullout restraint.
 - 5.1.2 *McElroy test caps* shall be equipped with the test cap lanyard which will minimize the travel of the test cap in the event the cap accidentally becomes dislodged. McElroy test cap has a maximum pressure rating of 165 psig. Refer to [POLY 4](#) McElroy TP 300 Series Test Cap.
- 5.2 Minimize the number of people (employees or general public) in the vicinity of the pressure test.
- 5.3 All valves, gauges, hoses, and fittings used for pressure testing shall have pressure ratings equal to or exceeding the maximum pressure that could be applied.

6.0 Roles and Responsibilities

- 6.1 *Gas Tech Engineering (GTE)* is responsible for reviewing testing requirements for:

- 6.1.1 All steel gas main/facility projects with Design MAOP greater than 60 psig which includes transmission or high-pressure distribution lines or facilities located outside of the Gas Storage Field or compressor plants.
- 6.1.2 All steel or PE service lines that are 2-inch nominal diameter and larger that have a Design MAOP greater than 60 psig.
- 6.1.3 All large meter sets with connected loads greater than 10,000 CFH and/or inlet pressure greater than 60 psig.
- 6.1.4 All regulator/flow control stations, odorizer stations and valve stations.
- 6.1.5 Service farm taps smaller than 2-inch nominal diameter are excluded since they are typically handled by Region Engineering.
- 6.1.6 Farm tap on a gas pressure system with a Design MAOP greater than 1,000 psig shall be designed or reviewed by GTE.
- 6.2 *Distribution Design Centers (DDC/PDC) or Region Engineering* are responsible for reviewing testing requirements for:
 - 6.2.1 All steel mains with Design MAOP 60 psig or less.
 - 6.2.2 All PE mains with Design MAOP of 125 psig or less.
 - 6.2.3 All PE and steel service lines with Design MAOP 125 psig or less.
 - 6.2.4 All PE and steel service lines 2-inch nominal diameter and larger with Design MAOP greater than 60 psig should also be reviewed by GTE.
 - 6.2.5 All high-pressure distribution farm tap services smaller than 2-inch nominal diameter.
 - 6.2.6 Emergency projects or maintenance projects on steel mains and services with Design MAOP 100 psig or less: Testing requirements may be specified by Region Engineering.
- 6.3 *Gas Storage Engineering (GSE)* is responsible for:
 - 6.3.1 Designing pressure-containing facilities, similar to a farm tap located within gas storage fields and compressor plants.
 - 6.3.2 Reviewing testing requirements on all gas facilities located within gas storage fields and compressor plants.

7.0 Test Medium

- 7.1 The test medium shall be air, nitrogen, water or combination of air and nitrogen, or natural gas. Natural gas should only be used for Uprates or Tie-Ins.
 - 7.1.1 Limitations on the use of natural gas, air or nitrogen as test medium during Strength Test are listed in [PTST 2.2, Section 5.0](#) Strength Test, Test Medium.
 - 7.1.2 The test medium must be compatible with the pipe material, be relatively free of sediment material, AND be nonflammable, except for natural gas.
 - 7.1.3 The test medium shall be water for:
 1. New or replaced transmission lines located in a High Consequence Area (HCA).
 2. Assessment for manufacturing and construction defects in an existing transmission line within an HCA.

3. New or replaced transmission line installed within 300 feet of a building intended for human occupancy in a Class 1 or Class 2 location unless the building is vacated while the test pressure exceeds 50% SMYS.
- 7.1.4 Water is the preferred test medium for all transmission lines. Other mediums may be used with engineering approval. Exceptions include, but are not limited to, locations where: there is not adequate accessibility, temperatures may cause test medium to freeze, de-watering processes are not feasible.

The transmission testing requirements do not apply to control lines, service lines, or gas regulator stations not considered transmission.

- 7.2 For hydrostatic testing requirements, including spike hydrostatic pressure test, see [PTST 2.3](#).
- 7.3 For nitrogen testing requirements, see [PTST 2.4](#).

8.0 Test Recording Methods

- 8.1 The following methods can be used to record leak, strength, or combination leak/strength test which establish or verify the design MAOP:
 - 8.1.1 *Gauges*: The following gauges can be used when performing a leak, strength, or combination leak/strength test on lines that are being tested at less than 20% SMYS OR for fabricated unit and short sections of pipe.
 1. Process Gauges: See [Section 8.2](#) below.
 2. Test Gauges and Calibrating Gauges: See [METR 2.6 Section 5.0](#), Gauge Definitions.
 - 8.1.2 *Pressure Recording Device*: Refer to [PTST 1.1 Appendix D](#) for recording devices required for hydrostatic testing designated transmission or classified transmission facilities.
 1. Mechanical pressure chart recorder.
 2. Electronic pressure recorder.
 3. Calibrated dead weight tester system: The pressure reading shall be manually recorded every half-hour and entered on a log that will become part of the final as-built documentation.

Gauges or recorders with digital displays should be read and recorded in whole units. Round down readings to the nearest whole psig unit.

- 8.2 *Process gauges*: Use process gauges rated ASME Grade 2A with minimum accuracy of $\pm 0.5\%$ full scale to perform a leak and/or strength test which establishes or verifies the Design MAOP.
 - 8.2.1 The gauge shall be in good condition and the needle should read zero before subjecting the gauge to pressure.

8.2.2 See Table 1 below for stock coded process gauges.

Table 1: Process Gauges

Grade 2A, ± 0.5% Full Scale Accuracy, Black Plastic Case, 4-1/2" Face	
Stock Code	Range (PSIG)
49 22 284	0 - 30
49 22 285	0 - 60
49 22 286	0 - 100
49 22 287	0 - 200
49 22 288	0 - 400
49 22 289	0 - 600
49 22 290	0 - 1000
49 22 291	0 - 1500
49 22 292	0 - 2000
49 22 293	0 - 3000

8.2.3 Process gauges used to perform a leak and/or strength test should be verified for accuracy (±0.5%) at mid-scale annually not to exceed 15 months.

1. New process gauges placed into service do not need to be verified for accuracy until the following year.
2. Use a test gauge, calibrating gauge or calibrated dead weight tester to verify accuracy of a process gauge.

8.2.4 Process gauges should have a unique identifier assigned. Document verification date.

8.3 Pressure and temperature chart recorders or electronic recording devices shall be calibrated annually not to exceed 15 months.

8.4 Calibration of Ameren-owned pressure and temperature chart recorders and electronic recording devices shall be maintained in Maximo.

8.5 For projects using contractor-owned pressure and temperature chart recorders, recording devices, or a calibrated dead weight tester, the contractor shall provide a copy of the calibration documentation for the recorder. See [PTST 2.1 Section 7.0](#) Leak Test Records and [PTST 2.2 Section 7.0](#) Strength Test Records.

9.0 Design MAOP

9.1 The Design MAOP is the highest pressure that a new or replaced pipeline segment could ever be expected to be operated.

9.2 Any new systems or additions to existing systems shall be designed to the appropriate Design MAOP.

9.2.1 Region Gas Engineer, GTE or GSE will designate the specific Design MAOP for systems or segments to be operated over 60 psig.

9.2.2 The Design MAOPs of an existing system are shown in the Ameren Illinois electronic mapping system.

9.3 Maximum test pressure on steel pipe with Design MAOP of 100 psig or greater should not exceed that designated by GTE or GSE.

- 9.4 If the specified maximum test pressure is exceeded immediately reduce to below maximum, and notify Gas Supervisor or Contractor Services Supervisor. Gas Engineering, GTE or GSE will evaluate and determine what action needs to be taken, if any.

10.0 Testing

- 10.1 See [PTST 2.1](#) for required leak testing information.
- 10.2 See [PTST 2.2](#) for required strength testing information.
- 10.3 Refer to [PTST 1.1](#) Test Pressure and Duration Requirement Tables for test pressure and test duration requirements for standard construction activities associated with mains, services, fabricated units, and farm taps.
- 10.3.1 [Table A - Service Lines, Less Than 2" Diameter, Plastic or Steel](#)
- 10.3.2 [Table B - Plastic Main, All PE Pipe Sizes Thru 12" With Design MAOP 125 psig or Less](#)
- 10.3.3 [Table C - Steel Main, All Steel Pipe Sizes Thru 18" With Design MAOP Less Than 100 psig](#)
- 10.3.4 [Table D - Steel Main, All Steel Pipe Sizes Thru 30" With Design MAOP 100 psig or Greater](#)
- 10.3.5 [Table E - Fabricated Unit/Assembly or Short Section of Pipe](#)
- 10.3.6 [Table F - Farm Tap, Single Cut, 60 To 450 PSIG Inlet Pressure](#)
- 10.3.7 [Table G - Farm Tap, Double Cut, 451 To 1000 PSIG Inlet Pressure](#)
- 10.4 Refer to [Section 13.0](#) below for testing requirements for components (other than pipe) being replaced or added to a pipeline.
- 10.5 Main and service lines should be tested separately. This helps to locate leaks resulting from a pressure test. For short main extension, repair, or emergency projects, the Gas Supervisor or Project Engineer may approve testing main and services together. Refer to Subsection 10.6 for PE4710 testing and meter valve limitations.
- 10.5.1 Service lines smaller than 2 inch in diameter: The minimum required test duration for the combination main and service is determined by the required test duration of the main as shown in [PTST 2.1 Section 5.0](#) Leak Test Duration. There is no need to add time for the service lines.
- 10.5.2 Service lines 2 inch and larger shall be tested as main with the minimum duration determined in accordance with [PTST 2.1 Section 5.0](#) or if applicable [PTST 2.1 Section 5.4](#), leak test duration when testing main of various sized pipe.
- 10.5.3 Record service line pressure test on the Service Card within ClickMobile with the actual test pressure and actual test duration reported for each services.
- 10.6 PE4710 mains and service lines with Design MAOP of 125 psig shall be tested separately, due to meter valve limitations, unless approved by the gas engineer.
- 10.6.1 Meter valves rated for 175 psig shall not be exposed to a pressure of 200 psig or higher for more than 2 hours. Exceeding 200 psig for longer periods may cause damage to the valve.
1. The minimum test pressure for a MAOP of 125 psig is 188.0 psig
 2. Testing the PE4710 service line separately should limit the test duration to less than 2 hours and allow the pressure on the service line to be relieved or lowered to below 200 psig following completion of the pressure test.

3. The meter valve pressure limitations stated above applies to all service lines, PE2708, PE4710 and steel.

10.7 Short segments of piping should be tested as follows:

- 10.7.1 *Short segments of piping and with nominal diameter of 2 inches or larger* should be tested in accordance with [PTST 1.1 Table E](#), Fabricated Unit/Assembly or Short Section of Pipe.
- 10.7.2 *Short segments of piping, smaller than 2 inch nominal diameter, and fittings/assemblies typically known as gauge taps, pressure taps, odorant taps, purge points, and/or control line taps* should be tested in accordance with [PTST 1.1 Table A](#), Service Lines - Less Than 2" Diameter; Plastic or Steel.

11.0 Plastic Pipe Testing

- 11.1 Before testing, fusion joints shall be allowed to cool for the manufacturer's specified cool time.
 - 11.1.1 **Do not** test PE pipe if the temperature of the material is greater than 140°F.
 - 11.1.2 **Do not** make fusion joints on PE pipe that is being pressure tested.
 - 11.1.3 **Do not** perform hydrostatic pressure testing on PE pipe.
- 11.2 If McElroy Test Cap is being utilized, follow the manufacturer's operating instructions. Refer to [POLY 4](#) McElroy TP 300 Series Test Cap.
 - 11.2.1 McElroy Test Cap is limited to a maximum test pressure of 165 psig.
 - 11.2.2 McElroy Test Cap shall not be used when testing HDPE for a MAOP of 125 psig.

12.0 Tie-In Joints

- 12.1 Tie-in joints are the final connections made when connecting a new segment of pipe, a component, or an assembly, that has been tested to the appropriate Design MAOP, to or into an existing pipeline or facility where post-installation testing is impractical.
- 12.2 Tie-in joints that are not pressure tested must be checked for leaks at current operating pressure with leak detection fluid or leak detection instrument (if test medium is natural gas).
- 12.3 Tie-in joints on steel transmission pipelines shall be tested in accordance with the NDT provisions contained in [WELD 1 Section 10.0](#) Nondestructive Testing, before performing a leak test at current operating pressure.
- 12.4 Document and record the leak test results.

13.0 Components and Fabricated Unit/Assemblies

- 13.1 If only a single component, other than pipe, is being replaced or added to the pipeline, then the connection to the pipe shall be checked for leaks.

An exception exists for pressure rated repair fittings. See the [REPR](#) section.

- 13.1.1 *Component attached to pipeline with Design MAOP less than 100 psig*: Minimum test pressure required to check for leaks should be 90 psig.

- 13.1.2 *Component attached to pipeline with Design MAOP 100 psig or greater:* Minimum test pressure required to check for leaks should be a minimum of 100 psig with a maximum not to exceed the pressure specified by Engineering.
 - 13.1.3 Components shall be tested for leaks using leak detection fluids, leak detection instrument or via gauge test.
 1. Gauge test shall be held for minimum of 10 minutes.
 2. Leak detection fluids or leak detection instruments have no minimum test duration.
 - 13.1.4 Tapping and stopping components (Stopper, Save-A-Valve, Thread-O-Ring) shall be tested for leaks PRIOR to tapping.
 - 13.1.5 *A component (e.g., cap, valve, elbow) installed within an existing pipeline:* Connections shall be tested for leaks at operating pressure of the pipeline using leak detection fluids or leak detection instruments.
 - 13.1.6 Component with a nominal diameter of less than 2 inches shall be, at a minimum, tested for leaks at operating pressure of the pipeline using leak detection fluids or leak detection instruments. Engineering may specify gauge test prior to tapping on critical applications.
- 13.2 The component does not have to be strength tested to substantiate the MAOP after installation IF:
- 13.2.1 It carries a pressure rating established through applicable ASME/ANSI/ASTM specifications that meets or exceeds the design MAOP of the pipe to which it is being added or attached. Examples of such components include:
 1. Flange
 2. Steel valve
 3. PE valve
 4. Line stopper fitting
 5. Weld-End Insulator
 - 13.2.2 It is manufactured under a quality control system that ensures each item manufactured is at least equal in strength to the prototype AND the prototype was tested to at least the design MAOP of the pipe to which it is being added or attached. Examples of such components include:
 1. Weld fitting (i.e., in-line tee, elbow, cap, thread-o-let, service tee with mechanical connection, save-a-valve nipple)
 2. Threaded fitting (i.e., tee, elbow, cap, coupling, union, nipple, reducer)
 3. TDW PE Branch Saddle Valve
 - 13.2.3 The manufacturer certifies that the component was tested to at least the design MAOP of the pipe to which it is being added or attached. Examples of such components include:
 1. Rotary meter loops
 2. Meter headers
 3. Ultrasonic Meter spool

13.3 Prefabricated Unit/Assemblies

13.3.1 Once another item (e.g., pipe, fitting or another component) is attached to the component, it becomes an "assembly" which requires testing to establish or verify the assembly's Design MAOP prior to installation. Examples of prefabricated assemblies include:

1. Metering Station
2. Regulating Station
3. Valve station
4. Pig launchers and receivers built from pipe and standard fittings
5. Prefabricated sections of pipeline sections consisting of one or more joints of pipe, valve or fittings.

13.3.2 Prefabricated assemblies are tested in accordance with:

1. *Assemblies with nominal diameter smaller than 2 inches*: Test in accordance with [PTST 1.1 Table A](#).

13.3.3 *Assemblies with nominal diameter of 2 inches or larger*: Test in accordance with [PTST 1.1 Table E](#).

13.3.4 Prefabricated assemblies classified as a transmission facility are to be hydrostatic pressure tested. Refer to [Paragraph 7.1.4](#) for an exception

13.3.5 Short assemblies of all NPT threaded components listed above may be leak tested at current operating pressure. These assemblies may include:

1. Meter tie-ins.
2. Meter rebuilds.
3. Relief stacks.

This does not apply to any welded connections or NPT connections made from cut and threaded pipe.

If the required test pressure for a bottom-out line stopper assembly exceeds the collapse pressure of the carrier pipe, see [TAPS 1 Appendix C](#) for fabricating and testing details of the assembly.

13.4 All mechanically connected instrument, control, and sampling lines shall be rated for the maximum service pressure of the pipe or equipment to which it is attached and shall be checked for leaks at the current operating pressure.

13.5 ASME pressure vessels testing and inspection requirements are in [PTST 2.6](#) ASME Pressure Vessels.

14.0 Test Records

14.1 Requirements

14.1.1 All test records shall be retained for the useful life of the facility. This includes:

1. Leak test for service lines.

2. Leak tests for distribution lines with MAOP less than 100 psig.
3. Leak and strength tests for transmission lines or high-pressure distribution lines with MAOP of 100 psig and less than 30% SMYS.
4. Strength tests on transmission lines with MAOP of 30% SMYS or greater.
5. A separate leak test is not required when hydrostatic pressure testing lines or facilities
6. Hydrostatic tests on transmission lines.
7. Required spike tests on transmission lines.

14.1.2 Each leak test and/or strength test shall be documented on the appropriate Ameren Illinois (AIC) forms. [Click here to access the SharePoint site](#) where the most current test forms are maintained:

1. *The Leak Test Form/Stamp (LTF)* ([PTST 3 Form 01](#)) is included on construction plans generated by the Distribution Design Centers, or Region Gas Engineers. This stamp is normally used on projects with MAOP of 60 psig or less. However, this form/stamp can be used for HDPE pipe installations which have a MAOP of 100 psig.
2. *The Leak & Strength Test Form (LSTF)* ([PTST 3 Form 02](#)) is included with the projects generated by Gas Tech Engineering, Gas Storage Engineering or Region Gas Engineer. This form is normally used on projects with MAOP of 60 psig or higher but is acceptable for any project.
3. *The Hydrotest Strength Test Form* ([PTST 3 Form 03](#)) is included with projects generated by Gas Tech Engineering or Gas Storage Engineer when hydrostatic pressure testing is required.

14.1.3 Changes may be made to the test form between O&M Updates, so the test form/stamps on the plans may differ from the ones in [PTST 3](#). Whichever version is on the plans continues to be valid and acceptable.

14.1.4 For pre-tested pipe, either transfer the test record to the appropriate test stamp/test record or place a copy of the original test record in the as-built job file.

14.2 Leak, Strength, and Hydrostatic Test Records

14.2.1 Each leak test performed on a main or fabricated unit shall be documented on the appropriate AIC forms. See [PTST 3](#) for LTF (Leak Test Form) or LSTF (Leak Strength Test Form) or Hydrotest Strength Test Form.

1. Leak tests performed on service lines are documented on the Service Card module within ClickMobile.
2. Leak testing on meter set piping shall be recorded on the meter set plans test stamp.

14.2.2 Each strength test shall be documented on the appropriate AIC forms. See [PTST 3](#) for LSTF (Leak Strength Test Form) or Hydrotest Strength Test Form.

14.2.3 Test records shall include the following information, at a minimum:

1. Description of facilities being tested, including:
 - 1 a. Pipe size and type.
 - 1 b. Length of test segment.

- 1 c. Beginning and end location of the test segment (e.g., measurements, stationing, GPS coordinates, facility identification, or other methods that will describe the location).
2. Test medium used.
3. Actual leak test pressure or strength test pressure (as applicable).
4. Actual leak test duration or strength test pressure (as applicable).
5. Actual spike test pressure (if applicable).
6. Actual spike test duration (if applicable).
7. Documentation of beginning and end of test period(s). If recording chart is recording both a leak and a strength test that have different test pressures and duration, the beginning and end of each test should be indicated.
8. Date of the test.
9. Employee responsible for overseeing the test.
10. Contractor's name and/or name of test company (if applicable).
11. Recording device type, ID or serial number of recording device, and calibration date.

When hydrostatic pressure test is performed, locations of the pressure recording devices shall be recorded and maintained in the final as constructed job packet.

12. Owner of the pressure recording device.
 13. Any leaks and failures shall be noted and their disposition shall be recorded in the Comments section on the test stamp. Once the leak or cause of failure is repaired or corrected, initiate a new test.
 14. Once the pressure has initially stabilized, document any pressure fluctuation due to outside forces on the recording chart.
 - 14 a. Pressure fluctuation due to temperature change that occurs during test duration should be documented with calculation verifying the fluctuation is not due to a leak and approved by Integrity Management, GTE or GSE prior to acceptance of the test.
- 14.2.4 Test records shall be retained in the final as constructed job packet.
- 14.2.5 Test records shall be retained for useful life of the facility.

End of Instructions.

Operator Qualification (OQ) Required?

Revision Notes

Location of Changes	Summary of Changes
Paragraph 8.1.1 – Test Recording Methods – Gauges	Correction – 20% SMYS replaced 30% SMYS. Consistent with testing tables in PTST 1.1. Pressure recording devices are required when testing transmission classified or designated facilities.
Paragraph 8.1.2 – Test Recording Methods	<p>Revised - Pressure Recording Device: Refer to <u>PTST 1.1 Appendix D</u> for recording devices required for hydrostatic testing designated transmission or classified transmission facilities.</p> <ol style="list-style-type: none"> 1. Mechanical pressure chart recorder. 2. Electronic pressure recorder 3. Calibrated dead weight tester system.
Paragraph 8.1.2 – Dead weight tester system - Item 3	Grammatical – The pressure reading shall be manually recorded every half-hour and entered on a log that will become part of the final as-built documentation.
Paragraph 8.1 – Test Recording Methods	Original Item 4 under Paragraph 8.1.2. was placed in a NOTE that applies to Paragraph 8.1.1 and 8.1.2: Gauges or recorders with digital displays should be read and recorded in whole units. Round down readings to the nearest whole psig unit.

PRESSURE TESTING

April 1, 2023

PTST 1.1 Test Pressure and Duration Requirement Tables

1.0 Purpose

The tables in this section provide the minimum (and in some cases, the maximum) test pressure and minimum test duration for leak test and when required strength test.

Table designation is based on standard construction activities for PE2708 (MDPE), PE4710 (HDPE) and steel pipe construction and installation along with the Design MAOP.

Specific testing requirements are contained in [PTST 1](#) Requirements, [PTST 2.1](#) Leak Test, and [PTST 2.2](#) Strength Test.

2.0 Tables

- 2.1 [Appendix A](#) - Service Lines, Less Than 2" Diameter; Plastic or Steel
- 2.2 [Appendix B](#) - Plastic Main, All PE Pipe Sizes thru 12" with Design MAOP 125 psig or Less
- 2.3 [Appendix C](#) - Steel Main, All Steel Pipe Sizes thru 18" with Design MAOP Less Than 100 psig
- 2.4 [Appendix D](#) - Steel Main, All Steel Pipe Sizes thru 30" with Design MAOP 100 psig or Greater
- 2.5 [Appendix E](#) - Fabricated Unit/Assembly or Short Section of Pipe
- 2.6 [Appendix F](#) - Farm Tap, Single Cut, 60 to 450 psig Inlet Pressure
- 2.7 [Appendix G](#) - Farm Tap, Double Cut, 451 to 1,000 psig Inlet Pressure

End of Instructions.

Document Rescission

PTST 1.1 Test Pressure and Duration Tables – October 1, 2022

Revision Notes

Location of Changes	Summary of Changes
Appendix D - Steel Mains, All Sizes, MAOP of 100 PSIG or Greater – Original D-5	Removed, Information covered in Notes 3 and 4 below Table D

UNCONTROLLED IF PRINTED

Appendix D - D-5	New- Facilities that are designated as transmission or with a Design MAOP that result in stress of 20% SMYS or higher, a mechanical pressure chart recorder is required in addition to an electronic pressure recorder or dead weight tester system when recording hydrostatic pressure tests.
Appendix D –Table D	Added "Excluding designated transmission (4)" under the ≥100 psig AND <20% SMYS in the Design MAOP column.
Appendix D –Table D – Bot- tom Line of Table	Revised - All pipeline facilities that are designated as transmission or with a Design MAOP at or above 20% SMYS are to be hydrostatically pressure tested whether tested in place or re-tested. Refer to PTST 1 Paragraph 7.1.4 for exceptions.
Appendix D – Note (4)	Replaced original D-5 - For designated transmission pipe with a Design MAOP less than 20% SMYS, the pipe shall meet the requirements shown in Table D for 20% SMYS to less than 30% SMYS.
Appendix F – Farm Tap, Sin- gle Cut	Reformatted bottom section of table. From Main to Out- let of Farm Tap line relates to the Note: Outlet Service Lines are a separate issue.
Appendix G – Farm Tap, Double Cut	Reformatted bottom section of table. From Main to Out- let of Farm Tap line relates to the Note: Outlet Service Lines are a separate issue.

Appendix A - Service Lines, Less than 2" Diameter, Plastic or Steel

A-1. Table A provides test pressure and test duration requirements for standard construction activity associated with plastic and steel service lines, short segments of pipe sizes smaller than 2 inches in nominal diameter and gauge tap type fittings/assemblies.

Table A: Service Lines, Less Than 2" Diameter; Plastic or Steel

Material	Design MAOP	Test	Test Pressure		Test Duration
			Minimum	Maximum	
PLASTIC MDPE & HDPE	60 psig	Leak Test Note (1)	90 psig	180 psig	Minimum 10 Min.
PLASTIC HDPE	125 psig	Leak Test Note (1)	188 psig	260 psig Note (3)	Minimum 10 Min.
STEEL	≤ 100 psig	Leak Test Note (1)	90 psig OR 1.5 x Design MAOP Note (2)	260 psig Note (3)	Minimum 10 Min.
	> 100 psig	Leak Test Note (1)	1.5 x Design MAOP Note (4)		Minimum 10 Min.
PLASTIC AND STEEL	If the service has both steel and plastic pipe, then test to the Plastic Pipe Requirements.				

UNCONTROLLED IF PRINTED

Gauge or Recording Device can be used to measure test pressures.

Note (1): The single Leak Test satisfies requirements in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the service line.

Note (2): If Design MAOP is greater than 60 psig, the minimum test pressure is 1.5 times Design MAOP.

Note (3): Maximum pressure shall be lowered to below 200 psig within 2 hours to avoid damage to meter valve.

Note (4): Steel services only: If the service line is tested at a pressure that will result in hoop stress of 20% SMYS or more, then it shall be tested in accordance with [Table D](#), Steel Main with Design MAOP ≥ 100 psig.

Stock Code	Pipe Size (inches)	Wall Thickness (inches)	20% SMYS (psig)
32 23 302	¾"	0.113"	1,507
32 23 303	¾"	0.154"	2,053
32 23 312	1-1/4"	0.140"	1,181

Appendix B - Plastic Main, All PE Pipe Sizes Thru 12" With Design MAOP 125 psig or Less

B-1. Table B provides test pressure and test duration requirements for standard construction activities associated with plastic main pipe sizes through 12 inch, which includes plastic service lines pipe sizes with 2 inch and larger nominal diameter:

Table B: Plastic Main, All PE Pipe Sizes Thru 12" With Design MAOP <_ 125 psig

Material	Design MAOP	Test	Test Pressure		Test Duration
			Minimum	Maximum	
PLASTIC MDPE & HDPE	60 psig	Leak Test Note (1)	90 psig	180 psig (150 psig for 8" and larger MDPE)	See B-2 below
PLASTIC HDPE	125 psig	Leak Test Note (1)	188 psig	260 psig	See B-2 below Note (2)

Gauge or Recording Device can be used to measure test pressures.

Note (1): The single Leak Test satisfies test requirements in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the pipe.

Note (2): 2 inch and larger service lines with 175 psig rated meter valves shall not be exposed to pressures greater than 200 psig for more than 2 hours. Refer [PTST 1 Paragraph 10.6.1](#) for meter valve limitations.

B-2. Duration information from [PTST 2.1 Section 6.0](#) Leak Test Duration, is summarized below:

B-2.1 For mains and 2 inch and larger service lines, leak test duration shall be 5 minutes per inch of nominal pipe diameter per 100 feet of pipe length with minimum test duration as listed below for the specific pipe diameter.

Pipe Size	≤ 2"	4"	6"	8"	10"	12"
Time per 100 ft. of Pipe	10 Min.	20 Min.	30 Min.	40 Min.	50 Min.	60 Min.
Minimum Duration	10 Min.	20 Min.	30 Min.	40 Min.	50 Min.	60 Min.

UNCONTROLLED IF PRINTED

- B-2.2 To determine the required test duration, round up the actual pipe footage to be tested to the next 100-foot increment. (i.e., 25 feet would round up to 100 feet).
- B-2.3 Calculate the required leak test duration for the pipe size and length to be tested. The maximum required leak test duration is 8 hours regardless of the additional footage of pipe to be tested.

Appendix C - Steel Main, All Steel Pipe Sizes Thru 18" With Design MAOP Less Than 100 psig

C-1. Table C provides the test pressure and test duration requirements for standard construction activity associated with steel main pipe sizes through 18 inch nominal diameter and steel service lines 2 inch and larger nominal diameter with Design MAOP of less than 100 psig:

Table C: Steel Main, All Steel Pipe Sizes Thru 18" (Design MAOP < 100 psig)

Material	Design MAOP	Test	Test Pressure		Test Duration
			Minimum	Maximum	
STEEL	≤ 60 psig	Leak Test Note (1)	90 psig	180 psig	See C-2 below
	> 60 psig AND < 100 psig	Leak Test Note (1)	150 psig OR 1.5 x Design MAOP Note (2)	200 psig	See C-2 below
<i>Gauge or Recording Device can be used to measure test pressures.</i>					

Note (1): The single Leak Test satisfies requirements in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the service line.

Note (2): If Design MAOP is greater than 60 psig AND less than 100 psig, the minimum test pressure is 1.5 times Design MAOP.

C-2. Duration information from [PTST 2.1 Section 6.0](#) Leak Test Duration is summarized below:

C-2.1 For mains and 2 inch and larger service lines, the leak test duration shall be 5 minutes per inch of nominal pipe diameter per 100 feet of pipe length with minimum test duration as listed below for the specific pipe diameter.

Pipe Size	≤ 2"	4"	6"	8"	10"	12"	14"	16"	18"
Time per 100 ft. of Pipe	10 Min.	20 Min.	30 Min.	40 Min.	50 Min.	60 Min.	70 Min.	80 Min.	90 Min.
Minimum Duration	10 Min.	20 Min.	30 Min.	40 Min.	50 Min.	60 Min.	70 Min.	80 Min.	90 Min.

C-2.2 To determine the required test duration, round up the actual pipe footage to be tested to the next 100-foot increment. (e.g., 25 feet would round up to 100 feet).

C-2.3 Calculate the required leak test duration for the pipe size and length to be tested. The maximum required leak test duration is 8 hours regardless of the additional footage of pipe to be tested.

Appendix D - Steel Main, All Steel Pipe Sizes Thru 30" With Design MAOP 100 psig or Greater

D-1. Table D provides the test pressure and test duration requirements for general construction activity associated with steel mains pipe sizes through 30 inch and steel service lines 2 inch and larger with Design MAOP greater than or equal to 100 psig.

D-2. GTE or GSE is responsible for reviewing testing requirements for all gas main/facility projects with Design MAOP greater than 100 psig which includes transmission, high

pressure distribution lines and facilities or transmission lines and facilities within Gas Storage Fields/Compressor Plants.

- D-3. GTE or GSE should be notified when there is any testing to be performed on these pipes. Region Engineering can specify testing requirements for replacement or relocation projects due to line repair.
- D-4. GTE or GSE will provide hydrostatic testing plan for pipelines classified as transmission. The test pressure and duration shall at least meet the minimum shown under the appropriate category in Table D.
- D-5. Facilities that are **designated as transmission or with a Design MAOP that results in stress of 20% SMYS or higher, a mechanical pressure chart recorder is required in addition to an electronic pressure recorder or dead weight tester system when recording hydrostatic pressure tests.**

Table D: Steel Main, All Steel Pipe Sizes Thru 30" (Design MAOP ≥ 100 psig)

Material	Design MAOP	Test	Test Pressure		Test Duration	Test Pressure Measurement	
			Minimum	Maximum			
STEEL	≥ 100 psig AND < 20% SMYS Excluding designated transmission (4)	Leak Test	100 psig	20% SMYS	Minimum 1 hour	Gauge or Recording Device may be used.	
		Strength Test	1.5 x Design MAOP	Note (2)	Minimum 1 hour		
	≥20% SMYS and < 30% SMYS	Leak Test Note (3)	100 psig	20% SMYS	Minimum 1 hour	Recording Device is Required.	
		Strength Test	1.5 x Design MAOP	Note (2)	Minimum 1 hour		
	≥ 30% SMYS	Leak Test	100 psig	20% SMYS	Minimum 1 hour	Recording Device is Required.	
	≥ 30% SMYS Note (1)	Strength Test	1.5 x Design MAOP	Note (2)	Minimum 8 hours		
	All pipeline facilities that are designated as transmission or with Design MAOP at or above 20% SMYS are to be hydrostatically pressure tested, whether tested in place or re-tested. Refer to PTST 1 Paragraph 7.1.4 for exceptions.						

Note (1): Refer to [STLP 2.2 Appendix A](#) Design Pressure - Steel Pipe Stock Code Table to determine pressure that would result in stressing pipe to 30% SMYS. If the pipe being tested is not shown in this table, contact GTE, GSE, or local Gas Engineer.

Note (2): Maximum test pressure on steel pipe with Design MAOP of 100 psig or greater should not exceed that designated by GTE or GSE.

Note (3): Leak test is required when non-hydrostatic testing is performed.

Note (4): For designated transmission pipe with Design MAOP less than 20% SMYS, the pipe shall meet the requirements shown in Table D for 20% SMYS to less than 30% SMYS.

Appendix E - Fabricated Unit/Assembly or Short Sections of Pipe

UNCONTROLLED IF PRINTED

- E-1. Tables [E\(1\)](#) and [E\(2\)](#) provide test pressure and test duration requirements for fabricated units/assemblies (except farm taps) and for short sections of pipe (typically 40 to 45 feet or less) where post installation testing is impractical. Once pipe or fitting is attached to a component (see [PTST 1 Section 13.0](#) Components) it becomes a unit/assembly which requires testing in accordance with the applicable table below.
- E-2. A single joint of steel pipe with a MAOP of 100 psig or greater, where the end caps will be removed prior to installation, requires only a strength test. If the single joint of pipe contains joints within the segment, both leak and strength is required.
- E-3. Fabricated Unit/Assembly refers to sections of pipe and various fittings which are assembled together, either in a shop environment or in the field, and then attached to the pipe or connected to the system. Where post installation testing is impractical, the fabricate unit/assembly shall be pre-tested to at least meet the Design MAOP of the system to which it is being attached. Typical examples of fabricated unit/assembly include: regulator stations, valve stations, commercial/industrial regulating/metering sets, odorizer stations, pig launcher/receivers, pipeline offset sections, valve connections, etc.
- E-4. Transmission fabricated units and short sections of pipe, where post installation testing is impractical, a pre-installation hydrostatic pressure test shall be conducted in accordance with [Table E\(2\)](#). Only a strength test is required when hydrostatic pressure test is performed.
- E-5. If test pressure for bottom-out line stopper assembly exceeds the collapse pressure of the pipe, refer to [TAPS 1 Appendix C](#).
- E-6. GTE or GSE will determine when transmission facilities are to be hydrostatically pressure tested and will provide required test durations and pressures in the testing plan which may deviate from those shown in [Table E\(2\)](#).
- E-7. Short segments of pipe sizes smaller than 2 inches in nominal diameter and gauge tap type fittings/assemblies are to be tested in accordance with [Appendix A](#).
- E-8. When installing a pre-tested fabricated unit at its final installation location, check for damage including at inlets, outlets and lifting locations. Identify defects such as dents, gouges, bending, corrosion, and cracking. If threats are found, conduct non-destructive test, re-pressure test, or repair.
- E-9. Table E(1), Fabricated Unit/Assembly or Short Section of Pipe (Design MAOP Less than 100 psig, or 125 psig or less for PE pipe):

Table E(1): Fabricated Unit/Assembly or Short Section of Pipe (Design MAOP Less than 100 psig, or 125 psig or less for PE pipe)

Material	Design MAOP	Test	Test Pressure		Test Duration
			Minimum	Maximum	
PLASTIC MDPE & HDPE	60 psig	Leak Test Note (1)	90 psig	180 psig (150 psig for 8" MDPE)	See E-9.1 below
PLASTIC HDPE	125 psig	Leak Test Note (1)	188 psig	260 psig	See E-9.1 below
STEEL	< 100 psig	Leak Test Note (1)	90 psig OR 1.5 x Design MAOP Note (2)	200 psig	See E-9.1 below
Gauge or Recording Device can be used to measure test pressures.					

Note (1): The single Leak Test satisfies requirements in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the unit, assembly or pipe.

Note (2): If Design MAOP is greater than 60 psig but less than 100 psig, the minimum test pressure is 1.5 times Design MAOP.

E-9.1 *Minimum Leak Test Duration Table*: For fabricated unit/assembly containing multiple sizes of pipe and/or fittings, use the minimum duration for the largest size of pipe.

Pipe Size	≤ 2"	4"	6"	8"	10"	12"	14"	16"	18"
Minimum Duration	10 Min.	20 Min.	30 Min.	40 Min.	50 Min.	60 Min.	70 Min.	80 Min.	90 Min.

E-10. Table E(2), Fabricated Unit/Assembly, or Short Section of Steel Pipe (Design MAOP of 100 psig or Greater):

Table E(2): Fabricated Unit/Assembly or Short Section of Steel Pipe

Material	Design MAOP	Test	Test Pressure		Test Duration
			Minimum	Maximum	
STEEL	≥ 100 psig	Leak Test	100 psig	20% SMYS	Minimum 1 hour
	AND < 20% SMYS	Strength Test	1.5 x Design MAOP	Note (3)	Minimum 1 hour
	≥ 20% SMYS	Leak Test Note (5)	100 psig	20% SMYS	Minimum 1 hour
	AND < 30% SMYS	Strength Test	1.5 x Design MAOP	Note (3)	Minimum 1 hour
	≥ 30% SMYS Note (4)	Strength Test	1.5 x Design MAOP	Note (3)	Minimum 4 hours
	All pipeline facilities with MAOP at or above 20% SMYS are to be hydrostatically pressure tested, whether tested in place or re-tested, unless otherwise approved				
<u>Recording Device is required when pressure testing transmission facilities.</u>					

Note (3): Maximum test pressure on steel pipe with Design MAOP of 100 psig or greater should not exceed that designated by GTE or GSE.

Note (4): Refer to [STLP 2.2 Appendix A](#) Design Pressure - Steel Pipe Stock Code Table, for pressure that would result in stressing pipe to 30% SMYS. If the pipe being tested is not shown in this table, contact GTE, GSE, or local Gas Engineer for pressure determination.

Note (5): Leak test is required when non-hydrostatic testing is performed.

Appendix F - Farm Tap, Single Cut, 60 To 450 psig Inlet Pressure

F-1. Table F provides test pressure and test duration requirements for piping on a single cut farm tap.

Table F: Farm Tap, Single Cut - 60 To 450 psig Inlet Pressure

	Material	Design MAOP	Test	Test Pressure	Test Duration	Test Pressure Measurement
From Main to Inlet of Regulator	Inlet Service	> 100 psig	Leak Test Note (1)	Minimum 1.5 x Design MAOP OR Maximum 675	Minimum 10 Minutes	Gauge or Recording Device can be used to

UNCONTROLLED IF PRINTED

	Line < 2"			psig (if Design MAOP is unknown)		measure test pressures.
	Inlet Service Line ≥ 2"	> 100 psig	Leak Test	Minimum 100 psig	Minimum 1 Hour	
			Strength Test	Minimum 1.5 x Design MAOP OR Maximum 675 psig (if Design MAOP is unknown)	Minimum 1 Hour	
From Main to Outlet of Farm Tap	Note: All of the piping from the main to the outlet of the farm tap can be tested together at the inlet service line test pressure. See Note (2) and Note (3).					
Outlet Service Line < 2"	Test the same as Service Lines - Less than 2" Diameter; Plastic or Steel. See Table A . See Note (4).					
Outlet Service Line ≥ 2"	Test the same as Main - See Table B if plastic service. See Table C OR Table D if steel service. See Note (4).					

Note (1): The single Leak Test satisfies requirements in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the service line.

Note (2): Regulators and relief valves must be removed during the pressure test. If test pressure is 1,000 psig or more, Pete's plugs must also be removed.

Note (3): Regulators, relief valves and Pete's plugs connections shall be checked for leaks with leak detection fluid or leak detection instrument at current operating pressure once service has been reinstated.

Note (4): If the outlet service has both steel and plastic pipe, then test to the plastic pipe requirements.

Appendix G - Farm Tap, Double Cut, 451 To 1,000 psig Inlet Pressure

G-1. Table G provides test pressure and test duration requirements for piping on a double cut farm tap.

Table G: Farm Tap, Double Cut, 451 To 1,000 psig Inlet Pressure

	Material	Design MAOP	Test	Test Pressure	Test Duration	Test Pressure Measurement
From Main to Inlet of 1st Cut Regulator	Inlet Service Line < 2" Note (5)	> 100 psig	Leak Test Note (1)	Minimum 1.5 x Design MAOP OR Maximum 1500 psig (if Design MAOP is unknown)	Minimum 10 Minutes	Gauge or Recording Device can be used to measure test pressures.
	Inlet Service Line ≥ 2"	> 100 psig	Leak Test	Minimum 100 psig	Minimum 1 Hour	
			Strength Test	Minimum 1.5 x Design MAOP	Minimum 1 Hour	
Piping Between Regulators	Steel	150 psig (Max inlet for 1805 Relief)	Leak Test Note (1)	Minimum 225 psig	Minimum 10 Minutes	Gauge or Recording Device can be used to measure test pressures.

UNCONTROLLED IF PRINTED

From Main to Outlet of Farm Tap	Note: All of the piping from the main to the outlet of the farm tap can be tested together at the inlet service line test pressure. See Note (2) and Note (3).
Outlet Service Line < 2"	Test the same as Service Lines - Less than 2" Diameter; Plastic or Steel. See Table A . See Note (4) below.
Outlet Service Line ≥ 2"	Test the same as Main - See Table B if plastic service. See Table C OR Table D if steel service. See Note (4) below.

Note (1): The single Leak Test satisfies requirements in that it will ensure there are no hazardous leaks and qualifies the Design MAOP of the service line.

Note (2): Regulators and relief valves must be removed during the pressure test. If test pressure is 1,000 psig or more, Pete's plugs must also be removed.

Note (3): Regulators, relief valves and Pete's plugs connections shall be checked for leaks with leak detection fluid or leak detection instrument at current operating pressure once service has been reinstated.

Note (4): If the outlet service has both steel and plastic pipe, then test to the plastic pipe requirements.

Note (5): A test pressure of 1,181 psig or greater on a 1-1/4 inch service line will stress the pipe to 20% SMYS or more. Service line shall be tested in accordance with [Table D - Steel](#).

- G-2. Farm tap on a gas pressure system with a Design MAOP greater than 1,000 psig shall be designed or reviewed by GTE.
- G-3. Pressure containing facilities similar to a farm tap located within gas storage fields and compressor plants shall be designed by GSE.
- G-4. Piping between regulators can be tested with the inlet piping, provided all of the fittings are rated for the testing pressure.

PRESSURE TESTING

October 1, 2021

PTST 2.1 Leak Test

1.0 Purpose

This document specifies leak test requirements for mains, services, fabricated units/assemblies, and farm taps in accordance with 49 CFR 192 Subpart J.

Test Pressure and Duration Tables ([PTST 1.1](#)) specify pressure test requirements for given pipe materials, sizes and lengths.

2.0 Scope

This document addresses the following:

[3.0 Target Audience](#)

[4.0 General](#)

[5.0 Leak Test Duration](#)

[6.0 Leak Test Procedure](#)

[7.0 Leak Test Records](#)

3.0 Target Audience

- Gas Engineering
- Gas Distribution Design Specialist
- Field Engineering Representatives
- Gas Field Personnel
- Gas Supervisors
- Gas Construction Services Personnel
- Gas Tech Engineering (GTE)
- Gas Storage Engineering (GSE)
- Gas Storage Field Supervisor
- Gas Storage Field Operators

4.0 General

- 4.1 All new, relocated or replaced pipeline segments shall be pressure tested to identify any hazardous leaks and establish a maximum allowable operating pressure (MAOP).
- 4.2 Combination leak/strength tests are used to establish or verify pipeline segments or facilities with design MAOP of:
 - 4.2.1 125 psig or 60 psig for PE segments.
 - 4.2.2 Less than 100 psig for steel segments.
- 4.3 Refer to [PTST 1, Section 6.0](#) Roles and Responsibilities.
- 4.4 Hydrostatic pressure test plans for transmission lines prepared by GTE or GSE will include leak test procedures and requirements that will differ from those within this document. See [PTST 2.3](#) Hydrostatic Pressure Testing.

5.0 Leak Test Duration

- 5.1 Service lines less than 2 inches in diameter (plastic and steel) shall be tested in accordance with [PTST 1.1 Table A](#).
- 5.2 PE mains and PE service lines 2 inch and larger with a Design MAOP of either 60 psig (MDPE) or 125 psig (HDPE) and steel mains and steel service lines 2 inch and larger

UNCONTROLLED IF PRINTED

with Design MAOP of less than 100 psig will have the required test duration determined by the pipe size and length as indicated in [PTST 1.1 Table B](#) or [PTST 1.1 Table C](#). The basis of this calculation is as follows:

- 5.2.1 For mains and 2 inch and larger service lines, the leak test duration shall be 5 minutes per inch of nominal pipe diameter per 100 feet of pipe length with minimum test duration as listed below for the specific pipe diameter. See [Table 1](#) below.
- 5.2.2 When determining the required test duration, round the actual footage of pipe to be tested up to the next 100-foot increment. (i.e., 25 feet would be rounded up to 100 feet).
- 5.2.3 Calculate the required leak test duration for the pipe size and length to be tested. The maximum required leak test duration is 8 hours regardless of the additional footage of pipe to be tested.
 - 1. *Example: 4" pipe size and 1,500 ft. length to be tested.* The duration calculation would be 5 min x 4" x 15 = 300 minutes (5 hours). In this case, the minimum required leak test duration is 5 hours.
 - 2. *Example: 4" pipe size and 4,000 ft. length to be tested.* The duration calculation would be 5 min x 4" x 40 = 800 minutes (13 hours 20 mins). In this case, the minimum required leak test duration is the maximum duration of 8 hours.
- 5.2.4 The leak test pressure can be left on longer than the required test duration with the possible exception for service lines. The actual test duration time shall be recorded on the appropriate test records. See [PTST 1 Section 14.0](#) Test Records.
 - 1. Service lines with 175 psi rated meter valve that are being leak tested at a pressure greater than 200 psig shall have a maximum duration of no more than 2 hours. The test pressure shall be relieved or lowered to under 200 psig within the 2 hours. Refer to [PTST 1 Paragraph 10.6.1](#) for meter valve limitations
- 5.3 GTE or GSE shall specify the duration and pressure for leak tests performed during hydrostatic pressure testing of transmission lines.
- 5.4 When testing main segments containing different pipe sizes as a single test:
 - 5.4.1 Calculate the required leak test duration for each pipe size in same manner as in [Section 5.2](#) above. Required test duration is the sum of the calculated durations, not to exceed 8 hours.
 - 1. *Example: 10 feet of 4" pipe is connected to 2,000 feet of 2" pipe.* The required minimum duration would be: 20 min for 4" + (10 min. x 2000'/100' = 200 min) for 2" = 220 minutes. (3 hrs. 40 min.)
 - 2. *Example: 200 feet of 4" pipe is connected to 2,000 feet of 6" pipe.* The required minimum duration would be: (20 x 200/100) + (30 x 2000/100) = 1240 minutes (10 hrs. 40 min). In this case, the minimum required leak test duration is the maximum duration of 8 hours.
- 5.5 Table 1 provides the minimum test duration for pipe of a specific diameter.

Table 1: Minimum Leak Test Duration

Pipe Size	≤ 2"	4"	6"	8"	10"	12"	14"	16"	18"
-----------	------	----	----	----	-----	-----	-----	-----	-----

Time per 100 ft. of Pipe	10 Min.	20 Min.	30 Min.	40 Min.	50 Min.	60 Min.	70 Min.	80 Min.	90 Min.
Minimum Duration	10 Min.	20 Min.	30 Min.	40 Min.	50 Min.	60 Min.	70 Min.	80 Min.	90 Min.

5.6 The minimum required leak test duration for steel mains and service with Design MAOP of 100 psig or greater is 1 hour as indicated in [PTST 1.1 Table D](#). These mains and service lines require a separate leak test and strength test.

5.7 The test period begins after the test pressure has stabilized.

6.0 Leak Test Procedure

6.1 Isolate and seal all pipe ends using caps or fittings.

6.2 The mechanical recording chart, electronic pressure recording device or calibrated dead weight tester should be installed and recording prior to the initial pressurization to:

6.2.1 Verify operation of the recorder, and

6.2.2 Verify that the correct pressure is being recorded.

6.2.3 A test gauge or calibrating gauge may be used to verify accuracy of the recording device if there is question.

6.3 If the test segment will be blown down following the test, then the pressure recording chart, electronic pressure recording device or calibrated dead weight tester should be in operation at the initial start of the blow down to verify operation of the recorder.

6.3.1 If the test segment is not being blown down at the completion of the test, then document on the chart.

6.4 Fill test segment with test medium.

6.4.1 *Compressed air*: The air may be warmer than the pipe, causing an initial pressure drop in the first minutes or hours of the test as the air cools. If the pipe is exposed to sunlight or warm weather, then an increase in pressure may occur.
